GENERAL HISTORY

OF THE

DICHLAMYDEOUS PLANTS,

COMPRISING COMPLETE

DESCRIPTIONS OF THE DIFFERENT ORDERS;

TOGETHER WITH THE

CHARACTERS OF THE GENERA AND SPECIES, AND AN ENUMERATION OF THE CULTIVATED VARIETIES;

THEIR PLACES OF GROWTH, TIME OF FLOWERING, MODE OF CULTURE, AND

USES IN MEDICINE AND DOMESTIC ECONOMY;

THE SCIENTIFIC NAMES ACCENTUATED, THEIR ETYMOLOGIES EXPLAINED, AND THE CLASSES AND ORDERS

ILLUSTRATED BY ENGRAVINGS,

AND PRECEDED BY INTRODUCTIONS TO THE LINNÆAN AND NATURAL SYSTEMS,

AND A GLOSSARY OF THE TERMS USED:

THE WHOLE

ARRANGED ACCORDING TO THE NATURAL SYSTEM.

BY GEORGE DON, F.L.S.

IN FOUR VOLUMES.

VOL. III.—CALYCIFLORÆ.

LONDON:

PRINTED FOR J. G. AND F. RIVINGTON; J. AND W. T. CLARKE; LONGMAN AND CO.; T. CADELL; J. RICHARDSON; JEFFERY AND SON; BALDWIN AND CRADOCK; J. BOOKER; J. BOOTH; HARVEY AND DARTON; S. BAGSTER; SHERWOOD AND CO.; HARDING AND LEFARD; J. F. SETCHEL; WHITTAKER AND CO.; SIMPKIN AND MARSHALL; AND E. HODGSON.

THE

GARDENER'S AND BOTANIST'S DICTIONARY.

Flowers hermaphrodite, monoecious or dioecious (f. 1. b. c. f. 3. b. c.), axillary. Calyx gamosepalous (f. 3. a. b.), 5-toothed, sometimes obsolete. Corolla 5-petalled (f. 2. a. f. 1. c. f. 3. c.), but usually only 3-petalled, distinct from the calyx, and sometimes somewhat continuous with it, rising from the margin of the torus, sometimes fringed, constantly yellow, white, or red, very cellular, with strongly marked, reticulated veins. Stamens 5, either distinct, or joined in 3 parcels, and sometimes all together; filaments rarely pilose; anthers 2-celled, very long, sinuous, rarely ovate and short. Style rarely almost wanting, crowned by 3-5 lobed stigmas, which are thick and velvety, but rarely fringed. Ovarium 1-celled, with 3 parietal placentas. Fruit fleshy, more or less succulent, crowned by the scar formed by the calyx, 1-celled (f. 3. c. f. 2. b.), with 3 parietal placentas, which are indicated on the outside by nerves. Umbilical funicle tumid towards the seeds. Seeds frequently obovate, flat, fixed to the parietes of the fruit, enclosed in an arillus, which is either juicy, or dry and membranous; testa coriaceous, often thick at the margins; hylum oblique at the top of the seed. Embryo straight, flat, without albumen. Cotyledons foliaceous, palmately nerves; radicle basilar, directed towards the hylum.—Roots annual or perennial, fibrous or tuberous. Stems herbaceous, climbing by means of tendrils. Leaves palmate, or with palmate ribs, succulent, covered with numerous asperities. Tendrils solitary, lateral, divided or undivided. Flowers solitary, panicked, or in fascicles. Bracteas usually wanting. Branches rising between the leaves and tendrils.

This order is nearly related to Passiifloraceae, to which they are so closely allied, as hardly to be distinguishable, except in their monopetalous corolla, sinuous stamens, unisexual flowers, and exalbunminous seeds, the habit of both being nearly the same. There is an affinity between the order and Cactaceae in the perigynous insertion of the stamens, the inferior ovary, the single style with several stigmas, the quinary division of the flower, connected with the ternary division of the fruit, and some analogy in the nature of the floral envelopes. The small tribe Handirdocea consists of plants having the habit of Cucurbitaceae, but some resemblance in their fruit to that of Locytiaceae, which, as is well known, border close upon Myrtaceae; but beyond this resemblance of the fruit, which appears altogether to be a structure of analogy rather than that of affinity, there is nothing to confirm the approachment. Cucurbitaceae is one of the most useful orders in the vegetable kingdom, comprehending the melon, the cucumber, the choko, and the various species of gourd and pumpkin, all useful as food for man. A bitter laxative quality perhaps pervades all these, which in the colocynth is so concentrated as to become an active purgative principle. The colocynth of the shops is prepared from the pulp of Cucumis colocynthus; it is of so drastic and irritating a nature, as to be classed by Orfila among his poisons; but, according to Thunberg, this gourd is rendered perfectly mild at the Cape of Good Hope, by being properly pickled, Ainslie 1. p. 85. The bitter resinous matter in which the active principles of colocynth are supposed to exist, is called by chemists colocynthine. A waxy substance is secreted by the fruit of Benincasa hispida. It is produced in most abundance at the time of its ripening. Delisle describes the leaf of Peullea cordifolia, is asserted by M. Drapiez to be a powerful antidote against vegetable poisons. Edinb. phil. journ. 4. p. 221. The fruit of Trichosanthes palmata, pounded small, and intimately blended with warm cocoa-nut oil, is considered a valuable application in India for cleansing and healing the offensive sores which sometimes take place in the inside of the ears. It is also supposed to be a useful remedy poured up the nostrils in cases of ozaema. Ainslie 2. p. 85. The root of Bryonia possesses powerful purgative properties, but is said to be capable of becoming wholesome food, if properly cooked. The perennial roots of all the order appear to contain similar bitter drastic virtues, especially that of Momordica charantium or Squirtling
Cucurbitaceae.

Cucumber. An extremely active poisonous principle, called elatine, has also been found in the placenta of the fruit of this plant. It exists in such extremely small quantity, that Dr. Catterick only obtained 6 grains from 40 fruit. Edinb. phil. journ. 3. p. 207. An ingenious explanation of the cause of the singular ejection of the seeds of this plant will be found in Dutrochet's *Nouvelles Recherches sur l'Exosmos*. The root of *Bryonia rostrata* is prescribed in India internally in electroly in cases of piles. It is also used as a demulcent, in the form of powder. That of *Bryonia cordifolia* is considered cooling, and to possess virtues in complaints requiring expectorants. Ainslie 2 p. 21. The root of *Bryonia epigaea* was once supposed to be the famous colomba-root, to which it approaches very nearly in quality. The tender shoots and leaves of *Bryonia acida* are aperient, having been previously roasted. Ainslie 2 p. 212. The seeds of all the species are sweet and oily, and capable of forming very readily an emulsion. Those of *Amphelosicos sciedens* are as large as chestnuts, and said to be as good as almonds, having a very agreeable flavour. When pressed they yield an abundance of oil, equal to that of the finest olives. De Candolle remarks that the seeds of this family never participate in the property of the pulp that surrounds them.

**Synopsis of the Genera.**

**Tribe I.**

*Nhandirobee*. Tendrils axillary, in the place of peduncles. *Flowers dioecious.*

1 *Feuillea*. Calyx of the male flowers 5-cleft. Petals 5, joined at the base. Stamens 5, inserted with the petals, sometimes 10, but 5 of them are sterile. Calyx of the female flowers 5-cleft. Petals 5, distinct. Styles 3; stigmas broad, bifid. Fruit globose, fleshy.

2 *Zanonia*. Male flowers. Calyx 3-lobed (f. 1. a.). Petals 5, joined into a 5-parted rotate, spreading corolla (f. 1. b.c.). Stamens 5, joined at the base; anthers 1-celled. Female flowers. Calyx with a long turbinate tube, and a 5-lobed limb. Corolla as in the male flowers. Styles 3, spreading, bifid at the apex. Fruit long, turbinate, fleshy; seeds winged (f. 1. d.e.).

**Tribe II.**

*Cucurbitae*. Tendrils lateral, stipular. *Flowers hermaphrodite, dioecious, or monocious.*

3 *Lagenaria*. Calyx campanulate, with subulate or broadish segments; corolla white; petals obovate. Stamens 5, triadephous. Stigmas 3, thick, 2-lobed. Fruit 3-5-celled. Flowers dioecious.

6 *Benincasa*. Flowers polygamous, monocious, solitary; calyceine segments with undulated, toothed margins. Petals obovate, spreading, curled. Stamens in 3 parcels; anthers irregular, with distant circumvolutions. Stigmas very thick. Flowers yellow.

11 *Elaterium*. Flowers monocious; male ones racemose or corymbose. Calyx with inconspicuous teeth. Corolla hardly gamopetalous. Filaments and anthers joined. Female flowers solitary. Calyx ciliated at the base, with the neck filiform. Style crowned by a capitate stigma. Capsule coriaceous, reniform, ciliated, 1-celled, 2-3-valved, many-seeded, bursting elastically. Flowers yellow or white.

14 *Sechium*. Flowers monocious, yellow. Calyx 5-toothed, with 10 foveole. Corolla joined with the calyx. Stamens 4-5, monadelphous. Style thick; stigma capitate, 3-5-cleft. Fruit obovate, 1-seeded.

17 *Amphoscyos*. Flowers dioecious. Male flowers. Calyx turbinate, 5-cleft (f. 3. a); segments denticulated (f. 3. b).
Corolla 5-petalled (f. 3. c.) ; petals oblong, fringed (f. 3. d.). Stamens 5, in 3 parcels. Female flowers. Limb of calyx 5-toothed.

Corolla as in the male. Stigma capitulate, 3-lobed, ex Bojer. Fruit fleshy, 2–3 feet long, and 8 inches thick, elongated, furrowed (f. 3. c.). Flowers purple.

19 Involucrinia. Flowers monocoeous. Male ones umbellate, sessile; bracteas reniform, fringe-toothed, involucriform. Tube of calyx obconical; sepals linear, acute. Anthers joined together. Female flowers solitary, on long peduncles.

21 Anthria. Flowers monocoeous. Male flowers. Calyx campanulate, 5-toothed. Corolla joined with the calyx, ventricose, red, 5-parted. Stamens 2. Female flowers with a calyx and corolla as in the males, and 2 sterile stamens. Style semibifid; stigmas bifid. Fruit 2–4-celled, many-seeded, somewhat tetragonal.

† Genera not sufficiently known.

22 Zuca. Flowers solitary, axillary. Bracteas large, concave, involving a large, coloured, 5-sepaled calyx, and girded by 5 scales at the base. Stamens 5.

23 Alla sia. Flowers hermaphrodite. Calyx gamosepalous, girded by a short involucrum. Segments 5, acutish, pilose. Corolla 4-petalled; petals pilose. Stamens 4, but more probably 8, joined by two; anthers 2-lobed. Style subulate, crowned by an acute stigma. Berry fleshy, large, oblong, obtuse, 1-celled, many-seeded.

24 Grono vie. Flowers hermaphrodite. Calyx funnel-shaped, 5-parted; scales 5, linear, petal-formed, pellucid, alternate with the calycine segments. Stamens 5, free, alternating with the scales. Style crowned by a capitate stigma. Berry dry, nearly globose, 1-seeded, crowned by the dry permanent calyx.

Tribe I.

Lin. syst. Dioccia, Pentándria. Flowers dioecious. Male flowers. Calyx 5-cleft beyond the middle. Petals 5, rather joined at the base, inserted in the throat of the calyx, and alternating with the sepals. Stamens 5, inserted with the petals, and alternating with them, sometimes 10, but when this is the case, 5 of which are always sterile. (ex Juss.) Anthers 2-celled, didymous. Female flowers. Tube of calyx adnate to the ovary; limb 5-cleft. Petals 5, distinct, or joined at the base, oblong. Lamelle or abortive stamens 5, sometimes alternating with the petals (ex Juss.). Styles 3. Stigmas broad, bluntly bifid. Fruit globose, fleshy, 3-celled, indehiscent, with solid bark and a large fleshy trigonal central axis; cells many ovulate. Ovula erect from the centre. Seeds compressed, oval. Embryo straight. Cotyledons flat, rather fleshy.—Intratropical American, rather frutescent climbing herbs. Leaves alternate, petiolate, exstipulate, palmately nerved, coriaceous, glabrous. Tendrils axillary, spirally twisted, in place of peduncles. Peduncles axillary, 1 or many-flowered. Flowers small. Seeds oily, bitter. This genus has a habit emulating Passiflora. Fruit in the form of that of Couroupita, a genus of Lecythidaceae.

1 F. punctata (Poir. dict. 4. p. 418.) leaves 3-cleft or ternate, beset with glandular dots on both surfaces along the nerves, but more especially beneath; lobes of leaves lanceolate, rather cut. 2. C. S. Native of St. Domingo. Trichosanthes punctata, Lin. spec. 1432. amén. acad. 3. p. 423. exclusive of the country. Feuillea trilobata, Reichs. syst. 4. p. 253.

Dotted-leaved Feuillea. Pl. cl.

2 F. trilobata (Lin. spec. ed. 1. p. 1014.) leaves rather glaucous on both surfaces, 3-parted or trifid; lower lobes obtuse, upper ones acute. 2. C. S. Native of Brazil. F. scandens, Lin. spec. ed. 2. p. 1457. F. hederaecea, Poir. dict. 4. p. 419. Chandirobra or Nhandirobra, Margr. bras. 46. lower figure. Three-leaved-leaved Feuillea. Pl. cl.

3 F. cordifolia (Poir. dict. 4. p. 418.) leaves glandless, cordate, acuminate, or somewhat 3-cleft, and rather serrated. 2. C. S. Native of the West Indies. Plum. ed. Burm. t. 209. F. scandens, Lin. spec. ed. 2. p. 1457. F. hederaecea, Turp. in dict. ac. nat. with a figure. The leaves of this species are said to be a powerful antidote against vegetable poisons.

Heart-leaved Feuillea. Pl. cl.

2 F. Javilla (H. B. et Kunth, nov. gen. amer. 2. p. 124.) leaves glandless, roundish, sinuately cordate, acuminate. 2. C. S. Native of New Granada, in woods near Turbo, where it is called Javilla by the inhabitants. Seeds with subulate margins, hence this species agrees with the genus Zanonia.

Javilla Feuillea. Pl. cl.

 Cult. A light rich soil will suit the species of Feuillea; and cuttings of them will root readily under a hand-glass, in heat. They are well fitted for training up rafters in stores.

Lin. exer. Dioccia, Monadelphia. Flowersdioecious. Male. Calyx 3-cleft (f. 1. a.). Petals 5, joined into a 5-parted rotate corolla (f. 1. b. c.). Stamens 5 (f. 1. c.); filaments flat, connected at the base; anthers 1-celled, adnate to the tops of the filaments. Female. Tube of calyx long, turbinate; limb 5-
lobed. Corolla as in the male. Styles 3, spreading, bifid at the apex. Fruit long, turbinate, fleshy, having a circular line at the apex, formed from the vestige of the calyx, opening by 3 valves at the top, 3-celled; the rind solid: central placenta fleshy, large, trigonal; cells bioluate. Seeds ovate, margined by a foliaceous wing (f. 1. e. d.), exalbaminous. Embryo inverted.—Smooth, climbing, Indian plants. Leaves alternate, petiolate, exstipulate, ovate-lanceolate, cordate at the base, acuminate, quite entire. Tendrils axillary. Peduncles also axillary and racemose. This genus, from the general form of the fruit, is like the genus Coriaria, but from the characters it is allied to Feuillea. The interior fabric of the seeds is unknown.

Sect. I. ZANONIA (see genus for derivation). Blum. l. c. Cells of fruit 2-seeded. Fruit elongated, somewhat tetragonal.

1 Z. INDICA (Lin. spec. 1137.) leaves elliptic, acute, rather cordate at the base; racemes axillary. h. C. S. Native of Malabar, Ceylon, and Java. Blum. l. c. Pinuarvilli. Rheed. 6. t. 47 and 48.

Indian Zanonia. Pl. cl.

Sect. II. Alsomitra (from aleae, alas, a grove, and mira, nitra, a girdle; the plants grow in groves and entwine round the trees by means of ring-like tendrils.). Blum. l. c. Cells of ovary many-seeded. Fruit hemispherical, truncate at the apex, or elongated.

2 Z. MACROCA'RIA (Blum. l. c.) leaves ovate-elliptic, acutish, rounded at the base; racemes axillary. h. c. S. Native of Java, on the mountains of Parang.

Large-fruited Zanonia. Pl. cl.

3 Z. SARCOPHYLLA (Wall. pl. rar. asiat. 2. p. 28. t. 135.) leaves trilobulate; leaves thick, fleshy, ovate, obtuse, quite entire. h. c. S. Native of the East Indies, in sterile situations along the banks of the trawaddi. The plant climbs by means of simple and slender tendrils. The leaves are of a pale glaucous colour. Flowers small, very numerous, forming ample, greenish, nodding panicles. The different sexes are produced in distinct plants.

Fleshy-leaved Zanonia. Shrub cl.

4 Z. CLAVICERA (Wall. l. c.) smooth; leaves trilobar; leaves oblong, acuminate, quite entire; fruit large, clavate. h. c. S. Native of Silhet, where it is called in the Bengalese language Khinobera. The fruit is 3 inches long, and as thick as a thumb.

Club-bearing Zanonia. Shrub cl.

5 Z. ANGULA'TA (Wall. l. c.) smooth; stem angular; leaves simple, somewhat hastily lanceolate, cordate at the base; fruit large, clavate. h. c. S. Native of Silhet. The fruit is as long as a finger, and very thick.

Angular-stemmed Zanonia. Shrub cl.

6 Z. CISSOIDES (Wall. l. c.) stem filiform, angular; leaves pedate, with 5 or 7 leaflets; leaflets lanceolate, acuminate at both ends, coarsely and cuspilately serrated; petioles and peduncles pilose. h. c. S. Native of Nepaul.

Cissus-like Zanonia. Shrub cl.

7 Z. LAXA (Wall. l. c. p. 29.) stem filiform, much branched, bifurcantly pilose; leaves trilobar; leaflets acuminate, serrated, intermediate one lanceolate, lateral ones half cordate; petioles and peduncles pilose. h. c. S. Native of Silhet.

Loose Zanonia. Shrub cl.

8 Z. HETEROSPER'MA (Wall. l. c.) stem filiform, very slender; leaves pedate, with 5 leaflets; leaflets lanceolate, acuminate, serrated; capsule clavate, angular, borne on very long capillose peduncles; seeds sebaceous from scales. h. c. S. Native of Mount Taong Dong, near Ava. Capsule chartaceous, trigonal, 5 lines long, with a 3-toothed mouth. The scales on the seeds are elegantly imbriicated, and girded by a narrow margin.

Variable-seeded Zanonia. Shrub cl.

Cult. See Feuillea, p. 3. for the culture and propagation of the species.

Tribe II.

CUCURBITACEÆ (plants agreeing with Cucurbita in important characters). D. C. prod. 3. p. 299. Tendrils lateral, stipular. Flowers hermaphrodite, dioecious, or monoecious.

III. LAGENARIA (from lagena, a bottle; form of fruit of some of the species). Ser. diss. l. c. D. C. prod. 3. p. 299.—Cucurbita species of author.

Linn. sect. Diceria, Polydiophyta. Calyx campanulate; segments subulate or broadish, shorter than the tube. Corolla white; petals obovate, rising from beneath the margin of the calyx. Male. Stamens 5, in 3 parcels, the fifth one free. Female. Style almost wanting; stigmas 3, thick, 2-lobed, granular. Fruit 3-5 celled. Seeds ovate, compressed, 2-lobed at the apex, with tumid margins. Flowers monoecious.

1 L. vulga'ris (Ser. ms. ex D. C. prod. 3. p. 299.) plant musky scented, clothed with soft pubescence; stems climbing; tendrils 3-4-cleft; leaves cordate, nearly entire, bidentate at the base, pilose, rather glaucous; flowers monoecious, stellate, spreading much, in fascicles; connectives of anthers beset with oblong-ovate, acute papillae; fruit pubescent, but when mature quite smooth; flesh white, edible. C. c. H. Native within the tropics. Cucurbita lagenaria, Lin. spec. 1434. Sieh. hort. 1. t. 69.—Rumph. amb. 5. t. 144.—Mor. hist. 2. p. 22. sect. 57. t. 5. f. 1, 2, 3. Flowers large, white. Fruit shaped like a bottle; when ripe of a pale yellow colour, some near 6 feet long, with a roundish bottom and a neck; the rind becoming hard, and being dried, contains water: it is then of a pale bay colour. The bottle-gourd is called Charhari by the Arabians. The poor people eat it, boiled with vinegar, or fill the shells with rice and meat, thus making a kind of pudding of it. It grows in all parts of Egypt and Arabia, wherever the mountains are covered with rich soil. In Jamaica and many other places within the tropics, the shells are generally used for holding water or palm wine, and serve as bottles. The pulp of the fruit is often employed in resedative poultices; it is bitter and purgative, and may be used instead of colocynth.

Var. a. goi'arda (Ser. ms. ex D. C. l. c.) fruit unequally biventricose.—Moris. hist. sect. 1. t. 5. f. 1. Dodon. pempt. 668. f. 1. Bottle gourd. Gourd des périers.

Var. b. gongour'da (Ser. l. c.) fruit ventricose at the base, neck oblong.—Rumph. amb. 3. p. 398. t. 144. Brahm. icon. t. 17. Commonly called Gongunode.

Var. c. dépre'essa (Ser. l. c.) fruit globose, depressed.

Var. c. turbinata (Ser. l. c.) fruit somewhat campanulate pear-shaped. Mor. hist. sect. 1. t. 5. f. 2. Dodon. pempt. 668. f. 2. Gourd trompette, Gourd massein, or Trumpet gourd.

2 L. VITATTÁ (Ser. l. c.) leaves roundish-cordate, somewhat re pand, obsolescely denticulated, rough; peduncles crowded, 1-flowered; fruit pear-shaped, striped lengthwise, puberulous.

LIN. Syst. Diocia, Polygalëphila. Calyx tubularly campanulate; segments subulate, hardly the length of the tube. Petals hardly joined together or to the calyx.—Male. Stamens 5, in 2 parcles.—Female. Stigmas 3, thick, bipartite. Fruit 3-6-celled. Seeds ovate, compressed, not marginate. Flowers monoeccious or hermaphrodite, yellow.

1 C. Melo (Lin. spec. 1436.) stem trailing, scabrous, cirrhiferous; leaves roundish, angular, petiolate; male flowers having the tube of the calyx rather venicose at the base, and rather dilated at the apex; stamens inclosed; anthers shorter than their connectives; the hermaphrodite flowers with the anthers as in the males; stigmas 3-4, shortly 2-lobed; fruit ovate or sub-globose, 8-12-furrowed; flesh sugary, yellow, red, or white. —F. Native of Asia. Called rhetimou by the Hindoos; Melon, Engl. and Fr.; Melone, Germ.; Melone, Ital.

The melon is a tender annual, producing one of the richest fruits brought to the dessert, and has been cultivated in England since 1570, but the precise time of its introduction is unknown. It was originally brought to this country from Jamaica, and was, till within the last fifty years, called the musk-melon. The fruit, to be grown to perfection, requires the aid of artificial heat and glass throughout every stage of its culture. Its minimum temperature may be estimated at 65°, in which it will germinate and grow; but it requires a heat of from 75° to 80° to ripen its fruit, which, in ordinary cases, it does in 4 months from the time of sowing the seed.

Varieties.—There are numerous varieties, many of which, especially those raised from seeds brought from Italy and Spain, are not worth cultivating. The best sorts are included under the name of Cantaloops, an appellation bestowed on them from a seat of the Pope near Rome, where this variety is supposed to have been originally produced. The general character of the Cantaloops is a roundish form, rough, warty, or netted outer rind; neither very large in fruit or leaves. The Romans, an Italian sort, is next in esteem, are generally oval-shaped, regularly netted; the fruit and leaves middle-sized, and the plants great bearers. Many varieties of both these sorts, however, that were formerly in esteem, are now lost, degenerated, or supplanted by others of Spanish or Persian origin. The following is a descriptive list of the sorts.

List of Melons.

Var. a, reticulatus (Ser. in D. C. prod. 3. p. 300.) fruit roundish or oblong, with a grey reticulated rind. —Blackw. herb. t. 329. The following sorts of melons belong to this variety:—

1 Beechwood melon. This is an excellent, early, greenish yellow kind, with a netted rind and a greenish-white flesh, of a middle size.

2 Melon maraicher. The flesh of this sort is very thick and watery; hardly sweet-scented.

3 Melon de l'officier. A late melon, with a thin yellow rind, and pale red sugary flesh. It is of inferior quality but large in size.

4 Melon des Carmes. A well-flavoured large fruit, with a thick orange rind, and juicy sugary pulp.

5 Melon de Langois. A middle-sized, ribbed fruit, with orange-coloured, sugary, sweet-scented flesh.

6 Melon succin de Tours. Fruit large, with firm, sugary, orange-coloured flesh.

7 Succin à chair blanche.

8 Succin à chias.

9 Succin vert.

10 Succin à petits grains.

11 Succada. A late green middle-sized netted melon.

Var. b. Cantalupé (Ser. in D. C. prod. 3. p. 300.) fruit large, with broadly ribbed, and furrowed, warty, thick rind. The following sorts belong to this variety.

1 Early Cantaloup. A deep-furrowed, early, middle-sized kind, with white, deeply-furrowed, thin skin; and orange-coloured flesh, not very highly flavoured. It sets well, and is a great bearer.

2 Silver Cantaloup. Cantaloup argenté. A shallow-furrowed, middle-sized fruit, and before it is full grown is mixed with silver and green.

3 Large black Holland cantaloup. Cantaloup gros noir de Hollande. A large fruit, with green, furrowed, thin rind: and red rather coarse flesh.

4 Hybrid cantaloup. A small good early fruit, with a whitish rind and red pulp.

5 Montagu cantaloup. This is a variety produced from the Italian green-fleshed and the smooth scarlet-fleshed cantaloup. A middle-sized, early good fruit, but with a thick, yellow, furrowed rind and pale red flesh, which is soft and juicy, and completely melting in the mouth.

6 Netted cantaloup, or White-seeded cantaloup. This is a very juicy, highly-flavoured, small fruit, with a thin, netted, yellow rind.

7 Orange cantaloup. A small, round, pale yellow, netted fruit. The flesh, when just fit for cutting, is orange; but when ripe it is more red. In respect to flavour, it is excelled by none of the melon tribe, being juicy, sugary, and rich. The plant is a free grower, an early settler, and a great bearer.

8 Black rock cantaloup. A large late melon, with a thick dark green rind, and salmon-coloured flesh. It is juicy, but not very high flavoured.

9 Carcumbered rock cantaloup. Very like the black rock, as to colour and flavour, but differs in being cheese-shaped. There are a small and a large kind of this; the smaller kind is the best.

10 Lee's rock cantaloup. Rather long than round, and more green than black. Much the same in flavour as the preceding.

11 Scarlet-fleshed cantaloup. A middle-sized early good fruit, with a thick yellow rind and red sweet flesh. It is particularly high flavoured.
12 Italian green-fleshed. A middle-sized early good fruit, with a thick yellow rind and green flesh: in flavour both rich and sweet.

13 Ionian green-fleshed cantaloup. A large thin-skinned lemon-coloured and lemon-scented fruit, of excellent flavour, but not a great bearer.

14 Egyptian green-fleshed. A middle-sized early good fruit, with a thin white netted skin and green flesh: in flavour resembling the preceding.

15 Dutch green-fleshed. An indifferent sort.

16 Crimean green-fleshed. A useless late fruit, of middling size, with a thin green skin and pale red flesh.

18 Green-fleshed Musciputatan. A very small and excellent early sort, with green skin and green flesh.

19 Green-fleshed Valparaiso. Not very good.

20 Red-fleshed Valparaiso.

21 Dutch rock. A rather large good fruit, with a thick yellow rind, and orange-coloured flesh.

22 Early rock. A good early fruit.

23 Golden rock. A middle-sized fruit, with a thick yellow rind and pale red flesh, of excellent flavour.

24 Scarlet rock.

25 Silver rock. A large late fruit, with a thick yellow rind, and pale red flesh, which is juicy, sweet, and well-flavoured.

26 Netted scarlet-fleshed. A good sort.

27 Smooth scarlet-fleshed. A middle-sized fruit, of excellent flavour. The rind is thick, smooth, and yellow, and the flesh orange-coloured.

28 Windsor scarlet-fleshed. A rather large, excellent-flavoured, late kind, with thick green rind, and salmon-coloured flesh.

29 Lee's Roman. A middle-sized, longish, shallow-furrowed fruit. Rind hard, partly netted, and pale yellow: the flesh full yellow and pretty high flavoured, but not very juicy.

30 Large netted Roman. The largest of the Romanas, regularly netted all over, and shallow-furrowed, often attaining a large size. Rind hard, and pale yellow, the flesh full yellow, but not very juicy: very high-flavoured, if eaten sharp ripe.

31 Pair's Roman. A small oval fruit, the rind greenish yellow when ripe, and the flesh a pale yellow, not very juicy; but well-flavoured and agreeable.

32 Early Polignac. An early rich middle-sized fruit, with a thick yellow rind, and pale red flesh. It is in frequent cultivation.

33 Portuguese. There are two varieties of this kind, a small and a large sort; they are noted as good bearers and early, but well-flavoured and agreeable.

34 Sweet Italian. A large orange-coloured sort, of moderate quality.

35 Netted succado. A middle-sized late green-skinned sort.

36 Small Levant. A middle-sized sort, with a thick green skin and pale red flesh. Not of good quality.

37 Smooth yellow-fleshed Valparaiso. A middle-sized, late, green, thin-skinned sort; the flesh white, of moderate flavour.

38 Brasilian. An inferior middle-sized sort, with thin green skin and orange-coloured flesh.

39 Melon d'été d'Odessa. A rather large, late, indifferent fruit, with thin orange skin and white flesh.

40 Melon d'Olor. A very small fruit, with yellow skin and white flesh, of good quality.

41 Netted French melon. A rather large late fruit, with a thick yellow rind and yellow flesh, of bad quality.

42 Nittgen. A late green, thick-skinned sort, with white flesh.

43 Queen Amy's melon, early queen, or queen's pocket melon. A very small fruit, with ornamental striped thin skin, and white flesh.

44 Carthagena. A large high-flavoured fruit, with a thick orange-coloured rind and pale red flesh.

45 Cassabar. A large late fruit, with green thin skin, and white flesh.

46 Cephalonia. A large oblong fruit, with thin yellow skin and green flesh, of tolerable flavour.

47 Choisy. A large fruit of little use: the skin is thick and yellow, and the flesh pale red.

48 Gahoon. A large late fruit, of little value; with yellow skin and yellow flesh.

49 Greco, ostrich egg. A middle-sized late fruit, of excellent flavour: the skin as well as the flesh is green. The plant is rather tender.

50 Gros Prescott fond blanc. A large late fruit, with a thick yellow rind, and orange-coloured flesh.

51 Petit Prescott. Fruit depressed, crowned at the top; ribs warty: flesh delicious.

52 Cantaloup natif d'Allemagne. An early fruit, with a greenish-yellow smoothish rind, but not of good quality.

53 Cantaloup boite de Siun. Fruit very much depressed, with a dark green rind, full of warty ribs.

54 Hardy ridge. A middle-sized late fruit, with a thick yellow rind and red flesh, of good flavour.

A list of melons which are hardly known; but none of them are perhaps worth cultivation.

1 De Andalusie. 2 Cantaloup à chair verte. 3 Cantaloup à find noir. 5 Cantaloup Galleux. 6 Chili musk. 7 Crimean. 8 Citron. 9 D'Espagne. 10 Fagor. 11 Fin hatif. 12 Golden egg. 13 Grand Mogul. 14 Green Spanish oval. 15 Gros Galleux à chair verte. 16 Hardy scarlet-fleshed. 17 Highlever. 18 D'Hiver. 19 Large Astrachan. 20 Levant. 21 Melon gris des Carmes. 22 Melon de Honda. 23 Melon de Jaffa. 24 Melon Turc. 25 Madeira. 26 Mendoza. 27 Le Mogul. 28 De Petron. 29 Pine apple or Melon d'Arunas. 30 Musk melon. 31 Carthagena musk melon. 32 Murray's pine-apple. 33 Noir de Hollande très gros. 34 Turkish melon. 35 Valentin or winter melon. 36 Wynestay.

Iar. γε, Multénsis (Ser. in D. C. prod. 3, p. 300.) fruit with a smooth thin rind. This variety is divisible into two parts, as Maltese Melons and Persian Melons.

* Maltese melons.

1 Melon de Malte blanc or Melon de Malte à chair blanche. An early middle-sized ovate-oblong fruit, with white watery sugary flesh.

2 Melon de Malte jaune. Flesh of fruit orange-coloured, sweet-scented.

3 Melon de la Morière ou de Candie, or Melon de Malte à l'hiver. This kind is cultivated in various countries bordering on the Mediterranean sea, and particularly in the orange gardens at Hiers, near Toulon, whence its fruit is sent to Paris. The skin is thin; the flesh white, firm, sugary, and juicy; not rich, but pleasant. The shape oval, size about a foot long and eight inches broad; of a dark green colour. This fruit is regularly imported, and may be had in the fruit shops from September to January.

** Persian melons.

1 Daree. A good-sized fruit; skin thin and green; flesh white, high-flavoured. A late fruit.

2 Damphsa melon. An excellent, late, rather large fruit, of nearly a cylindrical form, and netted; rind thin and yellow when ripe; flesh green, quite melting, and of excellent flavour. The fruit will keep, if hung up by its stalk, for some time.

3 Large gernerke. An excellent early green-skinned sort, of considerable size; flesh green.
Small gernex. This is much smaller than the last-named sort; the skin is yellow and the flesh green.

Goorgab. A middle-sized late fruit, with yellow rind and white flesh. A useless sort.

Green Hoosainee. A middle-sized late sort, of good quality; rind thin, green; flesh white.

Striped Hoosainee. A very good late sort, with green-yellow rind, and white flesh.

Kasan sugar melon. A good sort.

Keiseng. This is said to be one of the best Persian melons; the skin is thin, pale yellow, and red, and the flesh white.

Kerching. A very good sort, of considerable size; the skin is lemon-coloured, and the flesh white.

Melon of Erivan. A middle-sized good fruit, with yellow skin and red flesh.

Melon of Nukhawan. This is an excellent late kind; the skin is yellow, and the pulp white.

Melon of Nusserabad. A middle-sized fruit of indifferent quality.

Melon of Sena. A middle-sized fruit of indifferent quality.

It is a late sort, with yellow rind and green flesh.

Green Persian. A fruit of indifferent flavour.

Oldaker's Persian. A fruit of considerable size but no merit; the rind is orange-coloured, and the flesh green.

Sir Gore Ouston's Persian. A large fruit of good quality; the skin is yellow and the flesh white.

Sweet melon of Isphahan. This is said to be one of the very best melons. It grows to a large size; the skin is yellow and the flesh green, crisp, sugary, and rich in taste.

Tabibee melon.

Teheran melon.

Salonica. A round fruit, with a gold-coloured rind, and white flesh; improves in flavour and richness till it becomes quite soft; consistence of its pulp nearly that of a water melon, and very sweet.

On the degeneracy of the larger varieties of Persian melons.—Mr. Knight thinks that it would be strange if very large and excellent variety of melon did not degenerate, under our ordinary modes of culture. For every large and excellent variety of melon, must necessarily have been the production of high culture and abundant food; and a continuance of the same measures to it, in its highly improved state, must be necessary to prevent its receding in successive generations from that state. Abundant food, it is true, is generally, perhaps always, given by the British gardener to his melon plants: but sufficient light, under the most favourable circumstances, can only be obtained during a part of the year, and a sufficient breadth of foliage to enable the melon plant properly to nourish a fruit of large size and rich saccharine quality, so that it may obtain the highest state of growth and perfection which it is capable of acquiring, has rarely, and probably never, been given in any season of the year, by any British gardener. Mr. Knight has cultivated the Sweet Isphahan melons, and found it a very superior variety. He has cultivated this variety generally in brick pits, surrounded by hollow walls, through which warm atmospheric air at all times enters abundantly; putting each plant in a separate large pot, and suffering it to bear one melon only: but the fruit sets sufficiently well in a common hot-bed. The rind of the Isphahan melon, being very soft and thin, the fruit is apt to sustain injury on the lower side; they should be raised above the ground a little by some means while young, so that the air may pass under them. When seeds of the Isphahan melon are only wanted, it is quite time enough to sow in the beginning of April, so that the fruit may ripen in August. Very valuable varieties of melons may be obtained, for one generation at least, by cross breeding among the smaller and more Hardy varieties of green and white-fleshed melons and the large Persian varieties. It is generally supposed that the offspring of cross-bred plants, as of animals, usually present great irregularity and variety of character; but if a male of permanent character and habits, and, of course not cross-bred, be selected, that will completely overrule the disposition to sport irregularly in the cross-bred variety: alike in the animal and vegetable world, the permanent habit always controlling and prevailing over the variable. The finest varieties of melon are usually supposed by gardeners to be fruits of as easy culture as the pine-apple, but experience has led us to draw a contrary conclusion. If the leaves of the melon plant be suddenly exposed to the influence of the sun in a bright day, which has succeeded a few cloudy days, for a short time only, they frequently become irreparably injured. If the air of the bed be kept a little too damp, the stems of the plants often canker, and the leaves and stalks sustain injury in the common hot-bed; and, if the air be too dry, the plants, and consequently the fruit, are injured by the depredations of the red spider.—Loud, gard. mag. vol. 7. pp. 186, 187, 188.

In the cultivation of the melon, Knight observes, "it is a matter of much importance to procure proper seed. Some gardeners are so scrupulous on this point, that they will not sow the seed unless they have seen and tasted the fruit from which they were taken. It is proper, at least, not to trust to seeds which have not been collected by judicious persons. Some make it a rule to preserve always the seeds of those individual specimens which are first ripe, and even to take them from the ripest side of the fruit. A criterion of the goodness and probable fertility is generally sought by throwing them into a vessel containing water; such as sink are considered as good, and likely to prove fertile, and those that float imperfect. It is remarked of seeds brought from the Continent, that they must have more bottom heat, and the young plants less water, than are necessary for seeds ripened in this country, or young plants sprung from these."

The culture of the melon is an object of emulation among gardeners, and the fruit of the best sorts have a peculiarly rich flavour, thought by some to bear some resemblance to that of the pine-apple. "Ripe fruit," Abercrombie observes, "may be had by forcing at any season, but the main crops, raised for the general demand, are seldom cut, at the earliest, before May, and the last succession mostly ceases to yield fruit after October."

"To ripen the best large fine kinds," McPhail observes, "as great an atmospheric heat, and a bottom heat to its roots also, is required as is sufficient to ripen the pine-apple in this country; but as the melon is produced from an annual plant, the seeds of which must be sown every year, it requires a different mode of culture. Different methods of culture, and various kinds of earth and of manures have been recommended and used successfully in rearing of melons. The great thing, after planting, is to give them plenty of atmospheric heat, and a sufficiency of external air, and water. Those methods which are most simple and the least expensive, and best calculated to assist in making a suitable climate for the melon to grow in and ripen its fruit well, should be preferred."

Soil.—Abercrombie says "The melon will succeed in any unenriched loam, rich in vegetable rudiments, with a mixture of sand, but not too light. The following is a good compost: two-thirds of top-soil earth from a sheep common, adding sharp sand, if the earth contains little or none, till half is sand; one-sixth of vegetable mould; and one-sixth of well-considered horse-dung. Or, if the earth is not obtained from a pasture, rotted sheep-dung may be substituted for the last. The ingredients should have been incorporated and pulverized by long previous exposure and turning over. The compost should be dried under shelter before it is used, and warmed in the frame.
CUCURBITACEÆ. IV. Cucumis.

for potting.” M'Phail says, “Melons will grow and produce fruit of a good flavour, if they be planted in any kind of earth, not of too light a texture, whether it be taken from a quarter of the kitchen garden or from a corn-field, mixed well with good rotten dung; but earth of a loamy nature is the best, because it retains moisture longer than lighter earth. Earth, dug from the surface of a common, where sheep and cattle have long been pastured, is excellent for the melon. It should be broken well, and lie a few months before it is used, and if it be exposed to a winter's frost it will do it good. This sort of earth, if it be taken from the surface of the common, will require no manure the first year of using. I would here mention that unless the earth which I used for the melon plants was very strong, I made it a practice, when the melon-beds were wholly earthed up, to tread the surface all over, which makes the earth retain its moisture longer than if it were left loose.”

Earth for melons, according to Nicol, “may be thus composed: one-half strong brown loam from a pasture, a quarter light sandy earth, an eighth part vegetable mould of decayed tree leaves, and an eighth part rotten stable-yard dung. The mould for both cucumbers and melons should be well incorporated, should be exposed to frost, and be frequently turned over to aerate.” It appears from a passage in Moret's second journey into Persia, p. 147., that pigeons' dung has from time immemorial been much sought after for manuring melons. Immense pigeon-houses are built on purpose to collect it, and when there is a dearth, as melons produce the earliest return of food, every one is eager to cultivate them, and that kind of manure, being then in great demand, sells very high. During the famine in Samaria, mentioned in 2 Kings, ch. vi., it is said to have sold for five pieces of silver the cub.

A correspondent in the garden mag. 2, p. 404., on melon compost, and on the influence of soil on Hydrængæa hortensiæ, has always used for his melons the compost to which the Dutch so strongly adhere, viz. one-third strong hazel loam, one-third scoriings of ditches, and one-third rotten dung, exposing the mixture two years to the influence of the summer and winter, to evaporate what noxious qualities may lurk in the earths: for it is well known, that in proportion to the degree of salt of iron, it will be proportionably sterile. He had often observed the leaves of his melon plants turn yellow, occasionally plants died, for which he could not account; he suspected iron, as it pervaded his district, to be the cause; but as a magnet would not take up any of the compost, his attention was diverted from that point. Similar results in future seasons again called his attention to it, and he added lime, to correct the sulphate of iron, if any; but he lost his whole crop, which he fancied by the application of the lime.

As during winter a red oxide filtered from the compost heap, he again felt certain of the presence of iron. He submitted the compost to the test of burning, and having by that means got rid of the superabundant carbon, the magnet immediately detected the iron. He changed his soil, and has never lost since any melon plants. The experiment proves that the old test of the loadstone may be defeated by the presence of other adherent matter; for though it was inactive over the cold soil, it acted in full force upon the soil when, by roasting, it had discharged its gas. While a profitable experiment resulted on the one hand, a great amount occurred on the other, with some greenhouse plants. He mixed the compost fresh from the ditch with water, and found a precipitation of iron. He used the soil and water to Hydrængæa hortensiæ, a cutting from the common pink variety, and it so altered the pink colour of the flower to purple, as to form a new plant. He applied the same to other plants, in some of which it altered the colour of the flowers, but in others it had no effect.

Estimate of sorts.—Examine the list. The cantaloups are in the highest estimation for quality and neatness, although not uniformly such great bearers as others in the list.

Time of beginning to force.—“From the time of sowing, ripe fruit may be cut in about fifteen weeks, as an average period; when many short and winter days fall in the course, it may last eighteen weeks; but when the forcing is not commenced until the days are nearly twelve hours long, and continually lengthening, ripe fruit is sometimes cut in ten weeks. The period also depends upon the sort. Little time is gained by beginning excessively early. The early and main crops are commonly originated from the middle of January to the first week of February, the latter or succession crops at the beginning of March; and late crops, intended to fruit at the end of summer, in the middle of April. M'Phail and Nicol sow in January. “The latter says, “I formerly cut melons for three years successively on the 15th, 12th, and 10th of May, and never sowed before the last week of January or 1st of February. In 1788, when at Rainham Hall in Norfolk, I sowed melons on the 12th of March, and cut ripe fruit on the 20th of May. The kind was the Early golden cantaloup. This shows how little is to be gained, or rather how much may be lost by early forcing.”

Growing the seed externally. The plants may be originated in a cucumber-bed, and this is the general practice; but Abercrombie prefers a separate bed, built a slight degree higher than for the cucumber at the same season, and adapted to a one or two-light frame, according to the quantity to be raised.” Nicol raises the melon almost exactly in the same manner as he does the cucumber.

Choice of seed.—“Seed under the age of two years is apt to run too much to vine, and show more male than female blossoms; but new seed may be mellowed by being carried in the pocket a fortnight or more, till the heat of the body has dried and hardened it. Seed 20 years old has been known to grow and make fruitful plants, but seed that has been kept 3 or 4 years is quite old enough, and less likely to fail than older.” M’Phail says it is best not to sow melon seed till it be 2 or 3 years old. It cannot be too old if it be sound and grow well. Nicol says, “I have sown melon seeds 20 years old, from which I have raised very healthy and fruitful plants.” Kal. p. 396. Miller and Nicol say young melon seeds may be worn in the pocket, near the body, for several months previous to sowing, which has the effect of fully maturing them. “If seeds of the last season,” Nicol observes, “be sown without taking this precaution, or something similar, the plants will not be fruitful, but will run much to vine, and show chiefly male blossoms.” — Kal. p. 396.

Sowing.—Abercrombie says, “Having moulded the bed, and proved the heat, sow in pans 3 inches or pots 4 inches deep, rather than in the earth of the bed, Sow a second portion in 5 or 7 days, to provide against failure. Do not at once plunged the pots to the rims.” — Pr. gard. p. 105.

Treatment till removed to the fruiting-pit.—“As soon as the plants appear, give air cautiously, guarding the aperture with matting at night and on frosty or gloomy days. At favourable opportunities wipe the condensed steam from the glasses. When the seed-leaves are about half an inch broad, prick the plants into small pots, 5 inches in diameter, 3 in each pot, giving a little aired water just to their roots, then plunge the pots into the earth of the hot-bed partially or to the rims, according to the heat. Admit fresh air every day in moderate weather, at the upper end of the lights, raised an inch or two, according to the temperature of the external air, more freely when sunny than cloudy, shutting closer or quite close as the afternoon advances towards the evening, or sooner, if the weather changes cuttily cold, and cover the glasses every night with mats, and uncover in the morning, as soon as the sun is high enough to reach the
frames. Give occasionally a very light watering, when the earth appears dry. As the plants advance into the first rough leaves, the first runner-bud in the centre should be stopped, by cutting or pinching the top off, close to the first or second joint, an operation which strengthens the plants, and promotes a lateral issue of fruitful runners. Be careful to support a regular tenor of heat in the bed, by laying first an outward casing of straw-litter round the sides, to defend it from the weather; afterwards, if the heat declines, remove the above casing, and apply a moderate lining of hot dung to one or more of the sides. In matting at night, be careful not to drive the rank steam of the linings into the beds, by letting the ends of the mats hang down.

Fruiting-bed.—Form it as directed for the cucumber-bed, but 6 inches deeper. M'Phail says, "4 feet high, and after it has stood about a week, try it down, and make it level, and set the frames upon it."

Moulding the bed.—Abercrombie directs to "mould it by degrees to 8, 10, or 12 inches' depth, first laying the compost in little hills of that thickness, one under each light, with the intervals earthed only 2 or 3 inches for the present, till the general heat is moderated." M'Phail lays in, under each light, a small hill of earth about 1 foot high.

Planting.—When the earth of the hills is warmed by the heat of the bed, and the plants have leaves 2 or 3 inches broad, or have begun to push lateral runners, turn them out of the pots, with the ball of earth entire; set a ball containing one plant in the middle of each hill, inserted clean over the ball; or set at most 2 plants under the centre of a large light. After planting, give a gentle watering over the hills and round the roots, avoiding to wet the shanks of the plants; shut down the glasses close, till the heat and steam arise, then give air moderately. Extend a slight shade over the glasses in the middle part of warm summer days, if the plants shrink or flag their leaves before fully rooted in the hills, which they will be in 2, 3, or 4 days after planting.

Temperature.—"The melon requires a minimum heat of about 65° from the time of germination till the fructification, and the heat of about 75° to fruit in."—Abercrombie. M'Phail, as appears from the table in his "Gardener's Remembrancer," kept his melon and cucumber frames at the same temperature; stating, that if any person kept melon or cucumber plants in their greenhouses, he would be sure to fail of success. Nicol's medium heat for melons is 70°. The proper temperature must be kept up by repeated linings, at least till the middle of July. After that, sun-heat may suffice to ripen the crop. Till this season the greatest care is necessary not to burn or overheat the plants. M'Phail says, "examine daily with your hand the heat of the bed, pushing your fingers into the dung immediately under the hills of earth in which the plants grow; and if you find the heat likely to be too powerful, pour cold water all round the bottom of the hills of earth, to lower the heat of the bed. Remember this must be daily attended to till the heat of the bed be so declined in the middle, that the roots of the plants be in no danger of being hurt by the heat of the dung under them. In case this necessary precaution has been neglected, till the heat immediately under the stems of the plants has become too hot, pour plenty of water 80° warm round about the sides of the hills in which the plants grow, and among the stems of the plants, which will bring the earth and dung immediately under the plants to the same degree of heat as the water which is poured into it. When the heat in the middle of the bed becomes so cool that there is no fear of its being too great for the roots of the plants, watering that part of the bed to keep the burning heat down of course must cease, and as the roots of the plants extend, earth may be added to the hills. As soon as the heat of the bed declines, linings must be applied to it, which will set it into a fresh fermentation, and then the surface upon the bed must be examined occasionally, by pushing the hand into it in different parts, and when a burning heat is felt, pour in some water as before directed. In this way you should persevere, still keeping a strong heat in the linings. Remember that the surface of the bed all round about the hills should be left uncovered with earth, and the dung should be loo-eened occasionally, to let the heat rise freely to nourish the plants."

In July, "melons will do without heat in the linings, but I found by experience that they do best by keeping a heat in the linings all the summer. If a heat be kept constantly in the linings, and the plants watered sufficiently, they will continue to produce fruit till the middle of October."

Air.—As long as weak steam is perceived to rise from the bed, leave an aperture, even at night, for it to escape; guarding against the influx of cold air by a curtain of matting. Admit fresh air to the plants by tilting the glasses more or less at the most favourable hours in a dry day. After the bed has come to a sweet heat, shut down close at night. As the fruit enlarges, it becomes more necessary to seize every proper opportunity of admitting air; raising the lights from 1 to 4 inches, according to the season, the heat of the bed, and temperature of the external air, shutting close if that should turn cold, and always timely towards evening. As confirmed summer approaches, admit air still more freely. Nicol says, "air should be freely admitted, though not in such quantity as for the cucumbers, which do not require so high a temperature as melons do. In sunshine, however, the mercury in the thermometer should be kept down, by the admission of air to about 80° or 75°?" M'Phail says, "look into your melon-pits in the morning, and if there is a dew on them, standing like beads round the edges of the young leaves, it is a good sign; but if there is no dew on them, in the form I have described, they are not in a very prosperous condition. The air in the frames is not sweet; they either want water or sprinkling of water, or else the heat of the air in the frames is too great in the night. In hot weather melons are better to have air left at them all night, and in very warm weather to take the glasses entirely off in the evening, and put them on again in the morning; by this means the plants will get refreshment from the dew in the night."

Water.—After the plants are placed on the hills, give copious turns of waterings, increase them as the season advances, and the growth of the plants advance. "Water circumspectly and scantily while the fruit is setting or young in growth, as too much moisture would make it decay. Take a warm morning for watering before the middle of May; in summer the afternoon or evening. Use soft water warmed to the air of the frame, and let as little as possible fall on the setting or new set young fruit; nor much near the main head of the plants, for fear of rotting that part. Shut down the lights after watering for a short time; and if in the morning part, and a strong sun, spread a mat over, to prevent the sun from injuring the plants by acting on the water lodged on the spray of the leaves. As a strong steam will now arise, remove the mats in an hour or two, and raise the glasses at the top, to give vent to the steam and give air to the plants. As the fruit becomes nearly ripe, lessen the quantity of water given, barely keeping the plant from flagging, and withhold water when the fruit begins to turn colour." Nicol says, "water once in 4 or 5 days in the afternoon, watering over the foliage. Repeat the waterings oftener, as the season and the growth of the plants and fruit advance, in order to swell them out the better."—Kalender, p. 387. M'Phail says, "If the weather is warm and dry, the melons will probably sometimes require water twice a week; if the weather is wet and cloudy, they will not require it so often."—Gard. C.
CUCURBITACEE. IV. CUCUMIS.

Rem. p. 300. Knight, finding that the leaves of melons sustained great injury from the weight of the water falling from the watering-pot, pours the water on the tiles which cover the surface of the bed. See Training.

Earthling.—Perform this operation as directed for the cucumber, after the heat of the dung has become moderate, earthing up by degrees the intervals between the hills, till the depth of the earth becomes equal. Eight or ten inches’ depth of earth M’Phail states to be enough for the roots of the plants to run in, provided the bed or fermenting mass beneath be made of leaves of trees, or of dung well prepared; for if the bed be the earth be in a good state, the roots will grow into it, and draw from thence considerable nourishment to the plants. The roots of the melon do not naturally run deep; they extend horizontally not far from the surface, especially in forcing frames, where the moist warm air is more confined than in the open atmosphere.—Gard. Rem. p. 63. In early forcing, leave unfilled up with earth a space of about 7 or 8 inches wide, against the inside of the frames, immediately adjoining the hot linings.

“By this method the heat of the linings do more powerfully warm the air in the frames, than if the earth was made level home to the sides of the boards of the frames to which the linings adjoin. But if melons be not planted earlier than the month of May, this precaution need not be attended to, unless the weather prove uncommonly cold, and the air little streight. As the plants advance into the first runners, 3 or 4 joints in length, if no fruit be shown, stop them at the third joint, in order that they may produce fruitful laterals; and as the runners extend, train them over the surface of the bed with neat pegs. Many of these runners, as the plant proceeds, will show embryo fruit at the joints; but a great many barren ones are occasionally produced, and hence it becomes necessary to regulate them. Abercrombie says, ‘cut out the superabundant, unfruitful, or evidently useless shoots, especially the very weak and most luxuriant, for the middle-sized are the most fertile.’ Nicol says, ‘melons should be kept moderately thin of vines, though not so thin as cucumbers (the foliage being smaller), which should never be much lopped at one time, as they are also apt to bleed. All bruised, damped, or decayed leaves should be carefully picked off as they appear, and the plants should be kept clear from weeds, or any rubbish that may be conveyed into the frames by wind or otherwise. M’Phail directs to ‘cut out from the melon-frames all superfluous or decaying shoots. Stop shoots a joint or two before the fruit, and also cut off the ends of the long running shoots immediately before showing fruit, if there is a leading shoot coming out by the side of it; for you ought to remember always in pruning melons, that a fruit will not swell well except there be a growing shoot before it; and this shoot, which is called a leader, because it leads or draws the sap from the roots to and past the fruit, should be stopped before a joint, that will, if the plant is in good health, sprout out again. Do not let your plants get too full of leaves, and cut off the oldest and worst leaves first. This ought to be done at least once or twice a week, by which method they will be nearly always in a medium state of thinness, and the plants and fruit will derive advantages which they would be deprived of were they suffered to become overcrowded with leaves and shoots, and then a great many cut out at one time. If melons are of a large kind, no more than 3 or 4 joints should be left on a plant to swell off at one time; if smaller three or four fruit may be left.”—Gard. Rem. p. 278.

Knight, in an ingenious and philosophical paper on the culture of the melon, states “that his crops of melons failed, because watering over the foliage, pruning, weeding, &c. had removed the leaves, on the extended branches, from their proper position, and these leaves, being heavy, broad, slender and feeble, on long footstalks, were never able to regain it. In consequence, a large portion of that foliage which preceded or was formed at the same period with the blossoms, and which nature intended to generate sap to feed the fruit, became diseased and sickly, and consequently out of office, before the fruit acquired maturity.” To remedy this defect, the plants were placed at greater distances from each other, viz. one plant of the Salutina variety, to each light of 6 feet long by 4 feet wide. The earth was mixed with tiles and lines, as described in the previous instructions, and hooked down over them with pebbles. They were thus secured from being disturbed from their first position, the leaves were held erect, and at an equal distance from the glass, and enabled, if slightly moved from their proper position, to regain it. “I, however, still found that the leaves sustained great injury from the weight of the water falling from the watering-pot; and I therefore ordered the water to be poured from a vessel of a proper construction, upon the brick tiles, between the leaves without at all touching them, and thus managed, I had the pleasure to see that the foliage remained erect and healthy. The fruit also grew with very extraordinary rapidity, ripened in an unusually short time, and acquired a degree of perfection which I had never previously seen. As soon as a sufficient quantity of fruit, between the lines, had ripened, I allowed the melons to drop, and recommended the further production of foliage to be prevented, by pinching off the lateral shoots as soon as produced, wherever more foliage cannot be exposed to the light. No part of the full grown leaves should ever be destroyed; however distant from the fruit and growing on a distinct branch of the plant, they still contribute to its support; and hence it arises, that when a plant has as great a number of growing fruit upon part of its branches, as it is capable of feeding, the blossoms upon other branches, which extend in an opposite direction, prove abortive.”—Loud. encycl. gard. p. 618.

Setting.—“As the fruit bearers come into blossom, you may assist the setting of the fruit, by impregnating some of the female blossoms with the male flowers, as described for the cucumber. The melon, however, will also set naturally, and produce fertile seeds, if the time of fructification fall at a season when the glasses can be kept almost constantly open.”—Abercrombie. Nicol says, “he has proved experimentally, that melons not impregnated will not swell off so fair and handsome as impregnated ones, and, therefore, considers it more necessary to attend to this operation in melons than in cucumbers. Therefore let nature be assisted in this work, considering that she is more under restraint here than if the plants grew in the open air, where the wind, insects, and other casualties, might be helped.”—Kalend. p. 384.

Care of fruit.—“As the fruit increases to the size of a walnut, place a flat tile or slate under each to protect it from the damp of the earth; the slab thus interposed will also assist the fruit to ripen, by reflecting the rays of the sun.”—Abercrombie. M’Phail says, “The fruit should lie upon dry tiles. When the fruit is young, it is better to have a gentle shade of leaves, but when it is full swelled, it should be entirely exposed to the sun.” Nicol advises placing the fruit on bits of slate or glass some time before it begins to ripen, as the flavour might else be tainted, but by no means slate or moss the whole surface of the bed, lest you encourage the red spider. Think on the reflection of the sun upon the slates or tiles, in hot weather particularly, and of his additional force in shining through glass. It is more consonant to the nature of the plants that they be trained on the earth. By mossing the surface, the indolent may find a pretext, as it no doubt, in some measure, lessens the labour of watering. But it is wrong to do so, in so far as it hampers and encourages the breeding of various insects, and as the fruit approaches to maturity, taints it with an unpleasant effluvia.”
Time of maturation.—"The interval between the setting of the fruit and perfect maturity is generally from 30 to 40 days; but the plants in the same bed, and the vines on the same plant, often show some difference in the time of reaching maturity."—Abercrombie.

Cutting the fruit.—"Ripe melons are distinguished by their full size; sometimes by turning yellowish, more constantly by imparting an agreeable colour, often by the base of the footstalk, close to the fruit, cracking in a little circle. On these indications, the fruit should be cut before too mellow or dead ripe, that it may eat with a lively sharp flavour. The morning is the time for cutting." Melons, Nicol observes, "if allowed to remain on the plant till they be of a deep yellow colour (which many do) lose much of their flavour. They should, therefore, be cut as soon as they begin to change to a greenish yellow, or rather, as soon as they begin to smell ripe. They may lie in the frame for a day or two, if not immediately wanted, where they will acquire sufficient colour. But if they are let remain many days in the frame, they will become as insipid as if they had been left too long on the plant."

Saving seed.—"The ordinary mode is to request the seeds of particularly fine fruits, of approved sorts, to be returned from table. The best way, however, is to pick some of the best ripe fruit, take out the seed, clean it from the pulp, and let it be well dried and hardened, and then put it up in paper."—Abercrombie. Nicol says, "wash it very clean, skimming off the light seeds, as those only that sink in water will grow."—Kal. p. 396. Great care must be taken that the sorts, from which seeds are saved, are genuine and distinct. When different sorts are planted in the same frame, this cannot be the case.

Second crop from the same plants.—"When the fruit of the first crop is off, a second crop may be obtained from the stools, which often proves more productive than the first. If the first crop is taken before the middle of June, the second will come in at a very good time. For this purpose, as soon as the fruit is cut, prune the plant, shorten the vigorous healthy runners at a promising joint. At the same time take off all decayed leaves, stir the surface of the mould, and renew it partially by 3 inches depth of fresh compost. Water the plant copiously, shutting down the glasses for the night. Shade in the middle of hot days, and give but little air until the plants have made new radicles and shoots. Afterwards repeat the course of culture above described, from the stage when the first runners are sent out till the fruit is cut." Nicol says, "When all the fruit of the first crop are cut, suppose in 3 or 4 weeks, the plants may be prune for the production of a second crop, equal and perhaps superior to the first. They should be cut pretty much in, in order to cause them to push plenty of new vines, which will be very fruitful, observing always to cut at a joint of some promise, and to thin out all decayed or unhealthy vines, dead leaves, &c. Observe also to cut an inch or two above the joint you expect to push, and then to bruise the end of the stem so lopped with the thumb and finger, which will, in a great measure, prevent it from bleeding. The plants should be shaded from the mid-day sun for a week or ten days, exposing them to his full rays by degrees. Now, also, let the mould in the frame be well watered, in order to put the roots in a state of active vegetation; point over the surface with a small stick, or little wedge, and cover the whole with about 2 inches of fresh mould. This will greatly encourage the plants, and cause them to make new fibres near the surface. At this period air need not be admitted very freely, especially while the glasses are covered, but rather as it were endeavour to force the plants into new life. After they begin to shoot, water, admit air, prune, train, and otherwise manage the plants as before directed. If the season be fine, they may yield you a third crop by a repetition of the above rules, coming in in September, which might be very gratifying. I once had 52 full-sized fruit produced in a 3-light frame, a second crop, and two dozen on a third off the same plants, the early golden cantaloupe. Of the first crop 26 fruit, two were cut the 10th of May. Thus, a 3-light box produced, in one season 102 full matured melons." McPhail says "if you intend to have melons as long as there is a sufficiency of sun to ripen them tolerably well, you had best put linings of warm dung to some of your beds. These, if applied in time and kept on, will east fresh heat into the beds, and with other necessary assistance, the plants will grow as long as you want them."

Plan of obtaining a second crop of melons.—"When the first crop of fruit is nearly gathered, cuttings are taken from the extremities of the shoots which show the most fruit; these are cut off close under the second advanced joint, or about the fifth leaf from the top; the two largest leaves at the bottom of the cutting are taken off, and thus prepared, are inserted in 24-sized pots, two in each pot, in light rich soil, gently shaken down. After being watered, the pots are placed in a 1-light frame, on a hot-bed previously prepared, and plunged in the moderately dry soil, with which it is covered. The frame is kept close and shaded for a few days, and in a week the cuttings will have struck root. The old melon-plants, with the soil in which they grew, are now all cleared out of the frames, fresh soil to the depth of 12 inches put in, and the beds well lined with fresh dung. In 10 days from the time of inserting the cuttings they will be ready to plant out, which is done in the usual way. When the plants have pushed about 14 inches, the end of each shoot is pinched off, to cause them to produce fresh runners, and the fruit which showed on the cuttings will swell rapidly, and in 3 weeks after replanting the beds, abundance of fine fruit may be expected. This way of getting a second crop is far more certain than either pruning back the old plants, or planting seedlings; because cuttings grow less luxuriantly, are less liable to casualties, and are much more prolific."—Harrison ex Loud. gard. mag. 2. p. 414.

Culivation of the Persian varieties of the melon.—T. A. Knight (Hort. reg. no. 6. p. 263.) erected a small forcing-house for the exclusive culture of this fruit, and grew them by means of fire heat. This house consists of a back wall, nearly nine feet high, and a front wall nearly 6 feet, inclining a horiztonal space 2 feet wide and 30 feet long. The fire-place is at the east end and very near the front wall; and the flue passes to the other end of the house, within 4 inches of the front wall, and returns back again, leaving a space of 8 inches only between the advancing and returning course of it, and the smoke escapes at the north-east corner of the building. The flue is composed of bricks laid flat, in order to give a temperate permanent heat, and the returning one with them standing on their edges, the usual way. The space between the flues is filled with fragments of burnt bricks, which absorb much water, and generally give out moisture to the air of the house. Air is admitted through apertures in the front wall, which are 4 inches wide and nearly 3 in height, and which are situated level with the top of the flues, and are 18 inches distant from each other. The air escapes through similar apertures near the top of the back wall. These are left open, or partially or wholly closed, as circumstances require. Thirty-two pots are placed upon the flues, each being 16 inches wide and 14 inches deep; but they are raised by a piece of stone or brick to prevent their coming in actual contact with the flues. In each of these pots one melon-plant is put, and afterwards trained upon a trellis, placed about 14 inches distant from the glass, and each plant is permitted to bear but one melon only. The height from the ground at which the trellis is placed, is such as can be con-
veniently walked under, to discover the appearance of red spiders or other noxious insects; and by this method two, and even three crops may be obtained in one season. Being so liable to burst, Mr. Knight raised the points of the fruit higher than the stems, and not one failed to ripen in a perfect state; they were found to ripen very well hanging perpendicularly, but the Lepidium grew very deformed.

Late crop on old hot-beds.—To ripen melons, not earlier than the month of August, M'Phail **generally made beds of dung which had first been used for linings to the early cucumber and melon-beds. For this purpose, this kind of dung is better than new dung, because it does not heat violently, and for a considerable time keeps its heat. Leaves of trees make very good melon-beds, but they do not produce heat enough alone for linings; but of whatever materials melon-beds be made, the air in the frames among the plants should be kept sweet and strong, otherwise the plants will not grow freely. It may be known whether the air be sweet or whether it be not, by putting the head in under the lights and smelling it. But it frequently happens to be difficult to bring dung-beds into a requisite state of kindliness for these delicate plants, for if the dung by any means get and retain too much water, before its noxious vapours pass off by evaporation, it will stagnate and become sour, and until these pernicious qualities be removed, which requires time and patience, the plants will not grow kindly; and besides this, although corrupted, stinking air hinders the growth of plants of the melon kind, it greatly promotes the health and forwards the breeding of different kinds of insects, which feed upon and otherwise hurt fruits and plants, and esculent vegetables of various kinds.

A method of growing the melon, adopted by Mr. Lowell, (Gard. mag. 7. p. 461.) varies in one or two very essential points from any that he has seen adopted; first in well bedding and firmly rooting the plants to support a good crop of fruit; second in early setting and preserving the first fruit, and forcing the whole of the plants luxuriantly through the whole of the period necessary for their maturity. To effect this he prepares his beds with dung well watered and fermented, or tan, not wishing such a strong heat as for cucumbers. He sows his seeds in pots, in which the plants remain until they are turned into the hills, leaving only 3 plants in each pot. These he places in the dung, in order to start them as soon as the bed is made up, unless there should be another bed in use at the same time. As soon as the second rough leaf appears, he puts a hill of good melon soil under each light, composed of good loam and turf, adding a sixth part of good rotten dung, well mixed with the spade, but not sifted. This he waters if dry, and treads in the hills firmly, making a hole in the centre, and turning out a pot of plants with the ball entire into each hole. Should the weather be very warm, he waters them overhead abundantly, and in the space of a fortnight they will have grown to four or five joints each: he then stops them down to three joints. By this time the heat of the bed will have become reduced to such a temperature as to allow of moulding up the plants, well heading in and watering as you proceed. As the plants will at this time be strongly rooted, and in vigorous growth, in the course of three days they will have pushed a strong shoot from each of the three eyes in a horizontal direction, and they will seldom fail of showing fruit at the first joint; you may rely at least on two out of three of these fruits setting. Before the fruit comes to blossom, the bed must be covered 1½ inch thick with dry sand, but mould will do, and do not water the bed any more for at least 3 weeks. This prevents the newly formed fruit from turning yellow and damping off. All shoots that appear, except the three above mentioned, must be removed. As these shoots will show fruit at the first or second joint, if such fruit be set and taken care of, it will be three parts grown before the vines will have reached the side of the bed, arriving at perfection in nearly half the time it would have done if the vines had been left in confusion. Particular care must be taken in pruning; never to stop the three shoots that bear the fruit, nor yet the lateral ones produced from the same joint as the fruit. These lateral shoots will show fruit at the first joint, which fruit must be preserved until the other is swelling, then take off this lateral shoot, but do not stop the vine. But should any accident happen to the other fruit, the shoot bearing it must be taken off, and the lateral shoot treated as a main one, when the fruit on it will swell accordingly; and all the laterals that spring from the main shoot must be stopped, leaving one joint and leaf only.

On the cultivation of the melon.—J. Holland (Gard. mag. 7. p. 575.) plants off his seedlings singly in 60-sizied pots, and when sufficiently advanced in growth they are stopped so near the seed-leaf, as only to admit of them throwing out 2 lateral shoots, and when these principal leaders extend to 2 or 3 joints, they are finally planted out into frames or pits, having the bottom heat arranged according to the advanced state of the spring months. Five melons were produced by a plant set in the centre of a two-light frame in the beginning of May, upon an old bed that had been previously employed for raising radishes. A dung lining was added to the back and one end of the frame, which was all the artificial heat the plant received, one vine was trained to the back and the other to the front of the frame. His practice is never to stop the vines until they have extended as far as their confinement will permit, and the laterals from the two leading vines, as they advance in growth, are trained to the right and left over the bed with nest pegs, and every fruit blossoms, as it expands, is carefully impregnated and placed upon a tile under the shade of a neighbouring leaf. In a day or two, or as soon as he thinks the fruit will set, he stops the vine at the first or second joint beyond it. In this way he proceeds, in setting all the fruit he can, until the surface of the bed is covered with foliage, which is never deranged more than can be avoided. While the fruit is setting, he gives air very freely, sometimes he draws the lights quite off for a few hours on sunny days, and he also, by applying or withholding heat or water, endeavours to keep them in a state betwixt luxuriance and debility, for in either extreme they will not set well. Having advanced thus far, he commences swelling them off. He begins this with pinching off all the ends of the lateral shoots that have not already begun to swell, and when the fruit begins to swell, he now gives no more air than will prevent the sun from searching their leaves. He looks over them every morning, and takes off all the blossoms as they appear, and stops every young shoot back to one joint above that of the vine which produces it. He watches over them every afternoon in fine weather, and before the sun has quite left the frame, he syringes or waters them all over, leaves, fruit, and all, and shuts down the glasses for the night. He always prefers performing this while the departing rays of the sun have sufficient strength to raise a sweet vaporous heat of about 90°, which serves them to feast upon long after the sun has disappeared. A few days of such treatment will determine which fruit will take the lead in swelling off, out of which he selects 2 or 3 to each plant, according to the sort, and all the rest he cuts away. As the fruit advances in growth, it is necessary at intervals to turn them a little on the tiles, to prevent them from growing flat, and discoloring on one side, and also from rotting. When they have attained as large a size as he thinks the sort will admit, he leaves off watering, and again gives all the air he can, by taking the lights entirely off when the weather is favorable; and if the season is not too far advanced, he leaves them to ripen without any other assist-
Cucurbitaceœ. IV. Cucumis.

For an early crop of melons, he grows the small early cantaloup, 1 plant in a light when the frame is narrow, and 2 if wide, with 2 or 3 fruit on each plant, which in general weigh from 2 to 3 pounds each. He succeeds with these with the scarlet and green-flesh, planted and trained as above, the produce of which is from 2 to 6 pounds. His principal crop is, however, from the black rock, which he has grown of all sizes up to 15 lbs. weight; the plants are much more hardy than many other sorts, it is a good bearer, the fruit handsome, and the flavour excellent. The sort which he grew so large was originally from France, and in its primeval state was a rock; but it has lately been strongly impregnated with the scarlet, flesh, which fruit it now resembles in all its characters, except in growing much larger. The largest melon weighed 244 lbs. The above is Mr. Holland's general practice of cultivating the melon, which practice he says he will still continue to adhere to unless fully convinced he can adopt a better.

Insects and diseases.—To prevent melon plants from being infested with insects or injured by diseases of any kind, no better method can be adopted than to keep the plants constantly in a healthy, vigorous, growing state; for this purpose, M'Phail observes, "they must be constantly attended to, giving them plenty of heat and water. In warm weather in the spring and the summer, they should be watered occasionally all over the fruit and leaves, till the earth in which they grow be thoroughly moistened, and a stronger heat than usual be kept in the frames about the plants for a few hours; also the lights should be shut down every afternoon, with a good strong heat among the plants. If there be sufficient moisture in the earth the greatest sun heat in the afternoon will not hurt the plants, but it might scorch the sides of the large fruit, exposed to the sun-beams operating upon the glass, which should be guarded against. The frames and lights should be kept clean and painted over once every year. Melon plants are subject to be infested and hurt by the mildew and by the canker. These diseases come upon them because they are not in a good climate, they have not a sufficiency of heat, or the dung and earth of the bed is in a stagnated state. Melon plants are liable to be greatly injured by an insect called the red spider, which increases surprisingly in hot dry weather. As I said before, nothing will prevent plants from the inroads of disease and insects but heat, sweet air, and a sufficiency of water, which sweetens the atmosphere, and makes it healthy for vegetables as well as for animals. All things will eradicate disease and insects from melon plants but good management, strong heat, and plenty of water given all over them. Diseased plants, or plants much infested with insects, cannot produce good healthy fruit. The mildew is a most pernicious disease to all sorts of plants. On melons it generally makes its first appearance on the oldest leaves and on the extremities of the young shoots. The cause of it, I apprehend, is unhealthy nourishment comprehended in the elements, or their not harmonising in the promotion of the growth of the plant; for by practitioners it may be observed, that when a dung hotbed gets into a stagnated sour state, the plants do not grow kindly, the air in the frames is saturated with unhealthy particles, and so also must be the juices drawn into the plants by their roots. These must breed diseases, if preventive means be not applied. It cannot be reasonably supposed that plants of a delicate nature will continue in a healthy state growing upon a heap of stinking dung, and in confined air. When melon plants have become diseased, or much infested with the red spider, they should either be destroyed, or effectual means used to cure them. To destroy the plants is easy; to cure them let the following methods be put in practice: get plenty of horse-dung thrown up in a large heap, turn it over once or twice, shaking and mixing it well, and let it lie till its rankness be somewhat evaporated, and if there be linings at the beds, take them entirely away, examine the dung of the beds, and if it be wet and has a bad smell, take a sharp-pointed stake, and make holes all round in the sides of the beds unto their centre, in such a slanting way that the water may easily run out of them; then make a strong lining of the prepared dung all round the beds, and by occasional augmentations, keep up the linings nearly to a level with the surface of the earth in which the plants grow. As soon as the linings have cast a strong heat into the beds, scatter some flour of sulphur all over the plants, and keep as strong a heat in the frames as the plants can bear; a heat of 120° will not destroy them, if the stench of the linings he prevented from getting in among the plants. Water the plants all over their leaves about once a week, with clean water 100° warm, and if the sun shine keep the lights close shut down all day, and cover them up in the evenings, leaving a little air all night at each light, to prevent a stagnation of air among the plants. Continue this process till the mildew and the insects disappear, and the plants appear to grow freely, and afterwards manage them in the usual way, taking care to keep up a good strong heat in the linings. This method sets the old stagnated bed in a state of fermentation, which makes the moisture run out of it, and dries it so, that water given to the plants has free liberty to pass off. If the linings do not heat the air in the frames sufficiently, let some of the earth in the inside all round the sides of the boards be removed, to let the heat from the linings rise freely in the frame."—Abercrombie.

Culture of melons in a dung-pit.—"A glazed pit to receive either stable-dung, leaves, or tanners' bark, is calculated to ripen superior fine fruit. The well of the pit may be formed either by a nine-inch wall, or by strong planking, a yard in depth, from 6-8 feet wide, and in length from 10-20 feet or more as required. A low glass-case is to be fitted to it, adapted to the growth of the melon. Having raised the plants in a small seedbed, as for the frame crop, ridge them out into the pit in the usual manner. Give the proper subsequent culture, and when the strength of the fermenting mass begins to decline, add linings outside the pit, if inclosed by boards, but if inclosed by a nine-inch wall, cut away as much of the dung and earth within, and throw it out, as will admit a lining of well-tempered dung."—Abercrombie.

Culture of melons in a fixed pit.—One such as that proper for the nurseries of pinery is here understood; and the plants being raised in the usual way, and the bed, whether filled with dung, tan, or leaves, or a mixture of these, being moulded, planted about the end of July. Nicol prefers for such late crops "the early golden cantaloup, the orange cantaloup, and the netted canta-
loup, planting a part of the pit with each." A very mild bottom heat is sufficient for the purpose here in view; and if the pit has been occupied in forcing asparagus, French-beans, or straw-
berries, on a bark, or a bark and dung, or on a bark and leaf heat, it will require no other preparation than to be stirred up and have a little fresh materials added, keeping the fresh bark, dung, or leaves well down, and finishing the bed with some of the smallest and best reduced. When it has settled a few days, let it be moulded all over to the thickness of 12 or 15 inches; previously laying on a little more of the above small materials, in order to keep the plants well up to the glass, as the bed will fall considerably in the settling. It should be formed, and the mould should be laid on in a sloping manner from back to front, so as in some measure to correspond with the glasses. All being ready for the plants, they may either be planted in a row, in the middle of the pit, at 2 feet apart, or may be planted in 4 rows at 4 feet apart; or, if they have been planted in nursing, in a pot; plant in the centre of each light, as directed for the common hot-bed, in March. Let them have a little water
and be shaded from the sun for a few days, exposing them to his rays by degrees. The further management of the plants differ in nothing from that of melons in a hot-bed till September, when it will be proper to apply fire heat."

About the beginning of September it will be proper to apply fire heat, in order to further the progress of late fruit, and to dry off damps. Let the fires be made very moderate at first, however, and increase their strength as the season becomes more cold and wet. Keep the mercury up to 70° in the night, and in the day by the addition of air keep it down to about 80° or 75°. Very little water will now suffice for the plants, as their roots will be fully established, and be spread over the whole bed; the heat of which will also have subsided. They should only, therefore, have a little water once in 8 or 10 days, and as the fruit begins to ripen off, entirely withhold it. Keep the plants moderately thin of vines and foliage; be careful to pick off all dashed leaves as they appear; and fully expose the fruit to the sun as it ripens, in the manner directed for melons in the hot-bed. In this manner I have often had melons in October and November fully swelled, and in good, but not of course in high perfection, for want of sun to give them flavour. Any who have a pit of this kind, however, for the forcing of early vegetables, strawberries, flowers, &c. cannot, perhaps, occupy it to a better purpose in the latter part of the season, as the trouble is but little, and the expense not worth mentioning.

Culture of melons in Mr. Phail's pit.—The inventor of this pit says, "For the purpose of raising melons early, for many years I cultivated them on a brick-bed, on the same construction as that which I invented for rearing early cucumbers, excepting only that through the pit of each 3-light box I carried no cross flues. When this bed was first set to work, I had the pits filled level with the surface of the flues, with well fermented dung or with the dung of old linings from the cucumber-bed. In each 3-light division I made the pit about 3 feet 6 inches wide and 10 feet long, and 3 feet deep below the surface of the flues. On the surface of the dung in the pits, I had laid about 10 inches thick of good earth, in a ridge of about 20 inches wide, from one end of the pit to the other. When this was done, I made a lining round the bed, and as soon as the earth became warm, I set the plants into the ridge of the earth, and gave them a little water, and kept a strong heat in the frames, and filled up the pit gradually as the roots and plants advanced themselves."

"The dung or leaves of trees in the pit require not to be changed every year, neither need the earth for the plants be removed entirely every season, for by experience I found it to do very well by digging, and mixing with it some fresh earth and manure in winter, and exposing it to the rains, the frost, and the snow."—"In forcing melons early, the surface of the cross flues, as well as the surrounding and outside ones, should be kept bare of mould till the days of the spring get long, which will let the heat of the linings arise freely through the covers of the flues to warm the air among the plants. After the cross flues are covered with earth, those which surround each frame may be left uncovered till the month of May or June."—Gard. rem. p. 64.

The culture in the brick bed is, in other respects, the same as that already given for melons in frames, and cucumbers in brick beds. See the monthly table of temperature under the cucumber.

Culture under hand-glasses.—"A successive or late crop, to fruit in August and September, may be raised on hot-bed ridges under hand-glasses. Sow in a hot-bed from the middle of March to the middle of April. When the plants have been up a few days, while in the seed-leaves, prick some into small pots, two plants in each; water and plunge them into a hot-bed, managing as directed for the young frame plants, till the rough leaves are from 2-4 inches long, and the plants ready to shoot into runners. From the middle of March to the third week of May, when the plants are a month or five weeks old, they will be fit to ride out under hand-glasses. With well-prepared stable-dung, or, with a mixture of fermented tree-leaves, build the hot-bed four feet wide and 2 feet thick, the length according to the number of glasses intended, allotting the space of 4 feet each. In a week or ten days, or when the dung and leaves are brought to a sweet or well-tempered heat, mould the bed 10 or 12 inches thick, then place the glasses along the middle, and keep them close till the bed has warmed the earth. The same, or next day, insert the plants; turn them out from the pots with the ball of earth entire, and allotting plants for each glass, insert the ball into the earth, clean down over the top, closing the mould about the stems. Give a little water and place the glasses over close. From about nine in the morning till three in the afternoon, of the first two or three days, shade the plants till they have taken root, when admit the sun more freely, yet only by degrees from day to day, till they can bear it fully without flagging much. Give air daily, in temperate weather, by tilting the edge of the glasses on the south side, an inch or two; but in the present stage of the plants shut close at night. Cover with mats till morning, constantly keeping the glasses over. Give occasional moderate waterings with aired water. Cover in the day time with mats in bad weather, or heavy or cold rains; and continue the night covering until confirmed summer in July. Meanwhile attend to the heat of the bed; if this be declined, so that the minimum temperature does not 65° at night, with the aid of cutting, line the sides with hot dung, covered with a layer of mould. The renewed heat from the linings will forward the plants in fruiting, while the earth at top will enlarge the surface for the runners, and the bed for the roots. When the runners have extended considerably and filled the glasses, they must be trained out. Accordingly, at the beginning of June, in favourable settled warm weather, train out the runners, cutting away dwindling and useless crowding shoots; then the glasses must be raised all round, 2 or 3 inches, upon props to remain day and night. Cover with mats in cold nights and bad weather, but first arch the bed over with rods or hoop-bands to support the mats. Apply moderate waterings as necessary in the morning or afternoon. Oiled paper frames, formed either arch-wise, or with 2 sloping sides, about 2 feet or 2 feet 6 inches wide, the width of the bed, are very serviceable in this stage. Some persons use them from the first, under a deficiency of hand-glasses. But the proper time for having recourse to them, is when the plants have been forwarded in hand-glasses till the runners require training out beyond the limits of the glasses, some time in June; then removing the glasses, substitute the oiled frames, as these paper screens will entirely afford protection from heavy rains or tempests, as well as from nocturnal cold, and also screen the plants from the excessive heat of the sun, while, being pellicid, they admit its influence of light and warmth effectually. Give proper admission of free air below, and occasional watering. With respect, however, to the crop for which no oiled paper frames have been provided, continue the hand-glasses constantly on the bed, over the main head and stem of the plants throughout the season, to defend those capital parts from casual injuries by the weather. Throughout June, and thence to the decline of summer, be careful, if much rain or other unfavourable weather, or cold nights occur, to shelter the beds occasionally, with an awning of mats or canvass, particularly when the plants are in blossom. Likewise turn in some of the best full set exterior fruit under the glasses, or some spare glasses might be put over the outside melons, to forward them without check to maturity. Some will be ready to cut in July, others in August, the more general time, and in September; they being generally, after setting, from 30-40 days.
CUCURBITACEÆ. IV. CUCUMIS.

in ripening. The crop coming in at the decline of summer will not ripen well, unless guarded from cold at nights, and assisted by limings. The fruit that do not ripen may be used for mangoes.

"Wide ridge, or the fruiting-bed, may be made 6, 7, or 8 feet wide, for the plants to have an ample surface for their extending runners, defended either with a regular frame, and glasses of proportionate dimensions, or a case formed of an inch and a half boarding, ranged connectedly along both sides of the bed, without any external cross divisions, other than top cross bars, to stay the sides and support the glasses."

Method of growing crops of melons in the open borders.—The mode of cultivating cucumbers on ridges of shallow beds of half-spent dung in the open air, is well known to gardeners; and in warm situations melons may be grown in the same manner. The sorts grown by Mr. Greenshields were the black roots, green-fleshed, netted, and early cautalum. The seeds of the first crop were sown about the middle of March, in pots in a cucumber-frame, and the bed or ridge was prepared in the first or second week in May, 4 feet wide, and 1 foot higher at the back or north side than in front. Hand-glasses, with 2 or 3 plants in each, are placed, 4 feet apart, along the centre of the bed. Very little air is given till the plants have filled the glasses, but when these appear to get crowded with vines, the glasses are raised up, and the plants allowed to grow up in the manner of ridged cucumbers. If the vines are very thick, a few of the weakest may be pinched off, and the top of each leading shoot or vine removed. No more pruning will be necessary for the season. Setting the fruit at this season of the year is quite necessary. To have handsome fruit, not more than one or two should be left on the plant. They will begin to ripen about the first week in August, and continue to be produced through that month and part of September. To prolong the season, seeds may be sown three weeks later, planted out like the first crop, and when there is appearance of frosty nights, a cucumber-frame and sashes may be placed over them. By this means tolerably good melons may be had till the end of October.—Greenshields, ex Loud. gard. mag. 3. p. 182.

There is another method of cultivating melons in the open air; that is, to raise a bed of old tan, and tramp it well and firmly down, placing some stakes and boards behind to keep up the tan, so that the bed may slope in front; 6 inches of mould should be placed on the tan, and the melon plants planted into it. Grass or leaves may be placed at the back of the bed to keep up the heat. The plants should be reared on a hot-bed.

C. Deliciosa (Roth. cat. 3. p. 397.) angles of leaves blunt; fruit roundish-ovate, pubescent, with white, very fragrant flesh, and a thin rind. C. F. Native of the East Indies, but now cultivated in Spain. Perhaps only a variety of the common melon.

3 C. sativus (Linn. spec. 1437.) stems rough, bearing tendrils; leaves cordate, obscurely 5-lobed, petiolate, terminal lobe the largest; flowers on short peduncles, largish, usually by threes; male flowers having the tube of the calyx tubularly-campanulate, and with a spreading deflexed limb; fruit long, somewhat triquetrous, smooth or prickly, and usually shining, having the carpels distinctly separable in the inside. C. F. Native of Tartary and the East Indies.—Blackw. herb. t. 4.—Lob. strap. 563. f. 1. The cucumber is called Kettmon and Timou by the Hindoos. Flowers yellow, as in the rest of the species.

The cucumber is called concombre in French; gurke in German; and Citriulo in Italian; it is a tender annual, a native of the East Indies, and was introduced in 1578. It is a trailing and climbing plant, with large, roundish, rough leaves, furnished with tendrils, and if sown in the open air in May, produces flowers from July to August. The cucumber is of nearly as great antiquity as the vine, for Moses, the earliest Jewish author, mentions it as abounding in Egypt when the children of Israel were there, above 3000 years ago. (Numbers, chap. ii.) In England it is cultivated generally and extensively in forcing frames, and in the open air, and especially near large cities and towns. "Not only gentlemen," as M'Pheil observes, "but almost every tradesman who has a garden and dung, have their cucumber-frame." In Hertfordshire, whole fields are annually seen covered with cucumbers, without the aid of dung or glass, and the produce of which is sent to the metropolis for pickling. In March, cucumbers fetch in the London market a guinea a dozen; in August and September a penny a dozen. The village of Sandy, in Bedfordshire, has been known to furnish 10,000 bushels of pickling cucumbers in one week.

Use.—The green fruit is used as salad; it is also salted when half grown; and preserved in vinegar when young and small. In Germany and Poland, barrels of half, and also full grown cucumbers, are preserved from one year to another by immersion in deep wells, where the uniform temperature and exclusion of air seem to be the preserving agents.

Varieties.—The principal of these are as follow:—

List of cucumbers.

1 Early long prickly.—This fruit is from 5-7 inches long, of a green colour, with few prickles. The plant is a good bearer, and upon the whole this is the best cucumber for the general summer crop, the flesh being very crisp and pleasant.

2 Largest green prickly.—From 7-10 inches long; it has a dark green skin, closely set with small prickles. This is a hardy sort, but does not come early.

3 Early short prickly.—Not more than 4 inches long; the skin green and rather smooth, but with a few small black prickles. This is one of the hardiest and earliest sorts, and is often preferred for the first crop.

4 Dutch or white short prickly.—Though not much cultivated, is recommended by some as preferable even to the early long prickly; it has fewer seeds, is evidently different in taste from most other cucumbers, but of agreeable flavour.

5 Cluster cucumber.—A very early sort; the flowers appear in clusters of 3 or 4 together; the fruit is seldom more than 5 inches long; it is at first of a fine green colour, but becomes yellowish as it ripens. The stems of this variety are much inclined to climb by means of their tendrils upon sticks; the leaves are small, and the plant altogether occupies but little room.

6 Smooth green Roman.—An early sort; the fruit becomes large and long, and is quite smooth; the plants grow very strong, and require a good deal of room.

7 White Turkey.—The stalks and leaves are larger than in the other varieties; the fruit also is very long, sometimes from 10-15, or even 20 inches; it is quite straight, and has a smooth skin, destitute of prickles; it is produced sparingly, and late in the season.

8 Long green Turkey.—Sometimes sown for the late crop. Late cucumbers, however, are much less cultivated than the early varieties, most gardeners being of opinion, that these kinds which are best for the early crop, are also best for the late.

9 Nipaul.—Fruit very large, usually weighs upwards of 12 lbs., measures in girth 24 inches, and in length 17 inches; flavour pleasant, and esteemed for standing. It is a native of Nipaul, from whence it was introduced to the botanical garden at Calcutta; but it is not likely that it ever will be much cultivated in this country.

Culture.—The culture of the cucumber, as a table esculent,
is chiefly carried on by artificial heat, and is therefore treated of under that head. For pickling it is chiefly cultivated in the open ground, by what is termed drilling. To have a crop in the natural ground, the seed is sown in warm compartments of rich earth, towards the end of May or beginning of June, when the weather is settled, warm and dry. The plants should mostly remain where sown, to produce late fruit towards the end of July, or more generally in August and September; small for pickling, and in larger growth for ordinary consumption. Sow a portion in a warm border, and the main crop in an open compartment. Dig the ground neatly even. Trace lines with intervals of 5 or 6 feet; and in the lines mark stations 3½ feet distant, then with a trowel at each of these spots, form shallow circular saucer-torn cavities in the surface, 10 or 12 inches wide and about an inch deep in the middle. Sow in the middle of each cavity 8 or 10 seeds, half an inch deep. When the plants are come up, and begin to put forth the first leaves in the centre, thin them to 3 or 4 of the strongest in each hole. Earth these up a little between and close round the stems, pressing them a little asunder, and give them some water to settle the earth below and above. In their advancing growth train out the leading runners, supplying them with required waterings in dry weather 2 or 3 times a-week, and sometimes every day in very dry hot weather, in July, August, or September. At this season water early in the morning and late in the afternoon towards evening."

Gathering.—"The crop comes in sometimes towards the end of July, but more generally not before August in full production; continuing till about the middle or end of September, when the plants begin to dry up. Be careful to gather the fruit in a fine state both for pickling and other purposes. They must be quite young for pickling, not exceeding 2 or 3 inches in length."—Abererombie.

Forcing cucumbers.—To produce cucumbers at an early season, is an object of emulation with every gardener; and there is scarcely any person who has not a cucumber-bed in his garden. We shall lay down a systematic view of the practices of the most approved gardeners in the culture of this plant, as has been our usual custom with other garden plants. Cucumbers are forced in hot-beds, pits, and hot-houses, and the heat of fire, and warm water, and steam, and dung, have been applied to their culture; but dung, as the author last quoted observes, is the only thing yet found out, by the heat of which the cucumber may be advantageously cultivated.

Soil.—Cucumbers, like every other plant, will grow in any soil, though not with the same degree of vigour, provided they be supplied with a sufficiency of heat, light, water, and air. For early forcing, Abererombie recommends a mould or compost of the following materials: "One third of rich top-soil, from an upland pasture, one-third of vegetable mould, and one-sixth of well decomposed horse-dung, with a small quantity of sand." M'Phail used vegetable mould made from a mixture (accidental) of the leaves of elm, lime, beech, sycamore, horse and sweet chestnut, spruce, and Scotch fir, walnut, laurel, oak, evergreen oak, ash, &c. and among them withered grass and weeds of various kinds. "This vegetable mould," he says, "without a mixture of any thing besides, is what I used for growing cucumbers in, and by experience I found it preferable to any other moulds, earths, or composts whatever, either in my new method of a brick bed, or in the old method of a bed made of horse-dung." Nicol says, "soil thus composed will produce cucumbers in great abundance: three-fourths light rich black earth from a pasture, an eighth part vegetable mould of decayed tree-leaves, and an eighth part rotten cow-dung." Kal. p. 593. W. T. Aiton gives the following as the compost used in Kew Gardens: "Of light loam a few months from the common, one-third part, the best rotten dung one-third part, leaf-mould and heath-earth of equal parts, making one-third part. The whole well mixed for use." G. Mills states that the soil he uses "is half-bog or black mould, got from a dry heathy common, and half leaf-mould : after lying 12 months in a heap, the compost is fit for use."

Time of beginning to force. Abererombie says, "Managers who have to provide against demands for early cucumbers, must raise the seedlings from 10-12 weeks before the fruit will be required, according to the length of the days in the interval. In proportion as the entire course embraces a greater part of the mid-winter, the liability of failure from obstacles in the weather will be greater. The last fortnight in January, or first week in February, is a good time for beginning to force the most early crop. In the subsequent months, both main and secondary crops may be started as required, and will come forward more freely. To have a constant succession, seedlings should be raised twice a month. As the course of forcing more coincides with the natural growing season, the length of it will be reduced to 8, 7, or 6 weeks." M'Phail says, "those who are desirous of having cucumbers early, had best sow seeds about the 20th of July, they require five or six days the first year, but the spring and autumn are the best seasons. Cucumber plants may be made to bear fruit plentifully from about the middle of March till the middle of September; but from the middle of September till the middle of March their produce will be but scanty. Cucumber-plants, raised from seed in October, will begin to produce fruit in February or March, and will continue to bear till the following month of October, provided they be kept in frames and get plenty of heat and water," Nicol recommends the middle of January. He says "Some begin sooner, but it is straining hard against the stream to little purpose. If the dung be prepared and the bed be got ready, so as to sow about the first of February, the success will often be greater than by sowing a month earlier, the growth of the plants being frequently checked by bad weather, and sometimes they are entirely lost." Aiton, in the paper above quoted, sowed on the 12th and 20th of August, with a view to cultivate in stoves, a regular supply of this vegetable being annually required for the royal tables. G. Mills sows on the first of October.

Sorts.—Abererombie recommends the short prickly for very early fruit, and the long prickly kinds for the chief early and main summer crops. Nicol says every gardener has its favourite sort of cucumber, and it is no easy matter to advise. He names as early sorts generally known, the early short prickly as the earliest; the early smooth green, a long fruit, the long green prickly, and the white prickly, a white fruit.

Choice of seed.—"It is advisable," Abererombie observes, "to have that at least from 2-4 years old, in preference to newer seed, which is more apt to run luxuriantly in vine, and the plants from it do not show fruit so soon or so abundantly as those from seed of greater age. But when seed has been kept more than 4 years, it is sometimes found to be too much weakened."

Forming the seed-bed.—"A one-light frame," Abererombie says, "will be large enough for ordinary purposes. Choose a dry sheltered part of the melon-ground, and form a bed for a 1-light frame. When high winds are suffered to blow against a cucumber-bed, they have a very powerful effect on it, for in that case the heat will not only be greatly abated, but also forced and driven into the corners of the frames, and, consequently, some parts thereof are rendered too cold, whilst other parts are made too hot, and of course the plants are all equally endangered, retarded in their growth, and perhaps some, if not all of them, totally destroyed. Therefore, when a cucumber-bed is about to be built, the first object of consideration should be, to have it, as well as possible, sheltered from the high winds and
boisterous, stormy weather." Having put on the frame and waited till the bed is fit for moulding, lay in five or six inches' depth of the proper earth or compost. M'Phail "makes up a bed of good dung, four feet high, for a 1-light box." Nicol "builds a bed of dung, carefully fermented, to the height of 5 feet at back, and 4 at front, keeping it a foot larger all round than a 1-light frame, or about five or six feet by three or three and a half. He then covers with turf, and on that lays fine sand, as free of earth as possible, to the depth of about 6 inches, laying in a sloping manner, corresponding with the glass and within 6 inches of it; over which lay an inch or two of dry light earth." Aiton and Mills also prepare a bed for a 1-light box; the latter forms it on a stratum of wood 1 foot high for drainage, and 8 inches higher in the middle than at the sides, as the sides are liable, from the weight of the frame, to settle faster than in the middle, which causes the piles of earth to crack; by which in fruiting-beds more especially the roots of the plants are greatly injured.

Sowing.—Abercrombie sows some seeds in the layer of the earth, which he spreads over the bed, putting them in half an inch deep. He also sows some seed in 2, 3, or more small pots of the same kind of earth, which may be plunged a little into that of the bed. M'Phail sows in a pot filled with rich earth, covers about 2 inches thick, and sets the pots on the surface of the naked dung on the bed. Nicol sows immediately after the bed is made, without waiting till the heat arises, which he says is losing time, and the opportunity of bringing on vegetation by degrees as the heat rises. He sows in a broad pan 4 inches deep, or in small pots 3 or 5 inches in diameter, and as much in depth. These he fills with "fine light earth" or vegetable mould, and covers the seeds 2 inches. He ploughs these to the brim in the back part of the bed (which, it will be re-collected contains a stratum of earth 6 inches thick, over one of sand and another of turf), puts on the light, and lets the frame be matted at night, in the ordinary way.

Raising plants from cuttings.—M'Phail says, "Instead of raising cucumber plants from seeds, they may be raised from cuttings, and thus kept on from year to year, in the following manner; the method of sticking them in is this: take a shoot which is just ready for stopping, cut it off just below the joint, behind the joint before which the shoot should have been stopped, then cut smooth the lower end of the shoot or cutting, and stick it in fine leaf or other rich mould, about an inch deep, and give it plenty of heat, and shade it from the rays of the sun till it be fairly struck. By this method, as well as by that of laying, cucumber plants may readily be propagated." J. Mearns, gardener at Shobden Court, near Leominster, propagates his cucumber-plants for a winter crop in this way, and finds that the plants raised from cuttings are less succulent, and therefore do not so readily damp off, or suffer from the low temperature, to which they are liable to be exposed in severe weather; that they come into bearing immediately as they have formed roots of sufficient strength to support their fruit, and do not run so much to barren vine as seedlings are apt to do. He takes the cuttings from the tops of the bearing shoots, and plants them in pots 9 inches deep, half filled with mould. He then waters them, covers the tops of the pots with flat pieces of glass, and plungs them into a gentle bottom heat. "The sides of the pot act as a sufficient shade for the cuttings during the time they are striking, and the flat glass, in this and similar operations, answers all the purposes of bell-glasses. The cuttings form roots, and are ready to pot off in a fortnight."

Temperature of the seed-bed.—Abercrombie says, "The minimum heat for the cucumber is 58° at the coldest time of night, in the day-time 65° is sufficient for the maximum; because air admitted, when the sun has great influence, will do more good than a higher heat. M'Phail says, "If it were possible to keep the heat in the frames always to 80°, with the concurrence of proper air and moisture, I am of opinion that that would be a sufficient heat for the production of the cucumber." Nicol keeps the air in the bed to about 65° in the night, allowing a few degrees of a rise in sunshine. Aiton rears and fruits his plants in a stove. Miller says, "The heat I wish to have in the seed-frame is from 65° to 75°."

Treatment of the plants until removed to the fruiting-bed.—After sowing, Abercrombie "continues the glasses on the frame, giving occasional vent above for the steam to evaporate, that the bed may keep a moderate heat, and not become too violent. The plants will be up in a few days, when it will be proper to admit air daily, but more guardedly, at the upper end of the light, which may be raised from half an inch to an inch or two, according to the temperature of the weather, that the plants may not draw up weak, or be injured by the steam. In frosty weather hang part of a mat over the aperture. When the plants are a little advanced, with the seed-leaves about half an inch broad, take them up, and prick some in small pots of light earth, previously warmed by the bed. Put 3 plants in each pot, and insert them a little slopingly, quite to the seed-leaves. Plunge the pots into the earth, and you may prick some plants also into the earth of the bed. Give a very little water just to the roots; the water should be previously warmed to the temperature of the bed. Draw on the glasses; but admit air daily to promote the growth of the plants, as well as to give vent to the steam rising in the bed, by tilting the lights behind, from half an inch to an inch or two high, in proportion to the heat of the bed and temperature of the weather. Cover the glasses every night with garden-mats, and remove them timely in the morning. Give twice a-week, once in two days, or daily, according to the season, a very light watering; keep up a moderate lively heat in the bed by requisite linings of hot dung to the sides."

M'Phail, having sown, and placed the pots on the naked bed, says, "the plants will come up in a few days, and when they have fully expanded their seed-leaves, transplant them into small pots, 3 plants in each pot. Set them on the surface of the dung in the bed, and let a little air be left at the light day and night, to let the steam pass off freely."—"When the seedling plants have one or two joints, stop them, after which they generally put forth 2 shoots, each of which let run till they have made 1 or 2 clear joints, and then stop them, and afterwards continue throughout the season to stop the plants at every joint." Nicol directs to guard the seed from mice, which generally swarm about hot-beds, by laying a pane of glass over the pot or pan till they come up; and afterwards at night by covering with a pot of equal size, till the seed-leaves have expanded and the husks have dropped; for until then the plants are liable to be destroyed. The cover, however, should always be removed by sunrise, and be replaced in the evening. It is at night these vermin generally commit their depredations. No air need be admitted till the heat begins to rise, and steam begins to appear; but after that the lights should be tilted a little every day, in whatever state the weather may be, until the plants break ground. Air must then be admitted with more care, and if frosty or very chill, the end of a mat should be hung over the opening, that the air may sift through it, and not immediately strike the plants. A little air will be given from time the seeds begin to chip; and if a very strong heat rise, the pots should be raised a little to prevent the roots from being injured. They should be frequently examined on this account, and if the heat be violent, should be set loosely on the sand, or be placed entirely on the surface. The air of the bed should be kept to about 68° in the night, allowing a few degrees of a rise in the sunshine. If the weather be severe, the mats must be doubled D.
CUCURBITACEE. IV. CUCUMIS.

or tripled, and if mild perhaps a single one will suffice. But
unless in very bad weather they should always be removed by
sunrise, in order to admit all the sun and light possible to the
plants, which are very essential to their welfare. When the plants
are about an inch and a half high, they are then fit to be pricked
out into nursing pots. These pots should be about 3 or 4
inches in diameter at top, and as much in depth. The mould
to be used should be the same as that in which the seeds are
sown, and should be laid in the frame a few hours previous to
potting, in order to bring it to a proper degree of warmth, that
the tender fibres be not chilled by it. Let the pots be filled
about one half with the earth, turn the plants carefully out of
the seed-pot; place three in each, against the side of the pot,
and so as their leaves may be just above its margin; then cover
the roots with the mould, rubbing it fine between the fingers,
and filling the pots nearly to the brim. Work over the sand
in the frame to its full depth, plunge the pots to within an inch
of their rims, and cover the whole surface with a little dry earth as
at first, and level with the top of the pots. Then give a little
sized water, in order to settle the earth to the roots of the plants.

The plants will now require due attention. Let air be admitted
to them as freely as the state of the weather will allow, and
supply them moderately with water once in 2 or 3 days. Exa-
mine the pots frequently, if the heat be violent, lest the roots
be scorched, setting them loosely or pulling them up in that
case, or if thought necessary, placing them entirely on the sur-
face. If much steam abound in the bed at this time, it may be
proper to leave the light tilted half an inch in the night, ob-
serving to hang the lap of a single mat 2 or 3 inches over the
tilt. But if the bed was carefully turfed over, as directed at
making up, this will seldom be necessary, never but in thick
bOarv weather. Mat up carefully at night, but make a point
of admitting all the sun and light possible to the plants; therefore,
uncover always by sun-rise; and frequently wash and wipe the
glasses clean, outside and inside, as they are often clogged by a
mixture of steam and dust. Also, occasionally stir the surface
of the sand or earth in the frame with the point of a stick, in
order to expirate vapour, that hovers on the surface, and so
purify the internal air of the bed. If the heat begin to decrease,
and particularly if the weather be severe, it may be necessary to
line one or more sides of the bed, that the plants may receive
no check in their growth. If it be a 1-light box, both back and
front may be lined at the same time, and, if necessary, in 10 or
12 days, the two sides; and if much steam arise from the
lining in after they come into heat, it may be well at night to
leck up the edges of the mat, lest it be thrown into the bed.”

Mills, as soon as the seed-leaves of the plants are fully ex-
anded, transplant them singly into pots of 48th size, gives a
little water and air night and day. His temperature for seed-
lings, as already stated, is from 65° to 75°. With this heat and
water, as the earth in the pots becomes dry, and a little air night
and day, so as to keep the internal air in the frame sweet, and
fluctuating between the degrees of heat above mentioned, the
plants will be fit for finally transplanting out in a month, that is,
by the 14th of November, into the fruiting-framcs.

- Forming the fruiting bed.—Abercrombie directs, “When the
plants are advanced in some tolerable stocky growth, that is,
when the first rough leaves are 2 or 3 inches broad, or when the
plants have been raised about five weeks, transplant them to the
larger hot-bed, with a 2-light or 3-light frame, sometimes
called the ridging-out-bed.” Form the bed on general prin-
ciples, of superficial extent, according to the frame it is to sup-
port, leaving from 4 to 6 inches all round, and fixing the height
according to the season. Thus in January, Abercrombie directs
“the bed to be 3 feet 9 inches high in front, 4 feet 6 inches at
the back, and 6 inches larger than the frame all round. In February,
3 feet 3 inches high at the front, 4 feet at the back, and 4 inches
to spare round the frame. In March, 3 feet high in front, 3 feet
6 inches at back, and 4 inches beyond the frame every way.”

“Put on the frame and glasses presently after the body of the
dung is built up, to defend it from the weather. At the same
time raise the glasses a little at the upper end, in order both
to draw up the heat sooner, and to give vent to the rising steam,
until the bed is reduced to a regular temperature. In con-
nection with the thermometer, the cultivator may be assisted to form
a judgment of this by trying sticks, that is, 2 or more sharp-
pointed smooth sticks, thrust down in different parts of the bed,
which at intervals may be drawn up, and felt by a quick grasp
of the hand. The smell of the vapour is also a criterion; it
should not be strong and fetid, but mild and sweet. While
taking care that the heat is not so intense as to burn the mould
when applied as below, let it not be suffered to evaporate un-
necessarily by dehcy. If the temperature appear to be not suf-
ciently high, take off the frame, and add another course of dung.”

M’Phail, when he fruits the cucumber on dung beds, begins
to make preparation for the fruiting-bed, about 3 weeks before the
plants are ready to be planted for good. The dung collected,
after being well worked, is “made up into a bed of about 4 or
5 feet high, and the frames and lights set upon it. It is after-
wards suffered to stand for a few days to settle, and until its
violent heat be somewhat abated; and when it is thought to be
in a fit state for the plants to grow in, its surface is made level,
and a hill of mould laid in just under the middle of each light,
and when the mould gets warm the plants are ridged out in it.
After this, if the bed has become perfectly sweet, and there be
heat enough in it, and the weather prove fine, the plants will
grow freely.” Nicol builds his fruiting-bed about 4 feet high in
front, and it is 3 feet more than the frame all round. He turfs it,
and lays on sand as in forming the seed-bed, if the dung has not been well fermented. “But otherwise, placing a
thick round turf, a yard over, in the middle of each light, so that
as its centre may be exactly under the plants, will generally be
found sufficiently safe.” The frames are now put on, and the
beds matted up at night to make the heat rise the sooner.

Mills says, “Well preparing the dung is of the greatest im-
portance in forcing the cucumber, and if not done before it is
made into a bed, it cannot be done after, as it requires turning
and watering to cause it to ferment freely and sweetly; fresh
dung from the stable will require at least 6 weeks’ preparation
before it will be fit to receive the plants. A month before it is
made up into a bed, it should be laid in the heap, turned three
times and well shaken to pieces with a fork; and the outsides
of the heap turned into the middle and the middle to the outsides,
that the whole may have a regular fermentation, and if any ap-
pear dry, it should be made wet, keeping always between the
two extremes of wet and dry. A dry spot of ground should be
chosen to prepare the dung on, that the water may drain away
from the bottom of the heap. The dung having been a month
in heap, I make the bed as follows: I form a stratum one foot
high of wood of any kind, but if larger the better (old roots of
trees or any other of little value will do). This is to drain the
water from the bottom of the bed, for after a month’s prepara-
tion, with every care, it will frequently heat itself dry, and re-
quire water in large quantities, which, if not allowed to pass off
freely, will cause the frame to sweat, and the cucumber planl will not grow freely. On this bottom of wood,
I make the bed 4 feet high with dung, gently beating it down
with a fork. This is done about the 1st of November, and by
the month of February the 4 feet of dung will not be more than
2 feet thick, which, with a foot of wood, at the bottom, will
make the bed 3 feet high. This I consider a good height; for
if lower, it cannot be so well heated by linings, which is the
only method of warming it in the months of February and March, as by that time the first heat of the bed will have quite declined. Having made the bed, I put on the frames and lights, which I shut close till the heat rises. I then give air night and day, sufficient to allow the steam to pass off, and once in 2 days I fork the surface over, about 9 inches deep, to sweeten it, and if in the operation I find any part dry, I carefully wet it. The bed being quite sweet, I prepare it for the mould, by making the middle about 8 inches lower than the sides, as the sides are liable from the weight of the frames to settle farther than the middle, which often causes the hills of earth to crack, by which the roots of the plants are greatly injured."—Mills ex Loud. enchyed. gard. p. 632.

"Moulding."—"As soon," Abercrombie observes, "as you deem the bed to have a lively, safe, well-tempered heat, which may be in a week or 10 days after building, proceed to mould it. Earth the middle of each light, laying the mould so as to form a little hill from 6 to 10 inches in height, according as seed is to be sown, or plants from the seed-bed inserted. Then earth over the intervals between the hills, and the sides of the frame only, from 2 to 4 inches, as a temporary measure, until the heat is ascertained to be within safe limits. After the whole bed has been for some time covered, examine the mould; if no traces of a burning effect appear discoverable by the mould turning of a whitish colour, and caking, it will be fit to receive the plants. But if the earth appears burnt, such part should be replaced by fresh, and vacuities made to give vent to the steam, by drawing every part of the hills from the centre. When the bed is in fit order, level the mould to 6 inches deep to receive the seeds; but to receive plants in pots the hills of earth should be kept 10 inches deep or more. If there be any motive for haste, while an excess of heat is to be suspected, the danger from burning may be obviated by leaving vacuities in the top of the mould; by placing patches of fresh cow-dung or decayed bark to receive the pots of seeds or plants; and by boring holes in the bed with a round pole, sharpened at the end, which holes should be filled up with hay or dung when the heat is sufficiently reduced. Some persons place a layer of turf with the sword downwards between the dung and the mould; but this, if ever expedient, is only in late forcing; for in winter the full effect of a sweet well-tempered heat is wanted, much of which, by being confined at the top, may be forced out at the sides." M'Phail, in moulding common hot-beds, also raises hills in the centre of each light in the usual way. Gard. rem. p. 51. Nicol gathers up from the surface of the beds a sufficient quantity of earth to raise hills whereon to plant; one exactly in the middle of each light, about a foot broad at top, and to within 6 inches of the glass. If the frames be a proper depth, they should be 12 or 15 inches high above the turf. Kal. p. 365. Mills puts under the centre of each light one solid foot of earth, the top of which is hardly within 9 inches of the glass, and the top of the plants when planted in it will be within 3 inches of the glass.

"Planting out."—Abercrombie, when the temperature is ascertained to be right, brings the plants in their pots; turns over the hills of mould, forming them again properly, and then proceeds to planting. "Turn those in pots clean out, one pot at a time, with the ball of earth whole about the roots, and thus insert one patch of three plants which have grown together, with the ball of earth entire, into the middle of each hill, earthing them neatly round the stems. Also any not in pots, having been pricked into the earth of the bed if required for planting, may be taken up with a small ball of earth, and planted similarly. With water warmed to the air of the bed, give a very light watering about the roots, and shut down the glasses for the present, or till next morning. Shade the plants a little from the mid-day sun a few days till they have taken root in the hills, and cover the glasses every evening with large mats." Nicol, before planting, if the beds have settled anywhere unequally, rectifies and sets level the frames, by placing boards, slates, or bricks under the low corners, so as to make them correct. He then makes up the outsides of the bed with dung a few inches higher than the bottoms of the frame, over which he lays some dry litter or fern fronds, and planks at top to walk on. He then takes the pots of plants, each of which are supposed to have got two or three rough leaves, and making a hole in each hill, full large enough to receive the balls, turns them out of the pots as entire as possible, placing them level with the surface of the hill, fitting the earth round their sides, and settling all with a little water. In the case of planting older plants than the above, at a farther advanced period of the season, or such as have quite filled the pots with their roots, the balls may be reduced a little, and the fibres should be singled out, if anywise matted. But the above plants are supposed to have barely filled the pots with roots, and then the balls should be kept entire, that they may not receive a check in transplanting.

"Temperature for fruiting plants."—Abercrombie's minimum is 55°, and maximum in the day time 65°, the same as for the seed-bed. M'Phail says, "It appears that during the winter and spring months the medium heat of the air in the frames should be 75°, and the maximum heat 80°. But when the sun shines the heat of the air in the frames is increased to a much higher degree; so that reckoning this heat, the medium for that of the air in the frames may be 80°." Gard. rememb. p. 59. Nicol's medium heat for cucumbers is 60°; in sunshine he admits as much air as will keep down the thermometer to 60°. Kal. p. 366. Mills, in the fruiting frames, wishes "to have at all times from 70 to 90 degrees of heat, which I regularly keep up by applying linings of hot dung, prepared one month previously, in the same manner as that for the beds. For the first month I cover the glass with a single mat only; and as the nights become cold, I increase the covering, using hay, which I put on the glass, and cover that with a single mat. I regulate the heat at night by the warmth of the glass under the hay, for when the glass is warm, which should be in two hours after covering up, a little air is required. When the glass and hay covering are warm, which is easily known by putting the hand under the hay on the glass light, the internal heat of the bed will be about 78 degrees, in which degree of heat the cucumbers have grown in length in 16 hours one inch and a quarter. I give a little water round the insides of the frames, as often as I find them dry, which causes a fine steam to rise, and I think it better than changing the mould, for if this latter practice is often repeated in winter, when the sun's power is insufficient to absorb the moisture, and the glasses can be but little open to allow the damp to pass off, the earth in a few weeks will lose its vigour, and the roots of the plants will perish. Great care should also be taken, at this season, not to injure the roots by too much heat, which is not less detrimental than too much moisture: they can only be secured by keeping up a regular warmth, just sufficient to expel the damp, which arises in the night from the fermenting dung."
building a bed." When the heat decreases, Nicol cuts away the old dung perpendicularly by the frame, and adds new linings, (generally beginning with the back first,) 2 feet broad to the height of 6 inches about the bottom of the bed frame. As it will sink considerably in heating, he adds to it in a few days. Mills applies linings of hot dung prepared a month previously.

Covering.—This must be nightly performed till June, proportioning the warmth of the cover to the heat of the air in the bed, and that of the external air. Mats are laid next the glass; on these a layer of hay, and over these mats, made fast by boards, but not hanging over the linings, is the usual mode, early in the season. M'Phail says, "My method of covering up was as follows: in the first place I laid clean single mats on the light in length and breadth, just or nearly to cover the sashes, taking care not to suffer any part of the mats to hang over the sashes, on or above the linings, for that would be the means of drawing the steam into the frames in the night time. On these mats was spread equally a covering of soft hay, and on the hay was laid another covering of single mats, upon which were laid two, or sometimes three or four rows of boards, to prevent the covering from being blown off by the wind. The mats laid on next to the glass are merely to keep the seeds and dust, which may happen to be in the hay, from getting into the frames among the plants. If the bed be high, in covering up steps or short ladders must be used by those whose office it is to cover and uncover; and great care must be taken not to break or injure the glass."

Air.—Abercrombie directs to "admit air every day when the weather is moderate, without much wind; and always more freely on sunny days, than when cloudy or cold and frosty. Open the lights behind, only a little at first, sooner or later in the day, according to the temperature of the season; increasing the opening from about half an inch to 1, 2, or 3 inches, or very little more (decrease the opening occasionally, if the weather in the early part of the season changes very cold); and shut close in the same gradual order towards afternoon, generally shutting close in the evening, unless in the early state of the bed, a considerable heat and steam continues. In this case you may occasionally leave open about half an inch, hanging the end of the mat before each opening." M'Phail says, "A cucumber plant delights in a strong heat, and in sweet wholesome air; but if the air in which it grows be contaminated, unhealthy, or impure, the plant will not continue long in a healthy flourishing condition. Whatever is disagreeable to the smell becomes in time hurtful to the cucumber plant; therefore whoever would wish to know if the air in a cucumber house be clean and healthy nature for the plants, should smell to it." He adds, in giving and taking away the air, do it gradually, that is, by little and little at a time, which without doubt is the best way: for sudden changes are always attended with unpleasant consequences. A due proportion and continual supply of fresh air is at all times necessary, and more or less is required according to the heat of the linings, the temperature of the weather, and the thickness of the coverings put on at nights. Gard. rememb. p. 42. Nicol admits air regularly in as large portions as the state of the weather will allow, being careful to let off rank steam, if it abound, by leaving a tilt, even in the night. Mills says, "My usual time of giving fresh air to the frames, and permitting the foul to escape, in the winter months, (that is, from the middle November to the middle of February,) is as follows: between 8 and 9 in the morning I raise the lights, and let the confined air pass off, shutting them again; about 10 I give a little air; at 11 more; at one I lower the lights a little, and between 3 and 4 I close them entirely. About two hours after the covering of hay has been put on, I give a little air for the night. Should the weather be changeable, the lights must be raised or lowered more or less, as circumstances may require; but some air about the times of the day above mentioned is absolutely necessary to keep the plants in a free growing state."

Water.—"Give necessary waterings with water warmed to the air of the bed, mostly in the forenoon of a mild day, in early spring, and in the morning or afternoon in the advanced season of hot sunny weather."—Abercrombie. M'Phail says, "The quantity of water requisite to be given to the plants depends upon the heat of the bed, the strength and age of the plants, and also on the temperature of the weather. When the weather is cold, wet, and gloomy, and the air moist, they require less water than when the weather is clear, and the air more dry. If too much water be given, or if water be given too often, it will hinder the fruit from setting and swelling kindly; and if too little water be given, the plants will grow weak, and the fruit hollow. I seldom watered the plants with water warmer than 85°, nor colder than 65°; although in general I tried by the thermometer the warmth of the water I used, yet it is not necessary so to do. Whatever I say to know if the water be of a proper temperature is to take a mouthful of it, and when it feels neither hot nor cold, then it is in a fit state for accelerating the growth of the plants, or for making them grow fast. I made a constant rule never to water the plants but with clean sweet water; and if the water be clean and sweet, I am of opinion it makes little or no difference whether it be pump water, spring water, rain water, or river water. However, it is a good quality in water to bear soap, and make a lather therewith, which rain and river water readily do; but the pump and spring waters are found too hard to do it, yet this may easily be remedied in them, by letting them stand a few days in the open air, and sun's rays. With regard to the time of the day in which the watering ought to be performed, I think it is not material, nor did I ever make any rule with respect to the time, but gave them water at any hour of the day, when I saw they stood in need of it, and when it best suited my conveniency. Those who have hot-houses may get their water warmed there, and those who have no hot-houses may get some from the house, or from some other place where water is frequently heated. One gallon of hot water will properly water several gallons of cold water." Tate says "in spring and in the summer months the water may be warmed by exposure to the rays of the sun. Nicol airs his water "by some means or other;" waters once in two or three days after planting, and liberally from the rose of the watering pot as the plants advance. The time chosen is the afternoon about 4 or 5 o'clock, in order not to scorch the plants, which, he says, often happens, when, after morning waterings, the sun's rays suddenly dart on the plants. Kal. p. 366—355. J. Mearns, already mentioned, uses water impregnated with sheep's dung, as does Mr. Knight. Mearns tried this water first "on some cucumber plants in the Pine stove, which had been planted in January, but which in consequence of duli weather had become weak, and of a pale green colour; he applied the liquor to the roots, and in a few days a great change in the appearance of the plants was produced; the foliage assumed a hardy green, the shoots acquired an unusual degree of strength, with short joints, and although the stover had scarcely any air given to it, yet the fruit swelled rapidly, and attained a large size." These plants continued in bearing till May, and were then cut back to within 6 inches of the root, when they started again with vigour. "No water was ever given over the leaves, but a continued supply of the liquid pigeon-dung manure to the roots," Mearns. ex Loud. ency. Gard. p. 635. For Mills's practice as to watering see his process under temperature.

Earthing.—"Observe," says Abercrombie, "in proper time when the first heat of the bed is moderate, to begin adding more earth between the hills, as the extending roots require to be
CUCURBITACEÆ. IV. CUCUMIS.

covered, or the runners to be supported with mould; raising it by degrees equal with the tops of the hills, all in level order from 8 to 10 inches thick." Pract. Gard. p. 72. Nicol, "by the time the plants have sent out runners, and the roots spread quite over the hills, enlarges them; beginning by stirring up the earth in the other parts of the frame to its full depth with a hand-fork or weeding-iron, breaking it fine if anywise caked by the heat. To this add fresh mould, sifted or finely broken, and in a dry state, so as to raise the surface nearly to the level of the hills; laying it in a sloping manner from back to front. Previously he rectifies the position and level of the frames, and raises them so that the glass may be eight or nine inches above the mould in the centre." Kal. p. 307.

Training.—To force the cucumber into early fruit, Abercrombie directs to *stop the runners as soon as the plants have made two rough leaves; as the bud that produces the runner is disclosed at the base of the second rough leaf, it may be cut off or picked out, or if the runner has already started it may be pinched off close. This is called stopping at the first joint, and is necessary for a stronger stocky growth, and an emission of fruitful laterals; and from these other prolific runners will be successively produced. The vines, without the process of stopping, would generally be both weaker, and so deficient of fertile runners, that they would sometimes extend 2 or 3 feet without showing fruit. When plants which have been once stopped have extended the first runners to three joints without showing fruit, they are to be again stopped for the purpose of strengthening the plant, and disposing it for bearing. As fertile runners extend, train them out regularly along the surface, fastening them down neatly with pegs." McIlholl stops his plants when they have two joints; and "when the plants shoot forth again after the second stopping, they seldom miss to show fruit at every joint, and also a tendril; and between the tendril and the showing fruit, may clearly be seen the rudiment of another shoot, and when the leading shoot has extended itself fairly past the showing fruit; so that in pinching off the tendril and the shoot, the showing fruit is not injured. This stopping the leading shoot stops the juices of the plant, and is the means of enabling the next shoot (the rudiment of which was apparent when the leading shoot was stopped) to push vigorously, and the fruit thereby also receives benefit. When the plants are come into bearing, if the vines are suffered to make two joints before they are stopped, at the first of these joints, as I before said, will be seen showing fruit, a tendril, and the rudiment of a shoot; but at the second joint there is seldom to be seen either showing fruit or the rudiment of a shoot; but only a tendril, and the rudiments of male blossoms. It is therefore evident, and but reasonable, that the shoot should be stopped at the first of these joints; for were the shoot to be let run past the first joint, and stopped before the second, perhaps no shoot would ever spring forth at the said second joint, but only a cluster of male blossoms or leaves, which would serve for no good purpose, but would rather exhaust the juices of the plant, which ought to be thrown into the productive parts of it. If the plants are suffered to bear too many fruit, that will weaken them, and in such case some of the shoots will lose their leaders, that is, the rudiments of some of the shoots will not break forth, the numbers of fruit having deprived them of their proper share of the vegetative juices. The rudiments of some of the shoots may also be injured by accident, which sometimes prevents their pushing; but from whatever cause this happens it matters not, for by the losing of its leader the shoot is rendered unfruitful, and therefore should be cut entirely off. In the course of the spring and summer months, several shoots break forth here and there from the old ones. When too many break out, cut off the weakest of them close to the old shoots, and those which remain, with regard to stopping, serve nearly in the same manner as young plants. If the old shoot from which the new one bursts forth lie close to the moulds, it sometimes sends forth roots from the same joint from which the young shoot proceeded, by which the young shoot is much invigorated, and the old plant in some measure renovated. When this young plant is fairly formed on the old shoot, it somewhat resembles a young plant formed and struck root on a strawberry runner; and if the shoot were to be cut off on each side of the newly formed plant, and no part of the plant left in the frame but itself, by proper treatment it would soon extend itself all over the frame. In winter, when the plants are young, and before they come into bearing, it sometimes happens that they send forth too many shoots; in that case, cut the weakest of them off, not suffering them to become crowded and thick of vines, for that would weaken, and prevent the plants from bearing so early as they ought to do. Keep the leaves of the plants always regularly thin. The oldest and worst of them cut off first, and cut off close to the shoot on which they grow. This is necessary and right, for if any part of the stalk of the leaf were to be left, it would soon putrify and rot, and perhaps destroy by damp the main branch from which it proceeded." Nicol. "Cucumber plants will put out runners or vines, whether the heart-buds be picked out or not, which is a matter of trivial concern, although much insisted on by some, as being necessary to their doing so at all. For my own part I never could discover any difference, and I have repeatedly made the comparison in the same bed, which otherwise of course could not be fair. When the vines have grown to the length of 4 or 5 joints, and if fruit appear on them, they may be stopped at one joint above the fruit; but otherwise, they may be allowed to run the length of 7 or 8 joints, and may then be stopped, which will generally cause them to push fertile shoots. These should be regularly spread out, and be trained at the distance of 8 or 10 inches apart."
sooner than those raised from seeds, but they are not of so long
duration.

Upright training.—"Cucumber plants being climbers by
means of their tendrils, some branchly sticks being placed to any
advancing runners, they will ascend and produce fruit at a dis-
tance from the ground, in a clean growth, free from spots, and
well flavoured."

Setting the fruit.—"The cucumber," Abercrombie observes,
"bears male and female blossoms distinctly on the same plant.
The latter only produce the fruit, which appears first in mini-
tature, close under the base, even before the flower expands.
There is never any in the males; but these are placed in the
vicinity of the female blossoms: the fruit of which will not
otherwise swell to its full size, and the seeds will be abortive.
The early plants under glass, not having the full eurrent of the
natural air, nor the assistance of bees and other winged insects,
to convey the farina, the artificial aid of the cultivator is neces-
sary to effect the impregnation. At the time of fructification
watch the plants daily; and as soon as a female flower, and some
male blossoms are sufficiently expanded, proceed to set the fruit
the same day, or next morning at farthest. Take off the male
blossom, detaching it with part of the foot-stalk. Hold this
between the finger and the thumb; pull away the flower leaf
close to the stamens and anthers, which apply close to the stigma
of the female flower, twisting it a little about, to discharge
thereon some particles of pollen or fertilizing powder. Proceed
thus to set every fruit, as the flowers of both sexes open, while
of a lively full expansion, and generally perform it in the early
part of the day, using a fresh male if possible for each impreg-
nation, as the males are usually more abundant than the female
blossoms. In consequence the young fruit will soon be ob-
served to swell freely. Cucumbers attain the proper size for
gathering in about 15, 18, or 20 days from the time of setting,
and often in succession for 2 or 3 months or more in the same
bed by good culture. The above artificial operation will be
found both necessary and effectual in forcing the cucumber,
between the decline of autumn and May, while the plants are
mostly shut under glass. In plants more fully exposed to the
free air, in the increasing warmth of spring, and in having the
full open air in summer, from June and July till September, the
impregnation is effected mostly or wholly by nature. The male
flowers being by some ignorantly denominated false blossoms,
are often plucked entirely off, or not well enough strengthened
the plant; but this should not be generally done. Where crowded
too thin in clusters, some may be thinned out
moderately; but their agency being absolutely necessary in fer-
tilizing the females, they should only be displaced as they begin
to decay, except where they are superabundant.

It is the female blossoms of flowers," M'Phail observes, "that bear the
fruit; but if they were not to be impregnated by the male
flowers they would prove barren and unfruitful. The female
blossoms are easily to be distinguished from the male ones, for
the rudiment of the fruit is apparent at the bottom of the female
flower, and the flowers have no stamina, but have three small
pointed filaments, without summits; whereas the male blossoms
have not any rudiment of fruit about them, but in the centre of
the flower are three short stamina, which are inserted in the
corolla. When the female or fruit blossoms are in full blow,
take the male blossom which is in full blow, and holding it in
one hand, with the other split and tear off the corolla, taking
care not to part the stamina or male parts. Then hold the male
blossom thus prepared between the finger and thumb of the
right hand, and with the left hand gently lay hold of the female
blossom, and holding it between the two fingers, put the prepared
male blossom into the centre of the female blossom, and there
the farina or pollen of the anthers cling or sticks to the
stigmas, and thus the impregnation of the fruit is effected, and
the plants are thereby rendered fruitful, which, being in frames
in a climate by art made for them, would otherwise in a great
degree be rendered barren and unproductive; and which I have
frequently known to have been the case, even when at the same
time the plants were in a vigorous flourishing state. Generally
leave the prepared part of the male blossom sticking in the
centre of the female one, and take a fresh male blossom to every
female blossom. But if the male blossoms run scarce, which
seldom or never happens, make one male blossom do for two or
three females." Nicol states, that cucumbers will grow and
will arrive at full size without the female flowers being impreg-
nated: the seeds, however, will prove abortive. The directions
he gives for impregnating are in substance the same as those of
M'Phail. The fruit being set and swelling, some lay fragments
of glass or slate beneath it in order to keep it clean, and to ad-
mitt as much air and light as possible to the under side, so as to
cause its approach in greenness to the upper.

On keeping a fine bloom on cucumbers.—The art of producing
and keeping a fine natural bloom on cucumbers, either for a
gentleman's table for show, or for the market, merits great at-
tention, both as to the perfect appearance of the fruit, and also
to the general culture of the plant, after the fruit is set. From
that time a strong bottom heat should be given with dung linings
or, if late in the spring, short grass laid round the frame on the
dung, will cause a very strong heat. Water ought then to be
given plentifully, always at the back part of the frame; and
at no time should the plants be watered over their leaves, when
the fruit is wanted for its fine delicate bloom and long regular
shape. A fine foliage over all the bed is likewise a very essen-
tial point; and leaves should never be picked off near the fruit,
as it thereby deranges the juices of the plant, and consequently
the fruit does not swell off finely. Air also should be given
very sparingly in the middle of the day, even in bright sunshine,
and generally there should be a little left in the night, when the
bottom heat is very strong, as by that means the air in the frame
is kept sweet. When the fruit is fit to eat, for any of the
above purposes, great care should be taken to pack it in narrow
wooden boxes, in the largest nettle-leaves that can be got, filling
up the interstices with well-beaten moss, and covering over with
soft leaves of any kind. It may then be sent to a great distance
with a fine bloom, and, upon the whole, in a perfect state.—
Gathered in Yorke, Long. 6, lat. 50. 30.

Gathering the crop.—Cucumbers are used green and unripe,
and before they have attained their full size. They are cut and
gathered when 4, 5, 6, or 8 inches long, according to the kinds.
To this size they attain in 10 days or a fortnight in the best
part of the season.

To save seed.—"Select some best summer fruit, from good
productive plants, which permit to continue in full growth till
they become yellow. Then cut them from the vine, and place
them upright on end in the full sun for 2 or 3 weeks, when they
may be cut open, and the seed being washed out from the pulp,
spread it to dry and harden; then put it up in papers and
bags for future sowing; it will remain good many years; and
seed of 3 or 4 years' keeping is preferable for early frame
crops.

On forcing cucumbers.—In growing cucumbers under lights,
"the most obvious defects," according to Mr. Allen, "are com-
pound of too light a quality," and "dung not sufficiently worked
before it is earthed over." Mr. Allen has been in the habit of
growing early cucumbers under frames, on common dung-beds,
for twenty years, always producing abundance of fruit from
March till October. In 1823 he worked 70 lights for the
London market, the produce of which was 3360 cucumbers, or
4 dozen to a light, "a greater product than is usually obtained

8
CUCURBITACEÆ. IV. CUCUMIS.

by any of the ordinary methods of treatment." The beds are made in December or January, the hot horse-dung having been previously turned and watered 5 or 6 times. Before earthing it, round flat mats, about 15 inches in diameter, formed by coiling up a band of straw, 1 inch in diameter, and 10 feet long, are to be prepared and placed on the dung, under the centre of each light. Rye straw is preferred for these mats, as it does not encourage mice. A bushel of compost, consisting of loam and rotten dung, is placed on each mat, and 1 plant in preference to more, on the top of each hillock; the top of the plant should be left about 3 inches from the glass; the mould should then be dressed up round the hillock, and be pressed close to the roots, and within 1 inch of the seed-leaves of the plant; these, at no time of earthing, should be covered, for this is very apt to cause canker. The earth should be kept within the bounds of the straw mat, and not be suffered to mix with the dung, as that would cause a burning, which is not only troublesome, but in many instances fatal to the prosperity of the plant; because if the earth is once burnt, its vegetative quality is destroyed, and water will have no effect on it. The only remedy in such a case is to remove the mould, fork up and water the dung, lay on a little rye straw, and replace the earth. After ridging out, from one quarter to one inch of air is given in the day, and about one quarter during the night. The covering must be very slight for the first 3 or 4 weeks, and must not hang over the sides. "The heat must be kept up by augmenting the linings once a-week, turning over and watering them when they heat so as to become dry. The bed inside the frame will require forking up about 9 inches deep, 3 times a-week; the hillocks at the same time should be examined, and a round pointed stick, of about an inch in diameter and 18 inches long, must be thrust about 12 inches in the dung, under the straw mat, making 5 or 6 perforations under each hillock. Into each of the holes so formed, pour from the spot of a watering-pot as much water as the state of the bed seems to require; this may be ascertained from the facility with which the perforator goes into the bed. If the bed is husky or burning, the stick will go in with difficulty, and then a large pot of water is required to a hillock; on the contrary, if the bed is in a free state of working, the perforator will go into it very easily, and then a sprinkling from the rose of the pot will be sufficient." A great object of Mr. Allen seems to be to sweeten, rot, and moisten the dung under the frame for the roots of the plants, while the heat is principally supplied by the linings. "The dung," he says, "from the continued forking and watering, will become in a fine state to receive the roots of the plants; these, after passing through the proper depth of compost, placed over the dung, which is about 8 inches, will readily strike into the dung, and bear a productive crop of cucumbers throughout the summer, without their leaves flagging or requiring any shade. For ascertaining the proper periods to make additions to the earth, the best criterion is the appearance of the roots through the sides of the hillock. This should be earthed over about 3 inches, each time forking out the dung 2 inches below the mat, to give a greater depth of earth each time of performing the operation. The last time this is done, the depth of mould at the back of the frame should be 20 inches. It will be necessary to raise the frame and lights as the plants advance in growth." Water should be given plentifully 3 times a-week, without wetting the leaves or fruit, "pouring it against the back of the frame, for the mould will dry faster against the back than the front, in consequence of the heat being there heavier, and the air being admitted there." "In pruning, the runners should not be cut or thinned out, the tops only should be pinched, and at every joint, beginning where the plant has 2 rough leaves, and the second rough leaf is about an inch in diameter. That will cause the plant to produce fruit and a fresh runner in succession at every joint; it will likewise add to the strength of the plant." Pinch off the tendrils and male blossoms, and fecundate artificially in the early part of the season. The sort of cucumber which Mr. Allen finds most productive is the Southgate, and he prefers seed 3 or 4 years old to new seed.—Loud. gard. mag. vol. 1. p. 416, 417.

Insects and diseases.—The thrips sometimes attack early cucumbers, and are to be destroyed by fumigation. The red spider rarely makes its appearance; when he does water must have been improperly withheld. Some soils produce canker in the shoots, especially where they branch from the main stem. When this is the case, the only resource is to renew the soil and the plants.

Growing the cucumber under hand-glasses.—The following method is given by M'Phail as that generally practised: "The seeds are sown some time about the middle of April in a cucumber or melon-bed, and when they come up, they are potted out into small pots, 2 or 3 plants in each pot, and are kept properly watered, and stopped at the first and second joints. About the middle of May, a warm situation, where the mould is very rich is pitched on, and a trench is dug out about 2 feet deep, 3 feet broad, and the length is proportioned according to the number of glasses it is intended for. This trench is filled with good warm dung, and when the dung has come to its full heat, it is covered over with 8, 10, or 12 inches' depth of rich mould. The glasses are then set upon it about 3 feet distant from each other, and when the mould gets warm under them, the plants are turned out of the pots with their balls whole, and plunged into the mould under the glasses, and a little water given them to settle the mould about their roots, the glasses set over them, and after they have made roots, and begin to grow, in fine days, the glasses raised a little on one side, to let the plants have the free air; and as the weather gets warmer and warmer, air is given more plentifully to harden the plants, so that they may be able to bear the open air and run from under the glasses. When the plants begin to fill the glasses, they are trained out horizontally, and the glasses are set upon bricks or such like, to bear them from the plants. After this the plants require nothing more but to be supplied with water when the summer showers are not sufficient, and to stop them when they run too thin of branches, and thin them of leaves or branches when they are likely to become over-crowded. In warm summers and in warm situations, by this mode of management, the plants will bear plentifully for about 2 months, provided they be not attacked by insects or weakened by diseases." Abercrombie describes the practice somewhat different, but with his usual detail and order. He says, "To have a general summer crop, to fruit in hot-bed ridges under hand-glasses, sow some seed of the long prickly kind in a hot-bed, under a frame or hand-glass, or in any cucumber hot-bed in cultivation, about the middle of March, or thence till the middle of April. When the plants have been up 3, 4, or 5 days, prick some in the same or another hot-bed, 3 or 4 inches asunder. A portion may be put in small pots, 2 plants in each, and plunged in a bed. Give water, and shade from the sun till they take root; and manage as for the frame crop. In 3 or 4 weeks, when advanced in the first rough leaves, about 2 inches broad, and stopped at the first joint as directed in the early crop, the plants should be ridged out, that is, transplanted into hot-bed ridges, under hand-glasses, to remain for fruiting. The period for this may fluctuate from the middle of April to the beginning of May. Having a sufficient quantity of prepared dung, make a hot-bed on the level ground, 3½ or 4 feet wide, and 2½ feet high, the length as required, according to the number of hand-glasses intended. Earth it at top 6 or 8 inches thick, and place the hand-glasses along the
middle at 3½ feet distance. Sometimes the bed is made in a moderate trench, 12 or 15 inches deep, in some good soil in the kitchen-garden, in order to have the excavated earth of the trench ready at hand for moulding the bed. When the earth under the glasses is warm, proceed to put in the plants, removing them from the nursery-bed, with as much earth as will adhere about the roots. If you have any plants in small pots, turn them out with the ball entire, and plant 3 plants under each glass. Give a light watering; put down the glasses, and shade the plants from the sun, till they have taken root, after which let them enjoy the sun and light fully, only covering the glasses and bed every night with mats till June, or commencement of warm weather. Admit air every mild day, by propping up the southward side of the glasses 1 or 2 inches; moderate waterings will be necessary twice a-week or oftener. As the plants push runners of considerable length, train them regularly. When extended to the limits of the glasses, and when the weather is settled warm, about the beginning or middle of June, they should be raised upon 3 props 2 or 3 inches high, and the runners trained out in regular order, but cover them on cold nights with mats, for the first week or two. Continue the glasses, and circumspectly water in dry weather, as may be necessary; the plants will produce fruit in June, July, August, &c. in plentiful succession. To obtain a crop from hot-bed ridges, under hand-glasses, you may, in default of plants raised in a previous nursery-bed for transplanting, sow seed under the glasses in April or May, inserting several seeds in the central part under each glass. When the plants have been up a few days or a week, thin them to 3 or 4 of the strongest in each patch, managing them afterwards as the others. They will come into bearing about the end of June or July, and thence to September. (Should there be a scarcity of dung to make a regular bed,) in the last week of April, or in May, 1 may dig circular holes 2 feet wide, a spade deep, and 4 or 5 feet asunder; fill them with hot dung, trodden down moderately firm, and earthened over 6 inches. In these put either plants or seed, and place on the glasses; the plants will produce fruit in June or July till September. (In default of hand-glasses,) make a hot-bed, or holes of dung, as above, in May; put in plants or seed, and defend with oiled paper frames, to remain constantly, day and night, till settled warm weather in June or July. Give the additional protection of mats over the paper frame in cold nights and bad weather. In the culture of all the crops, give proper supplies of water in dry warm weather, 2 or 3 times a-week, or every day in the hottest season of June, July, and August. In the hot-bed ridges, made above ground, in April or May, 1 may dig circular holes 3 or 4 weeks or more after making, the heat be much declined, and the nights or general season remain cold, let a moderate lining of hot dung be applied to the sides, which will both throw in a reviving heat, and widen the bed for the roots and runners of the plants to extend."

*Cultivation of the cucumber in a fluid pit.—* Nicol says, "Those who would have cucumbers on the table at Christmas (a thing sometimes attempted,) will find it more practicable, and less troublesome, if the plants be grown in a fluid pit, in the manner of late melons, than if they be grown in a common hot-bed. In this case the cucumbers should take place of the melons planted in this compartment in July, and which will, by the middle or end of the month, have ripened off all their fruit of any consequence. The seeds of some of the earliest (the best for early being also best for late) should be sown in small pots about the first of the month, and should be placed in the pit along with the melons, or under a hand-glass, on a slow dung heat; where let the plants be nursed, and be prepared for planting about the second or third week in the month, as hinted at above. Observe to sow old seeds, not those saved this season, which would run more to vine than to fruit. Let the pit be prepared for their reception, by trenching up the bark or dung, and by adding fresh materials, in so far as to produce a moderate growing heat; observing the directions given for preparing the pit for the melons in July, and moulding it (however cucumber earth) all over to the depth of 1 foot or 14 inches. The plants may be placed closer in planting them out than is necessary in a spring hot-bed. They may be planted at the distance of a yard from each other, and 2 rows lengthwise in the pit, as they will not grow very vigorously at this late season. They should be moderately supplied with water once in 4 or 5 days, and should always be watered over the foliage, the more especially when strong fire-heat becomes necessary, as cucumbers naturally like a moist rather than a dry heat. The temperature should be kept up to about 64° or 65° in the night, by the aid of the flues, and by matting, or otherwise covering the pit. Air should be as freely admitted as the state of the weather will allow, and so as to keep the mercury down, in sunshine to about 70°. The plants will require little other pruning than to stop the vines, as they show fruit at the joint or two above it; for they will not push manysuperfluous shoots. Observe to pick off all damped leaves as they appear; and otherwise carefully attend to them, as above directed, while they continue to flourish, or to do any good worthy of such attendance."

*Cultivation of the cucumber in M'Phail's brick-bed pit.—* "When I used," observes M'Phail, "to cultivate cucumbers on a dung-bed, the fruit were sometimes watery and ill-tasted; but after 1 began to cultivate them on a brick bed, the fruit were constantly firm and well flavoured, which is certainly occasioned by the goodness and wholesomeness of the food with which the plants are fed or nourished." M'Phail's pit has many advantages over a common hot-bed; there is no chance of burning the roots of the plants in it, the linings being placed all on the outside, without any dung underneath the plants. "All the materials of my newly-invented bed are clean and sweet; and the flues being made perfectly close, no tainted or bad-smelling air can get through them into the bed; so that it is of little or no concern whether the dung of the linings be sweet or otherwise, or whether the linings be made of dung or of any thing else, provided there be a sufficient heat kept in them, and no pernicious steam be drawn in among the plants by the current of air. A sheltered dry situation is of the first consequence for this pit. The bed being built, " when the frame is about to be set upon it, a layer of mortar is spread all round upon the upper course of brick-work, on which the bottoms of the frames are to rest. Thus the frames are set in mortar on the bricks; and the flues are, with a bricklayer's brush, well washed, and rubbed with a thick grout, made of lime and water, which stops every crack or hole, and prevents the steam of the linings from getting into the frames. This washing of the flues I had done once a-year, for no crack or hole must ever be suffered to remain unstopped in the flues. I found little or no trouble in keeping the flues perfectly close, nor is it indeed likely that they should become troublesome, if the bed stands on a sound foundation, for the heat of the dung has not that powerful effect on the flues, as fire-heat has on the flues of the hot-house; because the heat of dung is more steady and not so violent as the heat of the fire, and, besides, the flues of a cucumber-bed are almost always in a moist state, which is a preventive in them against cracking or rending. When the brick is well built, the flues about 3 feet in depth below the surface of the flues. The pits I had filled up about a foot high, some of them with rough chalk, some of them with small stones, and some of them with brick-bats; this is to let the wet drain off freely from the mould of the beds. After this filling up with chalk, stones, and broken
bricks, there is a vacancy in the pits, about 4 feet deep below the surface of the flues; this vacancy I had filled to a level with the surface of the flues, with vegetable or leaf mould; and in putting it in, it was gently pressed, to prevent it from sinking too much afterwards. On the surface of the mould with which the pits were filled, under the middle of each light, and which is just in the centre of the mould in each pit, make hills of mould, in the same form as is commonly done on a dung-bed. These hills are to set the plants in, and are to be raised at first nearly close to or within a few inches of the glass. Raising the mould at first pretty high the glass is necessary, on account of the sinking of it; for as the frames are set on bricks, they cannot sink; but mould newly put in is sure to settle, and the measure of the settlement will ever depend upon the lightness and texture of the mould with which the pits are filled. Therefore, these and such-like matters must be left to the discretion of those who are intrusted with the direction and management of the frames. When the bed is thus finished, and ready for the reception of the plants, if the flues be strewed over with mould, so that their surface be just covered, to a stranger it is altogether a deception, for in every respect it has the appearance of a dung-bed. The ashes of the frames which I used were glazed in lead; but if any person who rears early cucumbers have lights which are not glazed in lead, but are slate-glazed, the vacancies between the glass had best be filled up close with putty, to prevent too much air from getting into the frames in the cold days of winter. The frames under my management were constantly kept in good repair, and painted over once every year. This method, I am clearly of opinion, is more profitable than if the frames were neglected for 2 or 3 years, and then have a thorough repair, with 2 or 3 coats of paint. When frames are new painted, they should be suffered to lie and sweeten for some time, at least for 2 or 3 weeks, or until the disagreeable smell of the paint is somewhat lessened. Although the frames I used were of a very good size, yet if they were a little smaller or larger, they would answer the purpose very well. Therefore those who intend to build a bed after my plan, have no occasion to make new frames merely for the purpose, but they may get the bed built to fit the frames they are already in possession of. The linings are to be applied to the bed a few days before the plants are ready for finally planting out, in order that the soil under the frames may be properly warmed for their reception. The dung, of which the linings are to be made, may either be cast together into a heap, to bring it to a heat before it be laid round the bed, or it may be laid round the bed as it is brought from the dung-yard; but whichever of these methods be taken, when the linings are making up, the dung should be well shaked, and laid up lightly, so that the heat of it may come up freely. As it takes some days before the linings are able to warm the earth in the bed sufficiently for the reception of the plants, the rank steam of the new dung linings is evaporated, unless the dung came immediately from the stables, which seldom is the case. The linings are to be made nearly 3 feet broad in their foundation, and tapered up to about 30 inches at the top, by which they will retain their heat long, and in sinking will keep close to the bed, which is what should at all times be paid proper attention to. In the winter and spring months, the linings should be trodden upon as little as possible, for treading on them would be the means of stagnating the heat. But should it at any time, in managing the plants, be found necessary to stand or kneel upon them, boards should be laid on their tops for that purpose; which will prevent the weight of a person from taking that effect on them which it otherwise would do. As the linings sink they are to be raised with fresh dung, but they should seldom be raised higher than the level of the mould in the frames on which the plants grow, especially when there is a strong heat in them; for when there is a great heat in them, if they are kept higher than the level of the mould, the heat dries the air in the frames too much. Nor should they be suffered to sink much below the level of the mould in the frames, for that, on the contrary, would cause too much moisture in the frames, especially in the winter and spring months. When the heat begins to be too little, notwithstanding the linings being kept to their proper height, the fresh unexhausted dung underneath should be taken away, and that which was laid aside put in the foundation, and fresh dung laid above it, in lieu of that which was carried away. Both the side linings, may be raised the same time, but both of them should never be renewed together; for if both were to be renewed at the same time, it would for a time cool the frames too much, and when the heat of both came to their full strength, it would probably be too powerful to the roots of the plants when extended to the flues. I seldom or never renew the end linings, because I found the heat of the side ones fully sufficient; for as there are flues or vacuities in every part of the bed, the steam being fluid, circulates in and warms every part thereof. And for the very same reason there is no occasion for having a strong heat in both the side linings at one and the same time, except in very cold weather. In making up and pulling down the linings, care should be taken not to injure the brick-work. The covering the lights in the winter and spring is absolutely necessary; for, notwithstanding the heat of the linings, it would be impossible to keep up a proper degree of heat in the frames for the plants without covering. Therefore, the covering up in the evenings and uncovering in the mornings must be particularly attended to, and more or less put on according to the heat of the linings and temperature of the weather. After the bed is set to work, heat and sweet moisture are the two principal agents required for promoting the growth and vigour of the plants; therefore if there be a heat kept in the linings, strong enough to keep the heat in the centre of the pits of mould fluctuating between 80° and 90°, cold water may be poured on the flues twice or thrice a week. There is no danger of creating damps or impure air in the frames by watering the flues; for the water is no sooner poured on them, than it runs down their sides, and passes clear off through the drains of the bed: consequently, water being poured upon the flues, gives only a momentary check to the heat of the frames; for the flues being at all times full of hot steam, when the watering is finished, the heat quickly resumes its former vivacity, and raises a warm vapour in the frames, well adapted for promoting vegetation, and for increasing the growth, and invigorating the plant in all its parts. The mould round about the sides of the pits close against the inner sides of the flues, should be kept nearly on a level with the surface of the flues, and as it is the mould that joins to the flues which receives the first and greatest heat from the linings, it should be continually kept in a moist state; for if the mould against the flues be suffered to become dry and husky, air will be generated in the frames disagreeable to the plants. In all other respects, the culture of cucumber or melon on M'Phail's brick-bed, corresponds with the culture of these fruits on common dung-beds. M'Phail has, in his "Gardener's Remembrancer," as well as in his "Treatise on the Cucumber," given the temperature of one of his beds for every day in the year, of which the following table shows the extremes for every month:

D. H. HILL LIBRARY
North Carolina State College
"By the heat described in these tables, and plenty of water, the cucumber plants, the seeds of which were sown on the 23rd day of October, were maintained in a healthy fruit-bearing state in the brick frame of my inventing, from the month of January to the beginning of December." The melon plants in the management of the author, were kept in about the same degree of heat which he has given for the culture of the cucumber, in the forcing frames; and he ventures to predict that if any person keep melon or cucumber plants in nearly the same degree of heat, as is set down in the foregoing plant tables, and the house well in other respects, the way to do which he thinks he has clearly pointed out in this treatise, he is persuaded they will not fail in having success. He adds, that notwithstanding the objections of some who have not been successful in making trial of his bed, "it is now generally approved of, and in practice by numbers of the best gentlemen’s gardeners in the kingdom, and by various market gardeners in the neighbourhood of London." West’s pit, however, seems superior to M’Phail’s, as requiring much less dung, presenting a much more neat and orderly appearance, and giving a greater command of temperature.

Cultivation of the cucumber in a common pit without flues.—Some form a narrow dung-bed along the middle of each pit, leaving room for adding a lining on each side when the plants well in other respects. The method succeeds very well late in the season; but at an early period the sinking of the bed from the glass leaves the plants at a great distance from the light.

Cultivation of the cucumber in houses.—"Cucumber plants," M’Phail observes, "will grow in a hot-house, where the pineapple is cultivated; but they will not be very long lived there, for that is not a healthy climate for them." "In August sow the seeds in boxes filled with vegetable or other light earth, and place them on shelves on the back side of the hot-house, where the sun may not be interrupted from shining on them in the short days. They may perhaps produce a few fruit in the month of December or January." Gard. rememb. p. 301. Abercrombie says, "some gardeners plant the cucumber in the frame without the disadvantage of December. Fruiting this plant in the house in narrow boxes 3 feet long, and full 20 inches deep, may be found much commodious than pots. The boxes may stand upon the crib-trellising over the flues, or be suspended near the back wall, 18 inches from the upper tier of lights, so as not to shade the regular house plants: this is the best situation for a very early crop. The plants may be originated in small pots, plunged into the bark-bed, in order to be transplanted with a half ball of earth into the borders. Those who aim to have fruit at Christmas introduce seedlings about the middle of August." "The chief deviation from the course of the hot-bed is, that the plants must be trained in the house upright, for which purpose form a light temporary trellis of laths. Give water every other day at least," Pract. Gard. p. 618. We have already quoted the particulars of Aiton’s method of raising cucumber plants in August, with a view to their being fruiting in the stove through the winter. We now subjoin the remainder of that paper. "The plants being raised on a well prepared one light hot-bed, when the cotyledons or seed-leaves became nearly of full growth, the plants were potted out, two into each pot, known to gardeners about London by the name of upright thirty-twos. When these pots became filled with roots, the plants were again shifted into larger ones, called sixteens, and removed from the seed-bed into a three light frame, with a sufficient bottom heat to allow a considerable portion of air being given day and night, both in the front and back of the frame. About the middle of September, the plants having again filled their pots with roots, and become stocky, were taken from the frame to the stove, and after a few days received the last shifting into larger pots of the following dimensions: at top 14 inches over, the bottom 10 inches across, and 12 inches deep, all inside measure; each pot at equal distances apart, having three side drain holes near the bottom, and a larger one in the centre of the bottom, and containing about three pecks of solid earth. The cucumber plants were fruited this season in a pinery. On the front edge of the back line of this stove, a fascia-boarding, 6 inches deep, was affixed the whole length of the building, forming all along a trough or inclosure for a reserve of compost, after the exhaustion of the mould in the pots had taken place. The pots were now placed in regular order upon the mould-trough over the flue at 3 feet apart, and remained in this station for good, for succession. A setting of the second sowing was placed upon the end flues of the house; underneath each pot was set an upright circular garden pan, 6 inches deep, and 14 inches in diameter, which being filled with earth, the pots were plunged therein about 2 inches deep, and the drain holes being sufficiently covered with mould, served as outlets to the roots. From this time the fire heat of the stove was kept day and night at 60° or 65° of Fahrenheit’s thermometer, varying only a few degrees when the sudden influences of the sun or steam produced an additional glow of climate. The plants being now established and vigorous, required stopping the laterals and fruit; and these second and third lateral shoots in their turn were stopped also, and the blossoms from time to time set, as usual, for succession of supply. Waterings were necessary only when the surface of the earth was evidently dry, and light sprinklings of soft water, tempered in the stove, were occasionally given over the leaves of the plants and path with good effect. Steam from a well regulated flue was considered always favorable to the cultivation, but applied sparingly on account of its scalding effect upon the leaves, when the vapour proved overheated. For the mildew, flower of brimstone, coloured leaf-green by a little soot, has been applied with the best success in all stages of the disease, and copious fumigations of tobacco were used for the destruction of the several species of the aphid tribe; and this simple practice with cucumbers have been produced abundantly in the months of October, November, December, and part of January, in all the royal gardens of His Majesty during a series of years." Aiton ex encycl. gard. p. 642, 643.

Cultivation of the cucumber in Week’s patent frame.—Only two instances in which this ingenious invention has been tried are known to us, both of which are mentioned at the end of "Week’s Forcer’s Assistant." The chief objection to it is, that the bed or stratum of earth in which the plants are grown, being but of moderate depth, and surrounded by air above and below, is extremely difficult to retain an equable moisture. There are several other structures for growing cucumbers and melons in besides those mentioned above; but none of them appear to us to have much importance.

On a mode of producing a crop of cucumbers during winter.—James Reed, (Gard. mag. 3. p. 23,) places his winter cucumber bed in a vinery. In this vinery the air could be admitted both by the front and top lights. About the 20th of September the cucumber seeds were sown on a moderate hot-bed in the open air, and heated in the usual manner until they were ready to ridge out. This generally happened about the beginning of
November, at which time the shoots of the vines were withdrawn from the house, and a dung-bed formed in the floor of the vineyard in the usual way. After placing the frame and mound on the bed, it may be left without the lights until the rank steam has passed off. After this, the plants being placed in the hills, and the ashes put on, the following are the leading features of management during the winter. Make fires in the evening, so as to warm the air of the house to from 56° to 60°, and in very severe frosts it may be raised to 70°. In the mornings of the coldest weather, and shortest days, make a strong fire, so as to raise the heat to nearly 70° when the house is shut up. About 8 o'clock, and from that time to half past 9, give plenty of fresh air, by opening the front sashes and top lights, after which, and during the remainder of the day, give plenty of air to the cucumbers, by tilting the sashes in the usual way. In mild weather, and during sunshine, the lights may be taken entirely off the cucumbers for some hours each day; and immediately after forming new linings, the top lights may be left open a little all night to permit the escape of rank steam. The advantage of this mode of growing cucumbers during winter is, the comparative certainty of an early and good crop at one-third of the trouble and expense of the common method out of doors. By this practice fruit may be cut in January. The vines may be introduced in the beginning of March, and will break beautifully and regularly in consequence of the genial steam of the dung. In April the shade of the vine leaves will have rendered the house too dark for the culture of the cucumber, and as by this time cucumbers are plentiful in the common hot-beds out of doors, the bed in the vineyard may be cleared away, and the vines treated in the usual way till the following November.

4. C. flexuosus (Lin. spec. 1437.) stems trailing, scabrous, flexuous, circirrhiferous; leaves cordate-ovate, somewhat lobed, dentilicated, stalked; flowers in fascicles in the axils of the leaves; calyx very pilose; fruit long, cylindrically-furrowed, furrowed, flexuous, replicate, white or yellow. ○. F. Native of the East Indies.—Lob. stirp. p. 563. f. 2. Dodon, pempt. p. 66. f. 2. Ger. herb. p. 763. f. 3. Fruit the size of a large pear, eatable, and delicious. It is cultivated about Nagasaki and elsewhere in Japan; is ripe in June, and is called by the Dutch Banket Melon.

Far, β, reflexus (Ser. ms.) leaves angularly-lobed. C. réflexus, Ziech.

5. C. Jamaica'nsis (Bert. ex Spreng. syst. 3. p. 46.) leaves cordate, 3-lobed, quintuple-nerved, glabrous, quite entire, beset with scabrous dots beneath; lobes acuminated; fruit nearly globose. ○. F. Native of Jamaica.

6. C. macrac'ápos (Wenderoth ex Mart. rase. bras. ex Linna. 5. p. 39.) leaves cordate, rather angular, acute, sharply-denticulated, scabrous from hairs; fruit oblong, oblongately striated and spotted, remotely tuberculated. ○. F. Native of Brazil.

Long-fruited Cucumber. Pl. tr.

7. C. Ch atræ (Lin. spec. 1457.) plant very villous; stems trailing, bluntly pentagonal, flexuous; leaves petiolate, roundish, bluntly angled, dentilicated; flowers small, on short peduncles; fruit pilose, elliptic, tapering to both ends. ○. F. Native of Egypt and Arabia.—Alp. exot. egypt. p. 54. f. 40.—Banlh. hist. 2. p. 248. f. 5. The fruit is rather watery; the flesh almost of the same substance with the melon; the taste somewhat sweet, and cool as the water-melon. The grandees and Europeans in Egypt eat it as the most pleasant fruit they have, and that from which they have to apprehend. With us it is very indifferent. It is most common in the fertile soil around Cairo, after the inundation of the Nile. Chate is the Egyptian name of the plant.

8. C. Duda'ain (Lin. spec. 1437.) plant hispid; lower leaves roundish, upper ones somewhat 5-lobed, cordate at the base, dentilicated; tendrils simple; petals ovate-roundish; male flowers having the calyx rounded at the base, the throat dilated, and with the connectives longer than the anthers; hermaphrodite flowers having the tube of the calyx ovate and pilose; stigmas 4-6; fruit globose, smoothish, variegated, rarely warty: with white sweet-scented, but insipid flesh. ○. F. Native of Persia. And. bot. rep. t. 548. C. odoratissimus, Mench. meth. 654.—Dill. hort. clt. 223. t. 177. f. 218.—Walth. hort. p. 133. t. 21. The fruit is variegated with green and orange, and oblong unequal green spots; when full ripe becoming yellow, and at length whitish. It has a very fragrant vinous musky smell, and a whitish, flaccid, insipid pulp. Dudaain is the Hebrew name of the fruit, rendered mandrake in Scripture, which is perhaps C. prophe'tatárum.

9. C. Co'xosox (Thum. jap. p. 524.) plant rather pilose; stem trailing, striated; leaves cordate, somewhat lobed, stalked, rather pilose; flowers small; fruit oblong, glabrous, 6-10-furrowed; flesh firm. ○. F. Native of Japan. Fruit larger than a man's head. Flowers aggregate, rather hispid stalks. This plant is cultivated every where in Japan for the sake of its fruit, which, when preserved, is sold under the name of Comme-mon, and is a common food among the Japanese. It is also frequently eaten by the Dutch at Batavia, and is sometimes brought to Holland.

Common Melon. Pl. tr.

10. C. Sep'tem (Meyer, prim. essaq. p. 278.) leaves cordate-ovate, somewhat 5-lobed; fruit oval, muricate, acuminated at both ends. ○. F. Native of Guiana, in the island of Wac-hanana. C. angúria, Rausch, but not of Lin. ex Steud. nom. It differs from our C. angúria in the leaves being subpalmate, with angular recesses, and in the fruit being globose-elliptic.

Hedge Melon. Pl. tr.

11. C. lineá'tus (Bosc, journ. hist. nat. 2. p. 251. t. 37.) stem climbing, pentagonal; tendrils trifid, longer than the leaves; leaves cordate, palmate, acutish, serrulata; petioles short; flowers usually twin, almost sessile; female ones having an oblong-ovate calyx, and lanceolate segments; petals ovate, retuse; fruit oblong-oblong, lined with green, 16-ribbed. ○. F. Native of Cayenne.

12. C. prophe'tatárum (Lin. spec. 1436. amon. acad. 4. p. 295.) stem trailing, striated; leaves cordate, 5-lobed, dentilicated; lobes obtuse; flowers axillary, 2-5-together, stalked; male ones with a campanulate calyx, and obovate petals; calyx of the female flowers globose at the base, 12-striped, and hispid; limb campanulate, crowned by teeth; fruit globose, echinated, variegated, size of a cherry. ○. F. Native of Arabia. Jacq. hort. vind. 1. t. 9.—Blackw. herb. 589. C. grossularioidés, Hortul. The plant has a nauseous odour. The fruit equals the Cobeynthus in bitterness.

14. C. angú'ria (Lin. spec. 1456. but not of Rausch. ex Steud. e 2.

leaves but D. lobe and fruit female
Native
leaves fruit native
angles petioles fruit fruit
angular, tary.

It Europeans, season, very in English, 772. Mill.

Large-fruited 18

The plant serves both for food, drink, and physic to the Egyptians. The fruit is eaten in abundance during the season, which is from the beginning of May until the overflowing of the Nile, that is, to the end of July. It is the only medicine the common people use in ardent fevers: when it is ripe or almost putrid, they collect the juice, and mix it with rose-water and a little sugar. The fruit should be eaten cautiously by Europeans, especially when taken in the heat of the day; but it is much used within the tropics, and in Italy. The fruit is large, green externally, white fleshed, reddish towards the centre, juicy, and refreshing, but not high flavored. It is generally considered the melon of the Jews, mentioned in various parts of the Bible. It requires nearly the same treatment as the common melon, but a larger frame to admit its more extended shoots to spread themselves.

Citrus or Water Melon. Fl. May, Sep. Ch. 1597. Pl. tr.
16 C. MEXICANUS (Wildl. spec. 4. p. 613.) leaves cordate and angular, rather hoary; angles rounded; fruit cylindrical, muricated; male flowers aggregate, nearly sessile; female ones solitary.

17 C. MEGACAREA leaves palmate; fruit long, ovate, very full of anastomosing fibres, which look like net-work when the fruit is dried up.

Large-fruited Cucumber. Pl. tr.
18 C. PECLUSignum (Wildl. I. c. p. 614.) leaves cordate, rather angular, acutish, sharply toothed, scabrous; fruit, elliptic, obtus, pubescent, green, painted with more obscure narrow stripes. F. Native country unknown. Fruit 3 inches long, elliptic, and an inch thick, obtuse at both ends, covered with fine down.

19 C. MACULATUS (Wildl. spec. 4. p. 614.) leaves cordate, obliquely angular, roundly obtuse, denticulated, scabrous; fruit elliptic, narrow at the base, glabrous, when young painted with broad green stripes; but when mature, white, variegated with green spots; connectives much longer than the anthers. F. Native of Guinea. Fruit smooth. Ser. diss. l. c. t. 3.

20 C. colocythus (Lin. spec. 1435.) stems trailing, rather hispid; leaves cordate-ovate, multifidly lobed, covered with white pili beneath; lobes obtuse; petioles equaling the limb of the leaf; tendrils short; flowers axillary, solitary, pedunculate; female ones having the tube of the calyx glabrous, and rather hispid, crowned by a spreading campanulate limb, and narrow segments; petals small; fruit glabrous, glabrous, yellowish at maturity, with a thin solid rind, and very bitter flesh. F. Native of Japan and Turkey. —Blackw. herb. t. 441. —Sabb. hort. 1. t. 70. —Mor. hist. sect. 1. t. 6. f. 1. Fruit about the size of an orange. The colocynth is a native of Turkey. The fruit is about the size of an orange; its medullary part, freed from the rind and seeds, is alone made use of in medicine; this is very light, white, spongy, composed of membranous plates, of an extremely bitter, nauseous, acrimonious taste. The fruit is gathered in autumn, when it begins to turn yellow, and is then peeled and dried quickly, either in a stove or in the sun. Newmann got from 7680 parts, 1680 alcohol extract, and then 2160 watery; and inversely 3600 watery, and 224 alcoholic. The seeds are perfectly bland, and highly nutritious; and we learn from Captain Lyon, that they constitute an important article of food in Northern Africa. The extract of colocynth is one of the most powerful and useful of cathartics, but there is no more efficacious way of lessening its violence than by reducing its dose.

Colocynth or Bitter Cucumber. Fl. May, Aug. Ch. 1551. Pl. tr.
21 C. CAMPECHIANUS (H. B. et Kunth, nov. gen. amer. 2. p. 123.) stem ciriroidiform; leaves cordate-roundish, sinuately 5-lobed, toothed;lobes rounded, intermediate one the largest; male flowers racemose, few; tube of calyx villous; fruit unknown. F. Native on the shores about Campeachy. Perhaps a variety of C. prophetarum, according to Spreng. syst. 3. p. 47. Campeachy Cucumber. Pl. tr.
22 C. PERIENOS (E. James, exped. rock. mount. 2. p. 345. and in isis 1824. p. 235.) leaves triangularly cordate, with undulated margins; tendrils trichotomous; lobes of calyx subulate; fruit orbicular, smooth, usually 4-celled; seeds ovate, gibbous, with an acute margin. F. Native of or cultivated in North America. Flowers about the size of those of Cucurbita Pino. Fruit nearly sessile.

Perennial Cucumber. Pl. tr.

Cult. See culture of the Cucumber and Melon in the open air in the proper place, for the culture of the rest of the species.

V. LUFFA (Lufff is the Arabic name of L. Egytipica).

V. LUFFA (Lufff is the Arabic name of L. Egytipica).

Cav. icon. i. p. 7. t. 9. D. C. prod. 3. p. 302.—Cucumis species of authors, and Monomorica species of authors.

LIN. SIST. Moraesia, Pentandria. Male flowers yellow, in panicles; tube of calyx hemispherical, with the segments longer than the tube. Petals free, deciduous from being ruptured at the base. Stamens 5, not joined. Anthers very fleshy. Female flowers solitary; tube of calyx oblong-clavated, with the segments shorter than the tube. Stamens almost abortive. Stigmas reniform. Fruit ovate, 3-celled. Seeds 2-lobed at the base, reticulated. Flowers yellow.

1 L. PEA'TIDA (Cav. icon. i. p. 7. t. 9.) stem furrowed; leaves cordate, 5-angled, scabrous; the angles acute and serrated; tendrils umbellate; fruit mucronate, not crowned by the limb of the calyx. F. Native of the East Indies, the islands of Bourbon and France, as well as in many places on the western
CUCURBITACEÆ. V. LUFFA. VI. BENINCASA. VII. ERYTHROPAulum.

29
cost of Africa, in fields, hedges, and among bushes. Sims, bot. mag. 1638. Ojoung Bhumü is its Hindoo name.

2 L. cordifolia (Blume, bijdr. p. 929.) leaves cordate, acuminate, sharply toothed, scabrous; flowers dioecious; male ones rather umbellate; female ones solitary; fruit furrowed and wrinkled. ○ F. Native of Java, on the mountains, where it is called by the natives Aroy kajornayan, AroY Kalayar hurit, but Tiwak by the Hindoos.

Heart-leaved Luffa. Pl. tr.

3 L. acutangula (Ser. in D. C. prod. 3. p. 302.) stem twisted; leaves cordate, somewhat 3-lobed, acutely toothed; tendrils univalved, or 2-3-cleft; fruit oval, 10angled, crowned by the linear calyce segments: the rind hard; seeds flat, roundish-oblong, black, and shining at maturity. ○ F. Native of China, and plentiful in India near the habitations of the Indians. Cucumis acutangulus, Lam. spec. 1436. Jact. hort. ind. 3. p. 73, 74. ex Lam. dict. 2. p. 74.—Rumph. amb. 5. p. 408. t. 149. Dringi is the Hindoo name of the plant. Leaves like those of Tussilago Petasites or Vitis, with the scent of Datura stramonium. Male flowers umbellate, female ones solitary. Fruit insipid, but is eaten by the natives of India boiled or pickled.

4 L. plankeata ('a) (Ser. mss. in D. C. prod. 3. p. 302.) leaves cordate, doubly toothed; tendrils 2-3-cleft; fruit obovate, crowned by the marcescent limb of the calyx. ○ F. Native of the East Indies. Cucumis acutangulus /, Lam. dict. 2. p. 74.—Plank. phyt. t. 172. f. 1.

Plunkett’s Luffa. Pl. tr.

5 L. Catte-piicinna (Ser. mss. in D. C. prod. 3. p. 303.) stem tetragonal; leaves cordate, roundish, somewhat 5-lobed, angular; sepals broadly ovate, acuminate; fruit oblong-ellip- tic, mucronate, lined with warts, and crowned by the calyce segments; seeds ovoa. ○ F. Native of Malabar.—Cattpicina, Rheed. mal. 8. p. 15. t. 8. Leaves nearly the size and form of those of Allthea a rosca. Male flowers size of those of Prinodia tenofolia.

Catte-piicinna Luffa. Pl. tr.

6 L. Eeyptica (Mill. dict.) leaves roundish-cordate, lobed; lobes angular, cut at the base, with incumbent margins; tendril simple; fruit ovate-clavate, 10-angled, crowned by the segments of the calyx. ○ F. Native of Arabia. Monardiaca Luffa, Lam. spec. 1435. L. Arábunn, Alp. pl. egypt. p. 199. t. 58.—Mor. hist. 2. p. 35. sect. 1. t. 7. f. 1, 2.—Sabb. hort. 1. t. 62. The Egyptians call the plant Luff or Loff: they cultivate it, and it climbs up the palm-trees, covering, and elegantly adorning their trunks. It is also cultivated largely in China and Cochín-china, if Loureiro’s plant be the same (Coch. p. 590.). The fruit when young is made into a pickle, like the mango, but it has a disagreeable taste, and is not accounted very wholesome.

7 L. Pétolaka (Ser. mss. in D. C. prod. 3. p. 303.) stems terete; leaves cordate, 5-7-lobed; lobes acute, serrated, middle one very long; tendrils bifid; segments of the calyx oblong and bluntish; petals obcordate, toothed, shorter than the calyx segments; fruit ovate-clavate, mucronate, woolly, afterwards furrowed, green, spotted with white, with watery flesh. ○ F. Native of the East Indies.—Pétola, Rumph. amb. 5. p. 405. t. 147.

Pétola Luffa. Pl. tr.

8 L. Pentandrea (Wall. cat. no. 6751.) leaves cordate, downy, 5-7-lobed, mucronately denticulated; middle lobe the longest; female peduncles 1-flowered, solitary; male ones umbellate? ○ F. Native of the East Indies, in Rungpur and Mungeri.

Pentandrous Luffa. Pl. tr.

9 L. graveolens (Roxb. ex Wall. cat. no. 6752.) downy; leaves cordate, obsoletely lobed, and mucronately denticulated; flowers axillary, 2-4 together, on very short peduncles; fruit mucrinated. ○ F. Native of the East Indies, in in Mirkapur.

Strong-scented Luffa. Pl. tr.

10 L. amara (Wall. cat. no. 6754.) scabrous; leaves cordate, 5-7-lobed, middle lobe the longest, all acute; female peduncles 1-flowered, solitary: male ones racemose; fruit long, downy. ○ F. Native of the East Indies, in Rungpur and Gualpara.

Bitter Luffa. Pl. tr.

11 L. hederae (Wall. cat. no. 6755.) leaves cordate, palmately 5-lobed, mucronately denticulated; female peduncles 1-flowered, solitary: male ones racemose; fruit oblong. ○ F. Native of the Burman Empire, at Amherst, and below Melloa.

Ivy-like Luffa. Pl. tr.

12 L. echinata (Roxb. ex Wall. cat. no. 6756.) scabrous; leaves cordate, 5-lobed; lobes rounded, mucronately denticulated; female peduncles 1-flowered, solitary; male ones umbellately racemose; fruit roundish, echiinated by spines. ○ F. Native of the East Indies, in Bandel, Deyra, and Dhooon.

Echinated-fruited Luffa. Pl. tr.

13 L. satiata (Hamilt. ex Wall. cat. no. 6757.) scabrous; leaves cordate, angularly toothed; peduncles racemose. ○ F. Native of the East Indies, in Nathpur, where it is called Satpatia.

Satiata Luffa. Pl. tr.

14 L. parvula (Hamilt. ex Wall. cat. no. 6758.) roughish; leaves 5-7-lobed; lobes acuminate, mucronately denticulated; female peduncles 1-flowered, solitary; fruit long, downy when young. ○ H. Native of the East Indies, in Puraniya.

Small Luffa. Pl. tr.

Cult. Sow the seeds in a hot-bed, and afterwards treat the plants as recommended for ridiging out cucumbers.

L.N. syst. Polygámia, Monóecia. Flowers polygamous, monocious, solitary, yellow. Segments of the calyx short, broad with undulate, toothed margins. Staminodes in 3 bundles in the male flowers, divaricate. Petals obovate-rounded, curved, and undulate; anthers very irregular, with distant convolutions. Female flowers with the stamens as in the males, but usually nearly abortive. Stigmas very thick and irregular. Seeds with thickish margins.

1 B. cerifera (Savi, l.c.) plant very hairy, with a musky scent; leaves cordate, somewhat 5-lobed; lobes acutish and crenated; tendrils simple; fruit ovate-cylindrical, woolly, pendulous, green. ○ F. Native of the East Indies. Cecubíra cerifera, Fisch. cat. hort. Gorenk. ex Savi, l. c. B. cylindrica, Hortul. Cumbilam, Rheed. mal. 8. p. 5. t. 3. The fruit is either short or long, but always covered with numerous fragrant hairs, and clothed with glaucous, glittering bloom. Flowers sometimes hermaphrodite.

Wax-bearing Benincasa. Fl. May, Cl. 1827. Pl. tr.

Cult. Sow the seeds on a hot-bed in spring; and afterwards treat the plants as in ridging out cucumbers.

VII. ERYTHROPAulum (from ἐρυθρός, erythros, red, and παλός, palos, a shaking; application not evident). Blum. bijdr. p. 921. D. C. prod. 3. p. 303.

I.N. syst. Monóecia, Pentandria. Flowers monocious, perhaps only from abortion. Limb of calyx obliquely 5-toothed. Petals 5, ovate, alternating with the teeth of the
calyx, bicellular at the base inside. Stamens 5, opposite the petals, borne at the margin of the tube; filaments short; anthers erect, dehiscing at the side. Style short. Fruit clavate, 1-celled, 3-valved; valves fleshy, partible into two. Seed one coated.

1 E. scandoensis (Blum. bijdr. p. 922.) shrub climbing; leaves stalked, rather peltate, oblong, acuminate, quite entire, glabrous; peduncles branched, axillary; pedicels rather umbellate. The fruit is called Aroy want Ban hong by the natives.

Climbing Erythrophalum. Shrub cl.

Cult. A mixture of loam, peat, and sand, or vegetable mould, will suit this plant; and cuttings will grow freely in the same kind of soil, if placed in heat.

VIII. TURIA (Arabic name of one of the species). Forsk. fl. agr. p. 165. no. 35. Lam. dict. 8. p. 139. D. C. prod. 3. p. 303.

Lin. syst. Monoeция, Pentádria. Flowers monoeocious, male ones umbellate. Calyx 5-parted; segments lanceolate, spreading. Corolla 5-petalled, rotate, yellow. Stamens 5, erect, filiform, in 3 bundles; anthers irregularly curved; rudiment of germ half globe. Female flowers having the calyx and corolla as in the male, but with the stamens castrated. Germin cylindrical, thickened. Stigma 5, 2-lobed. Fruit cylindrical? attenuated, villous, warted.

1 T. cylindrica (Forsk. l. c.) stems twining, 5-angled, scabrous; leaves palmate; lobes toothed; tendrils trifid; fruit terete, attenuated at both ends, villous, crowned by the style and calyx.—Native of Arabia Felix. Gymn. syst. nat. 1. p. 403. ex Lam. dict. 8. p. 140. Flowers yellow.

Cylindrical-fruited Turia. Pl. tw.

2 T. Lelója (Forsk. l. c. p. 165.) stem striated, mealy; leaves 5-lobed, cordate at the base; lobes angular, middle longest, but not lobed; fruit conical, glabrous; seeds size of a small pea. 2. F. Native of Arabia. Gymn. syst. nat. 1. p. 403. ex Lam. dict. 8. p. 140. Lelója is the Arabian name of the plant. Flowers green.

Lelója Turia. Pl. tw.

3 T. cordáta (Lam. dict. 8. p. 140.) leaves cordate, angular, ciliated, 2 inches long.—Native of Arabia Felix. The fruit, when matured, opens at top by a lid, and ejects its seeds with force. Forsk. fl. agr. p. 166.

Cordate-leaved Turia. Pl. tw. trailing.

4 T. Giléf (Forsk. l. c. p. 166.) stem 6 angled, scabrous; leaves 3-lobed, dentilicate, scabrous on both surfaces; fruit ovate, 10-furrowed, glabrous.—Native of Arabia. Flowers small, green. Fruit smaller than a nut, greyish at maturity, dehiscing, with revolute valves. Giléf is the Arabian name of the plant.

Giléf Turia. Pl. tw. trailing.

5 T. Mogádd (Forsk. agr. p. 166.) stem terete, smooth; leaves 3-lobed, quite entire; lateral lobes somewhat 3 lobed; fruit oval-oblong, quite glabrous.—Native of Arabia Felix. Flowers large, white. Immature fruit green, spotted with white, but when mature yellow and eatable. Mogádd is the Arabian name of the species.

Mogádd Turia. Pl. tw. trailing.

Cult. See Cucúrbita, p. 41, for culture and propagation.

Lin. syst. Monoeция, Polyadéphia. Flowers monoeocious or dioecious. Petals joined at the base. Male flowers with a 5-toothed calyx. Stamens in 3 bundles; anthers flexuous. Female flowers with a trifid style. Fruit ovate or globose, smooth; perhaps always few-seeded. Seeds ovate, hardly compressed, more or less margined. Tendrils simple, rarely forked.

* Leaves angular.

1 B. rostro'ata (Rottl. nov. act. serol. 4. p. 215, and Willk. spec. 4. p. 616.) stem filiform, furrowed; leaves cordate, obtuse, dentilicate, scabrous; peduncles axillary, solitary; fruit ovate, angular, acuminate. C. F. Native of Tranquebar. Fruit the size of a pea. Plant scabrous, but when cultivated it becomes smooth in every part. The root of this species is prescribed in India internally in diaphytes, in cases of piles.

Rostrate-fruited Bryony. Pl. cl.

2 B. Perrotetti'ana (Ser. miss. in D. C. prod. 3. p. 304.) tendrils simple, capillary; leaves broadly cordate, unglute, sessile, villous, scabrous, with undulated margins; male flowers, as on p. prod. peduncles; female flowers sessile; fruit ending in a long taper point, sessile, clothed with very long and very numerous hairs; seeds compressed, blue-coloured, granularly edged, and covered with adpressed hairs. 2. S. Native of Senegal. Flowers white.

Perrotet's Bryony. Pl. cl.

3 B. Microna'ta (Blume, bijdr. p. 923.) leaves cordate-ovate, mucronate, rather angular, and repandly denticulated, scabrous from dots above, and smooth beneath; flowers in fascicles, dioecious; berry oval. 2. S. Native of the East Indies, on the mountains, where it is called Parinengie by the natives.

Var. b. denticulata (Ser. in D. C. prod. 3. p. 304.) leaves all undivided,-obliquely denticulated; fruit usually contracted in the middle. 2. G. Native of the Cape of Good Hope. The tender shoots of this plant are aperient, having been previously roasted.

5 B. Verbreadoc'ca (Ait. hort. kew. ed. 1. vol. 3. p. 285. ed. 2. vol. 5. p. 246.) leaves cordate, angular, beset with callous dots above and with pili beneath, therefore scabrous on both surfaces; flowers umbellate; fruit globose; seeds smooth. 2. G. Native of the Catary Islands. Willk. spec. 4. p. 616. Fruit the size of a sloe.

6 B. Sca'bra (Blum. bijdr. p. 923.) leaves cordate, cuspidate, undivided, and somewhat angular, denticulated, scabrous above, rough on the veins beneath; flowers monoeocious; umbels on short peduncles; fruit globose.—Native of the East Indies, on the mountains, particularly in Java. Cucúrbita scabra, Blum. cat. hort. buit. no. 105. Aroy korreg kotak of the Javanese. Allied to B. scabra and B. Japónica.

Rough Bryony. Pl. cl.

7 B. Punca'ta (Thunb. prod. 13.) leaves cordate, angular, callous above, and pilose beneath; peduncles 1-flowered. 2. G. Native of the Cape of Good Hope.

Dotted-leaved Bryony. Pl. cl.

8 B. Repán'da (Blum. bijdr. p. 923.) leaves cordate, cuspidate, repandly denticulated, scabrous above and puberulous beneath; umbels pedunculate; flowers dioecious; buxous globose.
Native of Java, in the higher mountain woods of Bureangang.

Repand-leaved Bryonia.  Pl. cl.

9 B. cordata (Thumb. in Hoffm. phyt. blatt. 5. ex Pers. ench. 2. p. 594.) leaves cordate, scabrous, denticulated; flowers axillary, twin.  Z. S. Native country unknown. B. Thunbergiana, Dietr. ex Steud. nom.

Heart-leaved Bryonia.  Pl. cl.

10 B. angulata (Thumb. prod. 13.) leaves 5-angled, scabrous on both surfaces; flowers unbellate.  Z. G. Native of the Cape of Good Hope.

Angular-leaved Bryonia.  Pl. cl.

11 B. leucocarpa (Blume, bijdr. p. 924.) leaves ovate-oblong, acuminate, deeply cordate at the base, somewhat repandly denticulated, beset with rough dots above, paler beneath; peduncles usually twin, few-flowered; flowers monocous; berries globose.  Z. S. Native of Java, at the foot of Mount Salak.

White-fruited Bryonia.  Pl. cl.

12 B. acutangula (Thumb. prod. 13.) leaves angular, entire, smooth, glabrous.  Z. G. Native of the Cape of Good Hope.

Acute-angled-leaved Bryonia.  Pl. cl.

13 B. graecus (Lin. mant. p. 128.) leaves cordate, lobed, beset with callous dots above and glandular at the base beneath: terminal lobe obtuse; tendrils simple; fruit oblong, prickly at the base; prickles few, reflexed (ex icon. Burrn.) reddish.  Z. S. Native of the East Indies. Lour. coch. 595.—Rumph. amb. 5. t. 166. f. 1. Peduncles 1-flowered. Flowers large, white, androgynous. Berries red.

14 B. Moimoi (Ser. miss. in D. C. prod. 3. p. 305.) leaves cordate, 5-angled, acutely denticulated; terminal angle elongated and acute; tendrils simple; fruit prickly at the base; prickles few, reflexed; fruit red.  Z. S. Native of Ceylon and of Senegal, in hedges, in which last place it is called Moimoi, according to Adanson. Sencg. p. 159. Burrn. eyzl. t. 19. f. 1. Flowers large, white.

Moimoi Bryonia.  Pl. cl.

15 B. geminata (Blum. bijdr. p. 924.) leaves ovate-cordate, or somewhat hastate, bluntish, obsoletely denticulated, scabrous from dots; flowers pedunculate, twin, monocous; berries oval.  Z. S. Native of Java, about Linga-jattie at the foot of Mount Tjermani, where it is called Wawalahan by the natives.

Twin-flowered Bryonia.  Pl. cl.

16 B. Cochinchinesis (Lour. coch. 595.) leaves 5-angled, rough; flowers monocous, large, axillary, solitary, on long peduncles; fruit ovate, acutish at both ends, 10-angled, red, smooth; seeds oblong-ovate, compressed, smooth.  Z. G. Native of Cochinchina, in hedges. Flowers yellow.

Cochin-china Bryony.  Pl. cl.

17 B. Abyssinica (Lam. dict. 1. p. 497.) stem villous on the apex; tendrils simple; leaves cordate, toothed, large, soft, nearly glabrous; upper ones angularly-lobed; pedicels and peduncles very villous; flowers twin, yellow; fruit unknown.  Z. G. Native of Abyssinia and neighbouring parts of Africa.

Abyssiniana Bryony.  Pl. cl.

18 B. Jaroxica (Thumb. jap. p. 325.) leaves cordate, undivided, and angular, toothed, green above, and beset with very minute hairs: pale beneath, and beset with scaly dots.  Z. G. Native of Japan, near Nagasaki.

Japan Bryony.  Pl. cl.

19 B. sagittata (Blum. bijdr. p. 925.) leaves on short petioles, sagittate, glaucous-beneath; male peduncles subumbellate, female ones 1-flowered.  Z. S. Native of Java, about Batavia, in humid bushy places. Allied to B. heterophylla and B. umbellata.

Sagittate-leaved Bryony.  Pl. cl.

20 B. Bluemei (Ser. miss. in D. C. prod. 3. p. 305.) leaves ovate-cordate, or cordately-sagittate, acuminated, repandly dentilicate, scabrous; flowers monocous, male ones umbellate, female ones solitary; berries oblong.  Z. S. Native of Java, near Batavia, among bushes. B. heterophylla, Blum. bijdr. p. 925., but not of Steud. Allied to B. marginata.

Blume’s Bryony.  Pl. cl.

21 B. marginata (Blum. bijdr. p. 924.) leaves cordate-ovate, acuminated, rather angular at the base, obsoletely denticulated, marginate, rough; umbels on long peduncles; berries oblong.  Z. S. Native of Java, about Rompian, where it is called Korro-routeng Kambibie by the natives.

Marginate-leaved Bryony.  Pl. cl.

Umblellated-flowered Bryony.  Pl. cl.

23 B. amplexicaulis (Lam. dict. 1. p. 496.) stem angular, glabrous; leaves smooth, cordate, rather angular, stem-clasping, dotted, and glaucous beneath; upper leaves generally narrowly 3-lobed; flowers small, solitary, axillary, pedunculate; fruit solitary, acuminated, smooth.  Z. S. Native of the East Indies. Flowers white.

Variable-leaved Bryony.  Pl. cl.

24 B.? heterophylla (Steud. nom. p. 128) lower leaves cordate, upper ones cordate or denticulate; tendrils solitary; flowers solitary, pedunculate, hermaphrodite; fruit scarlet; seeds blackish.  Z. S. Native of Cochinchina and China.

Solena heterophylla, Lour. coch. p. 514. Flowers pale.

Dowry Bryony.  Pl. cl.

25 B. ? heterophylla (Steud. nom. p. 128.) leaves cordate, somewhat 5-lobed; lobes acute, with spiny teeth; pedicels villous; tendrils long, much branched; flowers small, white, downy, umbellate.  Z. G. Native of the Levant. Flowers whitish.

Madder Bryony.  Pl. cl.

26 B. Maderaspatana (Berg. pl. cap. p. 351.) stem angular, cirrhose, glabrous; leaves cordate, oblong, acuminated, toothed, scabrous from small callous dots above, hairy beneath; stipulas awl-shaped, solitary; flowers twin, axillary.  Q. S. Native of the East Indies. Cucumis Maderaspatana, Lin. spec. 1438.—Pluk. altn. t. 170. f. 2.

Madras Bryony.  Pl. cl.

27 B. hederaefolia (Jacq. fragm. 73. no. 230. t. 113.) dioecious; root thick, fleshy; stem terete, glabrous, with the internodes distant; tendrils very long, simple; leaves cordate, somewhat 5-angled, quite entire, rather wrinkled above, and hispid beneath; racemes simple, many-flowered; calycine segments of the male flowers lanceolate and acute; lobes of the corolla ovate, acute, yellowish.  Z. S. Native of Teneriffe.

Flowers yellowish.

Ivy-leaved Bryony.  Pl. cl.

28 B. ? heterophylla (Ser. miss. in D. C. prod. 3. p. 306.) stem filiform, furrowed, rough, with the internodes longer than the leaves; tendrils simple, narrow, and spirally twisted; leaves cordate, lanceolate, on short petioles, somewhat 5-angled, bluntly toothed, clothed with a kind of roughomentum beneath; terminal lobe elongated; fruit thin, globose, sessile, smooth; seeds wrinkled from dots, girded by a slender zone.  Z. S. Native of the island of Timor. Flowers white.

Althaea-like Bryony.  Pl. cl.

29 B.? pedunculosa (Ser. miss. in D. C. prod. 3. p. 306.)
plant pilose; stem pilifer, striated, having distant internodes; tendrils bifid; leaves on long petioles, cordate, long-acuminate, crenately toothed, beset with long, distant hairs; flowers large, in loose racemes; peduncles longer than the leaves; pedicels long, pilose; fruit unknown. **G.** Native of Nipaul.

*Hedgehogs.* Pl. cl.

30 B. RIEDELI (Blum. bijdr. p. 925.) leaves on short petioles, oblong, cordate, rather angular at the base, remotely denticulated, smoothish, dotted above, glaucous beneath; upper leaves hastately 3-lobed; male pedicels disposed in dense racemes, 1-flowered, bearing one bracteae in the middle of each, female pedicels solitary, 1-flowered. **L.** Native of Java and Malabar, on the mountains. Rheod. mal. 8. t. 26. The plant is called *Aroy-hui-Walleh* by the natives of Java.

*Rheode's Blyony.* Pl. cl.

**Leaves lobed.**

31 B. FRIECA (Rottl. in nov. act. berol. 4. p. 223.) stem furrowed, glabrous; leaves coriaceous, somewhat cordately 3-lobed, usually dentate, rough; lateral lobes somewhat 2-lobed, intermediate one elongated, acuminate; flowers monocious, male ones umbellate, female ones solitary; berries globose. **S.** Native of Java, about Rompilen, in corn fields. Wild. spec. 4. p. 610.—Blum. bijdr. p. 925. *Corro-bontung* of the natives of Java. The root of this species was once supposed to be the famous colombo-root, to which it approaches very nearly in quality.

*Earth Blyony.* Cht. 1815. Pl. cl.

32 B. SCABRELLA (Lin. suppl. 421.) stem muricate, hispid; leaves 3-lobed, toothed, closely hispid on both surfaces; lateral lobes dilated, angular, intermediate one elongated, acuminate; petals hispid; flowers axillary, nearly sessile, numerous; fruit nearly globose, beset with a few obverse strigie; seeds muricate. O. F. Native of the East Indies. Wildl. spec. 4. p. 619. *Balbon tengang* of the Hindoos. Flowers yellow. *Habit of Melothria.*

**Var. a.** leaves smaller; seeds tuberculare. Blume, l. e.

**Var. b.** leaves coarsely toothed, as in the preceding variety, and beset with scarce striige; berries elliptico-globose. Blume, l. c.

33 B. LATEBROSA (Ait. horiz. kew. ed. 1. vol. 3. p. 384. ed. 2. vol. 5. p. 347.) leaves somewhat 3-lobed, pilose, attenuated at the base, hardly cordate, running down the petiole on one side only. **G.** Native of the Canary Islands. Flowers white.

34 B. THLEORAYA (Thumb. prod. 13. but not of Lour.) leaves 3-lobed, smooth above, and scabrous beneath. **G.** Native of the Cape of Good Hope.

*Three-lobed-leaved Blyony.* Pl. cl.

35 B. STIPULACEA (Willd. spec. 4. p. 620.) stem shrubby? furrowed; tendrils trifid; leaves cordate, 3-lobed, toothed, glabrous, smooth on both surfaces; stipules roundish, concave, serrated; flowers monocious, solitary; fruit ovate, acutish, glabrous, yellow, 5-celled, many-seeded. **G.** Native of Cochinchina. B. triloba, Lour. coch. p. 595. but not of Thumb. B. agristis, Rausch. ex Steud. nom. phan. p. 123. Flowers white.

**Var. b.** perpusilla (Blum. bijdr. p. 926.) leaves membraneous, deeply cordate, 3-lobed, obscurely denticulated, scabrous from margins above, smooth beneath: lateral lobes rather angular, intermediate one elongated, acuminate; flowers umbellate, monocious; fruit pea-formed. **S.** Cultivated perpusilla, Blum. cat. hort. but. p. 105. Native of Java, in the shady parts of mountains. The plant is called *Hamphr Bogor,* and *Korres koda* by the Javanese.

*Large-stipited Blyony.* Pl. cl.

36 B. AMERIAENA (Lam. dict. 1. p. 498.) root thick; stem angular; leaves cordate, 3-lobed, angular, wrinkled, with spine-formed teeth; lobes of corolla narrow, white inside; fruit ovate, red, few-seeded; seeds compressed. **S.** Native of the Antilles.—*Plum. spec. 3. icon. p. 66. ex Willd. spec. 4. p. 620.

*American Blyony.* Pl. cl.

37 B. GUINEENSIS; leaves cordate, petiolate, 5-lobed; lobes acute, toothed; peduncles axillary, many-flowered; tendrils axillary. **O. S.** Native of Sierra Leone. Flowers red.

*Guinea Blyony.* Pl. tw.

38 B. COROOLFILA (Lin. spec. p. 1483.) leaves cordate, oblong, 5-lobed, toothed, scabrous from callous points; terminal lobe hardly longer than the rest; tendrils twin; flowers racemose, monocious; stems distinct; fruit globose, black; seeds unknown. **G.** Native of Europe, in woods and hedges, as in Sweden, Denmark, and Carniola. Lam. ill. t. 769. Fl. dan. t. 813. Flowers whitish or yellowish.

40 B. JUCIFER (Jacq. fl. austr. t. 195.) stem climbing; leaves cordate, 3-lobed, toothed; flowers callous, from callous points; terminal lobe the longest and very dissimilar, perhaps always; tendrils simple; flowers racemose, dioecious; follicles pilose at the base; fruit globose, red; seeds ovate-globose, rather compressed, grey, variegated with black. **H.** Native of Europe, in hedges; plentiful in England, particularly in calcareous counties. Smith, engl. bot. t. 483. Mill. fig. t. 71.—Blackw. herb. t. 37. B. albiflora, Huds. 437. Wood. med. bot. t. 189. Flowers white, with elegant green ribs and veins. The root grows sometimes to an immense size; it is a famous hydrogogue, and highly purgative and acrid, a drachm of it in substance, or half an ounce of it infused in wine, is said to be a full dose; others give 2 drachms in dyspeptic cases. As a purgative it has great effect on some, while on others it has hardly any; but it frequently becomes diuretic and diaphoretic. A cold infusion in water is used externally in scabies pains. A cataplasm of it is a most powerful disinfectant. The best season to take up the roots for use in is autumn. It is called in English, *white wild vine,* *wild hops,* *white Blyony,* *wild hop,* _Tetter-berry._

**Var. b.** lutea (Ser. mss. in D. C. prod. 1. c.) leaves deeply lobed; lateral lobes nearly linear, terminal one lanceolate, bidentate laterally; fruit and seeds yellow. **H.** Native of Auvergne, in hedges and woods.

41 B. VITIS (Lin. comm. 2. p. 404.) leaves cordate, 5-lobed, apiculate, scabrous from hairs; peduncles umbiliferous. **G.** Native country unknown.

42 B. CREATICA (Lin. spec. 1139.) root fleshy; stems climbing; leaves cordate, 5-lobed, quite entire, ciliated, muricate on both surfaces; terminal lobe the largest; tendrils simple, spiral; flowers dioecious; female ones axillary, twin; fruit globose, red; seeds smooth, ovate. **O. H.** Native of Candia. Desf. coroll. p. 91. t. 70. ann. mus. 12. t. 17. Flowers pale.

43 B. QUEQUELOBA (Thumb. prod. 13.) flowers dioecious; leaves 5-lobed, scabrous above; lobes very blunt, mucronately toothed, mucrinated behind; tendrils simple; peduncles of male flowers 1-flowered, twin; calyx broadly campanulate, and acutely toothed; corolla campanulate, half 5-cleft; fruit unknown. **G.** Native of the Cape of Good Hope. Ker. bot. reg. 82. Sims, bot. mag. 1820. Flowers brown.

44 B. Nipalensis (Ser. mss. in D. C. prod. 3. p. 307.)... Native of Nipaul.

*Nipaul* Bryony. Pl. cl.

46 B. acetus (Desf. fl. atl. 2. p. 360.) stem slender; leaves somewhat 7-lobe'd; lobes lanceolate, acute, entire, or toothed; tendrils simple; male peduncles many-flowered; calycine segments narrow, acute; fruit unknown. 2. H. Native of the kingdom of Tunis, in hedges. Corolla campanulate, spirally cleft, twice the size of that of *b. alba*.

Acute-lobed Bryony. Pl. cl.

47 B. variata (Mill. dict.) leaves palmate, with lanceolate segments, which are dotted above and smooth beneath. 2. S. Native of America. Fruit ovate, scattered. Variegated Bryony. Pl. cl.

48 B. marajo's (in D. C. prod. 3. p. 308.) stem thick, striated; leaf cordate, lobed; angles cut; lobes toothed; petioles long; male flowers large, racemose, on long peduncles; female ones solitary, pedunculate; fruit obtlong, pilose. 2. S. Native country unknown. Leaves large, size of those of the common vine.

Large-leaved Bryony. Pl. cl.

* *** Leaves palmate.

49 B. racemosa (Mill. dict. and Swartz, prod. 116. fl. ind. occid. 2. p. 1148.) lower leaves rather palmate, upper ones 5-lobe'd and undivided; segments of the leaves ovate; flowers racemose; pedicels rather secund; fruit oval. 2. S. Native of Jamaica and St. Domingo, in woods and hedges.—Plum. and Ed. 83, t. 97. Roots oblong, fleshy. Flowers yellowish.

Racemose-flowered Bryony. Pl. cl.

50 B. pinatifida (Burch. cat. geogr. no. 2098. voy. 1. p. 547.) leaves ternately palmate, with pinatifid lobes, and linear and oblong, obtuse, veinless segments. 2. G. Native of the Cape of Good Hope.

51 B. tenuffolia (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 234.) leaves 3-parted; segments bipinnatifid; female peduncles solitary, simple, equal in length to the petioles; fruit oval, smooth, 2-seeded. 2. G. Native of Chili, in the Pampas, in the province of Cordova; and in sandy places near Santa Fe, and also of Buenos Ayres. The vernacular name of the plant is *Agi del Toreno*.

Fine-leaved Bryony. Pl. cl.

52 B. levius (Thumb. prod. 13.) leaves cordate, palmate, serrated, smooth; flowers axillary, rather umbellate. 2. S. Native of the Cape of Good Hope.

Smooth Bryony. Pl. cl.

53 B. palmata (Lin. spec. 1438.) leaves cordate, palmate, smooth, 5-parted, with lanceolate, repandly serrated segments, lateral segments the shortest; fruit large, globose. 2. S. Native of Ceylon.

55 B. acutocapitata (Willd. 1. c. p. 624.) leaves palmately 5-parted; with linear-lanceolate, 5-parted lobes, having sebacious margins; tendrils simple; peduncles axillary, 1-flowered. 2. S. Native of the East Indies.

Holhocks-leaved Bryony. Pl. cl.

56 B. lacinioba (Lin. spec. 624.) leaves palmately 5-parted, cordate, rough, and blistered; with obluro-lanceolate, acuminated, serrated segments; petioles nutribucted; peduncles 1-flowered, nutribucted; corollas hairy inside, or tormentose, but smooth on the outside; fruit the size of a cherry, striated with white; seeds obovate, circled by a longitudinal elevated zone. 2. S. Native of Ceylon. Hern. Hort. lund. 95. t. 97. *Aray-periadinge* of the Hindoos. Flowers yellow.

57 B. cucumerosa (Ser. in D. C. prod. 3. p. 308.) seeds rusty, transversely oblong, surrounded by a very thick dotted zone. 2. S. Native country unknown. Cucumerosum, Thunb. ex Gurtin. fruct. 2. p. 485.

Cucumber-like Bryony. Pl. cl.

58 B. africana (Thumb. prod. 13. but not of *Lin*.) root tuberous; upper leaves palmately 5-parted; lobes oblong, deeply toothed; lower leaves cordate, having the angles toothed. 2. G. Native of the Cape of Good Hope. Willd. spec. 4. p. 624.—Herm. par. 107. t. 108. Male flowers in subumbellate panicles. Fruit mucronate.

59 B. saana (Lam. dict. 1. p. 497.) stems slender; lower leaves roundish-cordate, quite entire; upper ones deeply 3-lobe'd; lobes obtuse. 2. S. Native of Africa.

Dwarf Bryony. Pl. cl.

61 B. digitata (Thumb. prod. 13.) leaves digitate; with linear 2-lobe'd sebacious segments; flowers umbellate. 2. G. Native of the Cape of Good Hope.

Digitate-leaved Bryony. Pl. cl.

62 B. wallischina (Ser. mss. ex D. C. prod. 3. p. 309.) stem filiform, striated; leaves nearly sessile, sagittate, rugged from warts; terminal lobe lanceolate-linear, very long, somewhat dentilicate; lateral lobes oblong, redexied, remotely dentilicate; male flowers in fascicles, numerous, on short peduncles; fruit unknown. 2. G. Native of Nipaul. B. filiformis, Roxb.

Wallich's Bryony. Pl. cl.

Cult. The hardy perennial species are plants of easy culture, only requiring to be planted in the ground. The stow perennial species should be grown in pots, and the stems trained up the rafters. The seeds of annual kinds require to be sown in a hotbed in spring, and when the plants are of sufficient size may be planted out in a sheltered situation. All the species are propagated by seeds. None of them are worth growing, except in botanic gardens.

Lan. syl. Monocica, Polyndaphikia. Flowers monocious; male ones with a 5-toothed calyx, and a 5-parted corolla; teeth of calyx subulate. Filaments 3? or more probably 5, in 3 bundles. Female flowers with a trifid style, and a thickish trifid stigma. Fruit 1-seeded from abortion, usually beset with spines. Seeds obovate. Male and female peduncles many-flowered, usually rising together from the same axilile.

1 S. angulatus (Lin. spec. 1438.) leaves cordate, angular, denticulated, scabrous; lobes 3-5, acuminate; tendril umbellate; male flowers in corymbose heads, each head on a long common peduncle; female flowers sessile, in bundles at the tops of the peduncles; fruit ovate, spinouscent, and tomentose; seeds truncate at the base, and very blunt at the apex. 

Native of North America. Lam. ill. t. 796. f. 2.—Dill. elht. 58. t. 51. f. 59. Flowers sulphur-coloured. Fruit beset with yellow spines, and curlingomentum.

2 S. Bryoniefolius (Moris, hort. taur. sem. 1831.) leaves cordate and angular, denticulated, hispid below; teeth of calyx obsolete; capsule clammy and warted. C. S. Native country unknown. This species differs from S. angulatus and S. parviflorus in the stem being hardly pilose on the joints, the rest smooth; in the peduncles being short, the flowers umbellate; male ones 5-8 pedicellate, female ones almost sessile.

3 S. Parviflorus (Willd. spec. 4. p. 630.) branches glabrous; leaves cordate, rather angular, denticulated, roughish; tendrils trifid; male flowers racemose, on long pedicels; female ones in sessile capitulate umbels; fruit crowned by the permanent calyx, size of an orange; seeds unknown. F. Native in the temperate parts of mountains about Quito, near Chillo, at the height of 4000 feet. Not of Mexico, H. B. et Kunt. nov. gen. amer. p. 2. p. 119. Flowers whitish. Fruit rarely solitary.

4 S. Baderoa (Hook. et Arn, in bot. misc. 3. p. 234.) leaves cordate, angular, minutely denticulated, glabrous on both surfaces; angles acuminate; lobes at the base of the leaf lying over each other; tendrils trifid; flowers few, capitate in both sexes; female peduncles one-half shorter than the male ones; fruit ovate while young. Y. G. Native about Valparaiso. Baderoa bryoniefolia, Bertero.

Baderoa's Single-seeded Cucumber. Pl. cl.

5 S. Pentaedrus (Wall. cat. no. 6682.) leaves cordate, denticulated, flowers racemose; racemes numerous, sometimes aggregate, and branched. ? S. Native of the East Indies. Pentaedrous Single-seeded Cucumber. Shrub cl.

6 S. Depeii; leaves broadly cordate, 7 lobed; lobes acuminate, middle lobe the longest; margins acutely denticulate, rough on both surfaces from conical hairs; male racemes elongated; fruit glomerate, ovate, nearly glabrous, but beset with strong retrograde prickles. S. Native of Mexico, near Jalapa. Flowers smaller than those of S. angulatus, but larger than those of S. parviflorus. Sicyos, nov. spec. Schlecht. et Cham. in Linn.ana. vol. 5. p. 88. Seeds the size of those of Citrus medica.

Depeii's Single-seeded Cucumber. Pl. tr.

7 S. Acutes (Rafin. fl. bore. p. 118.) climbing; leaves lobed; fruit glomerate, ovate, acute, bristly; bristles echinate, interwoven. F. Native of Louisiana.

8 S. Microphyllus (H. B. et Kunt, gen. et spec. amer. 2. p. 119.) branches roughish; leaves sinuate-cordate, 7 lobed, denticulated, roughish; tendrils smoothish, trifid; male flowers on long peduncles and pedicels; female flowers in crowded, nearly sessile heads; fruit echinated from bristle-formed hairs, size of an apple seed; seeds unknown. F. Native of Mexico, on the burning Mount Jorullo, at the height of 1620 feet. Small-leaved Single-seeded Cucumber. Pl. July, Sep. Clt. 1823. Pl. tr.

9 S. Pachycarpus (Hook. et Arnott, in Beech. bot. p. 83.) branches glabrous; leaves cordate, 5-7 lobed, denticulate, glabrous above and papillose, scabrous beneath; tendrils glabrous, trifid; male flowers in panicles; female ones in crowded heads; fruit ovate, rostrate, unmarked. F. Native of the Island of Oahu, on the Diamond Hill among the volcanic rocks. Allied to S. microphyllus.

10 S. Vittifolius (Willd. spec. 4. p. 626.) the whole plant clothed with very fine clammy down; leaves cordate, with a roundish recess, 5 lobed, toothed. F. Native country unknown. Flowers yellow, twice the size of those of S. angulatus. Fine-leaved Single-seeded Cucumbers. Clt. ? Pl. tr.

12 S. Triquetrous (Moc. et Sesse, fl. mex. ined. ex D. C. prod. 3. p. 309.) stem bluntly furrowed; leaves cordate, 5 lobed; lobes broad, obtuse, somewhat denticulate; tendrils much branched; calyx and corolline lobes 3; male flowers racemose, pedunculate, aggregate subtendiculate; female flowers subumbellate; fruit elongated, unmarked, triquetrous; seed oblong-cylindrical. F. Native of Mexico, in Chilapa. Flowers yellow. Fruit 6 lines long, acuminate, somewhat 3-winged. Triquetrous-fruited Single-seeded Cucumber. Pl. tr.

Cult. Sow the seeds in the hot-bed in spring, and treat the plants as directed for Guards, p. 42. Not worth growing except for curiosity.

Lin. syl. Monocica, Monodelphia. Flowers monocious, white or yellow; male ones disposed in racemes or corymbs; calyx petaloid, campanulate, with hardly conspicuous teeth, and with the corolla hardly gamopetalous. Female flowers solitary, or rising from the same axis with the males. Calyx elongated, petaloïd, echinated at the base, and girding the carpels; neck filiform, more or less elongated, at length dilated, and bearing the corolla and stamens. Style thick; stigma capitate. Capsule coriaceous, reniform, echinated, 1-celled, 2-3-valved, many-seeded, opening plastically, and ejecting the seeds.

1 E. gennelli (D. C. prod. 5. p. 310,) leaves cordately subagitate, somewhat 5 angled, with the middle angle acuminate; tendrils bifid; male flowers in long racemes; neck of calyx long, campanulate; petals ovate, acutish; fruit curved, 3-celled; prickles distant. F. Native of Mexico. Moc. et Sess. fl. mex. icon. ined.

2 E. cavatriculata (Dim. syl. 1873.) leaves cordate, angular, denticulated, echinated, roughish above; flowers white, sweet-scented; male ones in panicles; female ones solitary; tube of calyx terete above the ovariun, not dilated at the apex; petals linear-lanceolate, acute; fruit kidney-shaped, hispid;
seeds winged? flat, tridentate at the base, ex Kunth. O. F. Native of South America, in the hot regions of the province of Caracas, on the shore of Lake Tacarigua, in Laguna de Valencia; and in the Island of Cura, at the height of 690 feet. Lam. ill. t. 743. Jacq. amer. 241. t. 154. icon. pict. p. 115. t. 292. Corolla yellow. Fruit size of an olive.

**Cucurbitaceae.**

**XI. Elaterium.** XII. Momordica.

35. *petals* Native male bractea middle fruit calyx Charantia, Native Native tendrils peduncles male leaves lobes anthers tube tendrils tendrils males oblong, peltately hispid flowers lobed, white. form, not seeds of O-

**Carthaginian Squirtling Cucumber.** Fl. June, July. Clt. 1823. Pl. cl. 73.

3 E. **Tamnoches** (Willd. enum. p. 950.) leaves cardate, acuminate, remotely serrated, smoothish above, and hairy beneath; flowers yellowish; female flowers having the tube of the calyx campanulate above the ovaryum; petals 4-7, ovate; style very short; stigma large, flat; fruit 2-valved, few-seeded; seeds unknown. O. F. Native of Mexico. E. hastatum, Brouss. but not of H. B. et Kunth.

4 E. **hastatum** (H. B. et Kunth, nov. gen. amer. 2. p. 120.) leaves cordately sinuated, triangularly hastate, acuminate, denticulated, rather scabrous above, and glabrous beneath; tendrils simple or bifid; male flowers racemose, pedicellate, minute; fruit oblong, reniform, muricate, 2-valved, size of an olive; seeds 6, roundish, compressed, tridentate at the base. O. F. Native of Mexico, on the declivities of the burning Mount Jorullo, and the temperate regions near Patzcuara, at the height of 1620 or 3320 feet. Habit of Melothria pendula, according to Kunth.

**Hastate-leaved Squirtling Cucumber.** Pl. tr.

5 E. **quadrijugum** (D. C. prod. 3. p. 310.) stem, peduncles, petioles, and tendrils downy; leaves cardate, orbicular, 7-angled; tendrils bifid, pilose; male flowers umbellate; calyx long, tubular, articulated towards the base, and dilated at the apex, with the limb hardly evident; petals 4, linear-lanceolate, acute; female flowers hardly pedunculate, like the male ones; style filiform, crowned by an ovate stigma; fruit very pilose. O. F. Native of Mexico. Moc. et Sesne, fl. mex. icon. inde. Flowers white.

**Quadrijugum Squirtling Cucumber.** Pl. tr.

6 E. **brachystachyum** (D. C. prod. 3. p. 310.) leaves 3-lobed, quite entire, ciliated; middle lobe oblong, acuminate; flowers cream-coloured; male ones in spikes; tube of calyx campanulate at the apex; female flowers with a very gibbous hispid calyx, and a short neck, which is campanulate at the apex; capsule oblique, incurved, echinated with 8-10 long soft prickles, 2-3-valved, larger than those of the other species. O. F. Native of Mexico.

**Short-spiked Squirtling Cucumber.** Pl. tr.

7 E. **torqueatum** (D. C. prod. 3. p. 310.) leaves somewhat peltately cardate, 5-lobed, dentilicate; terminal lobe the longest, and acuminate; tendrils trifid; flowers greenish-white; male ones in racemes; female ones solitary, echinated at the base, with the neck long and bell-shaped at the apex; petals oblong, bluntish; capsule oblong, 2-valved, acuminate, echinated, with soft prickles. O. F. Native of Mexico. Pl. mex. icon. inde.

**Colored Squirtling Cucumber.** Pl. tr.

8 E. **trifolium** (Spreng. syst. 3. p. 477.) leaves ternate, cut. O. F. Native of Virginia.

**Trifoliate-leaved Squirtling Cucumber.** Pl. tr.

**Cult.** Sow the seeds in a hot-bed in spring, and put the plants out as directed for Gourds, p. 42.

elem. bot. no. 392.—Poppye, Neck. l. c. no. 391.—Ecbalium, Rich.

**Lin. syst.** Monetia, Polypadélphia. Flowers monoecious, white or yellow, on filiform unibracteate peduncles, perhaps always. Male flowers with a 5-cleft calyx, and a very short tube. Corolla 5-parted. Stamens in 3 bundles; anthers connate. Female flowers with 3 sterile filaments, or probably 5, joined in 3 bundles, a tridit style, and a 3-celled ovaryum. Fruit usually muricate, (perhaps always) opening elastically at maturity, and expelling the seeds. Seeds compressed, reticulated, perhaps always.

1 M. **Balsamea** (Lin. spec. 1405.) leaves palmately 5-lobed, toothed, glabrous, shining; fruit roundish-ovate, attenuated at both ends, angular, tuberculated, orange-coloured, splitting irregularly and laterally; bractea cordate, toothed, in the middle of the peduncle; aril red. O. F. Native of the East Indies. Lam. ill. t. 791. f. 1. Charantia, Lob. pempt. t. 670.—Ludv. ect. t. 127.—Blackw. herb. 6. t. 539. a. b. Flowers yellow. This plant is famous in Syria for curing wounds. They cut open the urripe fruit, and infuse it in sweet oil, and expose it to the sun for some days until the oil becomes red. It is applied to a fresh wound on cotton. The Syrians esteem this next to balsam of Mecca. The plant is also used to form arbours or bowers.

2 M. **muricata** (Willd. spec. 4. p. 602.) leaves somewhat palmately 7-lobed,cordate at the base; lobes remotely toothed, acuminate; tendrils almost simple; fruit ovate, acuminate, muricate; bractea cordate, quite entire. O. F. Native of the East Indies. Pavel, Rhed. mal. s. t. 10.

3 M. **charantia** (Lin. spec. 1408.) leaves somewhat palmately 7-lobed, dentate, rather hairy; tendrils downy; fruit oblong, acuminate, angular, tuberculated, copper-coloured or red; pulp yellow and soft; bractea cordate, quite entire, below the middle of the pedicle; seeds oblong, tuberculated (ex Rumph.) arillus of a reddish blood-colour. O. F. Native of the East Indies. Sims, bot. mag. t. 2455.—Rheed. mal. s. t. 17. t. 9. Popareth of the Hindoos. Corolla yellow. Seeds wrinkled very irregularly, yellow bay-coloured, and irregularly tuberculated towards the margin. Allied to the preceding species, but very distinct.

4 M. **Roxburghiana;** downy; leaves cardate, palmately 7-9-lobed, and lobately toothed; tendrils simple; peduncles 1-flowered, solitary, bearing a bractea under each flower; fruit long, muricate. O. H. Native of the East Indies, in Patna. M. charantia ♂ of authors. M. muricata, Roxb. but not of Willd. Roxburgh’s Momordica. Pl. tr.

5 M. **Senegalensis** (Lam. dict. 4. p. 239.) leaves deeply palmate, somewhat serrated, pale and villous beneath; fruit ovate, mucronate, tubercular, orange-coloured or red. O. F. Native of Senegal.

6 M. **cylindrica** (Lin. spec. 1413.) stem 5-angled; leaves cordate, somewhat lobate, angular, toothed; flowers yellow; fruit cylindrical, very long, rather villous, reticulated; bractea quite entire at the base of the pedicle; seeds black. O. F. Native of Ceylon and China. Willd. spec. 4. p. 605. The fruit of the species, according to Rumphius, does not open elastically, being composed of so many reticulated tough fibres.

**Cylindrical-fruited Momordica.** Pl. tr.
CUCURBITACEÆ.

7 M. HEMNEANA (Wall. cat. no. 6744.) leaves 3-lobed, mucronately denticulated; peduncles 1-flowered, solitary, furnished each with a large bractea under the flower, which encloses it before expansion; tendrils simple. C. F. Native of the East Indies. Flowers large.

8 M. SEBANGULATA (Blum. bijdr. p. 928.) leaves deeply cordate, acuminate, rather angular, mucronately denticulated, seceding above; flowers dioecious, 1-bracteate, cordate, quite entire at the top of the peduncle. C. F. Native of Java, on Mount Salak, where it is called by the natives Aroy Gambas. Allied to M. cylindrica and M. dioica. The inflorescence of this plant agrees with the figure in Rumph. amb. 5. t. 150. ex Blume. Fruit fibrous.

**Angular-leaved Momordica.** Pl. cl.

9 M. PAI'NA (Hamilt. ex Wall. cat. no. 6742.) leaves cordate, triangular or hastate, sometimes lobed at the base, acuminate at the apex, coarsely toothed; tendrils simple; female peduncles 1-flowered, solitary; male ones racemose; racemes aggregate; fruit round, beset with a few scattered prickles. C. F. Native of the East Indies, in Goyalpara.

10 M. TUBIFLORA (Roxb. ex Wall. cat. no. 6749.) plant white from down; leaves round, angularly and roundly lobed, cordate at the base; tendrils simple; fruit oblong, acuminated, ribbed; peduncles 1-flowered, solitary, bracteate. C. F. Native of the East Indies.

**Tube-flowered Momordica.** Pl. tr.

11 M. PUBIS (Mart. réise bras. ex Linnaea. vol. 5. p. 40.) stems angular, climbing, clothed with resinous farina at top; leaves ovate-orbicular, acuminated, with a roundish recess, cordate, obsoletely 3-lobed, denticulated; male corymbus erect, axillary; female flowers solitary, axillary, drooping; fruit oblong, crested longitudinally from waris. C. F. Native of Brazil.

**Purging Momordica.** Pl. cl.

12 M. OPERCULATA (Lin. spec. 1433.) leaves 5-lobed, toothed; fruit elliptic, angular, tuberculated, operculated by a deciduous bead. C. F. Native of America. Comm. rar. 23. t. 22. ex Lin. and Willd. spec. t. p. 693. This plant is probably referable to the genus Luffia. The top falling off from the fruit when it is green.

13 M. ELATHEUM (Lin. spec. 1434.) plant seceding, hispid, and glaeeulent; stem dwarf, without tendrils; leaves cordate, somewhat lobed, crenate-toothed, very ruged, on long petioles; fruit ovate, obtuse, hispid, and seceding, on long peduncles; seeds bay-coloured. C. F. or C. H. Native of the south of Europe. Sinis, bot. mag. 1814.—Blackw. herb. t. 108. Woodv. med. bot. t. 43. Elëtherium corydophillum, Meuxh. mat. p. 563. Edulium L. C. Rich. Root thick. Flowers yellow. Fruit green, expelling the seeds when ripe. Perhaps a proper genus. Dr. Chutterback has lately ascertained that the active principle of wild cumbner is contained almost exclusively in the juice around the seeds, and that genuine ELATHEUM is the matter which subsides spontaneously from the juice obtained without pressure. He found that the eighth part of a grain thus prepared seldom failed to purge violently, and of this according to Dr. Barry, from 55 to 64 per cent, were soluble in alcohol of 0-905. The bitter principle found in it is not in itself purgative, but quickens the action of elatin when combined with it. Elatin is a new principle obtained by Dr. Barry of a green colour; it is purgative in very minute quantities. In medicine a few grains of elatherium operates as a drastic purgative, and was sometimes used in dropics. It is high priced, and seldom used, though recommended by Dr. Ferrar.

---

14 M. ? LAMBERTI'NA (Ser. in D. prod. 3. p. 311.) hispid; stems prostrate, flexuous; tendrils nearly simple; flowers 4-seeded, denticulated, seceding; petals short; flowers fruit solitary, elliptic, pilose; peduncles short, hispid. C. F. Native of the East Indies. Ecbalium L. C. Rich. Allied to M. elatérîus, but distinct.

15 M. ECHINATA (Muhl. ex Willd. spec. 4. p. 605.) leaves cordate, with 5 lobed angles; lobes acuminated, quite entire, glabrous; tendrils multifid; fruit roundish, 4-seeded, echinated by bristles. C. H. Native of the western parts of Pennsylvania, near the river Ohio. Sieyos lobata, Michx. amer. 2. p. 217. Fruit roundish, size of a gooseberry, beset with long subulate bristles, very like those of Sieyos, but 4-seeded. Flowers yellow.

**Echinated-fruited Momordica.** Pl. tr.

16 M. dioïca (Roxb. ex Willd. spec. 4. p. 605.) stem angular, climbing; leaves cordate, acuminated, toothed, glabrous on both surfaces; tendrils filiform; flowers dioecious; female ones solitary; fruit elliptic, mucrinated. C. F. Native of the East Indies.

**Dioecious-flowered Momordica.** Pl. cl.

17 M. RENGÉ'RA (Wall. cat. no. 6743.) leaves cordate, dentate or distantly and mucronately denticulated; peduncles long, 1-flowered, solitary, furnished each with a kidney-shaped hooded bractea, just below the flower; tendrils simple. Y. S. Native of the Burman Empire, about Prone.

**Kidney-bearing Momordica.** Pl. cl.

18 M. HAMILTONIANA (Wall. cat. no. 6748.) leaves cordate, toothed, crenated, acuminated; bracteae toothed; peduncles 1-flowered, solitary; tendrils simple; fruit hispid. C. F. or C. H. Native of the East Indies, in Goyalpara and Goangachora. Flowers large.

**Hamilton's Momordica.** Pl. cl.

19 M. BICOLOR (Blum. bijdr. p. 928.) leaves deeply cordate, somewhat 5-angled, bluntish, glabrous, mucronately denticulated, with rather strigose margins (when dry dotted above), glandular beneath; flowers dioecious, pedunculate, axillary, usually 3-together; fruit oblong, glabrous, variegated with red. C. F. Native of Java, in calcareous soil near Kuripan, where it is called Aroy Pupassang by the natives. Nearly allied to M. dioïca.

**Var. a.** base of leaves deeply cordate. Native of the Moluccas.

**Var. b.** leaves cordately 3-lobed; lateral lobes angular. Native of Java, on Mount Parang.

**Two-coloured-fruited Momordica.** Pl. tr. or cl.

20 M. ACULEATA (Poir. dict. suppl. 3. p. 223.) stem slender, climbing; leaves palmately pedate, with 5-7 dentately lobed segments, having white scattered dots above, but with the nerves and petioles beset with short prickles beneath; petioles and middle nerves clothed with rough reflexed hairs; male flowers racemose, on long peduncles; female flowers solitary, hardly pedunculate; fruit subglobose, glabrous, size of a pea. C. F. Native country unknown.

**Prickly Momordica.** Pl. cl.

21 M. HYSTRIX (Gill. spec. ex Hook. et Arn. in bot. misc. 3. p. 234.) leaves 5-lobed, glabrous, smooth, somewhat curvated at the base; lobes mucronate, denticulated, middle lobe the longest; tendrils simple; male and female flowers rising from the same axis; male ones disposed in racemes; female ones solitary, pedunculate; fruit oblique, ovate, echinated with strong bristles. C. F. Native of Buecos Ayres.

**Porcupine Momordica.** Pl. tr.
22 M. \textit{lanata} (Thunb. prod. 13.) leaves ternately pinnatifid, scabrous; fruit woolly. ☑ F. Native of the Cape of Good Hope.

\textit{Woolly-fruited Momordica.} Pl. cl.

23 M. \textit{? sicyoides} (Ser. in D. C. prod. 3, p. 312.) stems twining, terete; tendrils simple; leaves triangularly cordate, somewhat 5-lobed, serrulately; female flowers pedunculate, solitary; calyx ovate, pilose, with narrow linear segments; fruit ovate mucronate, very pilose, of a yellowish orange-colour at maturity; seeds subglobose. ☑ F. Native of China—Brazil. Icon. t. 12.

\textit{Sicyoid-like Momordica.} Pl. tw.

24 M. \textit{spectabilis} (Lin. miss. ex Smith in Rees' cyc1. vol. 23.) stems furrowed, rugose; leaves cordate, 5-lobed, undulated, rugose from tubercles; male flowers racemose; racemes on long peduncles; tube of calyx very long; bracteas dilated, toothed, scabrous; female flowers solitary, on short peduncles; seeds elliptic, furrowed, hispid. ☑ F. Native country unknown.

\textit{Sicyoid-flowered Momordica.} Pl. cl.

\textit{Cult.} \textit{M. Elaterrium} and \textit{M. Lauvertii} being hardy, their seeds should be sown in the open border. The seeds of the rest of the species should be sown on a hot-bed in spring, and the plants put out afterwards as directed for \textit{Gourds}, p. 42.

\textbf{Lin. syst.} \textit{Momécea, Monadelphia.} Flowers monoeocious. Male flowers with a 5-parted calyx; and a 5-parted corolla, having an undulated rose margin. Stamens 5, diadelphous, having a gland alternating with each fascicle; one of the fascicles bearing 2 anthers, the other trigonal, and bearing 3 anthers. Anthers sessile, stellate. Female flowers with a parted corolla and calyx. Ovarium inferior, beset with 5 series of warts. Style trifid, girdled by 3 glands at the base; stigma 2-lobed. Fruit fleshy, 5-celled, but when mature 1-celled, 3-9-seeded. Seeds girdled by mucilaginous red aril, flat, nerved, with anastomosing veins, and a rugged edge. Perhaps a proper genus.

1 N. \textit{Cuspidata} (Rafn. l. c.) Native of Kentucky, North America. Perhaps the same as \textit{Moméridca batsaménsa}?

\textit{Cuspidate Neuroperma.} Pl. tr.

\textit{Cult.} See Sicyos p. 34. for culture and propagation.

\textbf{Lin. syst.} \textit{Momécea, Monadelphia.} Flowers monoeocious. Yellow. Male flowers with a somewhat 5-toothed calyx, exca
tated into 10 hollows, and with the corolla joined with the calyx. Stamens 4-5, monadelphous, free at the apex, diverging; anthers corolate, distant. Female flowers with a calyx and corolla, as in the male, but without stamens. Style thick; stigma subcapitate, 3-5-cleft. Fruit obcordate, 1-seeded. Seed ovate, flat, compressed.

1 S. \textit{elute} (Swartz, fl. ind. occid. 2, p. 1150.) stems terete, striated, smooth; leaves cordate, angular, rugose beneath; lobes connivent at the base, toothed; terminal angle longest and acu
nated; tendrils 4-5 cleft; male flowers racemose; female flowers solitary, arising from the same axis as the males; fruit large, obovate, 5-furrowed, gibbous at the apex, echinated by stiff hairs. ☑ F. Native of the West Indies, common. Sicyos edulis, Swartz, Prod. 116. Lam. dict. 1. p. 156.—Jacc. amer. p. 258. t. 193. Chayóta edulis, Jacq. amer. 2, t. 245. This plant is known in South America under the name of \textit{choko} and \textit{chajade}. The fruit is green, shining on the outside, whitish, and fleshy within, differing in size and singular in structure, containing one seed each, which is sometimes an inch long, and placed at the very top of the fruit; when it is ripe it protrudes itself a little, and puts forth many fibres at its extremity. In many of the West Indies the inhabitants put the fruit into soups or puddings, or boil it and eat it with their meat as a substitute for turnips or greens, in which state it is generally looked upon as wholesome and refreshing, but it is too insipid to be much liked. The fruit serves to fatten hogs in the mountains and inland parts of Jamaica, where the plant is much cultivated. The natives of Cuba notice two varieties; one which is most common they call \textit{choko}; it is best with harmless prickles, sometimes in great abundance, and sometimes with very few, and is about 4 inches in length; the other, less frequent, called \textit{chajade frances}, is for the most part entirely destitute of prickles, and is about the size of a hen's egg.

2 S. \textit{America} (Lam. dict. 7. p. 50.) leaves cordate, angular; flowers racemose; fruit glabrous, a little compressed, size of a pigeon's egg; seed oval-elliptic. ☑ F. Native of Jamaica. Fruit eatable like the last. This is perhaps the \textit{chajade frances} mentioned above.

\textit{American Choko.} Pl. cl.

2 S. \textit{Palmaeatum} (Ser. in D. C. prod. 3, p. 313.) stems terete, bluntly furrowed; tendrils simple; leaves palmately lobed, scabrous; stipula or bracteae sessile, corolate, 3-5 cleft; male flowers racemose; common peduncle short, many-flowered; filaments monadelphous at the base, and divericate towards the apex; female flowers twin, nearly sessile; fruit prickly, green, size of a silt. ☑ F. Native of Mexico, in Acachaltampa. S. palmátum, Moc. et Sessee, fl. mex. icon. ined.

\textit{Palmae-leaved Choko.} Pl. cl.

\textit{Cult. See Cucurbita, p. 42. for culture and propagation.}

\textbf{Lin. syst.} \textit{Momécea, Polyadelpia.} Flowers monoeocious. Male flowers with a 5-toothed calyx and a campylanthe corolla; petals orifoliate or toothed, not fringed. Filaments 5, in 3 parcels. Female flowers. Style 1; stigmas 3, fringed. Fruit 3-celled, many-seeded. Seeds unknown.

1 M. \textit{pendula} (Lin. spec. p. 49.) leaves cordate, 5-lobed, toothed; tendrils simple; female flowers solitary, on long peduncle; corolla rather pilose, denticulated; fruit ovate, nearly globose, pendulous. ☑ S. Native of South America, and the southern parts of North America. Lam. ill. t. 28. f. 3.—Pluk. alm. t. 85. f. 5.—Sloan. jam. p. 327. t. 142. f. 1.—Plum. spec. 5. t. 66. f. 2. Stems rooting at every joint. Flowers small, pale yellow. Fruit about the size of a pea, changing to black when ripe. In the West Indies these are pickled when green by the inhabitants.

2 M. \textit{forida} (Desr. in Lam. dict. 4. p. 87.) root fleshy, tur
tip-formed; leaves cordate, a little toothed, pilose, almost sessile; tendrils simple; male flowers racemose; peduncles short, few-flowered; female flowers solitary, sessile along with the males; fruit ovate, muricate, mucronate, pilose, of a dirty yellow colour; seeds obovate, compressed. ☑ S. Native of Guinea. Trichosanthes falcédissima, Jacq. coll. 2. p. 341. icon. rar. 3. t. 624. Flowers yellow. Herb fetid when bruised.

3 M. \textit{? indica} (Lour. cochr. p. 35.) stems angular; leaves triangular, denticulated, rough, small, on long petioles; flowers usually solitary, pedunculate, white; fruit ovate-oblong, smooth, small, whitish green. ☑ S. Native of Cochlin-china, in Bengal. —Rumph. amb. 5. t. 171. f. 2. ex Lour. l. c. Flowers white.
Indian Melothria. Pl. tr.

Cult. See Siegus, p. 54, for culture and propagation. The plants will exist through winter if kept in a stove.

XVI. TRICHOSANTHES (from греч. thrice (thrix) trikos, a hair, and αυτος, anthos, a flower; fringed or ciliated corollas). Lin. gen. no. 1476. D.C. prod. 3. p. 313.—Ceratoanthus, Juss. gen. p. 396.—Angulina, Mich. gen. 12.

Lin. syst. Monoe'cium. Monadsphila. Flowers monococious, white. Male flowers: Calyx rather club-shaped, 5-parted; lobes appressed, furnished with 5 teeth on the outside, which alternate with the lobes. Corolla 5-parted, ciliated; filaments 3, but probably 5, joined by twos; anthers joined, with very flexuous cells. Female flowers. Calyx 5-toothed. Corolla 5-parted (f. 2, a.), ciliately jagged. Style trifid (f. 2, d.). Stigma oblongly subulate. Fruit oblong, 1½ or 3-9-celled (f. 2, c). Seeds compressed, tumicate, blunt, very much deformed?

1 T. Angulina (Lin. spec. 1432) stem pentagonal; leaves cordate, 3-lobe; (reapantly toothed, puberulous; tendrils trifid, very long; male flowers racemose; racemes on long peduncles; calyces lobes very short, tooth-formed; lobes of corolla ovate, ciliately jagged; fruit terete-oblong, ending in a long beak, hispid, splitting. © F. Native of China. Lam. Ill. t. 794. Sims, bot. mag. 472.—Mill. fig. t. 32.—Mich. gen. 12. t. 9. Cucumin anguins, Lin. spec. 1437. Ex Lam. dict. 2. p. 75.—Rumph. amb. 5. p. 407. t. 148. Kukhijinjang of the Himala.

Flowers white. Fruit near a foot long.

2 T. Costata (Blum. biijdr. p. 933) leaves corolate, 3-lobe, denticulated, scabrous; lateral lobes somewhat 2-lobe; male flowers racemose, bracteate; female ones solitary; fruit ovate, oblong-rubbed. © F. Native of Java, about Batavia and the western provinces, on the margins of rivers, where it is called lopan by the natives.

Ribbed-fruited Snake-Gourd. Pl. tr.

3 T. Columbina (Jacq. fil. eclog. t. 128) stems furrowed, thickish; tendrils bifid; leaves roundish, corolate, 3-5-lobe; lobes short, broad, toothed; male flowers in panicles; common peduncles very long; female flowers sessile, solitary or in the same axes with the males; calyx very long, with a reflexed limb; fruit nearly terete, very long, lined; seeds obovate, red. © F. Native country unknown.

Viper Snake-Gourd. Pl. tr.

4 T. Nerifolia (Lin. spec. 1432) stem slender; leaves corate, 3-nerved; toothed; petiole short; tendrils bifid; male flowers racemose; racemes on long peduncles; lobes of corolla oblong, ciliate jagged; female flowers solitary; fruit ovate, acutish, green, lined with white, about the size of a hen's egg. © F. Native of the East Indies. Rhed. Hort. mal. 8. t. 17.

Nerve-leaved Snake-Gourd. Pl. tr.

5 T. officinalis (Hamilt. ex Wall. cat. no. 6694) scabrous; leaves corolate, denticulated; petiole hispid; female peduncle 1-flowered, solitary; fruit round, smooth. © © S. Native of the East Indies, in Chilimari.

6 T. Scabra (Lour. cooh. p. 589) branches woody, furrowed; leaves corolate, roundish, wrinkled, scabrous; tendrils bifid; flowers monococious; corolla shortly ciliated; fruit roundish, red, 10-angled, 5-celled; seeds flat, oblong. © G. Native of Cochini-china. Flowers white. Fruit small.

Scabrous Snake-Gourd. Shrub cl.

7 T. Cuspidata (Lam. dict. 1. p. 188) stem twining; leaves cordate, oblong, acute, toothed; tendrils simple; male flowers unknown; female flowers nearly sessile, on short peduncles; calyx long, tubular, with nearly linear, acute, stalked, ciliate, fringed segments; fruit ovate, ending in a long point. © F. Native of the East Indies.—Rheed. Mal. 8. t. 15. T. Caudata, Wildsp. 4. p. 600.

Cuspidate-fruited Snake-Gourd. Pl. tw.

8 T. Angulata (Lam. dict. 1. p. 190) stems angular, very slender, villous; leaves cordate, roundish, small, angular; tendrils forked, longer than the leaves; male flowers panicked; common peduncles much longer than the leaves; female flowers solitary, peduncule. © F. Native of the East Indies. Petals fringed.

Angular-stemmed Snake-Gourd. Pl. tr.

9 T. Villosa (Blum. biijdr. p. 954) leaves corolate, tricuspidate, obsoletely denticulated, villous; peduncles 1-flowered; fruit nearly globose, striated with white. © F. Native of Java, about Rompian and Buitenborg, where it is called Badug by the natives. Fruit indischiscent.

Villous Snake-Gourd. Pl. tr.

10 T. Ovigerum (Blume, l. c.) leaves deeply corolate, mucronate, sometimes sinuated, mucronately denticiled, shining above, and rough beneath; female peduncles 1-flowered; fruit ovate, vittate. © F. Native of Java, on Mount Salak, where the plant is called Tiwuk by the natives.

Egg-bearing Snake-Gourd. Pl. tr.

11 T. Grandiflora (Blum. l. c.) leaves large, quintuple-nerved, ovate, sometimes tricuspidate, quite entire, coriaceous, quite glabrous; flowers bracteate, disposed in dense spikes. © F. Native of Java, in humid places on the mountains, where the plant is called by the inhabitants Kalayar Budak.

Great-flowered Snake-Gourd. Pl. tr.

12 T. Coriacea (Blum. l. c. p. 935) leaves somewhat quintuple-nerved, corolate, acuminated, quite entire, coriaceous, reticulated above and glabrous, but paler and rough beneath; male flowers bracteate, in loose racemes, on elongated peduncles. © F. Native of Java, on Mount Salak, where the plant is called by the inhabitants Piet-tjyn-tjelling. Allied to T. grandiflora.

Coriaceous-leaved Snake-Gourd. Pl. tr.

13 T. Heteroclita (Roxb. ex Wall. cat. no. 6694) leaves smooth, coriaceous, 3-lobed, seldom 5-lobed; lobes acuminated, entire; peduncles racemose; tube of calyx long. © © S. Native of the East Indies, in Gualypara.

Variable-leaved Snake-Gourd. Shrub cl.

14 T. Cucumisina (Lin. spec. 1432) febrif; stems tetragonal, rather pilose; leaves corolate, angular, rather villous, petiole, with white nerves, and mucrinated petiole; tendrils bifurcate; male flowers disposed in something like umbels; female flowers solitary, on short peduncles; calyces lobes ovate; petals fringed at the apex; fruit ovate, mucronate, smooth, green, lined with white, but at last becoming orange-coloured; seeds with sinuated margins. © F. Native of Java, in the province of Bantam. Blum. biijdr. p. 934.—Rheed. Mal. 8. t. 15. Flowers white. The seeds are sometimes used in disorders of the stomach and bowels, and the plant is celebrated for its virtues in Hortus Malabaricus.

15 T. Anaba (Lin. spec. 1432) stems terete, glabrous; tendrils simple; leaves corolate, triangular, sinuated, scabrous from dots, stalked; female flowers solitary; peduncles longer than the leaves; calyx long, tubular, with lanceolate, acute segments; petals roundish-ovate, fringed; fruit ovovate-oblung, 9-celled, green, striped with longitudinal white lines; flesh white and
bitter; seeds oblong, narrow. 〇 F. Native of St. Domingo.

—Plum. descr. pl. amer. t. 100.

Bitter-fruited Snake-Gourd. Pl. tr.

16 T. hexasep'tema (Blumm. bijdr. p. 935.) leaves 3-nerved, ovate, tricuspidate, quite entire, coriaceous, glabrous; male flowers bracteate, disposed in racemes: female flowers solitary; fruit globose, 6-seeded. 〇 ? F. Native of Java, at the foot of Mount Salak, where it is called Aroy-pitiung-Tjelleng by the natives.

Six-seeded Snake-Gourd. Pl. tr.

17 T. Russell'ana (Wall. cat. no. 6096.) smoothish; leaves cordate, hastately 3-lobed, nearly entire; tendrils simple; peduncles 1-flowered. 〇 ? S. Native of the East Indies.

Russell's Snake-Gourd. Shrub cl.

18 T. Macrao'apa (Blum. l. c.) leaves cordate, orbicular, 5-lobed, but sometimes 3-lobed, coriaceous, glabrous; lobes ovate, acuminate, quite entire; lateral lobes rather bifid; fruit large, globose; stem suffruticose. 〇 ? S. Native of Java, on the mountains.

Long-fruited Snake-Gourd. Shrub cl.

19 T. tricuspi'data (Lour. coch. p. 589.) stems shrubby; tendrils trifid; leaves cordate, tricuspidate, denticulated, glabrous, many-nerved; stipules roundish, thick, created; flowers spicate, or perhaps paniedite; bracteas large, toothed; fruit yellow, small, ovate, 2-celled, 2-seeded. 〇 F. Native of Cochín-china; and among bushes and on the margins of rivers in Java. Flowers white. Tricuspidate snake-Gourd. Pl. cl.

20 T. Pilosa (Lour. coch. p. 588.) stems suffruticose, very long, furrowed; tendrils bifid; leaves cordate, denticulated, pilose on the veins, lower ones palmate, upper ones 3-lobed; male flowers? in spikes; bracteas large, lanceolate, ciliated; fruit ovate, acute, scarlet, 1-celled; seeds rhomboid, compressed, lobed, brown. 〇 ? S. Native of Cochín-china. Flowers white as in the rest of the species, fringed with curling hairs.

Pilose snake-Gourd. Shrub cl.

21 T. Laciniosa (Klein, ex Willd. spec. 4. p. 601.) stems filiform, angular, glabrous; leaves deeply cordate, palmately 5-7-lobed, remotely toothed, glabrous on both surfaces; male flowers disposed 4 or 6 in a corymb; petals ovate, toothed; female flowers solitary: petals ciliately fringed. 〇 ? F. Native of the East Indies.

Jagged-leaved Snake-Gourd. Pl. tr.

23 T. Chin'kese (Ser. in D. C. prod. 3. p. 315.) leaves cordate, triangular, bluntish, rather angular; petioles short; tendrils simple; male flowers solitary; calyx long, clavate, rather pilose; petals obovate, with fringed margins; female flowers solitary, almost sessile; tube of calyx ovate, acuminate, pilose: petals not fringed; fruit ovate, striated, ending in a long point. 〇 F. Native of China. Brauna. icon. t. 13.

China Snake-Gourd. Pl. tr.

24 T. Tann'ifolia (Poir. dict. suppl. 1. p. 386.) stems glabrous, striated; tendrils simple; leaves ovate-roundish, rather lobed, or entire, scabrous above; male flowers small, in loose racemes; petals villous? reflexed; fruit ovate, mucronate, glabrous. 〇 F. Native of Porto Rico.

Tamusnus-leaved Snake-Gourd. Pl. tr.

25 T. ru'bera (Blumm. bijdr. p. 936.) leaves deeply cordate, tricuspidate, denticulated, rather tomentose beneath; female flowers solitary; fruit ovate, acute. 〇 F. Native of Java, on the mountains, where the plant is called by the natives Aroy-kalayar-burun.

Downy Snake-Gourd. Pl. tr.

26 T. globo'sa (Blumm. bijdr. p. 936.) leaves palmately 3 or 5-lobed, quite entire, glabrous; lobes linear, acute; male flowers bracteate, disposed in dense spikes, on thick peduncles; female flowers solitary; fruit globose. 〇 F. Native of Java, on Mount Salak, where the plant is called Aroy-jantang by the natives.

Globose-fruit-Snake-Gourd. Pl. cl.

27 T. Palm'ii (Roxb. ex Willd. cat. no. 6688.) puberulous; leaves cordate, 3-5-lobed; lobes denticulated; peduncles racemose; corolla fringed. 〇 ? S. Native of the East Indies. Bracteas toothed.

Palmate-leaved Snake-Gourd. Shrub cl.

28 T. Tribol'iata (Blum. l. c.) leaves ternate; leaflets denticulate, scabrous; lateral ones gibbous at the base; male flowers bracteate, disposed in something like racemes; female flowers solitary; fruit ovate, muricate (ex Rumph); seeds complicate, denticulated? 〇 F. Native of Java, in the province of Krawang, near Tjirardjas. Monómórica trifoliáta, Lin. spec. 1494. Amára sylvestris, Rump. amb. t. 153. f. 2.

Triboliate-leaved Snake-Gourd. Pl. cl.

29 T. Lob'ata (Wall. cat. no. 6693.) downy or puberulous; leaves 5-7-lobed; lobes mucronate at the apex, narrowest at the base, denticulated; tendrils branched; peduncles long, bearing a raceme of flowers at the top. 〇 ? S. Native of the East Indies.

Lobed-leaved Snake-Gourd. Pl. cl.

Cult. So the seeds in a hot-bed in spring, and afterwards treat the plants as if they were cucumbers. The shrubby and perennial species should be protected from the frost and cold by placing them in the stove in winter: cuttings will root readily.

XVII. AMPELOSICYS (from aμpελος, ampolo, a vine, and σικος, sicos, a cucumber; intermediate habit.) Pet. Th. veg. d'Afr. p. 68. t. 22.—Fellíüaria, Hook, bot. mag. no. 2751. and 2752. (July 1827.) Fellíüaria, Smith. in bot. mag. t. 2751. Fellíüaria, Bojer, in litt. (1826.) and Delidd. mem. soc. hist. par. vol. 3. p. 314. (July 1827.)

Lin. syst. Diosécia, Monandíphlía. Flowers dioecious. Male flowers. Calyx tubinate (f. 3. a.), 5-cleft; segments acutely denticulated (f. 3. b.). Corolla 5-petalled (f. 3. c.); petals oblong, fringed. Stamens 5, disposed in 3 bundles. Female flowers. Limb of calyx almost wanting, 5-toothed (ex Smith). Corolla as in the male. Stigma capitata, 3-lobed (ex Bojer), 5-lobed (ex Smith). Fruit fleshy (f. 3. c.), 2-3 feet long, and 8 inches thick, elongated and furrowed, divided into 3 twin cells (ex Bojer), into 3 cells (ex Smith). Seeds compressed, nearly orbicular, reticulated on the outside. Cotyledons thick, oily. A climbing plant, with pedate leaves and showy purple flowers.

1 A. scändens (Pet. Th. l. c.) 〇 S. Native of the south-eastern coast of Africa, on the shores of Zanquebar. It has also been gathered in the Mauritius, where it is called by the negroes Koumé. Fellíüaria pedíata, Smith, l. c. t. 2681. a female plant. Telfíária pedíata, Hook, bot. mag. t. 2751 and 2752. with male flowers and fruit. Jol-...
liffia Africana, Delib. l. c. t. 6. Male plant and seed. The seeds are as large as chestnuts, and as good as almonds, and when pressed they yield an abundance of oil, equal to that of the finest olives.

*Cult.* Any light soil will suit this plant, and cuttings root readily under a hand-glass, in heat. It is a strong coarse growing plant, and therefore requires a great deal of room, both for the roots and the branches, or it will not flower.

Lin. syst. *Monocoa, Monandra*. Flowers monocious. Corolla campanulate, yellow; petals joined together and to the calyx. Male flowers. Calyx hemispherically campanulate. Stamens 5, in 3 bundles, or joined at the apex; anthers abruptly curved, both at the base and the apex, the rest straight and parallel. Female flowers. Calyx obovate-ellate, narrowed towards the top, or campanulate, and always circumscribed under the limb after flowering. Anthers usually sterile. Stigma 3, thickish, 2-lobe. Fruit 3-5-celled. Seeds ovate, compressed, with hardly tumid margins. 1 C. *Maxima* (Duch. in Lam. dict. 2. p. 151.) leaves coriace, very rugged; petiole hispid; tube of calyx obvate, ending in a short neck; fruit globose, somewhat depressed, yellow, red, or green. O. F. Native country unknown. Tourn. inst. p. 106. no. 2. t. 34. Leb. icon. 641. f. 2. Cucurbita Potiro, Pers. ench. 2. p. 593.

Var. *a*, *Potiro* (Ser in D. C. prod. 3. p. 316.) stems very long, climbing; tendrils strong; fruit large, yellow, or orange-coloured, hollow at maturity. *Common yellow gourd, potiron jaune commun, gourge de la France*. The shells of the fruit are generally used for holding water.

Var. *β*, *Erivis* (Ser. in D. C. prod. 3. p. 316.) stems very long, climbing; fruit green, large, hollow at maturity. *Large green gourd, Gros potiron vert de la France*. The shells of the fruit of this sort are also used as calabashes.

Var. *γ*, *Gourgero* (Ser. diss. in mem. soc. gen. vol. 3. pt. 2. t. 1.) stems assurgent, dwarf; nodes close; tendrils abortive; leaves ovate, coriace, 3-5-lobed, somewhat coelade; lobes narrow; fruit small, green, or yellow, full at maturity. *Gourgeron ou petit potiron vert*. Large Hollow Gourd. Fl. Jul. Aug. Ch.?. Pl. cl. or tr. 2 C. *Melopepo* (Lin. spec. 1435.) leaves coriace, obtuse, somewhat 5-lobed, dentilicate; tendrils usually transformed into very imperfect leaves; calyx hemispherically campanulate, short, having the throat much dilated; fruit depressed; carpels irregular, rising beyond the throat of the calyx; flesh dry, spongy, white; cells 4-5. O. F. Native country unknown. Willd. spec. l. c. p. 610. C. polymorpha Melopepo, Duch. in Lam. dict. 1. p. 157.—Bauh. hist. 2. p. 224. with a figure. Pepo maximum clupeatus, Mor. hist. 1. sect. 1. t. 8. Fruit flattened at both ends. It is of great use in long voyages, for it can be kept several months in a fresh state, and is commonly made into pies, like the pumpkin, or boiled and eaten with meat instead of turnips or potatoes. *Bouquet de d'extracte, bouquet de préite, et pastisson de la French.*

3 C. *moschata* (Duch. ex dict. scienc. nat. 11. p. 234.) corolla campanulate, very narrow at the base; leaves soft, tomentose; fruit oval or spherical, depressed; flesh yellow or orange-coloured, musky. O. F. Native of Martinique. C. *Indica rotundifolia*, Dakech. hist. 616. f. 3.

XVIII. CUCURBITA.

4 C. *Cératocéas* (Marr. reise, in bras. ex Linnaea. 5. p. 39.) leaves coriace, nearly orbicular, bluntly somewhat 5-lobed, denticulate; fruit large, oblong-pear-shaped, or cylindrical, lined longitudinally, glabrous; flesh subgranular. O. F. Native of Brazil.

*Horned-fruited Cucurbita*. Pl. tr.

5 C. *villosa* (Blum. biijdr. p. 931.) leaves roundish, coriace, 5-lobed, scabrous; lobes acute, sinuate denticulate; peduncles 1-flowered, those of the male longer than those of the female flowers; fruit oblong, villous. O. F. Gathered in the gardens in the East Indies. By the Javanese it is called *Baligo*.

*Villos Gourd*. Pl. tr.

6 C. *Péru* (Lin. spec. 1435.) leaves coriace, obtuse, somewhat 5-lobed, denticulate; calyx ending in a neck beneath the limb; fruit roundish or oblong, smooth. O. F. Native of the Levant. C. *polymorpha oblonga*, Duch. in Lam. dict. 2. p. 155. This species is called *Pumpkin* and *poinpion*, in English; *Gourmon, Citrouille impero, gourge de Saint Jean in French; Popone in Italian*. There are several varieties of poinpion, but the most striking are the two following: *Var. a, abroton échelé* (Willd. spec. 4. p. 509.) fruit roundish. C. major subrotunda, &c. Bauh. pin. 215. *Var. β, oblonga* (Willd. l. c.) fruit oblong. *Pepo oblongus*, Bauh. pin. p. 311.

The pumpkin is the melon or millon of our early horticulturists, the true melon being formerly distinguished by the name of musk melon. Though commonly cultivated in gardens for curiosity, yet in some country villages in England, the inhabitants grow it on dunghills, and train the shoots to a great length on the grass. When the fruit is ripe, they cut a hole on one side, and having taken out the seeds, fill the void space with sliced apples, adding a little sugar and spice, and then having baked the whole, eat it with butter. On the Continent, as well as in many other parts of the world, the fruit is a good deal used in soups, and also stewed or fried in oil or butter. Pumpkin-pie is also very common in many parts of the world.

Moles of dressing some varieties of the gourd.—Mr. Crichton (Cal. mem. vol. 4.) prefers the cheese-gourd, some of which have weighed with him 1 cwt., and the vegetable marrow; but he very judiciously attaches much more importance to the kind of cooking than to the variety cultivated. He therefore subjoins two receipts for the use of the cheese-gourd, and one for vegetable marrow.

To make soup of cheese-gourd.—Take the fleshly part of the gourd when ripe, and cut it into small pieces; put it into a pan with a small bit of butter, set upon a slow fire until it melt down to a purée; then add milk, in the proportion of half a gallon to 1 lb. of gourd, let it boil a short time with a little salt and sugar, enough to make it taste a little sweet; then cut some slices of bread very thin, toast them very well, and cut them into small dice, put them in a dish, and pour the pure over them, and serve it up.

Cheese-gourd dressed in the Spanish way.—When ripe cut the fleshly part into slices about half an inch, score it across into small dice about half through on one side of the slices; scrape a little of the fat of the bacon, and put it into a saucepan, with a little parsley, shallots, and musroomus chopped very small, adding a little salt and pepper; put them on a slow fire to fry a little, and place this seasoning upon the cut sides of the gourd slices. Put the whole into a quick oven, with a little butter or olive oil, and when baked a little serve up in a dish.

7 C. *Farinosa* (Blum. biijdr. p. 931.) leaves roundish, coriace, rather angularly 7-lobed, a little strigose; lobes acuminate, toothed; peduncles 1-flowered; fruit oblong, large, covered with a kind of glaucous mealliness. O. F. Native of Java, in
fields and in gardens, where the plant is called Doligo by the natives. Allied to C. Pepo. Compare Rumph. amb. t. 143, according to Blume.

Meal-y-fruited Gourd. Pl. tr.

8 C. verreciosa (Lin. spec. 1435.) leaves coriace, deeply 5-lobed, denticulated; middle lobe narrow at the base; fruit roundish-elliptic, warty. O. F. Native country unknown.—Bauh. hist. 2. p. 222, with a figure. C. polymorpha verrucosa, Duch. in Lam. dict. 2. p. 155. The plant, flowers, and seed &c. are like those of C. Pepo, but the fruit is smaller, with a harder, almost woody rind. Called Barbareine, and Barbaresque saugeine in French. The warty gourd is common in most parts of America, where it is cultivated as a culinary fruit. It varies in form and size, being round, flat, shaped like a bottle, or oblong; the rind is white when the fruit is ripe, and covered with large protuberances or warts. It is commonly gathered when half grown, and boiled by the inhabitants of America, to eat as a sauce to their meat. In England it is only cultivated as a curiosity.

9 C. subverreciosa (Wildl. spec. 4. p. 609.) leaves coriace, deeply 5-lobed, denticulated; middle lobe narrow at the base; fruit clavately-elliptic, rather warty. O. F. Native country unknown. Perhaps a hybrid from C. verrucosa, but the fruit is very different.

10 C. galantia (Willd. l. c. p. 667.) plant very scabrous; leaves subcordate, 3-lobed, cuspidate, sharply denticulated; fruit globos, smooth, having the appearance and colour of an orange. O. F. Native country unknown. The orange-gourd is rather more tender than the other sorts. It has been hitherto chiefly cultivated for curiosity, and when trained spirally round a pole, or against a wall, and loaded with its yellow fruit, it is very ornamental. The fruit should be used like those of other sorts of pumpkin or gourd.

Var. a. argentina (Ser. in D. C. prod. 3. p. 317.) fruit globose, 5-celled; pulp fibry, yellow, nearly dry, with a solid dark green rind, which at length becomes orange-coloured.—Orangine or Pissou orange in French; orange-gourd, English.

Var. b. colubynthoides (Ser. in D. C. prod. 3. p. 317.) kind of fruit thinner and variegated; pulp dry. Called Colouminelle or Fausse colouminelle in French, and False coloumin in English.

11 C. cocinea; fruit round, scarlet, about the size of an orange. O. F. Native of Sierra Leone.

Scarlet-fruited Gourd. Pl. tr.

12 C. ovirera (Linn. mant. p. 126.) leaves coriace, angular, 5-lobed, denticulated, pubescent; calyx oblong, ending in a short neck, and cut round after flowering to the neck. O. F. Native of Aestranae. C. polymorpha pyridaris, Duch. in Lam. dict. 2. p. 154.—J. Bauh. hist. 2. p. 222 and 223. f. 1. C. sylvester, Dod. pempt. 670. f. 1. C. pyriformis, Lob. hist. 367. f. 2. Herb and flowers very like those of C. Pepo, but less scabrous. Fruit obovate or ovate, smooth, greenish or yellowish, figure of an egg. Called in French Gowgourdette, and Vegetable marrow, in English.

Var. a. pyriformis (Ser. diss. l. c. t. 1.) leaves 5-lobed with undulated margins; lobes oblong-ovate, denticulated, rarely lobulate; fruit pear-shaped, green, or yellow, lined longitudinally with white.

Var. b. subglobosa (Ser. in D. C. prod. 3. p. 318.) leaves bluntly lobed; lobes broad, short; fruit obovate, globos, green lined with white; flesh red.

Var. g. grisea (Ser. l. c.) leaves 3-5-lobed, narrow; middle lobe trapeziform, usually lobulate; fruit larger, greener grey, spotted with white, hardly lined.

Vol. III.
17 C. mammeata (Molina, l. c.) leaves many-parted; fruit spherical, beset with protuberances. \( \odot \). F. Native of Chili.

Tender Gourd. Pl. tr.

18 C. lanosa (Mill. dict.) leaves rough, lobed; fruit woody. \( \odot \). F. Native of South America. This is a large gourd, and is cultivated for the sake of the shell of the fruit, which will frequently contain between 2 and 3 quarts. Where aloes is manufactured in any quantity, it is commonly preserved in these shells; but in Jamaica they are used to hold water, and small grain.

19 C. multiflora (Forst. ex Spreng. syst. 5, p. 45.) leaves broadly cordate, 5-lobed, acute, denticulated, glabrous; flowers minute, crowded in cymes. \( \odot \). F. Native of the Society Islands.

Many-flowered Gourd. Pl. tr.

Cult. The species of Cucurbita are propagated from seeds, which are large, and require to be covered nearly an inch. Sow in April in a hot-bed, under a frame or hand-glass, to raise plants for transferring to the open garden at the end of May, under a warm aspect, or for planting out in the middle of May on a trench of hot dung under a hand-glass or half shelter; otherwise sow at the beginning of May, under a hand-glass, without bottom heat, for transplating into a favorable situation; or sow 3 weeks later (after the 20th) at once in the open garden, under a south wall, for the plants to remain. The smaller fruited kinds do best trained to an upright pole or trellis. From time to time early cup the stems of the plants. As the shoots extend 5 feet or more, peg down at a joint, and they will take root. Water copiously whenever warm weather without showers makes the ground arid. Mr. Gray (Gard. mag. vol. 1. p. 150.) plants in paths between asparagus beds, and lets the vines of the gourds run over them; and he considers that their large leaves do good to the asparagus roots, by protecting them from the sun, while the tall stems of the asparagus afford a shelter to the leaves of the gourds. In very dry seasons they are an excellent substitute for cabbages and turnips, when the drought is apt to burn up these vegetables. Mr. Gray therefore recommends, especially where the soil is liable to be burnt up in summer, planting the vegetable narrow and other cucurbiteous plants as a reserve crop. The tender tops of all the edible species of Cucurbitaceae, boiled as greens or spinach, are a fully more delicate vegetable than the fruit. It must be worth something to gardeners and cooks to know that either or both may be used for this purpose when scarcely anything else can be got.

LIN. SYST. Monocica, Monadelphia. Flowers monocious. Male flowers umbraculate, sessile, involucrated by reniform bracteas, which are dentately fringed at the apex; common peduncle very long, furnished each with an oblong bractea at the base. Alabaster nearly like those of the rose. Tube of calyx obovate; limb with acute linear sepal. Corolla, stamens, and filaments unknown. Anthers joined, with the cells as in the rest of the Cucurbitaceae. Female flowers solitary on long peduncles, rising from the same axillary as the males, as well as of the same form.

1. I. Wallisii (Ser. I. c. t. 4.) leaves deeply 5-lobed, cut, scabrous; lobes obovate-oblong, coarsely toothed; tendrils quinquifid. \( \odot \). F. Native of Nipaul.

Wallis's Involucraria. Pl. cl.

Cult. See Cucurbita for culture and propagation.

LIN. SYST. Monocica, Monadelphia. Flowers monocious. Calyx of 5 sepals, inclosed in a large, undivided, 1-flowered sheath; sepals subulate, striated, coloured, joined together at the base. Corolla campanulate; petals 5, ovate-lanceolate, nerved. Stamens 5, in 3 bundles, and with the anthers connected at the apex. Style 1; stigmas 3, sagittate, horizontal. Berry muricated, 1-celled, many-seeded. Seeds orbicular, large, reticulated, with tubercular margins.

1. M. Cochinchinensis (Lour. 1. c. p. 506.) a large shrub, with 5-lobed leaves, the superior lobes acuminated, and the inferior ones obtuse, short, and denticulated; flowers yellow, solitary, on long peduncles; fruit reddish purple both inside and outside, scentless. \( \odot \). F. Native of Cochinchina and China. Monomorica Cochinchininensis, Spreng. syst. 3, p. 14. The seeds and leaves are aperient and abortergent.

Cochin-china Muricia. Shrub.

Cult. A mixture of peat and sand will answer this shrub; and cuttings will root in the same kind of soil.

XXI. ANGURIA (one of the Greek names for the cucumber, from αγγος, αγγος, a vessel; shape of fruit). Lin. gen. no. 599. Juss. gen. p. 395. Lam. ill. t. 747. D.C. prod. 3, p. 318.—Monomorica spec. of authors.—Psiguria, Neck. elem. bot. no. 384.

1. A. integrifolia (Nees et Mart. in nov. act. bonn. 12, p. 9.) leaves ovate, denticulated, 5-nerved, glabrous; peduncles 4-6-flowered, bractless; female flowers unknown.—Native of Brazil, at the river Ilheos. Flowers red.

Intire-leaved Anguria. Pl. cl.

2. A. thalorata (Lin. spec. 376.) root bitter; stems slender; leaves deeply 3-lobed, or somewhat 5-lobed, veiny; lobes a little toothed; tendrils simple; male flowers large, in racemes, female flowers, white, almost sessile; fruit ovate-oblong, subumbrellate, green, spotted with white; seeds oblong, falcate, 2. \( \odot \). F. Native of Martinico.—Plum. ed. Burm. pl. amer. t. 22. Jacq. amer. p. 243. t. 156. ed. pict. p. 119. t. 234. Flowers vermilion coloured.

3. A. pedatiseta (Nees et Mart. in nov. act. bonn. 12, p. 10.) leaves pedately 5-parted; lobes quite entire; tendrils subumbellate; corymbas many-flowered; flowers triandrous? fruit oblong, striated, attenuated both at the base and apex; pulp white, spongy, rather acid; aril black. \( \odot \). F. Native of Peru. Monotomica pediseta, Lin. spec. 1454. Lam. dict. 4, p. 241.—Feuill. per. 1. p. 754. t. 41. Flowers white. Two or three segments of leaves lobed. The Peruvians use the fruit in soups.

Pedate-cut-leaved Anguria. Pl. cl.

4. A. pedata (Lin. spec. 376.) stems slender, terete; leaves pedately 5-parted; lobes lanceolate, toothed; tendrils longer than the leaves; flowers inodorous, male ones in racemes; racemes on long peduncles; female one solitary; fruit oval-oblong, green, variegated with white. \( \odot \). S. Native of St. Domingo. Jacq. amer. 242. t. 155. ed. pict. t. 233.—Plum. ed. Burm. pl. amer. 23.7. Flowers with orange-coloured petals.

5. *A. rösea* (H. B. et Kunt, nov. gen. amer. 2. p. 122.) branches glabrous; leaves truncate-orbulate at the base, quite entire, 3-lobed at the apex, glabrous, membranous; tendrils undivided, glabrous; male flowers disposed in racemes; calyx cylindrically campanulate, ventricose at the base, with a 5-parted rose-coloured limb, having the segments roundish and longer than the tube; stamens 2, sessile. Z. S. Native of New Granada, in temperate places near Turbaco, at the height of 6000 feet. Flowers rose-coloured.

Rose-coloured-flowered Anguria. Pl. cl. 6. *A. umbrosa* (H. B. et Kunt, l.c. p. 121.) leaves pedately 5-parted, sinuate-orbulate; lobes quite entire, ovate-lanceolate, outer ones much the shortest and divaricate; flowers panicled; peduncles very long; calyx roughish, having the tube ventricose at the base, of a vermilion colour; stamens 2, free; anthers linear; female flowers unknown. Z. S. Native of the temperate provinces of New Andalusia, near Bordones and Cumanacoa.

Shaded Anguria. Fl. June, July. Clt. 1827. Pl. cl. 7. *A. trifoliiata* (Lin. spec. 1576.) stems thickish, terete, rugged; tendrils simple; leaves palmately ternate; leaflets entire: lateral ones unequal-sided; male flowers in racemes pure; tube of calyx long and ventricose; peduncles short; fruit irregularly ovate-oblong, blunted mucronate, 4-celled, green, lined with white; flesh of fruit red, and sweet. Z. S. Native of St. Domingo.—Plum. pl. amer. t. 99.

Trifoliate Anguria. Fl. June, July. Pl. cl. Cult. The species of this genus delight in a light rich soil, and may be propagated either from seeds or cuttings.

† Genera allied to Cucurbitaceae, but are not sufficiently known.

Lin. syst. unknown. Flowers solitary, axillary. Bractea large, concave, involving a large, coloured, 5-sepalid calyx, and girded by 5 scales at the base. Stamens 5.—A doubtful genus, said to be related to the order Passiflorae; but according to St. Hilaire (mem. mus. 9. p. 130.) it belongs to Cucurbitacceae, from the lateral situation of the tendrils.

1. *Commersoniana* (Sert. in D. C. prod. 3. p. 319.) Native country unknown.

Commerson's Zucca. Pl. cl. Cult. See Anguria for culture and propagation.

XXIII. ALLASIA (allana, allas, a sausage; from the colour and form of the fruit resembling a sausage). Lour. coeh. p. 85. D. C. prod. 3. p. 319.

Lin. syst. Tetrándria, Monogynia. Flowers hermaphroditic. Calyx gamosepalous, girded by a short involucrum; segments 5, acutish, hairy. Corolla 4-petalled; petals roundish, very hairy, small. Stamens 4 or perhaps 8 joined by two; anthers 2-lobed? Style subulate; stigma acute. Berry fleshy, large, oblong, obtuse, pendulous, 1-celled. Seeds imbedded in the pulp, ovate, compressed, turmid.

1. *A. Pa'yos* (Lour. l. c.) a tree, with spreading unarmed branches; opposite digitate leaves; the lobes 5, oval, quite entire and pilose; flowers nearly terminal, pale; peduncles many-flowered. B. S. Native of the eastern coast of Africa, on the shores of Mozambique. Jaraéctia Brasiliana, Pison, bras. p. 166. ex Lour. l. c. Flowers pale. Fruit brownish-red. Payor Allasia. Tree.

Cult. A light rich soil will suit this tree, and cuttings will strike root in the same kind of soil under a hand-glass in heat.

1 G. sca'ndens (Lin. spec. 292.) Z. S. Native of Vera Cruz. Jacq. coll. 3. p. 197. icon. rar. t. 538. Lam. ill. t. 144. f. 2. G. Humboldtiana, Ræm. et Schult. syst. 5. p. 492. Fruit ribbed, while young. Flowers greenish-yellow. Leaves 5-lobed. The hairs on the leaves sting like those of a nettle. Climbing Gronovia. Fl. June, July. Clt. 1731. Pl. cl. Cult. Being a tender annual plant, the seeds of it require to be sown on a hot-bed; and after the plants have grown a sufficient size in the seed-pot, they should be potted off singly into other pots, and after a time placed in the stove, and trained upon sticks.

XXV. KOTIBIA (this genus is dedicated to Peter Kolbe or Kolben, a German traveller, who published a description of the Cape of Good Hope). Beav. f. d'ow. 2. p. 91. t. 120. D. C. prod. 3. p. 320.

Lin. syst. Dioica, Monadelphia. Flowers dioecious. Male flowers with a gamosepalous calyx, composed of 5 joined sepals, having a crenulately margined; the corolla is gamopetalous, and 5-lobed; lobes lanceolate, with glandular edges. Nectarium? 5-leaved, having lanceolate lobes, which taper to the base, with their edges plumously dilated. Stamens 5, monadelphous; filaments short; anthers long, connivent. Pistillum unknown.

1 K. e'legans (Beav. l. c.) stem sarmcentose, bearing tendrils; leaves glabrous, petiolate, cordate; peduncles 4-flowered. Z. S. Native of the western coast of Africa, in the kingdom of Benin. Flowers red. Nectarium blue. Elegant Kolbin. Pl. cl. Cult. A light rich soil will suit this elegant plant, and cuttings will root in the same kind of mould under a hand-glass in heat.

Order CIV. PAPAYACEE (this order contains only the Papaw trees). Martius, 1829.—Papayae, Agardh. 1824.—Caricéeae, Turp. in atl. du dict. des sc. nat.

Flowers unisexual. Calyx inferior, minute, 5-toothed. Corolla monopetalous; in the male tubular, with 5 lobes and 10 stamens, all arising from the same line, and of which those that are opposite the lobes are sessile, the others on short filaments; anthers adnate, 2-celled, bursting longitudinally; in the female divided nearly to the base into 5 segments. Ovarium superior, 1-celled, with 5 parietal polyspermic placenta. Stigma sessile, 5-lobed, lacerated. Fruit succulent, indesicient, 1-celled, with 5 polyspermic parietal placenta. Seeds enveloped in a loose mucous coat, with a brittle pitted testa. Embryo in the axis of the fleshy albumen, with flat cotyledons, and a terete radicle, turned towards the hilum.—Trees, without branches, yielding an acrid milky juice. Leaves alternate, palmately lobed, standing on long terete petioles.

It was the opinion of Jussieu that the genus upon which this tribe is based, was a compound of the genera *Manacoa* and *Sycospermum*. No plant belonging to the family is now known in the West Indies. For the genus *Kotibia*, and its congeneric, *Sca'ndens*, Dr. Hooker states, that the leaves of the latter species are so tender, that they are destroyed by the atmosphere of the city of London.
order is founded, held a sort of middle station between \textit{Urticace} and \textit{Cucurbitaceae}. Auguste St. Hilaire has, however, well remarked upon this subject, that the only relation that it has with \textit{Urticace} consists in the separation of sexes, its milky juice, its habit, which is like that of some species of \textit{Ficus} or \textit{Fig}, its foliage, which is not very different from the \textit{Cecropia}, and the position of its stigmas; and to these it wisely attaches very little importance. Its fruit brings it near \textit{Cucurbitaceae}; but its true place is probably nearer to \textit{Passifloraceae}, with which it altogether agrees in the appearance of its testa, in its unilocular fruit, with parietal polyspermous placentas, and its having a calyx and corolla present, differing, however, widely in its habit, and monopetalous flowers.

The fruit of the Papaw is eaten when cooked, and is esteemed by some persons; but it appears to have little to recommend it. Its great peculiarities are, that the juice of the unripe fruit is a most powerful and most efficient vermifuge; the powder of the seed even answers the same purpose, and that a principal constituent of this juice is febrine, a principle otherwise supposed peculiar to the animal kingdom, and to fungi. The tree has moreover, the singular property of rendering the toughest animal substances tender, by causing a separation of the muscular fibres; its very vapour even does this.

Lin. syst. \textit{Die'a}cia, \textit{Decindiaria}. Character the same as the order.

1 C. \textit{PAPA\'YA} (Lin. spec. 1406.) leaves palmately 7-lobed; segments deeply lobed, oblong, acute; male flowers corymbose, \textit{b. S.} Native of both Indies.—Rumph., amb. 1. t. 50, 51.—Merian, Surin. t. 40. Rheed. mal. 1. t. 15. f. 1. Hook. bot. mag. 2898. Ker. bot. reg. 459. The papaw tree is a native of South America and the West Indies, whence it was brought by the Spaniards and Portuguese to the Philippines and the Moluccas; and from these islands, it being of very quick growth, it spread to all the other countries of India. In three years from seed a papaw tree will be 20 feet high, and loaded with flowers and fruit; and for the sake of this fruit the plant is generally cultivated; it has a pleasant sweetish taste, and is much liked by many people; when young it is generally used for sauce; and when boiled and mixed with lime-juice and sugar, is not unlike, or much inferior to, that made of real apples, for which it is commonly substituted. But Sloane says, the fruit is not in general gathered before it is ripe; cut into slices, soaked in water till the milky juice is out, and is then boiled and eaten as turnips, or baked as apples. The juice of the pulp, according to Descourtiz, in the \textit{Flore Medicale des Antilles}, is used as a cosmetic to remove freckles on the skin, caused by the sun; and the negroes in the French colonies employ the leaves to wash their linen instead of soap. As a medicinal plant the papaw tree is particularly deserving of notice. Hernandez long ago spoke of the milky juice of the unripe fruit as a powerful vermifuge; which has been confirmed by M. Charpenter-Cossigni, as mentioned in the Asiatic Researches by Dr. Hemsing (vol. 2. p. 162). A single dose, that gentleman says, is sufficient to cure the disease, however abundant the worms may be. Another writer (Pourpee Desportes) recommends the use of the powder of the seed instead of the juice. But the most extraordinary property of the papaw tree, is that which is related first, I believe by Browne, in his natural history of Jamaica, namely, that \textit{it water impregnated with the milky juice of this tree is thought to make all sorts of meat washed in it tender: but 8 or 10 minutes' steeping, it is said, will make it so soft that it will drop in pieces from the spit before it is well roasted, or turn soon to rags in the boiling.} This circumstance has been repeatedly confirmed, and moreover, that old hogs and old poultry which are fed upon the leaves and fruit, however tough the meat then, the flesh might otherwise be, is thus rendered perfectly tender, and good if eaten as soon as killed, but then the flesh passes very soon into a state of putridity. In the third volume of the Wernerian Society's Memoirs there is a highly interesting paper on the properties of the juice of the papaw tree, by Dr. Holder, who has witnessed its effects in the Island of Barbadoes, and speaks of them as known to all the inhabitants. The juice causes a separation of the muscular fibres. Nay, the very vapour of the tree serves this purpose; hence many people suspend the joints of meat, fowls, &c. in the upper part of the tree in order to prepare them for the table. Such is the effect upon hogs that feed upon the fruit, that the good housewives reject the flesh of such it if it be destined for salting, well knowing that it is not sufficiently firm for the purpose. It is not known whether the juice of this fruit is used in the same manner to render the animal matter or febrine contained in the juice of the Papaw. Two specimens of the juice were brought from the Isle of France; in the one the juice had been evaporated to dryness, and was in the state of an extract; in the other the juice was preserved by being mixed with equal bulk of rum. \textit{Both} were subjected to analysis by Vauquelin. The first was of a yellowish white-colour, and semitransparent; its taste was sweetish; and it had no smell, and was pretty solid; but attracted moisture when kept in a damp place. The second was reddish brown, and had the smell and taste of boiled beef. When the first specimen was macerated in cold water, the greatest part of it dissolved; the solution frothed with soap. The addition of nitric acid coagulated it, and rendered it white; and when boiled, it threw down abundance of white flakes. When the juice of the papaw tree is heated with water, the greatest part dissolves; but there remains a substance insoluble, which has a greasy appearance. It softens in the air, and becomes viscid, brown, and semitransparent. When thrown on burning coals it melted, let drops of grease exude, emitted the noise of meat roasting, and produced a smoke which had the colour of fat volatilized. It left behind it no residue. The substance was febrine. The resemblance between the juice of the papaw tree and animal matter is so close, that one would be tempted to suspect some imposition, were not the evidence that it is really the juice of the tree quite unquestionable. Thomson's System of Chemistry, extracted from the Annales de Chimie, vol. 13. p. 267. Febrine had been previously supposed to belong exclusively to the animal kingdom; but it has since been found in other vegetables, especially in \textit{Foug}. The name \textit{papaw} is abridged from \textit{papaw-iati}, its name in Malabar.

2 C. \textit{stipitifolius} (Jacq. fil. ex Spreng. syst. 3. p. 905.) leaves palmately 7-cleft; segments oblong, acute, middle one trifid; fruit oval, smooth. \textit{b. S.} Native of Peru, about Lima. Flowers yellow. Fruit the shape and size of an orange, edible like the rest.

Citron-formed Papaw. Clt. 1820. Tree 10 to 20 feet.

3 C. \textit{polystachy} (Walld. spec. 4. p. 815.) leaves cordate, 3-cleft; leaves angular, angles acute; flowers corymbose; fruit pear-shaped. \textit{b. S.} Native of Peru, and Chili, on the cliffs along the shore of Valparaiso. Feuille. per. 2. p. 52. t. 39. f. 1. C. Prosopoda, Lin. spec. 1166. ? Flowers rose-coloured. Fruit
yellow, pear-shaped. A doubtful species of the genus, from its small size and branched stem.

**Pear-shaped** Papaw. Clt. 1823. Shrub 3 to 6 feet.

4 C. cauliflora (Jacq. schedbr. 3. p. 33. t. 311.) leaves palmately 5-lobed; intermediate lobe sinuated; segments lanceolate, acuminate; male peduncles usually 5-flowered, rising from tubercles on the trunk. b. s. Native of South America, in the province of Caracas and of Trinidad. Flowers yellowish.

**Stem-flowered** Papaw. Clt. 1806. Tree 10 to 20 feet.

5 C. microcarpa (Jacq. schedbr. 3. p. 32. t. 309 and 310.) leaves 3 or 5-lobed; intermediate lobe 3-lobed; male flowers corymbose. b. s. Native of Caracas and Chili. Flowers yellowish. Fruit the size of a cherry.

**Var. ß., monoica** (Desf. in ann. mus. 1. p. 273.) lower leaves entire (smaller), cauline ones 3-lobed, upper ones 5-lobed; lobes somewhat pinnatifid; flowers monocious, subtruncate, erect. w. s. Native country unknown. Petioles channelled.

**Small-fruited** Papaw. Tree 10 to 12 feet.

**Spiní** Papaw. Clt. 1821. Tree 20 to 30 feet. Cult. These trees grow well in any light rich soil. They may be brought into a fruit bearing state in our stoves, by planting them in large pots, or in tubs made for the purpose.

**Order CV. PASSIFLOREÆ (plants agreeing with Passiflora in important characters).** Juss. ann. mus. 6. p. 102.

D. C. prod. 3. p. 321.

Calyx of 5 (f. 5. a.) or 10 sepals (f. 4. a. f. 6. a. f. 7. a.), combined into a short or elongated tube (f. 7. c.), free at the apex, disposed in 1 or 2 series; outer lobes large, foliaceous; inner ones alternating with the outer ones, and more petal-like than them, sometimes these last are wanting altogether; the sides or throat are lined by filamentous (f. 6. a.) or annular (f. 5. b. f. 6. c.) or membranous coloured processes, which are disposed in one or more series, having the bottom usually closed by a lid-formed appendage. Petals 5 in the tribe Paropsieæ, but wanting altogether in the tribe Passifloreæ. Stamens 5 (f. 4. b. f. 5. d. f. 7. c.), but indefinite in the genus Smeathmannia. Filaments opposite the exterior lobes of the calyx, joined into a long tube which sheaths the stipe of the ovaryum; anthers fixed by the back, petale (f. 4. b. f. 5. c.), reflexed, turned outwards, but reversed they are turned inwards, 2-celled, bursting lengthwise. Torus elongated into a long cylindrical stipe. Ovarium seated on the stipe, ovate, free. Styles 3, rising from the same point (f. 6. c. f. 5. d. f. 4. d.), crowned by a stigma each, which is somewhat 2-lobed. Fruit naked (f. 7. g.), or surrounded by the calyx (f. 8. a.), stalked, 1-celled, 3-valved, having a polyspermous parietal placenta in the middle of each valve; the valves sometimes dry and dehisce, sometimes fleshy and indehiscent. Seeds attached in several rows to the placenta, usually clothed with a large pulpy aril, compressed, and generally scrobiculate. Embryo straight, in the centre of the fleshy thin albumen, having a terete radicle, which is turned towards the hylum; cotyledons flat and foliaceous.—Herbs or shrubs for the most part climbing. Leaves of many forms, alternate, stipulate, usually bearing glands on the limb or petiole. Peduncles axillary, some of which are changed into tendrils from abortion, others are simple, and bear 1 flower each, very rarely branched and many-flowered; however, all the peduncles are floriferous in the upright species, or those that do not climb: always articulated under the flower, and generally furnished with a 3-leaved involucrum at the articulation.

The real nature of the floral envelopes of this remarkable order, is a question upon which botanists entertain very different opinions, and their ideas of its affinities are consequently much at variance. According to Jussieu (Dict. scienc. vol. 38. p. 49.) the “parts taken for petals are nothing but inner divisions of the calyx, usually in a coloured state, and wanting in several species;” and therefore, in the judgment of this venerable botanist, the order is apetalous, or monochlamydous. De Candolle adopts the same view of the nature of the floral envelopes as Jussieu; but he nevertheless considers, we think with propriety, the order polypetalous. Other botanists consider the outer series of the floral envelopes as the calyx, and the inner as the corolla; the one is green and the other coloured. The nature of the filamentous appendages, or rays as they are called, which proceed from the orifice of the tube, and of the membranous or fleshy, entire or lobed, flat or plaited annular processes, which lie between the petals and the stamens, are ambiguous, but are probably abortive stamens. With regard to the affinity of Passifloreæ, Jussieu, swayed by the opinion he entertain of their being apetalous, and De Candolle, who partly agrees and partly disagrees with Jussieu in his view of their structure, both assign the order a place near Cucurbitaceæ; but when we consider the stipitate fruit, occasionally valvarius, the parietal placenta, the sometimes irregular flowers, the stipulate leaves, and the climbing habit of these plants, it is not difficult to admit their affinity with Capparidaceæ and Violaceæ, the dilated disk of the former of which is probably analogous to the innermost of the annular processes of Passifloreæ.

The plants composing the Passifloreæ, are the produce of South America and the West Indies, where the woods are filled with their species, which climb about from tree to tree, bearing at one time flowers of the most striking beauty, and of so singular an appearance, that the zealous Catholics who discovered them adopted Christian traditions to these inhabitants of the South American wildnesses, and at other times fruit tempting to the eye and refreshing to the palate. Several are found in Africa, and a few in the East Indies, of which the greater part belong to the genus Modéeeæ.

Nothing is known of the properties of this order, further than that the succulent fruit and pulp that surround the seeds are fragrant, juicy, cooling, and pleasant in several species.

**Synopsis of the genera.**

**Table I.**

**Paropsieæ.** Petals 5. Ovarium sessile. Upright shrubs without tendrils.

1 **Smeathmannia.** Nectaria 1-leaved, urceolate, surrounding the base of the stamens. Stamens indefinite; anthers incumbent. Stigmas 5, peltate. Capsule inflated, papery, 4-5-valved.
leaves oblong, acute at the base, shining; nectarium cut, beardless. P. S. Native of Sierra Leone, in the mountains, where we have seen it growing in great plenty, and where it forms beautiful upright bushes, loaded with delicate white flowers.

3 S. Media (R. Br. in Lin. trans. 13. p. 221.) branches glabrous; leaves obovate-oblong, obtuse at the base, glabrous, rather opaque. P. S. Native of Sierra Leone. Flowers white.

Intersealate Smeathmannia. Shrub 6 to 8 feet.

Cult. These elegant shrubs grow best in a mixture of loam, peat, and sand; and young cuttings of them strike root freely in the same kind of soil under a bell-glass, in heat.

II. PAROPSIAS (from παρωπής, paropsis, a dish of meat; the seeds are inclosed in a fleshy arilus, of an agreeable sweet taste, much esteemed by the natives of Madagascar, as well as by Europeans). D. C. prod. 3. p. 322.

Edible Paropsis. Shrub 5 to 6 feet.

Cult. For culture and propagation see Smeathmannia.

Tribe II.

PASSIFLORE-VERE. (true passion-flowers.) Calyx with a 5-parted limb. Petals 5 or wanting. Stamens 5 in all, except one plant, which has only 4. Ovarium pedicellate. Some of the pedicels changed to tendrils. Stems generally climbing.

L. Syst. Monadelphia, Pentádria. Tube of calyx very short, having the throat ornamented with a multiple filamentous crown (f. 4. a.). Berry generally pulpy, rarely somewhat membranous.

1 P. Glauca (Humb. et Bonpl. pl. equin. 1. t. 22.) arborescent; leaves obovate-oblong, glaucous beneath, and bearing glands in the axils of the veins; petioles glandless; peduncles dichotomous, 3-5-flowered. P. S. Native of South America, on Mount Quindio, P. amethystalina, Mikin. P. arborescens. Spreng. syst. 3. p. 42. Flowers white. Crown tipped with yellow.

Glaucous Passion-flower. Tree 20 to 30 feet.

2 P. Emarina (Humb. et Bonpl. l. c. t. 23.) arborescent; leaves obovato-lanceolate, acuminate, or emarginate, pubescent beneath, and biglandular at the base; petioles glandless; peduncles dichotomous, 3-5-flowered. P. S. Native of Peru, on the Andes. Flowers white?

Emarginate-leaved Passion-flower. Shrub 10 to 16 feet.

3 P. Ova (Martin. ind. D. C. prod. 1. c.) arborescent; leaves oval, obtuse at both ends, somewhat cuneated at the base, glabrous, glandless beneath; petioles biglandular at the apex; peduncles 2-flowered. P. S. Native of French Guiana.

Ovate-leaved Passion-flower. Shrub.
Sect. II. Polyx'anthema (from πολυς, poly, many, and ανθος, anthos, a flower; in reference to the peduncules bearing many flowers). D. C. mem. soc. gen. 1. pt. 2. p. 435. prod. 3. p. 322. Peduncules many-flowered, sometimes twin, with a tendril in the middle, sometimes solitary and branched, the middle ending in a tendril. Involucrum wanting or very small. Limb of calyx 3-lobed. Petals 5. Stems climbing.

4 P. cirkifiôra (Juss., in ann. mus. 6. t. 41. f. 1) leaves pedate, glabrous; petiole branched, biglandular above the base; leaflets 5, ovate, having 1 tooth on each side at the base; peduncles branched, bearing flowers and tendrils. Native of French Guiana, in woods. Form of leaves like those of P. pedata. Crown variegated with white, yellow, and red.

Tendril-flowered Passion-flower. Shrub cl.

5 P. septen'ata (D. C. prod. 3. p. 323) leaves pedate; petioles branched, glandless; leaflets oblong, having 1 tooth on each side at the base; tendrils simple, distinct from the peduncles. Native country as well as the flowers unknown.

Septen'ate-leaved Passion-flower. Shrub cl.

7 P. sxtên'dora (Juss. loc. c. t. 37. f. 1.) clothed with soft velvety down; leaves coriace at the base, very broad, truncate at the apex, 3-lobed; petioles glandless. Native of St. Domingo and Jamaica.

Six-flowered Passion-flower. Shrub cl.

8 P. genniniflôra (D. C. prod. 3. p. 322) pubescent; leaves cuneated at the base, very broad, truncate, sinuate 3-lobed at the apex, glabrous beneath and shining above; petioles glandless. Native of Brazil.

Twin-flowered Passion-flower. Shrub cl.

9 P. molucca'na (Reinw. in Blum. bijdr. p. 938) leaves oblong, mucronate, somewhat emarginate at the base, quite entire; petioles biglandular; cymes bifid, many-flowered. Native of the Moluccas.

Molucca Passion-flower. Shrub cl.

10 P. tet'ändra (Banks, herb. ex D. C. prod. 3. p. 323) glabrous; leaves oval-oblong, acuminate, quite entire, glandless. Native of New Zealand. Flowers small, greenish.

Tetrandrous Passion-flower. Shrub cl.

11 P. fâ'llida (Lin. amen. 1. p. 218. t. 10. f. 2. exclusive of the synonymes) leaves glabrous, ovate, acuminate, 3-nerved; petioles biglandular above the middle; pedicels 1-3 together. Native of St. Domingo and Brazil.—Plum. amer. p. 75. t. 89. Ker. bot. mag. t. 600. Flowers small, yellowish-green.

12 P. cu're'a (Lin. amen. i. p. 219. t. 10. f. 3) leaves glabrous, ovate, glandular beneath, between the axis; petioles glandless; pedicels solitary. Native of the islands of Providence and Bahama. Jacq. icon. rar. 3. t. 606. Flowers blood-coloured, an inch and a half in diameter. Berries purplish.

13 P. Cayá'nille'en (D. C. prod. 3. p. 323) leaves glabrous, ovate, glandless, ciliated with stiff hairs; petioles glandless; pedicels solitary. Native of the West India Islands. Ciprea, Cav. diss. 10. p. 448. t. 273. Flowers pale purple; crown copper-coloured, but violaceous at the base.

14 P. multiplô'ra (Lin. amen. 1. p. 221. t. 10. f. 7) leaves ovate-oblong, entire, clothed with velvety down beneath; petioles very short, biglandular at the apex; pedicels numerous in the axes of the leaves. Native of St. Domingo, Cav. diss. 10. t. 272. There are varieties with the leaves either glabrous or downy above. Plum. amer. t. 90. Flowers greenish. Style purplish.

15 P. aur'icula (H. B. et Kunth, nov. gen. amer. 2. p. 131) leaves glabrous, ovate, rounded at the base, glandular beneath; petioles arched by 2 glands beneath the middle; pedicels 1 or 2 together. Native of the banks of the Oriñoco, in shady places, at the cataract of Maypure. Flowers white, but the calyx is greenish on the outside.

16 P. Nipaule'nis (Wall. tent. t. 11) smooth; leaves coriaceous, quite entire, 5-nerved, glandular beneath and on the petioles; peduncles bracteate, aggregate; crown triple, exceeding the calyx. Native of Nipaul, on woody hills in the great valley. Leaves glaucous, furnished with 2 glands underneath at the insertion of the nerves, and 2 in the middle of the petioles. Peduncles 2-3-flowered. Flowers small, white, with a greenish crown. Berry yellow, about the size of a small cherry.

Nipaull Passion-flower. Shrub cl.

17 P. lito'taris (H. B. et Kunth, l. c. p. 138) leaves beset with silky hairs on both surfaces, hastately 3-lobed, and nearly entire; petioles bearing 2 stipitate glands above; pedicels 2-3 together. Native of Peru, on the sea-shore near Patihlica, and in the valley of Lima. Flowers with a green calyx.

Sea-shore Passion-flower. Shrub cl.

18 P. glabra'ta (H. B. et Kunth, l. c. p. 135) leaves glabrous, shining, glandular beneath, half orbicular, truncate 2-lobed; lobes very short, spreading; petioles glandless; pedicels solitary, or twin. Native of New Granada, near Turbaco. Related to Maruthia accella. Flowers small, white; crown yellow.

Smooth Passion-flower. Shrub cl.

19 P. pure'scens (H. B. et Kunth, l. c. p. 133) leaves semi-orbicular at the base, lunately 2-lobed; lobes ovate-oblong, acute, divaricate, with an awn in the recess between the lobes, and as well as the petioles downy and glandless; pedicels solitary. Native of South America, in shady places of the province of Caracas. P. Lockhârtii, G. Don, in Loud. hort. brit. p. 269. Flowers small, greenish white.

Downy Passion-flower. Shrub cl.

20 P. bilôbâ'ta (Juss. ann. mus. 6. p. 107. t. 37. f. 2) leaves smooth, 2-lobed, rounded at the base, 3-nerved, glandless; lobes
obtuse, emarginate, rather diverging; petals short, glandless; pedicels twin. \( \gamma \), \( \omega \). Native of St. Domingo. Taucônia bilobàta, Sprengr. ex S. p. 44. Flowers very small, greenish.

**Tri lobed-leaved Passion-flower.** Shrub cl.

21 P. \textit{Mexicana} (Juss. l. c. p. 108. t. 58. f. 2.) leaves glabrous, 2-lobed, rounded at the base, 3-nerved; lobes oblong, diverging a little, glabrous beneath; petals short, glandless; pedicels twin. \( \gamma \), \( \omega \). Native of Mexico, about Acapeculo. Flowers small, white.

**Mexican Passion-flower.** Cl. 1820. Shrub cl.

22 P. \textit{Dictamo} (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 324.) leaves glabrous, 2-lobed, somewhat emarginate at the base, 3-nerved, glandless beneath; lobes oblong, divaricate; petals glandless; pedicels twin. \( \gamma \), \( \omega \). Native of New Spain, where it is called \textit{Dictamo}.

**Dictamo Passion-flower.** Shrub cl.

23 P. \textit{Normal}is (Lin. amen. 5. p. 498.) leaves glabrous, 3-nerved at the base, somewhat cordate, glandular beneath, somewhat 3-lobed; middle lobe small, lateral ones so much divaricate as to form a straight angle; petals very short, glandless. \( \gamma \), \( \omega \). Native of Jamaica. Brown, jum. p. 328. Flowers small, pale coloured. Fruit purple, downy.

**Normal Passion-flower.** Fl. May, June. Cl. 1771. Sh. cl.

24 P. \textit{Bauhinifolia} (H. B. et Kunth, l. c. p. 132.) leaves downy beneath, and rather glandular, elliptic, rounded at the base, 2-lobed at the apex; lobes obtuse; petals glandless, downy; pedicels solitary or twin, downy. \( \gamma \), \( \omega \). Native of Quito, in temperate places. Flowers small, white.

**Bauhinio-leaved Passion-flower.** Shrub cl.

25 P. \textit{Triquetra} (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 324.) leaves glabrous, glandular beneath, ovate, 3-nerved, equally 3-lobed at the apex; lobes mucronated by a bristle each; petals glandless; pedicels twin. \( \gamma \), \( \omega \). Native of Mexico.

**Three-bridled Passion-flower.** Shrub cl.

26 P. \textit{Miserabilis} (H. B. et Kunth, nov. gen. amer. 2. p. 136.) leaves glabrous, reticulately 3-nerved, cordate, 3-lobed; lobes obtuse, emarginate, and are, as well as the petals, glandless; pedicels solitary. \( \gamma \), \( \omega \). Native of South America, between Turbaco and Carihuela, in very hot places. Flowers small, with a greenish calyx, and violetaceous crown.

**Miserable Passion-flower.** Shrub cl.

27 P. \textit{Coriacea} (Juss. in ann. mus. 6. p. 105. t. 39. f. 2.) leaves smooth, coriaceous, glandular beneath, peltate, 3-lobed; middle lobe obtuse; lateral ones acuminate, 2-nerved; petals biglandular in the middle; pedicels twin. \( \gamma \), \( \omega \). Native of South America, near Honda; and perhaps also in Mexico, according to icon. fl. mex. ined. Flowers small, greenish.

**Coriaceous-leaved Passion-flower.** Shrub cl.

28 P. \textit{Difformis} (H. B. et Kunth, l. c. p. 136.) leaves glabrous, coriaceous, glandular beneath, peltate, somewhat 3-lobed, transversely lanceolate; petals biglandular in the middle; pedicels solitary. \( \gamma \), \( \omega \). Native of New Granada, in temperate places on the Andes. Allied to \textit{P. coriacea}. Perhaps the same as the figure in Henn. mex. p. 435. upper figure. Flowers with a greenish calyx, and violetaceous crown tipped with yellow.

**Deformed Passion-flower.** Shrub cl.

29 P. \textit{Augustifolia} (Swartz, prod. p. 97.) leaves glabrous, glandless, somewhat peltate: lower ones ovate, the rest lanceolate, 2 or 3-lobed; petals short, biglandular above the middle; pedicels solitary or twin. \( \gamma \), \( \omega \). Native of the Caribbean Islands. Ker. bot. reg. t. 189. P. heterophylla, Jacq. hort. schenck. t. 181. \textit{Ciceria heterophylla}, Muench. P. longifolia, Lam. dict. 3. p. 40. Flowers yellowish, with the rays purple at the base.

**Loose-leaved Passion-flower.** Fl. May, June. Cl. 1774. Shrub cl.

30 P. \textit{Maculata} (Scut. ex hort. bon. and Coll. hort. rip. p. 101.) leaves glabrous, deeply 3-lobed, painted with white on the upper surface; lobes nearly equal, oblong, acute: upper ones bluntly trifid, intermediate one rather larger than the others; petals glandless; pedicels solitary or twin, rather pilose. \( \gamma \), \( \omega \). Native of Curasson. Pluk. t. 210. f. 3. Perhaps the same as \textit{P. miniata} of Lin. Flowers greenish.

**Spotted-leaved Passion-flower.** Fl. June, July. Cl. 1820. Shrub cl.

31 P. \textit{Graecica} (Link, enum. hort. belor. 2. p. 182.) leaves subcordate, glandrous, 3-lobed; lobes roundish, beset with 2-4 glands; petals biglandular; peduncles axillary, solitary: fruit egg-shaped. \( \gamma \), \( \omega \). Native country unknown. Lindl. bot. reg. t. 870. Flowers whitish. Rays blue and white.

**Sleuder Passion-flower.** Fl. Aug. Cl. 1823. Shrub cl.

32 P. \textit{Lutea} (Lin. amen. 1. p. 224. t. 10. f. 13.) leaves almost glabrous, cordate, trifid; lobes ovate, mucronate by a bristle, and are, as well as the petals, glandless; pedicels twin. \( \gamma \), \( \omega \). Native of Virginia and Florida, and of the West Indies. Jacq. icon. rar. 3. t. 607. Ker. bot. reg. t. 79. Flowers pale yellow.

**Yellow-leaved Passion-flower.** Fl. May, June. Cl. 1714. Shrub cl.

33 P. \textit{Miniata} (Jacq. hort. vind. t. 29.) leaves glabrous, glandless, 5-nerved, trifid: lobes ovate, middle one drawn out most; petals biglandular at the apex; pedicels twin. \( \gamma \), \( \omega \). Native of South America. Sowerby in Lin. trans. 2. p. 27. t. 5. f. 6. Ker. bot. reg. t. 144. P. hederacea, Lam. Flowers greenish yellow, with white rays. Nectarium fourfold, inner one with an entire brown rim, the outerrenflated, of a dusky purple colour, the other ciliate, with capillary black hairs, with yellow tips; outmost one having the filamentous appendages twice as long as the others, dark purple at the base, and yellow from the middle to the tip.

34 P. \textit{Mirobula} (Lin. amen. 1. p. 227. t. 19. f. 16. exclusive of the synonyms of \textit{Hern.} and \textit{Pluk.}) leaves rather hairy between glands, somewhat 5-nerved, 3 cleft; lobes ovate, middle one much the largest; petiole biglandular above the middle; pedicels twin. \( \gamma \), \( \omega \). Native of the West Indies. Plum. amer. t. 85. A.-B. P. parvifolia, Swartz, prod. p. 97. Flowers whitish.

**Hairy Passion-flower.** Fl. Sept. Cl. 1778. Shrub cl.

35 P. \textit{Suberosa} (Linn. l. c. p. 236. t. 10. f. 14.) leaves glabrous, somewhat ciliated, 5-nerved at the base, ovate, somewhat cordate, usually 3-lobed; lobes ovate, acute: middle one larger than the rest; petioles biglandular above the middle; pedicels twin. \( \gamma \), \( \omega \). Native of the West Indies and South America. Smith, exot. bot. t. 1. t. 28. Plum. amer. t. 84. Jacq. schenck. t. 2. t. 165. Flowers of a greenish yellow colour; crown purple at the bottom. Fruit purple when ripe.

**Cork-barked Passion-flower.** Fl. June, Sept. Cl. 1759. Shrub cl.

36 P. \textit{Felata} (Cay, diss. 10. p. 147. t. 275.) leaves pubescent above, glandless, 3-nerved, rather peltate, 3-lobed beyond the middle; lobes lanceolate, divaricated; petals biglandular in the middle; pedicels solitary. \( \gamma \), \( \omega \). Native of the Antilles, in hedges, as well as in Virginia. Ker. bot. reg. 505.

—Plum. amer. t. 85. Flowers greenish.

37 P. \textit{Hederacea} (Cay. l. c. p. 448.) leaves somewhat pubescent, glandless, 3-nerved, trifid: lobes ovate, obtuse; petals biglandular in the middle; pedicels solitary. \( \gamma \), \( \omega \).
Native of the Antilles, in hedges. Plum. amer. t. 84.

P. farnosum (Smith in Rees’ cycl. no. 28.) leaves clothed with velvety hairs on both surfaces, glandless, cordate, unequally 3-lobed, rarely 2-lobed; lobes obtuse; petioles velutine; pedicels bearing 3 bracteoles each. t. & S. Native of the West Indies. Allied to P. rubra. Flowers small, greenish.

Cloth-leaved Passion-flower. Shrub cl. 49

P. bracteata (Balb. in litt. ex D. C. prod. 3. p. 325.) leaves glabrous, glandless, divided into 3 parts even to the base; leaflets petiolate, trifid, attenuated at the base, and very blunt at the apex; pedicels solitary or twin. t. & S. Native of St. Domingo.

Bertero’s Passion-flower. Shrub cl.

Sect. V. Decaloba (from cecum, deka, ten, and λοβος, lobos, a lobe; in reference to the 10 calyceate lobes). D. C. mem. soc. gen. 1. pt. 2. p. 435. prod. 3. p. 325.—Passiflora, Bory, ann. gen. 2. p. 138. Calyx 10-lobed, the 5 inner are probably petals. Involution wanting or very small, and distant from the flower. Pedicels 1-flowered, rising from the same axis as the simple tendrils.

P. repens (Lin. amm. 1. p. 222. t. 10. f. 9.) leaves velvety, cordate at the base, 2-lobed, with an awn in the recess between the lobes, glandless beneath, and on the petioles; pedicels solitary; ovary hairy, subglobose. t. & S. Native of the West Indies and the adjacent continent. Plum. amer. t. 83. Ker. bot. reg. t. 95. Stem reddish, silky. Flowers of a greenish yellow colour; crown red. Berry red.

P. capsulata (Lin. l. c. p. 231.) leaves downy, cordate at the base, 2-lobed, with an awn in the recess between the lobes, and are, as well as the petioles, glandless, pedicels solitary; ovary elliptic-oblong, and is, as well as the fruit, acutely hexagonal, glabrous. t. & S. Native of the West Indies. Plum. icon. amer. t. 138. f. 2. The flowers are reddish according to Plummer, but according to other authors they are whitish.

Fruit small, purple when ripe. Var. Al. acutidoba (D. C. prod. 3. p. 325.) leaves deeply 2-lobed, hardly pubescent above, painted with white. t. & S. Native of Brazil.

Var. γ. gminifolia (D. C. l. c.) leaves glabrous, hardly cordate at the base; branches triangular; pedicels twin. t. & S. Native of Jamaica. P. capsularis, Smith in Rees’ cycl. no. 22.

P. biflora (Lam. dict. 1. no. 36.) leaves glabrous, glandular beneath, cordate at the base, 3-nerved, truncate, somewhat 2 or 3-lobed; petioles short, glandless; pedicels twin. t. & S. Native of the West India Islands, and South America. P. lunata Smith, icon. pict. t. 1. Ker. bot. reg. 577. P. vespertilio, Lawr. pass. t. 8. Flowers white; rays of crown yellow. The Mexican plant differs in the leaves being roundly cuneate at the base, not cordate, and in the lobes being less divaricate.

Vol. III.

P. Leschenaultii (D. C. prod. 3. p. 326.) leaves semi-ombilicate at the base, somewhat truncate at the apex, tricuspidate, pubescent on the nerves beneath, glandless; petals biglandular in the middle; petaloid twin, 1-flowered. t. & S. Native of the East Indies, among the Neelgherry Mountains, where it is called by the inhabitants cvvaymonko. Bryonia tricuspidata, Lesch. herb. Flowers unknown.

Leschenaultii’s Passion-flower. Shrub cl.

P. geniculata (D. C. l. c.) leaves glabrous, glandular beneath, cuneately-rounded at the base, 3-nerved, truncate at the apex, subtruncate; petals long, glandless, pedicels twin, hardly longer than the petioles. t. & S. Native of the Island of St. Lucia. Flowers party-coloured.

P. Rohrii (D. C. l. c.) leaves nearly glabrous, ovate, somewhat truncate at the base, 3-nerved, blunt and somewhat 3-lobed at the apex; petals biglandular, rather velvety; pedicels solitary. t. & S. Native of Cayenne.

Rohri’s Passion-flower. Shrub cl.

P. penduliflora (Bert. in herb. Balb. ex D. C. l. c.) leaves glabrous, roundly obovate, 3-nerved, glandular beneath; nerves extending beyond the border of the leaf; petals glandless; pedicels solitary; petioles 2-lobed, rarely somewhat 3-lobed; peduncles pendulous, bracteolate beneath the middle. t. & S. Native of Jamaica, on the mountains. Flowers pale; threads of crown few and glabular.

Pendulous-flowered Passion-flower. Shrub cl.

P. hemicycla (Meyer, prim. ess. p. 225.) leaves glabrous, glaucous and glandular beneath, 3-nerved at the base, semicircular, somewhat 3-lobed at the apex; petals pubescent, glandless; pedicels twin, shorter than the petals. t. & S. Native of Guiana, about Essequibo; and of Trinidad. Flowers white.

P. vespertilio (Lin. amm. 1. p. 223. t. 10. f. 11.) leaves glabrous, glandular beneath, 1-nerved, cuneate at the base, divaricately 2-lobed, rarely somewhat 3-lobed; petals very short, glandless; pedicels solitary. t. & S. Native of South America.—Dill. hort. ethl. t. 137. f. 164. Flowers white, small.

P. retusa (Hook. et Arnott, in bot. misc. 3. p. 235.) leaves smoothish, biglandular beneath, cuneate at the base, or rounded, 3-nerved, 3-lobed; lobes mucronulate, middle one truncate, lateral ones divaricate, prolonged; petals glandless; pedicels solitary, exceeding the petals. t. & S. Native of Brazil, on the banks of the Uruguay; and at Santa Borgia. Closely allied to P. vespertilio.

Retusa-leaved Passion-flower. Shrub cl.

P. Maximiliana (Bory, ann. gen. 1819. vol. 2. p. 149. t. 24.) leaves glabrous, divaricately 2-lobed, drawn out a little in the middle, somewhat cordate at the base, red and biglandular beneath; petals glandless; pedicels solitary or twin, longer than the petals. t. & S. Native of Brazil. P. discolor, Link etotto, abh. 1. p. 13. t. 5. Lodl. bot. cab. t. 565. P. vespertilio, Ker, bot. reg. t. 597. This plant differs from P. vespertilio in the leaves being cordate at the base, not cuneate, blood-coloured beneath; and in the pedicels being three or four times longer. Flowers greenish; crown white.

P. Jorullesis (H. B. et Kunth, nov. gen. amr. 2. p. 133.) leaves glabrous, glandular beneath, semi-ombilicate at the base, 3-nerved, truncate at the apex, 2-lobed; petals puberu-
PASSIFLOREÆ. III. PASSIFLORA.

Faults and glandless; pedicels twin.  h. S. Native of Mexico, on the burning Mount Jorullo. Flowers greenish?

Jorullo Passion-flower. Shrub cl. 53 P. sievoides (Schlecht. et Cham. in Linnaea. vol. 5. p. 88.) leaves cordate, 3-lobed, sharply subdentate or quite entire, glaucous beneath, hairy, biglandular in the recesses, smoothish above; lobes triangularly acuminate, middle lobe the longest; petals hairy, biglandular in the middle; glands large, ciliate; stipular half ovate, cuspitudate acuminate; peduncles twin; bracteas filiform, small, approximating the flower.  h. S. Native of Mexico, in woods near Jalapa. Flowers pale. Habit of Bopyrnia.

Siyous-like Passion-flower. Shrub cl. 54 P. elongata (Swartz, prod. p. 97.) leaves glabrous, glandular beneath, oblong, rounded at the base, 3-nerved, 3-lobed at the apex; petals glandless; pedicels solitary.  h. S. Native of Jamaica, among bushes. P. elongata, Poir. suppl. 2. p. 839.

55 P. lyrifolia (Tuss. ant. t. 4.) leaves glabrous, glandular beneath, ovate at the base, 3-nerved, 3-lobed at the apex; lobes oblong, acute, middle lobe very small; petals glandless; pedicels solitary or twin.  h. S. Native of South America. Probably sufficiently distinct from the preceding and following species.

56 P. tuberosa (Jacq. Hort. sjenbr. t. 496.) leaves glabrous, glandular beneath, rounded at the base, 3-nerved, 3-lobed at the apex; lobes oblong, acute, middle lobe very small; petals glandless; pedicels twin; branches of root tuberos.  h. S. Native of South America. Ker, bot. reg. t. 432. P. punctata, Lodd. Bot. cab. t. 110. Lower leaves usually painted with white on the upper surface. Flowers greenish white; outer crown at the base, tipped with purple and white. Style purple.

57 P. rotundifolia (Lin. l. c. p. 235.) leaves rather glandular, velvety beneath, nearly orbicular, 3-nerved, 3-lobed; petals glandless; pedicels twin; berries globose, hairy.  h. S. Native of the Antilles. Plum. Icon. amer. t. 138. f. 1. Cav. diss. t. 290. Flowers white.

Var. β, Jacquinii (D. C. l. c.) leaves glabrous beneath; pedicels solitary; leaflets of involucrum ovate.  h. S. Native of Carthagena, in the woods. P. rotundifolia, Jacq. obs. t. 46. f. 1. Petals whitish; rays of crown yellow.

58 P. antronifolia (H. B. et Kunth, nov. gener. amer. 2. p. 136.) leaves puberulous beneath, glandular, ovate, roundly truncate at the base, 3-nerved, roundly 3-lobed at the apex; middle lobe emarginate; petals glandless, and are, as well as the pedicels, downy, and twin; berries spherical, glabrous.  h. S. Native of South America, on Mount Quindiu, at the river Cuello. Flowers large.

Adler-leaved Passion-flower. Shrub cl.

59 P. obtusae; leaves 3-lobed, somewhat cordate, truncate, velvety; lateral lobes divericate; intermediate one obsolete, emarginate; petals emarginate, shorter than the calyx; tube of calyx rotate, depressed; inner crown pubescent, plicate, lying on the base of the stipe, in the disc, outer crown radiate; ovarium vilous.  h. S. Native of the north-eastern coast of South America, but in what place we gathered it is now forgotten. Flowers small, pale green, with a downy pedicel: the inner crown is downy and purple: the outer crown has its lower half purple, and its upper white. This species seems to come nearest to P. antronifolia of Bonpland.

Obscura Passion-flower. Fl. Aug. Nov. Clt. 1823. Sh. cl. 60 P. mollis (H. B. et Kunth, l. c. p. 137.) leaves concescent beneath, glandular, ovate-cordate at the base, 3-nerved, 3-lobed at the apex: lateral lobes very small; petals glandless, and are, as well as the pedicels, pubescent; pedicels twin; berries globose, puberulous.  h. S. Native of South America, on Mount Quindiu. Flowers not seen.

Soft Passion-flower. Shrub cl.

61 P. punctata (Lin. amen. 1. p. 224. t. 10. f. 12.) leaves glabrous, transversely oval, glandular beneath, 3-nerved at the base, and emarginately cordate, very bluntly 3-lobed at the apex; petals glandless; pedicels solitary, longer than the petals.  h. G. Native of Peru. Feuil. per. 2. t. 11. Flowers with whitish petals: and violet rays, tipped with yellow.

Dotted-leaved Passion-flower. Shrub cl.

62 P. erythronoides (H. B. et Kunth, l. c. p. 140.) leaves hispid, cordate at the base, 3-nerved, palmately 3-lobed, sharply-toothed; petals biglandular at the apex, hairy; pedicels hairy, twin; berries elliptic, glabrous.  h. S. Native of Mexico, near Santa Rosa. Flowers greenish.

Bryony-like Passion-flower. Shrub cl.

SECT. VI. GRANADELLA. (Granadilla or Granadille is the French name of some Passion-flowers, so called from the resemblance of the fruit, in size and colour, to a pomegranate, with this difference, that it is not crowned by the calyx). D. C. in mem. soc. gen. 1. pt. 2. p. 435. prod. 3. p. 327. — Anthocinia, Bory, ann. gen. 2. p. 138. Involucrum 3-leaved under the flower; leaflets entire or toothed, never jagged. Calyx 10-lobed; the 5 inner lobes are probably petals. Pedicels 1-flowered, rising from the same axis as the teardrops, which are simple.

* Pedicles entire.

63 P. serratofolia (Lin. amen. 1. p. 217. t. 10. f. 1.) leaves pubescent beneath, ovate-lanceolate, acute, serrulated, feather-nerved; petals bearing 4 glands, and are, as well as the pedicels, pubescent.  h. S. Native of South America. Cav. diss. t. 279. Sims, bot. mag. t. 651. Jacq. hort. sjenbr. 1. p. 4. t. 10. Mart. dec. 4. t. 36. Flowers with purple petals, and the filaments of the crown pale purple at the base, and from thence bluish.

64 P. nitida (H. B. et Kunth, l. c. p. 130.) leaves glabrous, oblong-elliptic, acuminate, serrulaté, feather-nerved; petals biglandular.  h. S. Native in woods about the Orinoco. Very nearly allied to the preceding species. Flowers about the size of those of P. corvula, with a reddish calyx: crown with blue filaments, ringed with white.

Shining-leaved Passion-flower. Shrub cl.

65 P. guazuméolzæ (Juss. ann. mus. 6. t. 39. f. 1.) leaves glabrous, ovate-oblong, acuminate, denticulated; petals biglandular; crown one-half shorter than the calycine lobes.  h. S. Native of New Granada, in very hot places. Flowers large, with a whitish calyx.

Guazuma-leaved Passion-flower. Shrub cl.

66 P. coccineæ (Aubl. guian. 2. t. 224.) leaves glabrous, ovate, coarsely toothed, acutish; petals bearing 4-5 glands; bracteas ovate, sub serrated, velvety.  h. S. Native of Guiana, where it is also cultivated; and Maranham, in Brazil. Cav. diss. t. 280. Flowers scarlet, with orange-coloured rays. Fruit full of juicy sweet edible pulp.
PASSIFLORÆ. III. Passiflora.

67 P. vetusta (D. C. prod. 3. p. 327.) young leaves pubescent, at length glabrous, cordate, acutish, minutely lobed, serrated; petioles biglandular; bracteas glandularly serrated. S. Native of Brazil. Allied to P. cocinea. Flowers perhaps red or scarlet.

Velvet Passion-flower. Shrub cl.
68 P. glandulosa (Cav. diss. t. 281.) leaves glabrous, ovate, coarsely toothed, acutish; petioles biglandular; bracteas entire, biglandular at the base. S. Native of Cayenne. Taeṣōnia glandulosa, Spreng. syst. 3. p. 43. Fruit the size of a hen's egg.

Glandular Passion-flower. Shrub cl.
69 P. mecononata (Lam. dict. 3. p. 33.) leaves glabrous, ovate-cordate, obtuse, entire; petioles biglandular; stipulas broad-ovate, awned; bracteas oblong, serrate-crenated. S. Native of Brazil, at Rio Janeiro. Cav. diss. t. 282.

70 P. maliformis (Linn. amoen. 1. p. 220. t. 10. f. 5.) leaves glabrous, ovate, somewhat cordate at the base, acuminate, entire; petioles biglandular; bracteas ovate, acute, joined at the base, larger than the flower. S. Native of St. Domingo, Porto-Rico, &c. Plum. icon. amer. t. 82. Ker, bot. reg. t. 94. Leaves long and broad. Flowers sweet-scented, and beautiful, of various shades; the petals white, and the rays blue; the outer divisions of flowers are red. This species is called the apple-flowered Granadilla or sweet calabash. The fruit round, smooth, about 2 inches in diameter, of a dingy yellow-colour when ripe; the coat is hard and stringy, nearly a quarter of an inch in thickness, half of very agreeable gelatinous pale yellow pulp, which is eaten with wine and sugar.

71 P. tiliifolia (Linn. amoen. 1. p. 219. t. 10. f. 4.) leaves glabrous, cordate, entire, acute; petioles glandless; stipulas and bracteas entire, oval, acuminate. S. Native of Peru. Fertil. per. 2. t. 12. Flowers red; rays crimson, with a white line. Fruit globose, variegated with red and yellow, containing a sweet watery pulp. (f. 4.)

72 P. serratiflora (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 328.) leaves glabrous, cordate, acute, entire; petioles bearing 4 glands; stipulas and bracteas ovate, acute, serrated. S. Native of Mexico. Fruit edible.

Serrate-stipuled Passion-flower. Shrub cl.
73 P. ligulata (Juss. ann. mus. 6. t. 40.) leaves glabrous, cordate, acuminate, entire; petioles bearing 4-6 glands; stipulas and bracteas ovate-lanceolate, acuminate; bracteas ovate, entire. S. Native of Peru. Flowers party-coloured.

74 P. quadrangularis (Lin. spec. 1356.) leaves glabrous, cordate at the base, ovate, acuminate; petioles bearing 4-6 glands; stipulas ovate, and are, as well as the bracteas, entire; branches tetragonally winged. S. Native of Jamaica and South America. Ker, bot. reg. t. 14.—Jaq. amer. t. 143. pict. 218. Flowers highly odoriferous; calycine lobes white within; petals of the same shape, red within, and white outside. Crown 5-fold; outer rays in a double row, longer than the petals, round, white, and variegated with violet. The common granadilla or granadilla vine bears large fruit, of an oblong shape, about 6 inches in diameter, and 15 inches in circumference. It is externally of a greenish yellow, when ripe soft and leathery to the touch, and quite smooth; the rind is very thick, and contains a succulent pulp of a purple colour, which is the edible part. Wine and sugar are commonly added to it. The flavour is sweet and slightly acid, and is very grateful to the taste, and cooling in a hot climate. It has been successfully cultivated for its fruit in a few places in this country.

Var. β. sulcata (D. C. prod. 3. p. 328.) fruit furrowed transversely.

Cultivation of Granadilla (P. quadrangularis). Mr. Mitchell keeps a plant in a box 18 inches square, fixed on a level with the curb in one corner of a tan-pit. The sides of the box are perforated, to admit the roots to run among the tan, and the shoots are trained like vines, under the rafters. In autumn the shoots are pruned back to within two or three eyes of the old wood; and in March following, or just before the plant begins to break, it is taken out of the box, the root and ball reduced, and repotted in fresh compost. Abundance of water in the flowering season enables the plant to set its fruit without artificial impregnation. A strong plant will produce 40 fruits in a season in regular succession, from the end of June till Christmas. Half that number will grow to a larger size. Gard. mag. 2. p. 203. The Pass. lavrjolía and Pass. edulis may be cultivated in the same way for their fruit.

75 P. mauritiana (Pet. Th. ann. mus. 6. p. 65.) leaves glabrous, cordate at the base, ovate, acuminate; petioles bearing 4-6 glands; bracteas lanceolate, acuminate, denticulated.

Mauritius Passion-flower. Shrub cl.
76 P. alata (Att. iort. kew. 3. p. 306.) leaves glabrous, somewhat cordate, ovate, acute; petioles bearing 4 glands; stipulas lanceolate falcate, somewhat serrated; pedicels terete; branches tetragonally winged; bracteas a little toothed. S. Native of Peru. Sims, bot. mag. t. 66. Sowery in Lin. trans. 2. p. 23. t. 3. f. 6. Flowers very sweet-scented, the upper side of the calyx and petals deep crimson; rays variegated with purple, white, and crimson.

77 P. latifolia (D. C. prod. 3. p. 328.) leaves glabrous, broadly cordate, acuminate; lateral nerves approximate at the middle of the base; petioles glandular; stipulas and bracteas oval-oblong, entire; branches terete. S. Native of Peru. Flowers pale red.

Broad-leaved Passion-flower. Shrub cl.
78 P. albida (Ker, bot. reg. 677.) leaves glabrous, roundish-cordate, entire; petioles biglandular in the middle; stipulas ovate-lanceolate, setosely apiculated; bracteas approximating the flowers, soon falling off; pedicels twice the length of the leaves. S. Native of Brazil, near Rio Janeiro. Flowers white, not pale red as in the preceding. Column inclined. Staminodia second. Crown yellowish.

79 P. ornata (H. B. et Kunth, nov. gen. amer. 2. p. 129.) leaves glabrous, ovate-elliptic, acute, crenulatæ; petioles big-
Passifloræ. III. Passifloræ.

Passion-flower. S. Native of New Granada, in temperate places. Flowers white, with blue rays mingled with white.

Plumed Passion-flower. Shrub cl. 80 P. longipes (Juss. ann. mus. 6. t. 33. f. 1.) leaves glabrous, oval-lanceolate, somewhat cordate at the base, entire; petioles biglandular at the apex; stipulas and bracteas lanceolate; pedicels twice the length of the leaves. 8. S. Native of New Granada, on Mount Quindiu. Flowers about the size of those of P. coccinea, pale red.

Long-stalked Passion-flower. Shrub cl. 81 P. laurifólia (Lin. l. c. p. 229. t. 10. f. 6.) leaves glabrous, ovate-oblong, entire; petioles biglandular at the apex; stipulas setaceous, length of petioles; bracteas ovate-oblong, glandularly serrated at the apex. 8. S. Native of the West Indies Islands and South America. Used to be called also water-loen. The flowers are red and violet and sweet-scented; the fruit about the size of a hen’s-egg, but rather more elongated, and tapering equally at both ends; when ripe it is yellow, and dotted over with white spots. It contains a whitish watery pulp, which in the West Indies is usually sucked through a small hole made in the rind, which is tough, soft, and thin; the juice has a peculiar aromatic flavour, is delicately acid, and allays thirst agreeably.

Laurel-leaved Passion-flower or Granadilla. Fl. June, July. Shrub cl. 82 P. tinnifólia (Juss. 1. c. t. 41. f. 2.) leaves glabrous, oblong, entire; petioles biglandular in the middle; stipulas setaceous; bracteas oblong, hardly crenated. 8. S. Native of Cayenne, and about Essequibo. Very like P. laurifólia. Times-leaved Passion-flower. Fl. July. Sh. cl. 83 P. acumináta (D. C. prodr. 3. p. 328.) leaves glabrous, ovate-lanceolate, acuminate, entire; petioles biglandular at the apex; bracteas oblong, obtuse, entire. 8. S. Native of Brazil.

Acuminated-leaved Passion-flower. Shrub cl. ** Leaves lobed, parted, or cut to the base.

84 P. indecora (H. B. et Kunth, l. c. p. 131.) leaves puberulous beneath, rather glandular, semi-ornicicular, lunate, subcordate; lobes ovate, divaricate; petioles glandless, pubescent; stipulas linear, pubescent; bracteas ovate. 8. S. Native of New Granada, in temperate places. Perhaps belonging to the section Deciduæ.

Indecorous Passion-flower. Shrub cl. 85 P. fulchílæa (H. B. et Kunth, l. c.) leaves glabrous, somewhat glandular, semi-ornicicular, truncate 2 or 3-lobed; petioles glandless; stipulas linear-subulate; bracteas oblong, large, entire. 8. S. Native of South America, in the province of Caracass. Flowers white, with yellow rays ringed with blue.

Neat Passion-flower. Shrub cl. 86 P. racemósas (Brot. in Lin. trans. 12. t. 6.) leaves quite glabrous, rather peltate, glaucous beneath, for the most part 3-lobed; petioles usually bearing 4 glands; pedicels twin, forming terminal racemes, in consequence of the upper leaves being abortive. 8. S. Native of Brazil. Sims, bot. mag. 2001.

P. princeps, Lodd. bot. cab. t. 84. Flowers of a deep red or scarlet colour. Racemes pendulous. There is a variety having the outer ray of the crown white.

Blood-coloured-flowered Passion-flower. Fl. Ju. Oct. Clt. Shrub cl. 88 P. cártilleo-racemosæ (Sah. in Hort. trans. 4. p. 758. t. 9.) leaves quite glabrous, rather coriaceous, 3-5-lobed; lobes undulat, somewhat toothed at the base; petioles bearing 4 glands; pedicels axillary, solitary, 1-flowered. 8. S. A hybrid raised from the seed of P. racemósas, impregnated by the pollen of P. cártillea. Like the male parent, it will live throughout the winter in the open ground, with a little protection in severe weather. Lodd. bot. cab. t. 573. Flowers purple.

Blue-racemosae Passion-flower. Fl. June, Oct. Hybrid 1820. Shrub cl. 89 P. álato-cártilleo (Lindl. bot. reg. t. 848.) leaves glabrous, cordate, 3-lobed; lobes quite entire, ovate-lanceolate; petioles bearing 2-4 glands; stipulas auriculate, acuminate, the petioles terete, much longer than the pedicels; branches quadrangular. 8. S. A hybrid, raised from the seeds of P. álata, impregnated by the pollen of P. cártillea. Lobes of calyx rose-coloured on the outside. Petals white inside. Crown triple; outer filaments appendages variegated with black, blue, and white.

Winged-blue Passion-flower. Fl. June, Oct. Hybrid 1823. Shrub cl. 90 P. stipuláta (Aubl. guian. 2. p. 325.) leaves glabrous, glaucous beneath, cordate at the base, 5-nerved, trifid; lobes ovate, entire; petioles bearing 2-4 glands; stipulas oblong, somewhat auricled, macronate, and as are also the bracteas entire; peduncles about equal in length to the petioles. 8. S. Native of Cayenne and Brazil; and of Mexico, near Jalapa. P. glandula, Ker. bot. reg. t. 88, but not of Humb. Flowers whitish; crown variegated with purple and white.

Stipulata Passion-flower. Fl. Aug. Sept. Clt. 1779. Sh. cl. 91 P. raddiána (D. C. prodr. 3. p. 329.) leaves glabrous, somewhat cordate at the base, 5-nerved, trifid; lobes ovate, glandelary subcarnass at the base; petioles bearing 2 glands in the middle; stipulas ovate, dimidiate, awned; peduncles 4 times longer than the petioles. 8. S. Native of Brazil, where it was detected by Raddi.

Raddi's Passion-flower. Shrub cl. 92 P. álæa (Link. et Otto. abd. t. 33.) leaves glabrous, glaucous beneath, somewhat cordate at the base, 5-nerved, 3-lobed; lobes ovate, somewhat glandularly serrated at the base; petioles biglandular in the middle; stipulas cordate; superior peduncles longer than the petioles. 8. S. Native of Brazil. Flowers white. Very nearly allied to P. Raddiana.

White-flowered Passion-flower. Shrub cl. 93 P. setácea (D. C. l. c.) leaves velvety beneath, 3-nerved at the base, somewhat cordate, trifid; lobes ovate-oblong, acute, serrulat; petioles velvety, biglandular at the base; bracteas ovate, acuminate, ciliately serrated. 8. S. Native of Brazil, near Rio Janeiro.

Setacea-bracteae Passion-flower. Shrub cl. 94 P. menispermiális (H. B. et Kunth, nov. gen. amer. 2. p. 137.) leaves hairy beneath, pubescent above, roundish-cordate, angularly 3-lobed, sharply toothed; petioles hairy, usually bearing 4 glands; stipulas large, dimiditarily subcoriaceous, awned,
hence toothed on one side. $\beta, \varphi$. Native of South America, near Jaen de Bracamores. Flowers unknown.

Moon-seed-leaved Passion-flower. Shrub cl.

93 P. Siphonanthus (Ort. dec. 6. p. 78.) leaves glabrous, cordate, 3-lobed; lobes serrated; middle lobe more extended than the side ones; petals bearing 2-4 glands in the middle; stipulas semi-cordate, mucronate; bracteas cordate. $\beta, \varphi$. Native of New Spain.

Subulata-leaved Passion-flower. Shrub cl.

96 P. puncna (Ruiz et Pav. inded. ex D. C. prod. 3. p. 329.) leaves velvety beneath, rather scabrous above, 5-nerved, broadly subcordate, trifid; lobes sharply serrated, acute; petals velvety, glandless; stipulas setaceous; bracteas ovate, serrated. $\beta, \varphi$. Native of South America, probably of Peru. Flowers scarlet. Agreeing in habit with Tac sahia.

Scarlet-flowered Passion-flower. Shrub cl.

97 P. Incarnata (Lin. amon. 1. p. 230. t. 10. f. 19. a. c.) leaves glabrous, somewhat constricted at the base, 5-lobed, deeply trifid; lobes lanceolate, serrated; petals biglandular at the apex; stipulas small; bracteas glandularly serrated; ovarium villous. $\beta, \varphi$. Native of South America and Virginia, Abl. hort. farr. t. 50. 52. 58. Mor. ex. 2. p. 6, sect. 4. t. 1. f. 9. Calycine lobes; ovarium glabrous. $\beta, \varphi$. Native of Brazil. Flowers white. Fruit purple, edible. Purple-fruited Passiflora, Sab. in hort. trans. 3. p. 99. t. 3. Purple-fruited Granadilla, Sab. The flowers are fragrant, of a white colour tinged with purple. The fruit changes to a dark livid purple on becoming ripe, and much resembles the fruit of the purple eggplant. The shape is elliptic, an inch and a half in diameter, and 2 inches from the stalk to the top; the pulp is orange-coloured, and the seeds numerous; the taste acid, and the flavour somewhat like that of an orange. It produces fruit abundantly in stores.

98 P. edulis (Sims, bot. mag. t. 1893.) leaves glabrous, 3-lobed, serrated; petals biglandular at the apex; bracteas glandularly serrated; crown about equal in length to the calycine lobes; ovarium glabrous. $\beta, \varphi$. Native of Brazil. Flowers white. Fruit purple, edible. Purple-fruited Passiflora, Sab. in hort. trans. 3. p. 99. t. 3. Purple-fruited Granadilla, Sab. The flowers are fragrant, of a white colour tinged with purple. The fruit changes to a dark livid purple on becoming ripe, and much resembles the fruit of the purple eggplant. The shape is elliptic, an inch and a half in diameter, and 2 inches from the stalk to the top; the pulp is orange-coloured, and the seeds numerous; the taste acid, and the flavour somewhat like that of an orange. It produces fruit abundantly in stores.

99 P. Serrulata (Jacq. obs. 2. t. 46. f. 2.) leaves glabrous, 3-lobed, finely serrated; lobes oblong, middle one the longest; petals biglandular in the middle; bracteas entire. $\beta, \varphi$. Native of South America, in the woods of Carthagena. Flowers variegated with crimson and white, sweet-scented, 2½ inches wide.

Serrulata-leaved Passion-flower. Shrub cl.

100 P. Cuneifolia (Cav. dis. 10. t. 292.) leaves glabrous, 3-lobed, serrated; lobes ovate, acuminate; petals biglandular; bracteas large, ovate, entire; crown 3 times longer than the calyx. $\beta, \varphi$. Native of South America.

101 P. Triploa (Ruiz et Pav. ined. ex D. C. prod. 3. p. 330.) leaves glabrous, cordate, 3-lobed; lobes ovate-elliptic, obtuse, somewhat dentilicate; petals biglandular at the apex; stipulas ovate-cordate, dentilicate; bracteas large, ovate, mucronate. $\beta, \varphi$. Native of Peru.

Three-lobed-leaved Passion-flower. Shrub cl.

102 P. vitrifolia (H. B. et Kunth, nov. gen. amer. 2. p. 138.) leaves downy beneath, cordate, deeply 3-lobed; lobes ovate, acuminate, sharply toothed, with the sinuses biglandular; petals biglandular at the base, pubescent; bracteas glandularly toothed. $\beta, \varphi$. Native of South America, on the banks of the rivers Magdalena and Cassiquiarens. Flowers yellowish; outer crown orange-coloured; inner crown white.

103 P. filosa (Ruiz et Pav. inded. ex D. C. prod. 3. p. 330.) plant biped from rigid hairs; leaves cuneate at the base and cordate, 3-lobed; lobes coarsely toothed, ovate-lanceolate; petals biglandular; stipulas ovate-cordate; bracteas oblanceolate, ciliated. $\beta, \varphi$. Native of Mexico. (v.s. in herb. Lamb.)

Pilos Passion-flower. Shrub cl.

104 P. Adenopyga (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 330.) leaves glabrous, cordate at the base, 5-nerved, 3-lobed; lobes ovate, acuminate, somewhat serrated; petals bearing 2 pedicellate glands; bracteas deeply serrated. $\beta, \varphi$. Native of Mexico.

Stalked-glanded Passion-flower. Shrub cl.

105 P. filamentosa (Cav. dis. 10. t. 294.) leaves glabrous, 5-parted, serrated; petals biglandular at the middle; bracteas serrated longer than the calyx or nearly equal to it. $\beta, \varphi$. Native of South America. Sims, bot. mag. 1923. Flowers with whitish petals and blue crown, coloured very like those of P. caerulea.

106 P. Palma (Lodd. bot. cab. no. 97. Link, ennum. 2. p. 183.) leaves glabrous, palmately 5-parted, somewhat serrated; serratures glandular; crown a little shorter than the calyx. $\beta, \varphi$. Native of Brazil. P. filamentosa $\beta$, Ker. bot. reg. 584. Flowers the size of those of the following species; bluish; crown variegated with blue, purple, and white.

107 P. cereum (Lin. amon. 1. p. 231. t. 10. f. 20.) leaves glabrous, 5-parted; lobes oblong, quite entire; petals bearing 4 glands at the apex; stipulas fallac; bracteas ovate, entire; crown shorter than the calyx. $\beta, \varphi$. Native of Brazil and Peru. Curt. bot. mag. t. 28. Herb. amat. t. 102. Sowerby in Lin. trans. 2. p. 25. t. 4. t. 4. Calycine segments pale greenish white; the petals are nearly of the same shape and size. Styles purplish. Rays of the crown in two circles, purple at bottom, white in the middle, and blue at the ends. Fruit egg-shaped, size of a Mogul plum, yellow when ripe. The flowers have a faint scent, and continue but one day, like many other species of this genus. This is the only kind which can be considered truly hardy.

Var. $\beta$, angustifolia; lobes of leaves narrow; plant flowering later than the species. A hybrid.

Var. $\gamma$, glaucophylla; leaves glaucous beneath.

Var. $\delta$, Codileu (Sweet, fl. gard. t. 126.) leaves of oblong-lanceolate, serrated; petals biglandular at the apex; stipulas rather lunate, serrately ciliated; bracteas ovate, obtuse, serrated; threads of crown rather shorter than the corolla. $\beta$. A hybrid. Flowers whitish; petals tinged with blue; outer crown variegated with purple, white, and blue.

108 P. Serrata (Lin. amon. 1. p. 232. t. 10. f. 21.) leaves glabrous, 7-parted, 7-nerved; lobes serrated; petals bearing 4 glands; bracteas joined to the middle, acute, entire. $\beta, \varphi$. Native of Martinique. Plum. amer. t. 79. Petals white-coated. Crown variegated with purplish violet and white.

PASSIFLOREÆ. III. PASSIFLORA.

109 P. LOUREI (Lam. dic. 3. p. 30.) stem, petioles, and leaves clothed with soft velvety down on both surfaces; leaves truncate at the base, 5-nerved, trifid; lobes ovate-acuminate, somewhat dentate. Ψ. Native of the West India Islands. P. fe'tida, var. α, Lin. amoen. 1. p. 228. t. 10. f. 17. Plam. ans. 186. P. gossypifolia, Desv. in Ham. prod. p. 48. — Giseck, icon. fasc. 1. t. 20. Flowers whitish. Plant setid when bruised.

114 P. fe'tida (Cav. diss. 10. t. 289.) stems and petioles hispid; leaves villous on both surfaces, 5-nerved, cordate at the base, 3-lobed; lobes nearly entire, lateral ones very short, middle one acuminate. Φ. or Χ. Native of the Caribee Islands and South America. Sims, bot. mag. 2619. Ker.

115 P. ACRIFLÓLIA (Schlecht. et Cham. in Linnaea. 5. p. 89.) The whole plant scurfy from hairs; leaves deeply cordate, pedately 5-7-nerved, cuneate within the recesses, 5 and sometimes 7-lobed; paler and glandless beneath; lobes acuminate, subserrate; teeth mucronate; petioles biglandular at the apex; glands stipitate, recurved at the apex; stipulas semi-ovate, serrately toothed; teeth subulate; peduncles twine, involuted in the middle; involucrum multifidly jagged, hardly glandular. Ψ. Native of Mexico, in woods near Jalapa. Flowers a little larger than those of P. fe'tida.

Sycamore-leaved Passion-flower. Shrub cl.

116 P. ciliāta (Ait. hort. kew. 3. p. 310.) stem glabrous; petioles rather pilose; leaves glabrous, somewhat 5-nerved, cordate at the base, trifid; lobes acuminate, ciliated. Ψ. Native of Jamaica. Curt. bot. mag. t. 288. Petals greenish on the outside and red within. Rays of crown variegated with white and purple. Stipe of ovary deep purple, with darker spots.

† Species not sufficiently known.

* Leaves entire.

117 P. APPENDICULATA (Meyer, essq. p. 223.) leaves glabrous, glandular beneath, 3-nerved, rounded from the base, oblone, mucronate; petioles biglandular, puberulous; pedicels, shorter, than those of the involucrum wantin. Ψ. Native of Guiana, in shady sandy places. Perhaps belonging to either section Cica or Decaloba.

Appendiculate Passion-flower. Shrub cl.

118 P. CYATOPHORA (Desv. in Ham. prod. p. 48.) leaves oblong-lanceolate, undivided, undulated and narrowed in the middle, mucronulate, 3-nerved, subcordate at the base, quite glabrous above and nerve, glanecescent beneath; petals biglandular; glands large, lateral, hollow, cup-shaped, usually twine; involucrum wanting. Ψ. Native of Guiana. Perhaps belonging to section Cica or Decaloba.

Cup-bearing Passion-flower. Shrub cl.

119 P. FÉRIFRÓSUS (D. C. prod. 3. p. 331.) leaves glabrous, ovate, acuminate, feather-nerved; petioles biglandular; pedicels solitary; fruit pear-shaped. Ψ. Native of Brazil.

Pear-shaped-fruited Passion-flower. Shrub cl.

120 P. lanceolātata (Desv. in Ham. cl. c.) branches compressed, angular, ciliated with down; leaves lanceolate, acute, mucronulate, rounded at the base, with the sides subscurfurled, pilose on both surfaces, quite entire; petals biglandular; pedicels two, capillary; fruit on a long pedicel. Ψ. Native of the Antilles. Flowers scarlet. The rest unknown.

Lanceolate-leaved Passion-flower. Shrub cl.

121 P. tetraedrāta (D. C. prod. 3. p. 331.) leaves ovate, quite entire? petals bearing 4 glands; bracteas toothed; stem tetragonal, membranous. Ψ. Native of Brazil. Vand. fl. lus. et bras. in Reeve. script. 148. Perhaps P. aletta or P. quadrangulāris.

Four-glanded Passion-flower. Shrub cl.

122 P. TRIKOROMÉFÓLIA (D. C. prod. 4. p. 331.) stems erect; leaves cordate, ovate, acuminate, unequally serrated, rather puberulous; calyx double; petals spatulate. Ψ. Native country unknown. Flowered in the Botanic Garden at Schenbr. P. guazumae夕阳ia, Jacq. fragm. p. 18. but not of Juss. This plant perhaps belongs to a different genus, not belonging to this order.
Cacao-leaved Passion-flower. Shrub 4 to 6 feet. 123 P. Cochin-chinensis (Spreng. syst. app. p. 316.) leaves opposite, glabrous, ovate, undivided, quite entire; petioles biglandular; flowers axillary, twin, 5-cleft; berry ovate. h, u, G. Native of Cochin-china, among bushes. P. pallida, Lour. coch. p. 527. This species differs from all the other Passifloras in the opposite leaves; it is perhaps therefore a species of *Malpighia*. Flowers large, pale.

Cochin-china Passion-flower. Shrub cl.

124 P. SINGAPORENSIS (Wall. cat. no. 1232.) leaves glabrous, oblong; the rest of the plant unknown. h, u, S. Native of Singapore, in the East Indies. Like P. laurifolia. Singapore Passion-flower. Shrub cl.

125 P. PENANGIANA (Wall. cat. no. 1233.) leaves ovate-oblong, entire, acuminate; tendrils trifid. h, u, S. Native of Penang. Flowers unknown.

Penang Passion-flower. Shrub cl.

* * * Leaves 2-lobed.

126 P. LUNATA (Juss. herb. ex D. C. prod. 3, p. 331.) leaves rather downy beneath, glandular, 3-nerved, ovate at the base, lunately truncate at the apex; nerves ending each in a bristle; petioles glandless; pedicels thin; bracteas linear. h, u, S. Native of Peru. Perhaps belonging to the section *Cicca* or *Decaloba*.

Moon-shaped-leaved Passion-flower. Shrub cl.

127 P. CONTRAYRÆVA (Smith, in Rees' cycl. no. 23.) leaves glabrous, deeply 2-lobed; lobes oblong, obust, hardly diverging; calyx multifid. h, u, S. Native of Mexico—Hern. mex. p. 501. lower figure. Allied to *P. Mexicana* and *P. Dicot.*, but differs from them in the flowers being multifid, not 5-cleft. The root is famous for its medicinal virtues, being sweetish with some pungency and fragrance, and is considered a powerful counterpoison, deobstirum, cordial, &c.

Contrayræa Passion-flower. Shrub cl.

128 P. CUNÉATA (Willd. enm. p. 696.) leaves glabrous, glandular beneath, cuneated at the base, somewhat 2-lobed at the apex, with a mucrone between the lobes; petioles glandless; pedicels thin; calyx 10-cleft, the 5 inner divisions are called petals. h, u, S. Native of Caracas. Perhaps belonging to section *Decaloba* or *section Granadilla*.

129 P. bicorrinis (Mill. dict. no. 15.) leaves glabrous, stiff, 2-lobed; pedicels long, horizontal; fruit oval. h, u, S. Native of South America, at Cardagena. Flowers small, white.

Two-horned-leaved Passion-flower. Shrub cl.

130 P. cypriola (In Rees' cycl. no. 20.) leaves petiolate, glandular beneath, 5-7-nerved, reticulately veined, 2-lobed, furnished with a mucrone between the lobes; pedicels bearing 2 or 4 glands. h, u, S. Native of New Granada. Flowers unknown.

Buckler-leaved Passion-flower. Shrub cl.

* * * Leaves 3-lobed.

131 P. CEPHALÉMA (Bory, ann. gen. 2, p. 152. t. 22. f. 2.) leaves glabrous, rather glandular beneath, somewhat 3-lobed, margined at the base; lobes divaricate, linear, obtuse; rounded; petioles very short, biglandular beneath the middle. h, u, S. Native country unknown, and has never flowered in the gardens of Europe.

Headed-flowered Passion-flower. Cl. 1826. Shrub cl.

132 P. MULTIFLORUM (Jacq. fragm. no. 169. t. 67. f. 1.) leaves glabrous, wrinkled beneath, cordate at the base, simple, 2 or 3-lobed, acuminate, very minutely serrated; petioles biglandular. h, u, S. Native of South America, at Caracas. Willd. enm. 637. Flowers unknown. The plant agrees with *P. inescarnita* in the shape of the leaves.

Many-formed Passion-flower. Cl. 1820. Shrub cl.

133 P. HETEROPHYLLA (Lam. dict. 3, p. 41.) leaves glabrous, acute, lower ones lanceolate, nearly sessile; middle ones on short petioles, 3-parted; upper ones pedate, in consequence of the petiole being branched at the apex; tendrils wanting; pedicels solitary, without an involucrum; calyx 10-lobed, or the 5 inner lobes, so called, are petals. h, u, S. Native of St. Domingo. Plum. ed. Burm. t. 139. f. 1. Perhaps belonging to section *Decaloba* or section *Astrophyta*. Flowers yellowish.

Variable-leaved Passion-flower. Cl. 1817. Shrub cl.

134 P. HERMANI (D. C. prod. 3, p. 332.) leaves velvety, 5-lobed; involucrum small, of 3 entire leaflets; calyx 10-parted. h, u, S. Native of Curacao. Flowers white. Allied on one hand to *P. kirskit* and on the other to *P. kibisi-cifolia*.

Hermann's Passion-flower. Shrub cl.

135 P. ? TUBIFLORA (H. B. et Kuth, nov. gen. amer. 2. p. 139.) leaves glabrous, coriaceous, rounded at the base, 3-lobed; lobes oblong-lanceolate, equal, entire; petioles biglandular in the middle; pedicels thin; tube of calyx about equal in length to the 5 lobes of the limb. h, u, S. Native of Mexico, in arid places near Acapulco and Etambu del Egidio. Probably a species of *Tascionia*. Flowers with a greenish calyx.

Tube-flowered Passion-flower. Shrub cl.

Cult. All the species of this elegant and curious genus, are well suited for climbers in conservatories and stoves, being free growers, and of easy culture. They thrive well in very light soil, and the more room they are allowed, both for roots and stems, the freer they will grow and flower. They are all easily raised from cuttings planted in sand or mould, placed in heat; and the younger the cuttings are, the sooner they will strike root. Most of the species ripen fruit in our stoves, and consequently many fine varieties have been raised by impregnating the stigmas of one with the pollen of another. Several hybrids, raised from seeds set by the pollen of *P. corcula* are nearly hardy. Several of the species are marked greenhouse, in which they will grow and flower freely. *Passiflora corcula* is the only species that can be considered quite hardy, and it requires a sheltered situation; it is therefore safest to plant against a wall, that it may be protected by a mat in severe weather. They thrive well in any soil, and cuttings of it are readily rooted, under a hand-glass.

Culture of the edible species of *Granadilla*.—All the species will fruit even in large pots; but it is best to plant them in an angle of a stove, which has been parted off, either by boards or brick-work, as low as the pit goes. At the bottom of the cavity formed by this division, should be laid some brick rubbish, over which may be thrown a little dead tan, and the whole be then filled with equal parts of very old tan, and a compost of leaf-mould and rotten dung; therein the roots will strike freely, and will even spread through the partition into the pit. They do not require the full heat of a piec-stove, for they flourish best in a temperature of from 65° to 70°; but they will not bring their fruit to perfection if kept in a common greenhouse or conservatory, though they will grow and flower in it. The shoots as they advance may be trained near to and under the inclined glass of the stove; the first flowers will appear in May, and the blooming will continue until September, the fruit setting the whole time; but if it does not set well it will be advisable to impregnate the stigmas, by applying the pollen with a feather. As they grow, the very strong shoots should be cut out from their origin; for these do not bear fruit so abundantly as those which are less vigorous; but the fruiting-branches must not be shortened on any account.

The temperature must be kept up equally during the time of flowering and fruiting; the crop will begin to come in August, and will continue until January, but the earlier produce is the best. When the crop is all off, which will be early in January,
the heat must be reduced to about 50°, so as to check and stop the growth. This being effected, the shoots must be well cut in. As little old wood as possible, besides the main stem, which rises from the pit to the glass, and a few pieces (about 2 or 3 feet of each) of the old branches should be retained; for all that is to be trained under the glass to bear in each year, ought to be the growth of the same season. It is found that the shoots break better and in greater quantity from the older wood than from that of two years’ standing. In this dormant and reduced state it is to be kept during January and February, after which the necessary heat may be applied to cause it to resume its functions for the ensuing season.

IV. DISEEMMA (from eio, dis, two, and στεμμα, stemma, a crown; in reference to the crown of the flower being double, or in two). Lab. sert. cald. p. 78. D. C. prod. 3. p. 332.

Lin. syst. Monadelphia, Pentandria. Tube of calyx short, furrowed below. Crown of throat double; outer one composed of distinct filamentous threads; inner one tubular, with an entire or toothed border. The rest as in Passiflora. All the species are either natives of New Holland or New Caledonia.

* Petioles biglandular at the apex.

1. D. aurantiaca (Labill. cald. t. 79.) leaves glabrous, ovate at the base, broadly 3-lobed; lobes obtuse, middle lobe the longest; lateral ones furnished with a kind of appendage each on the outside; braeactea bristle-formed, glandular at the apex, rather remote from the flower; petioles biglandular at the apex; threads of outer crown about equal in length to the inner lobes of the calyx or petals. H. G. Native of New Holland. Passiflora aurantiaca. Forst. prod. p. 326. Cav. diss. 10. p. 457. Murucuia aurantiaca, Pers. ench. 2. p. 222. Flowers orange-coloured, with the tube of the inner crown green, longer than the simple upright rays that surround it.

Orange-flowered Disemma. Shrub cl.

2. D. Herbertiana (D. C. prod. 3. p. 332.) leaves pubescent, cordate at the base, broadly 3-lobed; lobes ovate, acute; petioles biglandular at the apex; pedicels twin, 1-flowered; braeacteae bristle-formed, very remote from the flower; threads of outer crown 3 or 4 times shorter than the inner calycine lobes or petals. H. G. Native of New Holland, in the interior. Passiflora Herbertiana, Ker. bot. reg. 737. Murucuia Herbertiana, Sweet. Flowers white and greenish, with the crown yellow.

3. D. Baueri; leaves 3-lobed, sparingly glandular beneath; lobes oblong, retuse, middle one more prolonged; braeacteae and stipulas secundae; rays filiform, longer than the corolla, which is plicate; disk 5-lobed. H. G. Native of New Island. Fruit oval, blood-coloured. Flowers at first pale yellow, but at length orange-coloured, with the segments keeled and rather undulated, green on the outside. Murucuia Baueri, Lindl. coll. t. 36.

Baueri’s Disemma. Shrub cl.

** Petioles glabrous.

5. D. adiantifolia (D. C. l. c.) leaves glabrous, glandular beneath, truncate at the base, 3-5-lobed; lobes obtuse, somewhat 3-lobed; petioles glandless, a little longer than the pedicels; braeacteae subulate, scattered. H. G. Native of Norfolk Island. Passiflora adiantifolia, Ker. bot. reg. 233. Passiflora aurantiaca, Audr. bot. rep. t. 295. but not of Forst. Passiflora glabra, Wendl. coll. t. 17. Passiflora Adiantum, Willd. enum. 698. Murucuia adiantifolia, Sweet. Flowers yellow at first, fading to an orange-colour, with the inner crown green, longer than the purple rays that surround it.

Cult. See Passiflora, p. 55, for culture and propagation. Splendid and curious climbing shrubs.

Lin. syst. Monadelphia, Pentandria. Tube of calyx furrowed below. Crown of throat simple, erect, tubularly-conical, truncate (f. 5. b. f. 6. c.); threads of crown not free, but joined together into a tube.—Habit of Passiflora. Petioles glandless.

—Species all natives of the West Indies.

Sect. I. Pentaeria (from πέντε, pente, five; calyx 5-lobed). D. C. prod. 3. p. 332. Calyx 5-lobed (f. 5. a.).

Sect. II. Drecania (from δρέκανος, a pigeon’s egg, flesh-coloured when ripe. Both the syrups and decoction of the plant is much used in the leeward parts of Jamaica, where it is frequent; and it is said to answer effectually all the purposes for which syrup of poppies and liquid laudanum are generally administered. The flowers are most in use; they are commonly infused in, or powdered and mixed immediately with
wine or spirits; and the composition is generally thought a very effectual and easy narcotic. Browne names it bull-hoof or Dutchman's laudanum, which are probably the vulgar names of the plant in Jamaica.

*Var. β;* leaves rounded at the base, somewhat 3-lobed.

*Cav. l. c.*

Small-eyed *Murucuja.* Fl. July, Aug., Clt. 1730. Sh. cl. *Cult.* Climbing shrubs, with the habit of *Passiflora,* bearing beautiful flowers. Their culture and propagation are the same as that recommended for that genus, see p. 36.

Lin. syst. *Monadelphia, Pentandria.* Tube of calyx long (f. 7. č.), with a 10-cleft limb (f. 7. ě.); the 5 inner lobes probably petals; throat furnished with a scaly membrane. Habit of *Passiflora.*

Sect. I. *Eutacsonia* (*eu,* well or good, and, *Tacsonia*; this section contains the genuine species of the genus). D. C. prod. 3. p. 333. Involuturng large, 3-leaved (f. ě.;) bracteas sometimes free, sometimes joined together.

*Leaves undivided.*

Adulerata *Tacsonia.* Shrub cl.

2 T. *Lanka* (Juss. ann. mus. 6. t. 59. f. 1.) leaves woolly beneath, glabrous above, ovate-cordate, entire, with somewhat revolute edges; petioles glandless; stipulas narrow, hidden among the tomentum of the stem. 7. S. Native of the Andes, about Quindiu. B. B. et Kunth, nov. gen. amer. 2. p. 141. Flowers white?

Woolly *Tacsonia.* Shrub cl.

**Leaves 3-lobed.**

3 T. *Trifolia*ta (Juss. l. c. p. 393.) whole plant white from silky tomentum; leaves trifoliate; leaflets ovate-oblong, quite entire; petioles glandless; stipulas half stem-clasping, ciliated with glands. 7. S. Native of Peru, in the valley of Canta.

Trifoliate *Tacsonia.* Shrub cl.

4 T. *Sanguinea* (D. C. prod. 3. p. 334.) leaves tomentose beneath, reticulately veined, smooth above, deeply 3-lobed; lobes acute, serrated; petioles glandless; bracteas glandularly-toothed. 7. S. Native of the West Indies. *Passiflora* sanguinea, Smith, in Rees' cyc. no. 45. Flowers deep red.

Blood-coloured-flowed *Tacsonia.* Shrub cl.

5 T. *Pinnatistipula* (Juss. l. c.) leaves white from velvety down beneath, trifid beyond the middle; lobes serrated; stipulas pinnate; petioles with 4-8 glands. 7. S. Native of Chili. Sweet, fl. gard. new. ser. 2. t. 156. Passiflora pinnatistipula, Cav. icon. 5. t. 428. Flowers rose-coloured or purplish; crown deep brown.

*Var. β, penipes* (Smith, in Rees' cyc. no. 48. under *Passiflora*) stipulas palmately parted into subulate lobes, one of which is pinnate at the apex.

Vol. III.

6 T. *Micrantha* (D. C. prod. 3. p. 334.) clothed with velvety tomentum; leaves trifid, somewhat cordate, 3-5-nerved; lobes ovate-lanceolate, serrated; petioles bearing small glands, which are hidden among the tomentum; stipulas pannally parted into capillary lobes. 7. S. Native of Peru.

Small-glanded *Tacsonia.* Shrub cl.

7 T. *Tomentosa* (Juss. l. c. p. 394.) leaves tomentose, trifid beyond the middle, 3-nerved; lobes ovate, serrated; petioles bearing 6 pedicellate glands; stipulas falcate, serrated on the outside. 7. S. Native of Peru. P. tomentosa, Cav. diss. 10. t. 275, 276. Flowers rose-coloured.

Tomentose *Tacsonia.* Shrub cl.

8 T. *Manicata* (Juss. l. c. t. 59. f. 2.) leaves somewhat tomentose beneath, trifid beyond the middle; lobes ovate-oblong, serrated; petioles bearing 3-4 glands at the apex; stipulas roundish, spreading, crestedly toothed on the outside. 7. S. Native of Peru, about Loa. H. B. et Kunth, nov. gen. Amer. 2. p. 139.

*Var. β;* lobes blunter and more tomentose beneath. Native of Villa de Ybarra.

Manicata-stippled *Tacsonia.* Shrub cl.

Sect. II. *Bracteogama* (from  βας, brakys, a cover, and γαιας, gamos, marriage; in reference to the bracteas of the involucrum being joined together). D. C. prod. 3. p. 334. Bracteas of involucrum 3, joined together into a tube.

9 T. *Triopia* (D. C. prod. 3. p. 334.) clothes with hoary hairs beneath, pubescent above, deeply 3-lobed; lobes oblong, diverging, serrated; petioles bearing 2-4 glands; stipulas manicated, denticulated, awned at the apex. 7. S. Native of Peru. *Passiflora* triopia, Ruiz et Pav. ined. (v. s. in herb. Labau).

Trigonal *Tacsonia.* Shrub cl.

10 T. *Pedunculalis* (Juss. l. c. p. 395.) leaves downy on the nerves beneath, cordate at the base, 3-nerved, trifid; lobes ovate, obtuse, serrated; petioles bearing 4 glands; stipulas ovate-lanceolate, acuminate, serrated. 7. S. Native of Peru. *Passiflora* pedunculalis, Cav. icon. 5. t. 426. Murucuja pedunculalis, Spreng. syst. 3. p. 43. Flowers purple or rose-coloured.

*Var. β, Dombejina* (D. C. prod. 334.) leaves of lobes acute; bracteas entire.

Very soft *Tacsonia.* Shrub cl.

12 T. *Tripartita* (Juss. l. c. t. 60.) leaves rather tomentose beneath, smooth above, 3-parted; lobes lanceolate, serrated; petioles bearing 6-8 glands; stipulas manicated, crestedly toothed. 7. S. Native of South America, in woods about Quito. H. B. et Kunth, l. c. 2. p. 142. Flowers rose-coloured.

Tripartite-leaved *Tacsonia.* Shrub cl.

I
PASSIFLORE. VI. TACSONIA.

Var. β, longiflora (D. C. prod. 3. p. 335.) leaves pubescent beneath; lateral lobes sometimes 2-lobed. η. S. Native of Peru. T. longiflora and T. Tásco, Pers. ench. 2. p. 223.

Flowers rose-coloured or purplish.

Mixed Taconia. Shrub cl.

14 T. speciosa (H. B. et Kunth, nov. gen. amer. 2. p. 143.) leaves glabrous, cordate at the base, reticulately 3-nerved, deeply 3-lobed; lobes ovate-oblong, sharply serrated; petioles bearing 6-8 pedicellate glands; stipulas suborbicular, awned, dentilculated. η. S. Native of Santa Fe de Bogota. Murucuja speciosa, Spreng. syst. 3. p. 43. Flowers rose-coloured.

Showy Taconia. Shrub cl.

15 T. glaeb'ërima (Juss. ann. mus. 6. p. 394.) leaves glabrous, coriaceous, 3-lobed; lobes ovate-lanceolate, stiffly serrated; petioles biglandular at the apex; stipulas glove-formed, dentately crested. η. S. Native of Peru, on the Andes in shady places. Flowers purple.

Quite-glabrous Taconia. Shrub cl.

16 T. Anastomosans (Lamb. herb. ox. D. C. prod. 3. p. 335.) leaves glabrous, coriaceous, cuneate at the base, 3-nerved, trifid; lobes ovate-lanceolate, callyx serrated; petioles bearing 4 glands; stipulas ovate, awned, callyx serrated. η. S. Native of Peru.

Anastomosing-veined Taconia. Shrub cl.

17 T. parvifölia (D. C. prod. 3. p. 335.) leaves glabrous, glaucous beneath, 3-5-nerved, trifid; lobes ovate-lanceolate, acutely serrated; petioles bearing 4 glands; stipulas semi-cordate, callyx, nearly entire. η. S. Native of Peru. Ruiz et Pav. (v. s. in herb. Lamb.)

Small-leaved Taconia. Shrub cl.

VII. PASCHANTHUS. VIII. MODECCA.

Var. β, conicalulata (D. C. l. c.) petioles thicker, and channelled at the base.

Glandular Taconia. Shrub cl.

19 T. Rohria (D. C. prod. 3. p. 335.) leaves glabrous, coriaceous, ovate-oblong, acuminated, quite entire, feather-nerved; petioles biglandular at the base, about equal in length to the pedicels; bracteas subulate, near the flower. η. S. Native of Cayenne. Passiflora glandulosa, Cav. diss. 10. t. 281.

Var. β, conicalulata (D. C. l. c.) petioles thicker, and channelled at the base.

Sect. III. Distępʰаna (from ëcë, dis, double, and στεφάνος, stephanos, a crown; in reference to the double crown in the throat). Juss. l. c. D. C. prod. 3. p. 335.—Distephoa, Salisb. in litt. Involucrum small, 3-leaved; leaves free, biglandular in the axils. Throat of callyx bearing a membranous tube, and a series of ligule.

18 T. glandulös (Juss. l. c. p. 391.) leaves glabrous, coriaceous, ovate, acuminated, quite entire, feather-nerved; petioles biglandular at the base, about equal in length to the pedicels; bracteas subulate, near the flower. η. S. Native of Cayenne. Passiflora glandulosa, Cav. diss. 10. t. 281.

Var. β, conicalulata (D. C. l. c.) petioles thicker, and channelled at the base.

Glandular Taconia. Shrub cl.

19 T. Rohria (D. C. prod. 3. p. 335.) leaves glabrous, coriaceous, ovate-oblong, acuminated, quite entire, feather-nerved; petioles biglandular at the base, one-half shorter than the pedicels; bracteas subulate, remote from the flower. η. S. Native of Cayenne.

Rohr’s Taconia. Shrub cl.

20 T. Stottystępʰa (D. C. l. c.) leaves glabrous, coriaceous, ovate, acuminated, quite entire, feather-nerved; petioles biglandular at the base; bracteas ovate, obtuse, fidiaceous. η. S. Native of Cayenne. Cav. diss. 10. t. 281. lit. x.

Stottys Taconia. Shrub cl.

21 T. cintrícula (Juss. l. c. p. 392. in a note.) leaves ovate, coriaceous, quite entire, feather-nerved; petioles biglandular at the apex. η. S. Native of Cayenne. (v. s. herb. Juss.)

Cintra-leaved Taconia. Shrub cl.

† Species belonging to section Distephoa, but doubtful.

Four-glanded Taconia. Shrub cl.

23 T. quadrí glandulös (D. C. l. c.) leaves glabrous, ovate-lanceolate, feather-nerved, with a few coarse acute teeth; petioles biglandular at the base; bracteas oblong, biglandular. η. S. Native of the West Indies.

Four-glanded Taconia. Shrub cl.

24 T. Ruiz's Taconia. (D. C. l. c.) leaves pubescent, ovate, lanceolate; petioles biglandular at the base; bracteas ovate-lanceolate, acuminated, glandularly serrated, and glandular on the back. η. S. Native of the East Indies.

Downy Taconia. Shrub cl.

Sect. IV. PALLANTHUS (from ψαλλεις, psallos, naked, and antheta, anthes, a flower; in reference to the flowers being naked, without the involucrum). D. C. prod. 3. p. 395. Involucrum none under the flower.

25 T. trińe'ëvia (Juss. l. c. t. 58.) leaves tomentose beneath, oval, 3-nerved; nerves protruding so much as to form teeth; petioles glandless; callyx 10-lobed. η. S. Native of South America, in shady places at the river Cassiquiare. H. B. et Kunth, l. c. p. 142. Flowers rose-coloured?

Three-glanded-leaved Taconia. Shrub cl.

26 T. viridi'flòra (Juss. ann. mus. 6. p. 380.) leaves petiole, 3-lobed; callyx 5-lobed. η. S. Native of Mexico, in the vicinity of Aacupalco. Passiflora viridiflora, Cav. ion. 5. t. 424. Intermediate between Taucinia, Passiflora, and Murucuja. Flowers green.

Green-flowered Taconia. Shrub cl.

Cult. The species have the habit of Passiflora, and some of them are equally showy. Their culture and propagation are the same, see p. 56.

VII. PASCHANTHUS. VIII. MODECCA.

(VII. PASCHANTHUS (from πασχεω, pascho, to be in a passion, and ανθος, anthes, a flower; the same meaning as Passiflora). Burch. trav. 1. p. 543. D. C. prod. 3. p. 336.

1 P. répandus (Burch. l. c.) leaves glabrous, glaucous, oblong-linear, repand, 1-nerved, bearing 3 glands beneath; petioles very short, glandless; peduncles bearing a tendril, and two 1-flowered pedicels. η. G. Native of the Cape of Good Hope.

Rependant Paschanthus. Shrub cl.

Cult. This very singular plant, being a native of the Cape of Good Hope, will thrive in a green-house, and will form an excellent climber for the rafters. Its culture and propagation are the same as that recommended for Passiflora, see p. 56.

LAN. SYST. Díóctia, Monadèélphía. Flowers dioecious. Calyx permanent, campanulate, 10-cleft (f. 8. b.); 5 outer lobes ovate acute; 5 inner lobes petaloid or probably petals (f. 8. b.). Scales 5-10 (f. 8. c.), rarely wanting, rising from the calyx. Stamens 5, inserted in the torus? monadéélphous: anthers standing, Ovarium (f. 8. d.) on a short stipe. Stigma 3, petaloid (f. 8. c.). Capsule bladdery, 1-celled, 3-valved, one or many-seeded. Seeds furnished by rows of terebules (f. 8. f.), arillate, fixed to 3 parietal placentas, which are adnate to the middle of the valves.—Habit of plants between Passiflora and Bryénia.
PASSIFLOREAE. VIII. Modecca. IX. Deidamia. X. Vareca.

1 M. palma'ta (Lam. dict. 4. p. 269.) leaves glabrous, variously palmately lobed, glandular beneath; stipules spinescent; pedicels bracteal. 之乡. S. Native of Malabar. Flowers yellowish. Probably many species are confused under this name.

Var. a, Naróla (D. C. prod. 3. p. 386.) lobes of calyx acuminate; petaloid lobes or petals wanting; fruit globose.—Rheed. mal. 8. t. 20.

Var. β, palmodecca (D. C. l. c.) lobes of calyx acutish; petaloid lobes or petals feathery palmately; fruit globose. 之乡. S. Rheed. l. c. t. 21.

Var. γ, Ólía (D. C. l. c.) lobes of calyx very much acuminate; petaloid lobes or petals wanting; fruit ovate.—Rheed. l. c. t. 22.

Palmate-leaved Modecca. Shrub cl.

2 M. lÓba'ta (Jacq. fragm. t. 131.) leaves glabrous, cordate at the base, 3-5-7-lobed, glandless; petioles biglandular at the apex; pedicels bracteal. 之乡. S. Native of Sierra Leone. Ker, bot. reg. t. 131. Flowers yellowish. (f. 5.)

S. M. integri'follía (Lam. dict. 4. p. 299.) leaves glabrous, ovate-lanceolate, usually entire, much acuminate; pedicels bracteal, very short, few-flowered; fruit globose. 之乡. S. Native of Malabar.—Rheed. mal. 8. t. 23.

Entire-leaved Modecca. Shrub cl.

4 M. wight'iana (Wall. cat. no. 6704.) smooth; leaves cordate, triangularly ovate, entire; tendrils simple; capsule bladerry; seeds scrobiculato. 之乡. S. Native of the East Indies, on the Gíngee Hills. Like M. integri'follía, Lam.

Wight's Modeca. Shrub cl.

5 M. ale'na (Wall. cat. no. 6766.) leaves deeply cordate at the base, oblong, acuminate; leaves at the base rounded, pedicels umbellate on the top of shortish peduncles; tendrils simple. 之乡. S. Native of Stíchet.

Allen Modeca. Shrub cl.

6 M. acumín'ata (Blum. bijdr. p. 940.) leaves ovate-oblong, acuminate, somewhat cordate at the base, and biauriculate; flowers racemose, rising from elongated axillary tendrils; fruit ovate, acuminate. 之乡. S. Native of Java, on Mount Salak. Allied to M. integri'follía according to Blume.

Acuminated-leaved Modeca. Shrub cl.

7 M. heteróphylla (Blum. bijdr. p. 940.) leaves undivided or 3-lobed, acuminate, somewhat cordate at the base, and somewhat biauriculate; fruit oblong, acuminate at both ends. 之乡. S. Native of Java, on Mount Gede.

Variable-leaved Modeca. Shrub cl.

8 M. diversifóllía (Wall. cat. no. 6763.) smooth; leaves triangularly ovate; upper ones 3-lobed, peltate at the base; lateral lobes sometimes bifid; pedicels 1-flowered, bracteal; tendrils simple. 之乡. S. Native of the East Indies. Fruit bladerry, 3-valved. Root tuberosous. Momórdica heteróphylla, Wight, mss.

Diverse-leaved Modeca. Shrub cl.

9 M. cordí'follía (Blum. bijdr. p. 939.) leaves membranous, on short pedioles, cordate, mucronulate, biauriculate at the base; flowers corymbose, dichotomous, rising from elongated axillary tendrils. 之乡. S. Native of Java, on Mount Salak.

Heart-leaved Modeca. Shrub cl.

10 M. obtus'a (Blum. bijdr. p. 939.) leaves coriaceous, oblong-cordate, obtuse, biauriculate at the base; flowers corymbose, dichotomous, rising from short axillary tendrils. 之乡. S. Native of Java, on Mount Salak.

Obtuse-leaved Modeca. Shrub cl.

11 M. varificó'ra; leaves oblong-lanceolate, entire, acuminate, glabrous; tendrils simple; pedicelles axillary, dichotomous. 之乡. S. Native of Sierra Leone. Flowers small, yellow.

Small-flowered Modeca. Shrub cl.

12 M. macro'phylla (Blum. bijdr. p. 939.) leaves coriaceous, oval, bluntish at both ends, somewhat auriculate at the base; flowers corymbose, dichotomous, rising from axillary tendrils. 之乡. S. Native of Java, on Mounts Salak, Parang, &c.

Long-leaved Modeca. Shrub cl.

13 M. austrálaís (R. Br. ined. ex D. C. prod. 3. p. 337.) leaves glabrous, somewhat peltate at the base, corolling down the petiole in an auriculate manner at the base, acute, entirely, glandless. 之乡. S. Native of New Holland, in the gulph of Carpentaria.

Southern Modeca. Shrub cl.

14 M. brac'cata (Lam. dict. p. 210.) leaves scabrous from the tubercles on both surfaces; palmately lobed, emarginate at the base; pedicels bracteate, racemose; calyxes somewhat serrated. 之乡. S. Native of the East Indies.

Bracteated Modeca. Shrub cl.

Cult. See Passiflora, p. 56, for culture and propagation. The flowers of the species are by no means showy.

Lin. syst. Monadéphfüa, Penta-Octándria. Calyx 5-6-parted; lobes petaloid; crown a simple series of filamentous appendages, rising from the interior part of the calyx. Stamens equal in number to the lobes of the calyx; filaments joined at the base into a column. Ovarium ovate. Styles 3-4. Capsule pedicellate, 3-4-valved. Seeds arillate.—Climing Madagascar shrubs, with axillary tendrils, impari-pinnate leaves, and glandular petioles.

2 D. com'ersoni'ana (D. C. l. c.) leaflets elliptic, mucronate at the apex; peduncles 5-7-flowered; flowers pentandrous. 之乡. S. Native of Madagascar. Commersen's Deidamia. Shrub cl.

Cult. See Passiflora, p. 56, for culture and propagation.

X. VARECA (altered from WALWARECA, the name of the fruit in CEYLON). Gaertn. fruct. 1. p. 219. t. 6. f. 6. D. C. prod. 3. p. 337.

Lin. syst. unknown. Flowers unknown. Berry 1-celled; pulp divided into numerous partial cells for the reception of the seeds. Placentas 3, parietal, many-seeded.

1 V. Zeyla'sica (Gaertn. l. c.) Native of CEYLON. Nothing but the fruit of this plant is known. Ceylon Vareca. Shrub cl.
Order CVI. MALESHERBIACEAE. (This order only contains the genus *Malesherbia*). D. Don, in edinb. phil. journ. 1827. p. 321.—Passiflorae, Tribe III. Malesherbiæ, D. C. prod. 3. p. 337.

Calyx tubular (f. 9. b.), membranous, inflated, 5-lobed (f. 9. a.); lobes imbricated in aestivation. Petals 5 (f. 9. b.), alternating with the segments of the calyx, permanent, convolute in aestivation, arising on the outside of the short membranous crown (f. 9. c.). Stamens 5-10, perigynous; filaments filiform, distinct, or connected with the stipe of the ovarium; anthers versatile. Ovarium superior (f. 9. g.), stipitate, 1-celled, with the placentas at the base, from which the ovaries arise by the intervention of umbilical cords. Styles 3, filiform, very long, arising from distinct points at the apex of the ovarium (f. 9. d.); stigmas clavate. Fruit capsular, 1-celled, 3-valved, membranous more or less, many-seeded. Seeds attached by umbilical cords to placentas, arising either from the axis of the valves, or from their base; testa crustaceous, brittle, with a fleshy crest, and no arillus. Embryo terete in the centre of fleshy albumen, with the radicle next the hymen.—Herbaceous or half-shrubby plants, clothed with glandular pubesceence. Leaves alternate, simple lobed, without stipules. Flowers axillary or terminal, solitary, yellow or blue.

This order agrees with *Passiflorae* on the one hand, and *Turneraceae* on the other. From the former they differ in the insertion of their styles, in their versatile anthers, in their short placentas, membranous fruit, terete embryo, want of arillus, and stipules; and altogether in their habit. From *Turneraceae*, to which their habit nearly allies them, they differ in the presence of a perigynous membrane, in the remarkable insertion of the styles, and in the want of all trace of an arillus; agreeing with that order in the aestivation of the corolla, and in the principal other points of their structure. The plants are unknown except as objects of great beauty.

Lin. syst. Pernardria, Monogynia. Character the same as that of the order.

Linear-leaved Malesherbia. Pl. 2 to 3 feet.

4. M. *humilis* (D. Don, l. c.) plant very villous; leaves jagged; throat of calyx dilated; crown simple, acutely toothed; anthers roundish. f. G. Native of Chili about Coquimbo. Stems procumbent. Flowers white.

Dwarf Malesherbia. Fl. Cl. 1832. Pl. procumbent.

5. M. *coronata* (D. Don, l. c.) plant clothed with glandular pubescesence; leaves linear, minutely toothed; throat of calyx dilated; crown simple, toothed. f. G. Native of Chili, at Valparaiso. Flowers blue; crown white. Sweet, fl. gard. new. ser. t. 167. (f. 9.)

Crowned Malesherbia. Fl. Cl. 1832. Pl. 2 to 3 feet.

6. M. *paniculata* (D. Don, l. c.) leaves lanceolate, acuminate, quite entire; flowers in fascicles; crown 10-cleft, with the segments tridentate. f. G. Native of Chili. A stiff erect shrub. Flowers small, in bundles at the tops of the branches.

Punicellated-flowered Malesherbia. Shrub 1 to 2 feet.

7. M. *tenuefolia* (D. Don in edinb. phil. journ. Oct. 1832.) leaves nearly pinnate; segments linear; calyx tubular; crown deeply lobed. f. G. Native of the south of Peru, in the province of Tarapaca at Huataconda, where it is commonly called *Agri de Zorra*, i. e. Fox capsicum. Flowers reddish, according to the dried specimen.

Cult. This genus is composed of curious plants, bearing very showy singular flowers, and are therefore worthy of culture as ornaments. A mixture of loam, peat, and sand, or any light rich earth is a good soil for them. The shrubby species may either be increased by seeds; or young cuttings will root if planted in light soil, under a hand-glass. The seeds of annual kinds require to be sown in a hot-bed, in order to forward the plants; and after they have grown an inch in height, they may be potted off into small pots, and afterwards shifted into pots of increasing size, as they grow. Some of them may be planted out into the open border, in a sheltered situation, where they will probably flower and seed freely.

Tube of calyx adhering to the ovarium, or girding it closely (f. 10. a. f. 12. a.); limb 5-parted (f. 11. a. f. 12. a.), rarely 4-parted, permanent. Petals equal in number to the lobes of the calyx (f. 12. b. f. 11. b.), with an inflexed valvate aestivation, or double that number (f. 10. b.), and disposed in 2 series; those of inner series, when present, usually much smaller (f. 10. b.) than those of the outer, scale-formed and truncate at the apex, inserted in the throat of the calyx. Stamens indefinite, arising from within the petals, disposed in several series, either distinct (f. 10. c.), or joined at the base in several parcels before each petal, within the cavity of which they lie in aestivation; filaments subulate (f. 10. g.), unequal, the outer ones frequently destitute of anthers. Ovarium adnate.
to the calyx (f. 10. a. f. 11. c.), or inclosed within it, 1-celled, with several parietal placentas (f. 11.), or with 1 free central lobed one. Style 1, composed of 3-5-7-jointed ones, crowned by as many lobes or stigmas. Capsule dry or succulent, crowned by the calyx (f. 10. d. f. 11. g. f. 12. c.), 1-celled, with several parietal placentas (f. 11.), originating at the sutures, and therefore may be called marginal, 5-4-7-valved; placentas equal in number to the valves, sometimes drawn out so far as to form dissepiments (f. 11.f.). Seeds numerous, without arillus. Embryo lying in the axis of a fleshy albumen; with the radicle pointing to the hilum, and flat cotyledons.—American herbs more or less pilose or hispid, with the hairs or bristles usually stinging like those of the nettle, in consequence of their secreting an acrid juice. Leaves opposite or alternate, exstipulate, simple, but usually variously divided. Peduncles axillary, 1-flowered. Flowers elegant. This order is distinguished from Onagrarıve by its unilocular ovary, and indefinite stamens, part of which are sterile; and perhaps by the latter character, and the additional 5 petals, connected with Passiflorıe, with which they sometimes also accord in habit. Their rigid stinging hairs, climbing habit, and lobed leaves resemble those of some Urtı-ceae. On the same account they may be compared with Cicurbi-tocce, with which they further agree in their inferior unilocular fruit, with parietal placentas, and in the very generally yellow colour of their flowers. This, indeed, is the order with which, upon the whole, Loa-seae must be considered to have the closest affinity.

**Synopsis of the genera.**

1 BARTONIA. Tube of calyx cylindric (f. 10. a.); limb 5-parted (f. 10. a.). Petals 5-10 (f. 10. b.), about equal in shape. Stamens numerous (f. 10. c.). Capsule 3-7-valved; each placentas bearing 2 rows of seeds.

2 BLUMENBA'CHIA. Tube of calyx spirally twisted (f. 11. c.); limb 5-parted (f. 11. g.). Petals 10 (f. 11. b.); 5 outer ones cussate, and the 5 inner ones scale-formed, each scale inclosing 2 sterile filaments. Fertile stamens disposed in 5 bundles (f. 11. b.). Fruit dividing into 10 parts at the base.

3 LO'AS. Tube of calyx not twisted (f. 12. a.); limb 5-parted (f. 12. d.). Petals 10 (f. 12. b.); the 5 inner ones scale-formed, bearing 2 sterile filaments inside. Outer series of stamens sterile and free; inner ones disposed in 5 bundles, but distinct. Capsule 1-celled, 3-valved at the apex.

4 CA'DÖRHA. The fruit is oval, bursting into 3 valves from the base upwards; the placentas then separate from the sides of the capsule, and have the appearance of 3 arched columelle. The rest as in Loa-as.

5 MENTSE'LI. Tube of calyx cylindric (f. 13. b.); limb 5-lobed (f. 13. d.). Petals 5 (f. 13. a.). Stamens free, usually disposed in bundles (f. 13. c.). Capsule turbinate, 3-valved, few-seeded (f. 13. f.).

6 KLAPO'ROTHIA. Calyx with a turbinate tube, and a 5-parted limb. Petals 4. Stamens numerous, 4-5 sterile in front of each sepal, and 4-5 fertile in front of each petal. Fruit baccate, few-seeded.
posed in a leafy panicle. ♀. Native of Chili, in the Jarillal, or uncultivated grounds between Mendoza and the mountains; generally by the side of dry water courses, at about 3000 feet above the level of the sea. Sweet, fl. gard. new ser. t. 182. B. sinuata, Preal. rel. Henk. 2. p. 38. Petals 10, pale yellow; Filaments all dilated. Stigmas 3-lobed. This species does not turn black on drying, as in the other species, and is readily distinguished from them by the beautiful white down on the stem.

Loasa. Fl. July. Sept. Clt. 1831. Pl. 1 to 4 feet. Cult. The seeds of the species should be raised in a gentle heat in spring; and when the plants are of a proper size, they should be potted separately in small pots, and shifted from size to size of pots as they grow; the pots should be well drained with sherds; and in the winter they should be placed on a dry shelf in a greenhouse or frame. The flowers are very showy, and the plants are therefore worth cultivating in every garden.

Lin. syst. Polydelephia, Polyantria. Calyx 5-parted (f. 11. g.), with the tube adhering to the ovary. Petals 5 (f. 11. b.), inserted in the top of the calycine tube, cucullate, equal, spreading. Scales 5 (f. 11. b.); alternating with the petals, and inserted with them, furnished with 3 sterile filaments at the back of each, and clasping 2 subulate appendages inside. Stamens indefinite, inserted in the top of the calycine tube (f. 11. b.), disposed in 5 bundles, one opposite each petal; anthers 2-celled, bursting inwardly. Ovary joined to the tube of the calyx. Style simple (f. 11. f.). Capsule marked with 10 spiral ribs, 1-cellcd, 10-valved; 5 of the valves thicker and broader than the other 5, with the placenta not reaching the axis; the other 5 narrower, with placenta almost reaching the axis (f. 11. k.), and bearing the seeds. Seeds rugose.—Branched, climbing, or trailing herbs, covered with stinging hairs. Leaves opposite, lobed. Flowers axillary, solitary, bracteate.

2 B. palmata (St. Hil. fl. bras. 2. p. 208.) leaves deeply and palmately 3-5-lobed; lobes pinnatifid. ♂. Native of Brazil, on the confines of the province of Rio Grande de St. Pedro do Sul. Flowers with white petals; scales with ciliated edges, yellow at the base, lined with white, and red above it, tipped with vermilion colour.

Palmate-leaved Blumenbachia. Pl. tr.

3 B. latifolia (St. Hil. fl. bras. 2. p. 209. t. 118.) leaves trilobate; lateral segments 3-lobed, unequal-sided, terminal one equal-sided, 3-5-lobed. ♂. Native of Brazil, in the province of St. Paul, between the towns of Rio Grande de St. Pedro do Sul and St. Francisco de Paulo. Flowers with white petals, and yellow scales tipped with orange colour. (f. 11.)

Bread-leaved Blumenbachia. Pl. tr.

4 B. punicea; plant very hispid; leaves opposite, pinnatifid, having the segments jagged; calycine lobes jagged, shorter than the petals, which are cuculate; bundles of stamens polyandrous. ♂. Native of Peru. Loasa punicea, Ruiz et Pav. fl. per. 5. t. 446. ined. (v. s. herb. Lamb.)

Scarlet Blumenbachia. Pl. 1 to 2 feet.

5 B. pterosperma; hispid; leaves opposite, pinnatifid, rather cordate at the base; segments toothed; peduncles long, 1-flowered, axillary; calycine segments toothed, shorter than the petals, which are cuculate; bundles of stamens polyandrous; stem climbing; seeds bordered by a wing. ♂. Native of Peru. Loasa pterosperma, Ruiz et Pav. fl. per. 5. t. 448. (v. s. herb. Lamb.)

Winged-seeded Blumenbachia. Pl. cl.

6 B. sepaliâ; stem climbing; leaves opposite, pinnatifid, with the segments pinnatifid or coarsely toothed; peduncles long, axillary, 1-flowered; calycine segments jagged, linear, longer than the petals, which are cuculate; bundles of stamens polyandrous. ♂. Native of Peru. Loasa sepaliâ, Ruiz et Pav. fl. per. 5. t. 449. ined.

Hedge Blumenbachia. Pl. cl.

7 B. micrantha; hispid; leaves opposite, ovate, serrate, petiolate; peduncles many-flowered, racemose, terminal, and rising from the forks of the stem; calycine lobes ovate, much shorter than the petals, which are cuculate, and holding 2 stamens each. ♂. Native of Peru. Flowers very small. Loasa micrantha, Ruiz et Pav. fl. per. 5. t. 442.

Small-flowered Blumenbachia. Pl. 1 foot.

8 B. grandiflora; leaves opposite, petiolate, oblong, runcate, acute, somewhat cordate at the base; pedicels 1-flowered, rising from the forks of them; stem climbing. ♂. Native of Peru. Loasa contorta, Lam. dict. 3. p. 579. D. C. prod. 3. p. 340. Juss. ann. mus. 5. p. 25. t. 3. f. 1. Loasa physiopetala, Ruiz et Pav. fl. per. 5. t. 447. ined. Flowers yellow.

Great-flowered Blumenbachia. Pl. cl.

Cult. Elegant annual plants, with very showy flowers; their culture and propagation are the same as that recommended for the species of Loasa, see p. 64.

Lin. syst. Polydelephia, Polyantria. Calyx 5-cleft, with the tube adhering to the ovary (f. 12. a.). Petals 5 (f. 12. k.), cuculate, equal, spreading, inserted in the top of the tube; scales 5, inserted with the petals, furnished with 3 sterile filaments on the back of each, and girding 2 subulate appendages inside. Stamens indefinite, inserted in the top of the calycine tube, disposed in 5 bundles (f. 12. b.), opposite the petals; anthers 2-celled, bursting inwardly. Ovary joined to the calyx. Capsule crowned by the lobes of the calyx (f. 12. a.), 3-valved at the top, 1-celled; placenta linear, alternating with the valves. Seeds rugose.—Branched, decumbent, or climbing herbs, beset with stinging hairs. Leaves alternate, or opposite, toothed or lobed. Flowers axillary, extra-axillary, or opposite the leaves, solitary or racemose.

* Leaves opposite.

1 L. tríóra (Juss. ann. mus. 5. p. 24. t. 1. f. 3.) leaves cordate at the base, usually 3-lobed; lobes acute, toothed; middle lobe usually somewhat 3-lobed; pedicels axillary; caly-
cine leaves small, acute. O. H. Native of Peru and Chili, about Valparaíso. Ruiz et Pav. fl. per. 5. t. 444. ined. Seeds petaloid, equally and bluntly 3-lobed. Flowers small.

**Three-lobed-leaved Loasa.** Pl. 1 foot.

3. **L. acerifolia** (Juss. l. c. p. 24. t. 1. f. 2.) leaves nearly opposite, cordate at the base, 5-7-lobed; lobes acute, toothed; pedicels shorter than the floral leaves; calyce lobes oblong, acuminate. O ? H. Native of Chili and Peru. Loasa viti-folia, Ruiz et Pav. fl. per. 5. t. 443. ined. L. tricolor, Ker. bot. reg. 667. Seeds as in L. triloba, but the calyce lobes are twice the length. Flowers with yellow petals and red scales.

**Maple-leaved Loasa.** Pl. tr.

3. **L. BRYONIEFOLIA** (Schrad. cat. hort. goett. 1823. pl. rar. hort. goett. with a figure) leaves cordate, lower ones 5-lobed, stalked, upper ones 3-lobed, almost sessile; all the lobes are sinuately lobed; pedicels exceeding the floral leaves; calyce lobes a little toothed, acuminate. O. H. Native of Chili. Stem erect, briskly. Flowers yellow, hardly smaller than those of L. acerifolia. Stigma blunt. Seeds without aril; hynum lateral.

**Bryony-leaved Loasa.** Pl. 1 foot.

4. **L. striida** (Lam. dicr. 3. p. 581.) leaves cordate at the base, many-lobed; lobes acute, toothed, lower ones unusually pinnatifid; pedicels axillary; calyce lobes oblong, toothed, shorter than the petals; wings of the corona very small, toothed, and stalked; stamens much shorter than the petals; style straight, shorter than the stamens; sepals erect, much shorter than the pear-shaped fruit. O. H. Native of Chili and Peru, on the mountains. Juss. ann. mus. 5. p. 25. t. 2. f. 2. Trat. tabl. 1. t. 23. Hook. exot. fl. t. 83. bot. mag. 2372. Ruiz et Pav. fl. per. 5. t. 445. Petals spreadingly reflexed, yellow, red at the base; scales red. Lobes of leaves bluntest. Stems prostrate.

Var. ? leaves more deeply lobed; lobes narrower.—Chili, about Valparaíso. L. tricolor, Lindl. bot. reg. 667.

5. **L. sagittatta** (Hook. et Arn. in bot. misc. 3. p. 228.) stems twining, pubescent; leaves all petiolate, opposite, cordately-sagittate, acuminate, with rather lobed margins: the lobes crenated; peduncles axillary and terminal, few-flowered; calyce lobes ovate-oblong. O. H. Native of Chili. There has none of the stinging hairs, so peculiar to this genus, been observed on this species.

**Sagittate-leaved Loasa.** Pl. tw.

6. **L. elongata** (Hook. et Arn. in bot. misc. 3. p. 230.) stems much elongated, nearly simple, shining; leaves remote, opposite, petiolate, cordate at the base, 5-7-lobed; peduncles axillary, few-flowered, twice the length of the leaves; calyce lobes broadly ovate, shorter than the petals, which are red; fruit hemispherical. O. H. Native of Chili, about Coquimbo.

**Elongated-stemmed Loasa.** Pl. 2 to 3 feet.

7. **L. prostrata** (Gill. miss. ex Arnott, in Cheek, edinb. journ. 3. p. 274.) stems prostrate, flexuous; leaves opposite, sessile, cordate, ovate, deeply angular; peduncles axillary, 1-flowered, about twice the length of the leaves; calyce lobes lanceolate, longer than the fruit, and about equal in length to the pedals; valves of capsule closely beset by long, rigid hairs; seeds egg-shaped, large, with a smooth testa. O. H. Native of Chili, on La Cuesta de los Manantiales, Cerro de San Pedro Nolasco, &c. Plant covered with long, rigid, stinging hairs.

Var. ? (Coomingii) (Hook. et Arnott, in bot. misc. 3. p. 230.) segments of leaves bipinnatifidly and sinuately toothed. About Valparaíso, and on the mountains near Aconcagua. In the species the segments of the leaves are simply and sinuately toothed.

**Prostrate Loasa.** Pl. prostrate.

8. **L. PaUllida** (Gill. miss. ex Arn. in Cheek, edinb. journ. 3. p. 274.) epidermis of stem loose, and shining; leaves opposite, all petiolate, ovate, coarsely toothed; panicles opposite, axillary, much longer than the leaves; pedicels short, in the forks, about equal in length to the flowers; calyce lobes linear-oblong, one half shorter than the petals. O. H. Native of Chili, among loose debris, on the banks of the El Rio del Yesso, near Arroyo de San Nicholas, at the elevation of about 5000 feet, &c., where it is called by the inhabitants Cavallena. The plant is most nearly allied to L. selacefolia, Juss. but that does not appear to have the loose epidermis on the stem, and the leaves are much larger. The pedicels in the forks of the panicle are elongated.

**Pale Loasa.** Pl. prostrate.

9. **L. lateritia** (Gill. miss. ex Arnott, in Cheek, edinb. journ. 3. p. 275.) stems almost wanting; leaves opposite, on long petioles, pinnate; segments roundish, crenated, lobed; peduncles twin, 1-flowered, terminal, about equal in length to the leaves; calyce lobes oval, exceeding the tube, but one half shorter than the corolla. O. H. Native of Chili, at Los-imposibles, near the foot of the descent from the Plancheon towards Chili, and in El Valle de Tray Carlos, at the base of the volcano of Pateroa, at an elevation of 9900 feet. This species is readily distinguished by its large flowers of a brick red colour, and by its very short stems and radical branches, each of which bear 1 or 2 pairs of opposite leaves, and between the upper pair of which arise 2 1-flowered peduncles, terminating the branch. Seeds with a strongly reticulated testa like the next species; and as in it the hairs are short and not stinging.

**Brick-coloured-flowered Loasa.** Pl. prostrate.

10. **L. pinmatifida** (Gill. miss. ex Arnott in Cheek, edinb. journ. 3. p. 275.) stems nearly erect; leaves opposite, on long petioles; radical and lower ones pinnate; segments pinnatifid, with roundish approximate lobes; upper leaves pinnatifid; peduncles axillary, usually 1-flowered; calyce lobes ovate, much shorter than the corolla, and half the length of the fruit. O. H. Native of Chili, at La Cuesta del Inga, at an elevation of about 9900 feet. Plant with short rigid, but not stinging hairs.

**Pinmatifid-leaved Loasa.** Pl. 1 foot.

11. **L. Dissecta** (Hook. et Arn. in bot. misc. 3. p. 240.) stem erectish, strong, a little branched at the apex, with a loose white epidermis; petioles opposite, lower ones elongated, becoming gradually shorter to the top of the stem; leaves tripinnatifid, with the ultimate segments ovate-obtuse; pedicels short, rising from the forks of the stem; calyce lobes narrow-oblong, not half so long as the petals. O. H. Native about Valparaíso, Los Osos de Agua, and Aconcagua.

**Dissected-leaved Loasa.** Pl. 1 foot.

12. **L. heterophylla** (Hook. et Arn. in bot. misc. 3. p. 228.) stem prostrate, dichotomous; leaves opposite, on short petioles; lower ones small, hasteately triangular, coarsely toothed; lower floral ones nearly reniform, 5-lobed, with the lobes nearly equal, and furnished with 1 or 2 teeth each; but the middle lobe of the uppermost leaves is rather lengthened; peduncles in the forks longer than the leaves; calyce lobes oblong-lanceolate, about equal in length to the petals; fruit conically hemispherical. O. H. Native about Valparaíso? and at Los Osos de Agua. The stem is rarely pubescent; but the branches, particularly in their upper part, and the turbinate tube of the calyx, are provided with long sharp spreading hairs.

**Variable-leaved Loasa.** Pl. prostrate.

13. **L. acanthifolia** (Lam. dicr. 3. p. 579.) leaves cordate at the base, pinnatifid; lobes acuminate, sinuately toothed; pedicels axillary, and also from the forks, solitary, 1-flowered; lobes of calyx narrow, acuminate, reflexed, equal in length to the petals, which are bidentate. O. H. Native of Chili. Juss. ann. mus. 5. p. 25. t. 3. f. 2. L. nitida, bot. mag. 2372? L. cymbepcastala, Ruiz et Pav. fl. per. 5. t. 442. b. ined. Ortiga
Chiñca, Feuill. obs. 2. p. 757. t. 43. Petals yellow. Scales red. Herb erect, 4 feet high. The leaves are often alternate.

**Acanthus-leaved Loasa.** Pl. 4 to 5 feet.

14. **L. Ruiziana**; leaves opposite, ovate, closely serrated, hairy from dusk, petiolate; peduncles axillary and terminal, 1-flowered; calyce segments acute, much shorter than the petals, which are cucullate. \( \odot \). H. Native of Peru. L. incana, Ruiz et Pav. fl. per. vol. 5. t. 441. ined. (v. s. herb. Lamb.)

**Ruiz's Loasa.** Pl. 1 foot.

15. **L. sclareaefolia** (Juss. l. c. 5. p. 25. t. 1. f. 1.) leaves ovate-oblong, sinutately lobed; lobes acute, toothed; upper leaves sessile; pedicels solitary, 1-flowered in the forks of the stem; calyce lobes oblong, acuminate, shorter than the petals. \( \odot \). H. Native of Chili, where it is called Urtica brava, Tratt. t. 22. Scales emarginate at the apex.

**Sclere-leaved Loasa.** Pl. tr.

16. **L. Placeli** (Lindl. in Hort. trans. 6. p. 97.) leaves coriace at the base, many lobed; upper ones sessile; pedicels axillary; sepals hardly toothed, reflexed, length of petals; the wings of the corona sessile, and quite entire; the longest of the stamens as long as the petals; style bent, longer than the stamens; capsule obovate, shorter than the reflexed sepals. \( \odot \). H. Native of Chili. L. acanthifolia, Ker, bot. reg. t. 785. but not of Juss. Flowers yellow, with red scales.

17. **L. grandiflora** (Lam. Dict. 3. p. 580.) leaves opposite; upper ones alternate, coriace at the base, 5-lobed; lobes deeply toothed; flowers axillary and terminal, on long pedicels; lobes of calyx acuminate, shorter than the petals. \( \odot \). H. Native of Peru. Juss. ann. Mus. 5. p. 26. t. 4. f. 2. Tratt. tab. t. 29. Ruiz et Pav. fl. per. 5. t. 440. Leaves long on leaves, and upper on short petioles. Flowers yellow. Scales oblong, 2-lobed, not appendaged on the outside.

18. **L. floribunda** (Hook. et Arn. in bot. misc. 3. p. 239.) root simple, fusiform; stem short, with a loose epidermis, simple beneath the indorcescence, but much branched and panicle above; leaves ovate-oblong, petiolate; cauline ones opposite, sinutately lobed, coarsely toothed, coriace at the base; lower floral ones alternate, sinutately lobed; upper floral ones smaller, cuneate at the base, toothed or quite entire; pedicels short, rising from the forks of the stems; calyce lobes elliptic, acute, incutinate at the base, shorter than the apical leaved petals; scales furnished with 3 appendages each on the back above the middle. \( \odot \). H. Native about Valparaiso, and on the Cordillera of Chili.

**Dandelion-flowered Loasa.** Pl. 1 foot.

* * *

19. **L. lossensis** (H. B. et Kunth, nov. gen. Amer. 6. p. 116.) leaves alternate, and nearly opposite, ovate-oblong, 3-5-lobed; lobes irregularly toothed; middle lobe very large; flowers terminal and axillary, somewhat racemose; lobes of calyx ovate, acuminate, 3-nerved. \( \odot \). S. Native of Peru, near Loasa. Leaves white beneath. Flowers yellow. Scales rounded at the apex, drawn out into a lobe at both ends. Herb suffruticos branched.

**Loasa Loasa.** Shrub.

20. **L. argemoneoides** (Juss. ann. Mus. 5. p. 26.) leaves coriace at the base, sinutately lobed, tomentose on both surfaces, white beneath; flowers terminal and axillary, pedicelate; lobes of calyx lanceolate, one-half shorter than the petals. \( \odot \). S. Native of South America, near Santa Fe de Bogota. Humb. et Bonpl. Pl. equin. 1. p. 53. t. 15. H. B. et Kunth, nov. gen. Amer. 6. p. 26. Tratt. tab. t. 30. Flowers nearly 3 inches in diameter. Scales bidentate, furnished with 2 acute lobes, which are gibbous at the base.

**Argemone-like Loasa.** Pl. 6 to 10 feet.

21. **L. ranunculifolia** (Humb. et Bonpl. Pl. equin. 1. p. 50. t. 14.) leaves all alternate, somewhat orbicular, coriace, toothed, clothed with yellowish tomentum above, and silky white tomentum beneath; flowers terminal and axillary, somewhat racemose; lobes of calyx much longer than the petals. \( \odot \). S. Native of Peru, on the Andes near Cajamarca. H. B. et Kunth, nov. gen. Amer. 6. p. 117. Tratt. tab. t. 27. Flowers large, yellow. Scales bidentate, bigibbous at the base.

**Crow-foot-leaved Loasa.** Pl. 2 feet.

22. **L. incana** (Graham in edinb. Phil. Journ. Oct. 1830.) plant suffruticos, reddish, eremoct. leaves scattered, petiolate, ovate-lanceolate, hoary, deeply serrated, scabrous; peduncles 1-flowered, opposite the leaves. \( \odot \). G. Native of Peru, from Yazo to the valley of Canta. Corolla white. Whole plant covered densely with harsh barbed white hairs, intermixed by a few stinging ones. Cuticle paper, and peeling off.

23. **L. xanthifolia** (Juss. l. c. t. 2. f. 1.) leaves petiolar, coriace, oblong, acute, coarsely toothed; pedicels extra-axillary; lobes of calyx oblong, hardly acute. \( \odot \). H. Native of Peru. Flowers small, yellow. Stems a foot and half high. Tratt. tab. t. 26. Xanthis-leaved Loasa. Pl. 1\frac{1}{2} foot.

24. **L. chenopodiifolia** (Lam. Dict. 3. p. 550.) leaves petiolar, somewhat ovate, deeply toothed; racemes loose, leafy, terminal; flowers drooping. \( \odot \). H. Native of Peru. Perhaps a mere variety of the preceding, according to Juss. ann. Mus. 5. p. 26.

**Goose-foot-leaved Loasa.** Pl. 1 to 2 feet.

25. **L. pariavelioflora** (Schrd. pl. rar. bras. indic. ex D.C. prod. 3. p. 342.) leaves on long petioles, ovate-axillary, sinutately 3-5-lobed, hoary; flowers racemose; racemes extra-axillary, few-flowered, shorter than the leaves; lobes of calyx eugast. \( \odot \). H. Native of Brazil, in the provinces of the Mines. Peduncles and calyces brisly. Flowers with white petals and brown scales. Bristles or sterile stamens at back of scales white.

**Small-flowered Loasa.** Pl. trailing.

26. **L. aspera** (Ruiz et Pav. Pl. per. 5. t. 441. b) hispid; leaves alternate, angularly lobed, and coarsely toothed; peduncles solitary, lateral; calyx long, very hispid; calyce segments ovate, longer than the petals. \( \odot \). H. Native of Peru.

**Rough Loasa.** Pl. 1 to 2 feet.

27. **L. ambrosisteifolia** (Juss. l. c. t. 4. f. 1.) leaves petiolar, bipinnatifid; lobes and lobules bluntish; pedicels extra-axillary; lobes of calyx lanceolate-linear, acute, shorter than the petals. \( \odot \). H. Native of Peru. Stem a foot high, hardly branched. Herb beset with yellowish prickles. Flowers yellow, an inch in diameter. Tratt. tab. t. 51. Scales bidentate, not appendaged on the outside.

28. **L. volubilis** (Juss. l. c. t. 5. f. 1.) leaves alternate and opposite, bipinnatifid; lobes linear, obtuse; flowers terminal and axillary, pedicelate; lobes of calyx a little toothed, one half shorter than the petals; stem twining. \( \odot \). H. Native of Chili, near Concepcion, in sandy places; and of Peru. Tratt. tab.
Twinling Loasa. Pl. tv.
20 L. TRIPHYLLA (Juss. l. c. p. 27. t. 5. t. 2.) leaves for the most part cut into 3 stalked, oblong, toothed segments; a few tripartite; pedicels extra-axillary; calyces lobed elliptic-oblong. • H. Native of Peru, in the high plains. Tratt. tab. 1. t. 21. H. B. et Kunth, nov. gen. amer. 6. p. 118. Steams ascending.

Three-leaved Loasa. Pl. ascending, 1 foot.
30 L. PAPAVERIFOLIA (H. B. et Kunth, nov. gen. amer. 6. p. 118.) leaves trilobate; segments or leaflets stalked, oblong, toothed: middle leaflet large, pinnatifid; flowers opposite the leaves, disposed in something like racemes; lobes of calyx elliptic, 3-nerved. • H. Native of the Andes, about Quindin. Stem simple, ascending. Flowers white. There is a figure in the Flora Mexicana which agrees with this plant, except that the petals are drawn bifid at the apex.

Cult. All the species of Loasa bear such beautiful flowers, that they are all worth cultivating for ornament, but they are so full of stings that it is impossible to handle them. The seeds of the annual species should be sown early in spring in the open ground, and the plants so raised will flower and produce seed the same season; or the seeds may be sown in pots, and reared in a hot-bed, and the plants may afterwards be planted out in the open border, in any convenient situation. All the species require a rich light soil and a warm situation. Some of the species are said to be perennial; we suppose all would be so if they were protected from frost.

Lin. syst. Polydolphia, Polyandria. Calyx 5-parted; segments jagged. Petals 5, unguiculate, concave. Scales 5, petaloid, emarginate, or 4-toothed at the apex, each furnished with 4 sterile filaments inside. Stamens numerous, disposed in 5 bundles. Style trigonal, permanent; stigma 3, connivent. Capsule ovate-oblong, with elevated spiral ribs, crowned by the reflexed calyx, 1-celled, many-seeded, opening at 3 of the sutures. Placentas marginal in the valves, but at length distinct from them. Seeds angular, echinated by bristles or reticulated.

—Usually climbing plants, with the habit of Loasa, beset with stinging hairs. Peduncles 1-flowered. Flowers yellow. This genus differs from Loasa and Blumenbachia in the echiscence of the capsule, in the scales being furnished with 4 sterile filaments instead of 3, and in many other points. There are several plants now referred to the genus Blumenbachia which belong to this genus; viz. B. grandiflora, which is Calypophora contorta, Presl. relq. Haeck. 2. p. 42. and B. punicea, which is evidently the Calypophora cireifolia, Presl. l. c. t. 54. and carduiola, Presl. l. c. p. 42.

1 C. CORONATA (Hook. et Arn. in bot. misc. 3. p. 238.) stems short; leaves opposite, petiolate, pinnate; segments bin pistatifid: lobes dentiliculat; peduncles axillary, 1-flowered, elongated; calyces lobes pinnatifid, with linear segments, longer than the ovarium. • H. Native of Chili, on both sides of the Cordillera of the Andes, between Mendoza and Chili, at an elevation of 8500 to 11,000 feet. The furrows of the fruit are nearly straight, or hardly spiral, so that this species partakes in some degree of the characters of Loasa. Loasa coronata, Gill. miss. ex Arnott, in Check, in edinb. journ. 3. p. 274. C. ab sinthofolia, Presl. in relq. Haeck. 2. p. 43.

Cult. See Loasa for culture and propagation.

V. SCYPHANTHUS (scyphos, scyphos, a cup, and anthos, a flower; in reference to the form of the flower). Sweet, fl. gard. t. 258.

Lin. syst. Polydolphia, Polyandria. Calyx deeply 5-parted, permanent, equal. Petals 5, inserted in the base of the calyx, on very short claws, concave, equal. Scales inserted with the petals, peltate at the apex, lobed, 3-lobed. Stamens numerous, perigynious, the 10 exterior ones destitute of anthers; and these are placed by two opposite the scales, and are longer than the rest, which are disposed in 5 fascicles opposite the petals; anthers 2-celled, erect. Ovarium prismatic, siliquiform; style one, erect, trigonal. Capsule prismatic, siliquiform, crowned by the tube of the calyx, 3-valved at the apex; seeds oval, wrinkled.—A twining herb, having its branches beset with retrograde stigmas. Leaves opposite, pinnatifid; superior ones bipinnatifid, hispid from hairs. Flowers sessile, erect, solitary, yellow.

1 S. ELEGANS (Sweet, l. c.). • H. Native of Chili. Stem dichotomous. Segments of leaves obtuse, ciliate. Gramnateocarpus volubilis, Presl. symb. bot. 1. p. 61. t. 38.

Lin. syst. Icoandria, Monogynia. Calyx permanent, with a cylindrical, somewhat 5-furrowed tube, and 5 lanceolate or subulate, equal lobes (f. 13. d.). Petals 5 (f. 10. a.), equal, inserted in the upper part of the tube of the calyx. Stamens indefinite (f. 13. e.), multiple the number of the petals, and inserted with them; filaments free, usually disposed in 5 bundles; anthers erect, ovate, bilocular. Ovarium adnate to the calycine tube. Styles 3, connected to the middle or to the top, marked by 3 corresponding stripes. Capsule turbinate cylindric, crowned by the calyicine lobes (f. 13. f.), 1-celled, 3-valved at the apex. Seeds 3-6-9, or irregular in number in consequence of abortion, inserted in 3 parietal placenates. Erect, branched, dichotomous herbes, rough from bearded or glabnodate stiff hairs. Leaves alternate, or nearly opposite, coarsely toothed. Flowers of a deep orange colour, solitary, almost sessile in the forks of the stem, or pseudo-axillary from one of the branches being abortive, expanding in the height of the sun.

1 M. ASPERA (Lin. spec. ed. 1. p. 516.) petals roundish-oval, obtuse, hardly longer than the calyceine limb, but much exceeding the stamens. • F. Native of the Antilles (Plum. ed. Burnu. t. 174. f. 1); Jamaica (P. Browne, jam. p. 249.); St. Domingo (Bertero). Seeds 5; parietal smooth, compressed. Hairs on plant glabrous at the apex.

** Stamens 30-100, the 10 exterior ones the longest. Seeds 6-9. Flowers larger than those of the last section.

3 M. nISPRA (Willd. spec. 2. p. 1176.) petals obovate, mu-

K.
crationately acuminated, longer than the calyx; stamens 30-35; leaves and flowers nearly sessile. **G.** Native of Mexico. \[Fig. 15.\] 4. **G.** Native of New Granada, on the Andes about Pasto. Seeds scabrous, 6-9.

**Scabrous**-seeded Mentzelia. Pl. 1 to 2 feet.

5. **M. grandiflora** (Ruiz et Pav. fl. per. 5. t. 441. ined.) petals obvolute, pointed, much longer than the calyx; calycine lobes ovate-lanceolate, acuminate, reflexed when the flowers are open; stamens numerous, from 30-40, unequal, outer ones the longest; leaves alternately ovate, coarsely toothed, on short petioles. **G.** Native of Peru.

**Great-flowered** Mentzelia. Pl. 2 to 3 feet.

7. **M. alta** (Pav. in herb. Lamb.) calyx covered with long hairs; calycine segments lanceolate, much shorter than the petals; stamens numerous; leaves cordate, lobed, obtuse, alternate, clothed with soft hairs; peduncles many-flowered. **G.** Native of Mexico. (v. s. in herb. Lamb.)

**Hairy** Mentzelia. Pl. 1 foot.

8. **M. stipitata** (Moc. et Sessee. fl. mex. icom. ined. ex D. C. prod. 3. p. 343.) petals oval, mucronately cuspidate, much longer than the calyx; stamens 30-40; flowers and leaves stipitate. **G.** Native of Mexico. Presl. in Haen. relic. 2. p. 40. Branches, pedicels, and ovaries scabrous from hairs. Leaves ovate, acuminate, 3-lobed, doubly toothed. Flowers lateral and terminal, solitary.

**Stipitate**-flowered Mentzelia. Pl. 1 to 2 feet.

**Culture.** The species grow well in any light rich soil; and cuttings will root readily in sand, under a glass-house. They are also easily reared from seeds, which ripen in this country.

**VII. KLAPROTHIA** (in honour of Martin Henry Klaproth, of Berlin, a celebrated chemist, and great friend of Humboldt). \[H. B. et Kunth, nov. gen. amer. 6. p. 121. t. 337. D. C. prod. 3. p. 343.\]

**Lin. syn.** *Icacinaria, Mosograea.* Calyx permanent, with a turbinate tube and a 4-parted limb; lobes ovate, equal. Petals 4, on very short claws. Stamens numerous, especially 4-5 fertile ones in front of each petal; these are longer than the others, and 4-5 sterile ones in front of each sepul; these are pilose, and somewhat dilated at the apex into a 2-lobed membrane. Styles 4, connected together almost to the apex in one. Ovarium 1-celled, 8-nerved inside, and 4-ovulate; ovula pendulous, fixed to the nerves opposite the sepals. Fruit baccate. Herb twining; branches scabrous from retrograde hairs. Leaves oppositely disposed, sharply toothed, stalked. Peduncles cymose or Corymbose at the tops of the branches. Flowers white.

**Order CVIII. TURNERACEAE** (plants agreeing with *Turneria* in important characters). \[H. B. et Kunth, nov. gen. amer. 6. p. 123. D. C. prod. 3. p. 345.\]

Calyx free, usually coloured more or less, profoundly 5-cleft (f. 14. a.), deciduous; lobes equal, imbricate in estivation. Petals 5, equal (f. 14. b.), inserted into the upper part of the tube of the calyx, and alternating with its lobes, narrow at the base, twisted in estivation. Stamens 5, inserted in the upper part of the tube of the calyx below the petals, and alternating with them; filaments free, flat; anthers oblong, erect, 2-lobed (f. 14. c.). Ovarium free, 1-celled (f. 14. d.), many-ovulate. Ovula ascending (f. 14. f.), fixed to 3 linear parietal placentas. Styles 3 (f. 14. e) or 6, usually more or less deeply bident, and cleft into many stigmas at the apex (f. 14. c.). Capsule 3-valved, 1-celled (f. 14. f.); valves bearing the seeds in their middle, along a longitudinal placentum, opening from the apex as far as the middle. Seeds subcylinndrical, curved, crustaceous, reticulated, furnished with a thin, membranous arillus on one side. Hilum situated at the base of the seed. Embryo in the centre of a fleshy albumen, somewhat incrusted, spartulate, with the radicle turned towards the hilum, and with plano-subconvex cotyledons.—Shrubs, subshrubs, and herbaceous plants, with a simple pubescence. Leaves alternate or scattered, simple, exstipulate, with occasionally 2 glands at the apex of the petioles, toothed, rarely pinnatifid. Flowers axillary, sessile, or pedunculate; the peduncles either distinct or connected with the petioles, simple and 1-flowered or branched and many-flowered, articulated in the middle or furnished with 2 small bracteoles. Petals yellow or yellowish, rarely blue. This order is placed by De Candolle between *Loasa* and *Faucariaeae*, chiefly it would seem on account of its manifest relation to the former, and its perigynous stamens. With *Maltracia* it agrees in the twisted estivation of the corolla and habit. With *Loasa* and *Passiflora*, they have also much in common. In the structure of the fruit it agrees with *Violaceae* and *Cistaceae*, but differs in the petals and stamens being inserted into the calyx, and the circumstance of their certain relationship to *Cistaceae* gives great weight to the ingenious approximation, by M. Du Petit Thours, of *Passiflora* to *Violaceae*. The presence of glands upon the ends of the petioles of *Turneracaeae* is a confirmation of their affinity to the former. It is distinguished from *Loasa* by the fruit being superior and 1-celled, with parietal placentas, and by the definite stamens; the former character is, however, weakened by the nearly superior fruit of some *Loasa*.

**Synopsis of the Genera.**

**1. Turnera.** Styles 3 (f. 14. e), simple, divided at the apex into multifid stigmas (f. 14. e). Capsule opening from the top to the middle.
2 Perique'ta. Styles 3, deeply 2-parted, crowned by 2 multifid stigmas each. Capsule opening from the top to the base.

—Turnera, sect. 1. Lam. ill. t. 212. dict. s. p. 141.

§ 1. Peduncles united with the petals, bi-nectarate.

* Leaves biglandular at the base.

1 T. ulmifolia (Lin. spec. ed. 1. p. 965.) leaves oblong, acute, serrated, pubescent above, but clothed with white tomentum beneath, and biglandular at the base; flowers almost sessile; styles shorter than the stamens. ½. S. Native of South America everywhere; common in Brazil. Lin. bort. cliv. 122. t. 10.—Sloan. hist. 1. t. 127. f. 4.—Mill. fig. t. 268. f. 2.

2 T. cuneiformis (Juss. in Poir. dict. 8. p. 142.) leaves confluently oblongate, coarsely serrated, pubescent above, but clothed with white tomentum beneath, and biglandular at the base; flowers nearly sessile. ½. S. Native of Brazil, about River Janeiro. Spreng. nov. prov. 42. St. Hl. fl. bras. 2. p. 215.

3 T. ulmifolia var. nana (Juss. in Poir. dict. 8. p. 142.) leaves oblong-lanceolate, coarsely serrated, cuneate at the base, and quite entire, pubescent; flowers sessile; styles exceeding the stamens. ½. S. Native of Brazil, island of Trinidad, and Mexico. T. elegans, Otto, l. c. Link, enunc. 1. p. 203. Petals pale yellow, or sulphur-coloured, with purplish-brown claws. Bracteoles subulate. Flowers as large as those of Bladder-kelmia.

4 T. laticarpa (St. Hl. fl. bras. 2. p. 213.) leaves roundish-ovate, unequally crenate-toothed, clothed with soft hairs above and woolly tomentum beneath, biglandular at the base; flowers on short peduncles; styles a little shorter than the stamens. ½. S. Native of Brazil, in the southern part of the province of Goyaz. Petals yellow, rather truncate at the apex.

Dead-nettle-leaved Turneria. Shrub 1 to 2 ft.

5 T. lanceolata (St. Hl. fl. bras. 2. p. 214.) leaves linear-lanceolate, acute, nearly entire, hairy, biglandular at the base beneath; flowers almost sessile. ½. S. Native of Brazil, in the province of Goyaz and Minas Geraes. Petals oblong-oblong, yellow. Styles exceeding the stamens a little.

Lanceolate-leaved Turneria. Shrub ½ to 1 ft.

6 T. oblongifolia (St. Hl. fl. bras. 2. p. 215.) leaves oblong, acute, obsoletely and dentately serrated, beset with rufescent hairs, biglandular at the base beneath; flowers almost sessile; styles a little longer than the stamens. ½. S. Native of Brazil, in the provinces of Minas Geraes and St. Paul, in grassy pastures and fields. Petals oblong, obovate, yellow.

Obovate-leaved Turneria. Shrub 1 to 1½ ft.

7 T. cuneata (Moc. et Sesse, fl. mex. icon. incd. ex D. C. prod. 3. p. 346.) leaves oblong, coarsely serrated, but quite entire at the base, and hardly attenuated, clothed with red villous pubescence beneath, biglandular at the top of the petiole; flowers sessile; styles longer than the stamens. ½. S. Native of Mexico. This species is very like T. triomiloma, but differs in the leaves being on shorter petioles, and in being hardly attenuated at the base, as well as in the hairs on the lower surface of the leaves being appressed. Bulb submucous. Flowers blue.

Blue-flowered Turneria. Pl. ½ to 1 ft.

8 T. subulata (Smith, in Rees's cycl. vol. 36. no. 2.) leaves ovate, acute, serrated, clothed with white soft hairs; bracteoles linear-subulate; flowers sessile. ½. S. Native of New Granada. Capsules plicate. Glands of leaves broad.

Subulate-bracteate Turneria. Pl. 1 ft.

9 T. acuta (Spreng. syst. 1. p. 940.) leaves lanceolate, acuminate at both ends, crenately serrated, glabrous; flowers sessile. ½. S. Native of Jamaica. Flowers yellow, about the size of those of Linum trigynum. Petals 3-4 lines long. Bracteoles setaceous, appressed to the calyx. Perhaps T. acuta, Willd. red. in Roem. et Schultes, syst. 5. p. 678, exclusive of the country.

Acute-leaved Turneria. Shrub 1 foot.

10 T. affinis (Mart. reis. bras. ex D. C. prod. 3. p. 346.) plant downy; leaves linear-lanceolate or lanceolate, acute, attenuated and biglandular at the base, remotely and acutely serrated, pubescent; stem suffruticoso; branches twiggly; flowers petiolate; bracteas shorter than the calyx. ½. S. Native of Brazil, at Rio Jaquinhonha and Rio Verde Grande.

Bee-bearing Turneria. Shrub 1 foot.

Silky Turneria. Shrub 1 to 2 ft.

12 T. mollis (H. B. et Kuhn, l. c. p. 126.) leaves ovate-oblong, coarsely crenately serrated, clothed with silky hairs on both surfaces, canescence beneath; flowers sessile; styles plicate. ½. S. Native of New Granada, near Honda. Petals yellow, with violaceous caps. Capsule roundish-ovate.

Soft Turneria. Shrub 1 foot.

13 T. longiflora (St. Hl. fl. bras. 2. p. 216.) leaves oblong, obtuse, crenately toothed, biglandular at the base beneath, woolly on both surfaces, but especially beneath; flowers sessile; styles 3-times longer than the stamens. ½. S. Native of Brazil, in the province of Minas Geraes. Petals obovate-oblong, yellow, red at the base.

Long-flowered Turneria. Shrub 1 to 1½ foot.

14 T. leucocarpos (St. Hl. fl. bras. 2. p. 217.) leaves lanceolate, acute, crenately toothed, lower ones glandless, upper biglandular at the base beneath, clothed with silky pubescence on both surfaces, and with yellowish tomentum beneath; flowers sessile in fascicles. ½. S. Native of Brazil, in the province of Minas Geraes. Petals oblong-ovate, of a golden yellow colour.

Yellownish Turneria. Shrub 2 to 3 ft.

15 T. incana (St. Hl. fl. bras. 2. p. 217.) leaves oblong or K 2.
oblong-lanceolate, acutish, crenately-toothed, clothed with velvety pubescence above, and hoary tomentum beneath, and biglandular at the base; flowers sessile; styles one half shorter than the calyx. ♂ S. Native of Brazil, in the province of Goiás. Petals yellow, ovate-oblong.

**Hoary Turnera.** Shrub 1 to 2 feet.

16 T. hermannioides (St. Hil. fl. bras. 2. p. 218.) leaves oblong-oblong, cuneated, unequally toothed, clothed with white tomentum on both surfaces, biglandular at the base beneath; flowers sessile; styles a little longer than the stamens. ♀ S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas. Petals oblong, marked with brown veins.

**Hermainna-like Turnera.** Shrub 1 to 1½ foot.

17 T. melochioides (St. Hil. fl. bras. 2. p. 219.) leaves oblong-oblong, obtuse, narrowed at the base, unequally crenate-toothed, rather roughish above, and clothed with rufescent tomentum beneath, biglandular at the base; flowers sessile; styles a little shorter than the stamens. ♀ S. Native of Brazil, in the province of Minas Geraes. Petals ovate, yellow.

**Melochia-like Turnera.** Shrub 1 to 2 feet.

18 T. na'na (St. Hil. fl. bras. 2. p. 219.) leaves ovate, rounded at the apex, crenated, pubescent on both surfaces, but especially beneath, biglandular at the base; flowers sessile; styles 3-times longer than the stamens. ♀ S. Native of Brazil, in the southern part of the province of Goiás, on a mountain called Serra dos Pyreneas, near the town called Meia. Petals oblong, pale yellow.

**Filaceous Turnera.** Shrub 1 foot.

* * Leaves glandless.

20 T. genistoides (St. Hil. fl. bras. 2. p. 220.) leaves linear, acutish, glandless, hairy; flowers sessile; styles twice the length of the stamens. ♀ S. Native of Brazil, in the province of Minas Geraes, near Tejucó. Petals obovate-oblong, glabrous.

**Genista-like Turnera.** Shrub ½ to 1 foot.

21 T. chamaedepioides (St. Hil. fl. bras. 2. p. 221.) leaves oblong-oblong, acute, deeply toothed, glandless, pubescent on both surfaces, but especially beneath; flowers on short peduncles; styles exceeding the stamens. ♂ S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, on the banks of the river Jiquitinhonha. Petals rose-coloured?

**Germainaud-like Turnera.** Shrub ½ to 1 foot.

22 T. pinnaütida (Juss. in Poir. dict. 8. p. 144.) leaves obovate-oblong, cuneated, toothed, or pinnagregated, glandless, hairy or tomentose; flowers sessile; styles 3-times longer than the stamens, purple. ♀ S. Native of Brazil, in the province of Cisplatin, in pastures and fields. Petals scarlet, denticulated at the apex.

*T. β. angostiloba (D. C. prod. 3. p. 347.) stems diffuse; leaves hairy, pinna aggregated; lobes narrow, acute; flowers of a dirty red or copper colour. ♀ S. Native of Brazil, about Monte Video, and in the province of Cisplatin.

*T. γ. carnea (St. Hil. fl. bras. 2. p. 222.) stems ascending, 6 inches high; leaves hairy, oblong-lanceolate, cuneated, deeply toothed; petal pale red, usually marked at the base with a dark purple spot each; filaments puberulous. ♂ S. Native of Brazil, in the province of Cisplatin.

**Pinnatifid-leaved Turnera.** Shrub ½ foot.

23 T. serris (Smith in R. sess. cyc. no. 6.) leaves obovate-wedge-shaped, serrated or pinna aggregated, very hairy on both sides, without glands; peduncles axillary, partly combined with the footstalks; outer calyx linear. ♀ S. Native of Monte Video and Buenos Ayres. Flowers tawny, red.

**Bristly Turnera.** Pl. ½ to ¾ foot.

24 T. pumilea (Lin. amoen. 5. p. 395.) leaves broad-lanceolate, deeply serrated, hairy; flowers sessile, propped by 2 linear bracteoles; styles and stamens length of petals. ♀ S. Native of Jamaica, in arid fields. Swartz, obs. 116.—Sioane, jam. hist. t. 127. f. 6.—Pumilea, no. 1. P. Browne, jam. 188. Stem hardly 3 inches long. Plum. icon. t. 150. f. 1. Flowers small, yellow.

**Dwarf Turnera.** Fl. July. Cl. 1796. Pl. ¼ foot.

**Small-leaved Turnera.** Shrub 1 foot.

§ 2. Peduncles distinct from the pedioles, axillary. Flowers bicnacteolate.

26 T. rep'estris (Aubl. guian. 1. p. 289. t. 113. f. 1.) leaves linear, serrated, glabrous, glandless; flowers nearly sessile, bearing 2 setaceous bracteoles at the base. ♀ S. Native of Guiana, in the fissures of humid rocks, at the river Sinemari. Petals yellow, somewhat toothed at the apex, 3 lines long. Flowers small.

27 T. rupest'scens (Aubl. l. c. p. 290. t. 113. f. 2. but not of Mill.) leaves lanceolate, acuminiated, equally serrated; flowers nearly sessile, bearing 2 sessile, lanceolate-linear bracteoles. ♀ S. Native of Guiana, in the fissures of rocks, on the banks of the river Sinemari. Very like T. rep'estris, but differs in the leaves being broader, and in the serratures being more crowded. Flowers small, yellow.

**Far. latifolia (D. C. prod. 3. p. 347.) leaves ovate, acute. ♀ S. Native of Cayenne.

**Shrubby Turnera.** Shrub 5 to 8 feet.

28 T. tomentosa (H. B. et Kunth, nov. gen. amer. 6. p. 125. but not of Willd.) leaves oblong, irregularly crenate-serrate, pubescent above, but clothed with canescent tomentum beneath, glandless at the base; flowers sessile, with 6 stamens and 6 petals. ♂ S. Native of South America, in the province of Venezuela. Styles hairy, about equal in length to the stamens. Petals yellow.

**Tomentose Turnera.** Shrub 1 foot.

29 T. sino'oides (Lin. mant. p. 38.) leaves obovate-cuneated, serrated, quite entire at the base, rather tomentose on both surfaces, pilose on the veins and margin beneath; flowers on very short pedicels; bracteoles linear, hairy. ♀ S. Native of Brazil. Habitat of T. eitoides. Petals obovate, yellow.

**Sidá-like Turnera.** Shrub 3/4 foot.

30 T. carpinifólia (H. B. et Kunth, l. c.) leaves oblong-lanceolate, doubly serrated, puberulous, biglandular at the base; flowers on short pedicels; bracteoles ovate, acuminate, serrated. ♂ S. Native on the humid banks of the river Orinoco, near Maypures, T. acuta, Willd. rel. in Rom. et Schult. syst. 6. p. 678. ex Kunth. Flowers yellow. According to Willd. the flowers are petioled; if such be the case, the plant belongs to the preceding section.

**Hornbook-leaved Turnera.** Shrub 1 to 2 feet.

31 T. durte'ana (St. Hil. fl. bras. 2. p. 223.) leaves ovate,
obtuse, crenated, glandless, pubescent above, hairy, tomentose beneath; peduncles simple. f. S. Native of Brazil. Petals oblong, striated, yellow, denticulated at the apex. Styles about equal in length to the calyx.

Willow-leaved Turnera. Shrub 2 to 3 feet.

38 T. capitata (St. Hil. l. c. p. 215.) leaves elliptic-oblong, or oblong-lanceolate, acute, denticately serrated, nearly glandless, pubescent above, and clothed with yellowish tomentum beneath; flowers sessile, forming a many-flowered head at the tops of the branches. f. S. Native of Brazil, in the province of Minas Geraes, on the margins of woods near Poso Alto, not far from the confines of the province of St. Paul, and on the iron mountains near Nossa Sura da Conceicao. Petals oblong-oblong, pale yellow. Styles much shorter than the stamens.

Capitate-flowered Turnera. Shrub 3 to 1 feet.

40 T. glabra (D. C. prod. 5. p. 547.) leaves linear, obtuse, sub serrated, narrowed at the base, glandless; racemes few-flowered; pedicels rising from the axes of small linear leaves and shorter than them, articulate and bracteolate above the middle. f. S. Native of St. Domingo. Stems erect, glabrous. Flowers yellow.

Glabrous Turnera. Pl. 1 to 2 feet.

41 T. cistoides (Lin. spec. 387.) leaves linear-lanceolate, serrated, pubescent above, tomentose beneath, glandless at the base; racemes terminal, leafy; pedicels rising from the axis of lanceolate leaves and shorter than them, articulate and bracteolate above the middle. f. S. Native of South America, in sterile places, Suriname, Jamaica, St. Domingo, Georgia, &c. Sloan. jam. hist. 1. p. 127. f. 7. Plum. ed. Burm. t. 150. f. 1. Swartz. obs. 117. T. hishita, Bert. flavus. Flowers small, yellow.

42 T. spera (Poir. dict. 8. p. 144.) leaves elliptic, sessile, a little toothed, pubescent above, and rather tomentose beneath, glandular; stem hardly pubescent, rough; racemes leafy, terminal; pedicels rising from the axis of the leaves, and shorter than them, articulated above the middle. f. S. Native of French Guiana. Flowers yellow. Perhaps a variety of T. cistoides or of Periquita villosa.

Rough Turnera. Pl. 1/2 foot.

† Species not sufficiently known.

Sweet-scented Turnera. Shrub.

44 T. nikita (Willd. rel. in Reem. et Schult. syst. 5. p. 678.) leaves linear-lanceolate, unequal, bluntly serrated, clothed with stellate tomentum on both surfaces; flowers axillary, solitary; stem branched, hairy. f. S. Native of Brazil. Flowers yellow.

45 T. braziliensis (Willd. rel. l.c.) leaves lanceolate, quite entire, clothed with hispid pubescence; flowers axillary, sessile, aggregate. f. S. Native of Brazil. Leaves biglandular at the base. ex Spreng.
Brazilian Turner. Fl. Ju. Jul. Ct. 1810. Pl.$\frac{1}{2}$ to 1 ft. 46 T. integri folia (Wild. rel. l. c.) peduncles 1-flowered, axillary; leaves linear-lanceolate, pubescent, glandless.—Native country unknown. Leaves revolute, sessile, strigose above, but clothed with stellate tomentum beneath. Peduncles branched, bracteless, (exo Sprmg. syst. 1. p. 942.)

Entire-leaved Turner. Pl.? 47 T. vire scapa (Wild. rel. l. c.) leaves ovate, serrated, pilate, biglandular at the base; flowers bibracteate; bracteae linear-scatceous. $\ddot{O}$. $\dddot{S}$. Native of Brazil.

Twiggy Turner. Pl. $\frac{1}{2}$ to 1 foot. 48 T. corchorifolia (Wild. rel. l. c.) leaves oblong, doubly serrated, tomentose beneath. $\ddot{O}$. $\ddot{S}$. Native of Brazil. The rest unknown.

Corchorus-leaved Turner. Pl. $\frac{3}{4}$ to 1 foot? 49 T. Desvaiuxii (D. C. prod. 3. p. 348.) stem suffruticos, branched; branches assurgent, hairy; leaves ovate, obvuse, cre- nately toothed at the base, rather pilose beneath; flowers axil- lary, on long peduncles.—Native of Guiana. T. birta, Desv. in Hamilt. prod. p. 33. but not of Wild. Deveaux's Turner. Pl. 1 foot.

Cult. All the species of Turné are elegant plants when in flower, and thrive well in any light rich soil. They seed freely in this country, and may be propagated by that means: cuttings also root freely, under a hand-glass, in heat. The seeds of annual species may be reared on a hot-bed in spring; and some of the plants may be planted out into the open border, in a warm sheltered situation, where they will probably flower and ripen their seeds, if the summer prove dry and warm.

LIN. Syst. Pentândria, Tri-Hexagynia. Calyx campanulate. Style 6, or 3 bipartite ones; stigmas multifid, flagellate. Capsule 3-valved from the apex to the base. Perhaps this genus is sufficiently distinct from the preceding. Habit of Turnéra racemosa, but which plant is only furnished with 5 styles, not 6. Flowers pedicellate, in the axils of the upper leaves. Pedicels bracteate, articulate above the middle. 1 P. villosa (Anbl. l. c.) leaves ovate-oblong, erosely toothed, wrinkled, clothed with rufous villi. $\ddot{O}$. $\ddot{S}$. Native of Guiana, in sand by the sea-side. Turnéra rugosa, Willd. spec. 1. p. 1504. Poir. dict. 8. p. 145. Turnéra villosa, Rausch. Corolla yellow.

Villous Piriquesta. Pl. 2 feet. 2 P. tomentosa (H. B. et Kunth, nov. gen. amer. 6. p. 128.) leaves oblong, acutish at both ends, irregularly crenate-serrate, pubescent above, clothed with soft hoary tomentum beneath. $\ddot{S}$. $\ddot{N}$; Native of South America, between Atures and Maypures, on the Orinoco. Turnéra tomentosa, Wild. rel. in Rem. et Schultes, syst. 6. p. 678. but not of H. B. et Kunth, Corolla yellow.

Tomentose Piriquesta. Shrub 1 to 2 feet.

Cult. The culture and propagation of these plants are the same for the annual species of Turnéra, see p. 70.

ORDER CIX. FOQUIERACEÆ (plants agreeing with Foquiera in important characters). D. C. prod. 3. p. 349.—Portulaceae affines, H. B. et Kunth, nov. gen. amer. 6. p. 81.

Calyx of 5 permanent sepals; sepals imbricate, ovate or roundish. Petals 5, combined into a tube, inserted in the bottom of the calyx or torus; limb of corolla 5-lobed, regular. Stamen 10-12, inserted with the corolla, exserted; anthers 2-celled. Ovary free, sessile. Style filiform, trilob at the apex. Capsule trigonal, 3-celled; valves bearing dissepiments in their middle, which go as far as the centre of the fruit, and therefore the capsule is 3-celled. Seeds compressed, winged, fixed to the centre of the fruit or axis, few when the capsule is mature, but numerous when it is in a young state. Embryo straight, in the centre of a fleshy albumen, with flat cotyledons.

—Trees or shrubs, natives of Mexico. Leaves in fascicles when young, in the axils of spines or cushions, quite entire, oblong, and rather fleshy. Flowers scarlet, disposed in a termi- nal spike or panicle.

This order is separated from Portulacea by De Candolle, as he tells us, (Mem. portul. p. 4) for the following reasons: first, because their petals cohere into a long tube, of the same nature as that of gamopetalous Crassulaceæ; second, because their capsule consists of 3 loculicidal cells, that is to say, which separate through the middle, forming 3 septiferous valves; and thirdly, because their embryo is straight, with flat cotyledons, and stationed in the centre of a fleshy albumen. They approach the monopetalous Crassulaceæ in the structure of their flowers; and Turnériaceæ and Loasaceæ in the form of their fruit.

Synopsis of the genera.

1 FOQUIERÁ. Sepals ovate, mucronate, free, 2 exterior and 3 interior. Limb of corolla spreading reflexed. Stamens 10-12, hypogynous.

2 BRONNIA. Sepals roundish; limb of corolla erect. Stamens 10.

LIN. Syst. Decârdia, Monogynia. Calyx coloured; sepals ovate, mucronate, 2 exterior and 3 interior, free. Corolla hypogynous; tube cylindrical, a little arched; limb spreading reflexed, nearly regular. Stamens 10-12, hypogynous, ex- serted; filaments ciliated below, and cohering together; anthers coriace. Ovaria 18, on each placenta, in 2 rows. Fruit unknown. A somewhat spinose shrub. Spikes terminal, erect. Flowers scarlet. Leaves oblong, rather fleshy.

1 F. FORMOSA (H. B. et Kunth, l. c.). $\ddot{S}$. Native of Mexico. Echeveria spicata, Moc. et Sesse, fl. mex. icon. ined. Flowers flesh-coloured, an inch long. Leaves scattered, according to Kunth's figure; but according to the figure in the fl. mex. they are a little narrower and in fascicles: therefore the 2 figures mentioned are very unlike each other.

Shozy Foquiera. Shrub 6 to 10 feet.

Cult. A light rich soil will suit this very showy shrub; and young cuttings will root freely under a hand-glass, in heat.

LIN. Syst. Decârdia, Monogynia. Calyx permanent; sepals 5, roundish. Tube of corolla cylindrical, straight; limb
erect. Stamens 10; filaments filiform, exserted; anthers ovate. Style exceeding the stamens. Cells of fruit 1-seeded when mature. A spinose shrub, with fascicles of obovate-oblong, membranous leaves in the axils of the spines. Flowers paniced, scarlet. It differs from the last genus in the placentas being drawn in more to the centre of the fruit.

Spiny Bronnia. Tree 12 to 14 feet. Cul. See Fouqueria. 1. p. 70. for culture and propagation.

Calyx free, or somewhat adnate to the very base of the ovarium (f. 15. a. f. 18. a.), usually of 2 sepals (f. 16. a. f. 18. a.), seldom of 3 or 5 (f. 20. a.), cohering at the base. Petals usually 5 (f. 15. b. f. 17. b.), but sometimes 3-4-6, very rarely wanting altogether, either distinct (f. 18. b.), or cohering into a short tube at the base (f. 15. b.), alternating with the sepals when the number is equal. Stamens inserted along with the petals, irregularly into the base of the calyx, and sometimes perhaps in the torus, variable in number in the species of the same genus, all fertile; filaments distinct, adnate to the base of the petals (f. 15. g.), and usually opposite them where the number is equal; anthers ovate, 2-celled, opening lengthwise, versatile (f. 18. c.). Ovarium one, usually roundish (f. 15. c.), 1-celled (f. 15. f.). Style sometimes single, filiform, cleft into numerous stigmas at the apex (f. 15. c.); sometimes wanting or nearly so; when this is the case the stigmas are distinct (f. 17. c.), and rise in numbers from the top of the ovarium. Capsule 1-celled, opening either transversely (f. 15. f.), or by the 3 valves from the base to the apex; but they are also occasionally 1-seeded and indehiscent. Seeds numerous when the fruit is dehiscent, attached to the central placenta (f. 15. f.). Albumen farinaeous. Embryo curved round the circumference of the albumen, with a long radicle, and oblong cotyledons.—Fleshy shrubs or herbs. Leaves alternate, rarely opposite, entire, usually succulent, without stipulas, or sometimes with membranous ones on each side of the petioles. Flowers axillary or terminal, usually expanding in the sun, and of short duration. The 1-seeded genera of this order agree in character with the order Portulacaeae, and the apetalous genera with the order Ficoideae. This order is related in nearly every point of view to Caryophyllaceae, from which they scarcely differ except in their perigynous stamens, which are opposite the petals when equal to them in number, and two sepals; the latter character is not, however, very constant. The presence of scarous stipulas in several Portulacaeae, although perhaps an anomaly in the order, indicates their affinity with Caryophyllaceae, from which the monospermus genera of Portulacaeae are distinguished by the want of symmetry in their flowers, and by the stamens being opposite the petals, instead of the sepals. So close is the relationship between these orders, that several of the genus Gigninsia in Portulacaeae have been referred to Pharmaceae in Caryophyllaceae, and several Portulacaeae have been described by authors as belonging to genera of Paronychiae. De Candolle remarks, that his Gigninsia brevicalis resembles certain species of Andróneae, and that Portulacaeae have been more than once compared to Primulaeae (mem. p. 14.), and the same author remarks in his prod. 3. p. 351. that the genera with definite stamens, and hairy axillae approach Ciceae, while the apetalous genera tend towards apetalous Ficoideae.

Insipidity, want of smell, and a dull green colour, are the usual qualities of this order, of which the only species of any known use are common Parslane and Claytoria perfoliata, which resemble each other in properties.

Synopsis of the genera.

1. TRIAN'THEMA. Sepals 5, concrete at the base, coloured. Petals wanting. Stamens 3, rarely 10 or more. Styles or stigmas 1-2, rarely 3. Capsule opening transversely.

3. PORTULACA. Calyx bipartite (f. 15. a.), at length falling off. Petals 4-6, equal (f. 15. b.), free or concrete at the base. Stamens 6-15 (f. 15. g.). Style one, 3-5 cleft at the apex (f. 15. c.); or style wanting, and the stigmas 3-8 elongated. Capsule opening transversely (f. 15. f.).

8. CALANDRINA. Calyx 2-parted (f. 18. a.). Petals 3-5 (f. 18. b.), free or rather connate at the base. Stamens 4-15 (f. 18. c.). Style one, very short, tripartite at the apex (f. 18. c.); lobes clavate. Capsule oblong-elliptic, 3-valved. Seeds wingless.

9. PORTULACARIA. Calyx of 2 sepals, membranous. Petals 5, permanent. Stamens 5, or probably 10, 5 of which are abortive. Style wanting; stigmas 3, spreading, glandular. Fruit triquetrous, winged, indehiscent, 1-seeded.

PORTULACEE.

12 Moéstia. Calyx of 2, rarely of 3 sepals. Petals 5, rather connate at the base, 3 of which are a little smaller than the rest. Stamens usually 3 in front of the smaller petals, making 9, very rarely 3-4. Capsule 3-valved, 3-seeded.

16 Ateleria. Calyx 2-parted, coloured. Petals 5. Stamens 10, membranous, connected into a hypogynous tube, the 5 inner ones abortive. Style one, crowned by a depressed capitate stigma. Capsule bladdery, membranous, valveless. Seeds numerous in the bottom of the cell.

Lin. syst. Pent-Deccindria, Monogynäia. Sepals 5, permanent, connected together at the base, rather coloured on the inside, and mucronated under the apex. Petals wanting. Stamens 5-10, rarely more, distinct, inserted in the bottom of the calyx; anthers kidney-shaped. Ovary ovate. Styles or stigmas filiform 1-2; rarely 3. Capsule opening transversely below the middle; the upper valve, which separates like a lid, is hollow, and contains a seminiferous cell; therefore both cells are either simple, or of two divisions, one or few-seeded. - More or less fleshy herbs, which are sometimes suffruticoses at the base. Leaves opposite, quite entire, petiolate. Petioles dilated into a stipula-formed membrane on both sides. Flowers axillary, sessile, usually by threes.

sect. i. Zaléya (meaning not explained by Burmann), Burm. fl. ind. p. 110, D. C. Prod. 3. p. 352. Stamens 10 or more.

1 T. Polyantha (Blum. bijdr. p. 1137.) stems herbaceous, procumbent; branches terete; leaves linear, obtuse; flowers pedunculate, solitary, polyandrous, trinervus. 2. 8. Native of Batavia, in boggs.

Polyandrous Trianthes. Pl. cr.

2 T. Govinda (J. am. ex Cat. no. 6638.) stems suffruticos, trailing; leaves opposite, elliptic, emarginate at the apex; those opposite each other of unequal size; flowers axillary, aggregate, sessile. 2. 8. Native of the East Indies, in Manggee. Plant glaucous. The number of stamens and styles unknown. Govinda Trianthes. Shrub prostrate.

4 T. Trigeta (Rottl. et Willd. in nov. act. nat. berol. 4. p. 180.) stems herbaceous, dichotomous, branched; branches compressedly triquetrose; leaves somewhat spatulate, petiolate; flowers axillary, sessile. - Native on the coast of Coromandel. Structure of flower unknown. Trigétrea Trianthes. Pl. diffuse.

5 T. Humíra (Thunb. fl. cap. p. 389.) stems frutescent, trailing, terete; leaves lanceolate, attenuated at both ends. 2. 6. Native of the Cape of Good Hope, in Konde Bokeveld. Stamens 10, alternate ones shorter. Thunberg in his prodromus says the flowers are monogyrous, but in his flora he says they are digynous. Var. ?; other than 10, one-half shorter than the calyx, fixed by pairs to the base of the calycine segments. - Native of the Cape of Good Hope, at Hex River.

Trailing Trianthes. Shrub tr.

6 T. Aces (Thunb. fl. cap. p. 399.) stems frutescent, diffuse, 2-edged; leaves lanceolate, attenuated at both ends, acuminated. 2. 6. Native of the Cape of Good Hope. Stamens 10. Style 1, very short.

Two-edged-stemmed Trianthes. Shrub diffuse.

7 T. Pentandra (Lin. munt. p. 70.) stems rough from velvety hairs; leaves elliptic, obtuse, flowers crowded in the axils of the leaves. 2. (ex Forsk.) (ex Lin.) Native of Arabia. Roçama digyna, Forsk. l.c. Roçama Arabica, Genl. syst. 1. p. 455. Phuk. phy. t. 120. f. 3. ex Lin. T. pentandra, Gürtn. fruct. 2. p. 213. t. 128. f. 5. Lam. ill. t. 375. f. 2. Stamens 5. Styles 2. Perhaps 2 species are here confused, the stems being, according to Linnaeus, erect and shrubby, and according to Forskal annual and prostrate. Var. ?; other than 5, sessile emarginate at the apex. - Native of the East Indies. T. roçama, Roxb. hort. beng. p. 34.

8 T. Monogyra (Lin. munt. p. 69.) stems herbaceous, diffuse, dichotomous, branched, glabrous; leaves oval, obtuse, opposite, one of them smaller than the other; flowers axillary, sessile, bibracteolate. 2. 6. Native of Jamaica, Curassow, and Mexico. D. C. pl. grass. t. 109. Lam. ill. t. 375. f. 1. T. portulacæastrum, Sauv. meth. p. 127. Lin. spec. 635. T. procmabens, Mill. - Phuk. aln. t. 55. f. 4. Stamens usually 5, alternating with the sepals, but sometimes 10. Styles 1 or 2. Lower cell of capsule about 4-seeded; upper one 1-seeded.

9 T. Cristallina (Vahl. symb. 1. p. 32.) stems shrubby, diffuse, terete, glabrous, papillose; leaves linear or lanceolate, opposite, one of them smaller than the other; flowers crowded, axillary. 2. 6. Native of Arabia and the East Indies. Papulária cristallina, Forsk. desc. p. 69. Stamens alternating with the petals. Style 1.

Iey Trianthes. Shrub diffuse.

Cult. The seeds of the species of Trianthes require to be sown on a hot-bed in spring; and about the end of May they may be planted out in the open border in a warm sheltered situation, where they will probably flower and seed. Some are said
to be shrubby, these it will be requisite to treat as other stow plants; and cuttings of them will be easily rooted.

II. CYPSELEA (from kypsele, a bee-hive; in reference to the form of the capsule). Turp. in ann. mus. 7. p. 219. t. 121. f. 5. D. C. prod. 3. p. 333.—Radiâna, Rafin. speecli. 1. p. 88.

Lin. syst. Di-Trimandria, Dicygnum. Calyx campanulate, permanent, coloured, 5-petalled; lobes obtuse, 2 of which are smaller than the other 3. Corolla wanting. Stamens 2-3, inserted in the calyx and alternating with its lobes (ex Turp.), or opposite the smaller lobes (ex Rafin.). Ovarian free, 1-celled Style hardly any, 2-petalled, or stigmas 2. Capsule 1-celled, many-seeded, opening transversely. Seeds fixed to an ovular, central placenta, very small, and very numerous.—Herbs, natives of St. Domingo, with the habit of Moâsta or Crip'ta, rather succulent, annual, and glabrous. Leaves opposite, obovate; petioles widened into a stipule-formed, jagged membrane. Flowers axillary, small, greenish, solitary, on short pedicels.

III. PORTULACA (from porto, to carry, and lac, milk; plants milky). Tourn. inst. t. 118. Adans. fam. 2. p. 242. Juss. gen. p. 312.—Portulaca species of Lin.—Meridiâna, Lin. et Schrank.—Lêmià, Vand. in Röm. script. p. 116. t. 7. f. 15.—Merida. Neck. Lin. syst. Octo-Dodecandria, Monogynia. Calyx free from or adhering to the ovular at the very base, bipartite (f. 15. 1.), at length cut round about at the base, and falling off. Petals 4-6 (f. 15. b.), equal, distinct, or joined together at the very base, inserted in the calyx. Stamens 8 (f. 15. g.)—13; filaments free, sometimes adnate to the bottom of the corolla (f. 15. g.). Ovarian roundish. Style 1 (f. 15. d.), 3-6-cleft at the apex (f. 15. c.), or the style is wanting; but in this case, the stigmas are 3-8 and elongated. Capsule sub-globose (f. 15. f.), 1-celled, opening transversely in the middle. Seeds numerous, fixed to a central placenta (f. 15. f.).—Humble fleshy herbs. Leaves scattered, quite entire, thick, usually bearing hairs in the axes, crowded, or somewhat verticillate about the flowers. Flowers expanding from 9 till 12 o'clock in the morning, if the sun shine, otherwise they remain closed.—This is a heterogenous genus, and probably divisible, but easily distinguished by the capsule opening transversely.

* Flowers yellow. Axis of leaves or joints pilose.

—Blackw. icon. t. 287.

Var. b, sativa (D. C. prod. 3. p. 353.) stems diffuse; branches erectish. O. H. Native of South America, and now cultivated in some parts of Europe. P. doméstica, Lob. icon. p. 388. P. sativa, Haw. misc. p. 136. syn. 122. P. latifolia, Horn. hort. hafn. 2. p. 491. There is a variety of this with green leaves (P. viridis, Hortul.), and yellowish leaves (P. aërea, Hortul.). The young shoots and succulent leaves are esteemed cooling, and are used in spring and summer as an ingredient in salads, and as pot-herbs and pickles. The plant was formerly in much more request than at present. Both the green and yellow-leaved sorts are raised from seed, and for a bed 4 feet by 4 feet, sown either broadcast or in drills, 9 inches apart, one-eight of an ounce will suffice. Each variety is somewhat tender; the green, which is usually preferred, is perhaps rather the hardiest. An early crop may be sown in February or March, on a moderate hot-bed; the plants will require the aid of a gentle heat till the middle of May, when the seed may be sown in a warm border. If a continued succession is required, sow every month during summer, till August, or while the plant can be raised; generally in small drills, from 3-6 inches aunder. The plants will soon come up; they should remain where sown. In very dry hot weather, water thrice a-week. The shoots may be gathered for use when they are from 2-5 inches in height, and are well furnished with leaves. Cut them off low, and the bottom part will soon sprout out again. When seed is required, leave some of the first open border plants to run; they will set seed in Autumn.

2 P. parvifolia (Haw. syn. p. 122.) leaves cuneiform, minute, fleshy; stem much branched, prostrate; flowers sessile, or on long peduncles. O. H. Native of Jamaica. Probably only a variety of P. sativa, but the plant is much smaller, and the leaves are 10-times smaller.

** Flowers yellow. Axis of leaves or joints pilose.

3 P. foliosa (Ker. bot. reg. 793.) stem diffuse; branches erect; leaves subulate; flowers solitary at the tops or in the forks of the branches, surrounded by white hairs and a many-angled, yellowish, and rather inconspicuous perianth. O. F. Native of Guinea, near Accra. P. Guineensis, Spreng. There is a plant figured in fl. mex. of Moc et Sesve, called by them P. stelliformis, a native of Mexico, which is very like this species. Flowers small, yellow.

5 P. lanuginosa (H. B. et Kunth, nov. gener. amer. 6. p. 74.) stems procumbent, branched; leaves terete; obtuse, upper ones in whorls; flowers in clusters of 2-5, surrounded by soft hairs; petals ovate-spatulate, obtuse. O. F. Native of South America, on the banks of the Amazon. Style 1; 3-5-cleft at the apex. Petals 4-5, yellow. Woolly Purslane. Pl. pr.

6 P. marginata (H. B. et Kunth, l. c. p. 72.) stems rather dichotomous; leaves cuneately spatulate, rounded at the apex, subverticillate, obsoletely veined, margined with red; axis hairy; flowers 5-7 in each head, involucrated. O. F. Native near Caracas, in Venezuela. Said to be allied to P. oleracea. Flowers yellow.

Marginated-leaved Purslane. Pl. pr.

7 P. laportottana (St. Hils fl. bras. 2. p. 190.) stem suffruticos at the base, pilose in the axils of the leaves; leaves lanceolate, flatish, narrowed at the base, acute, longer than the hairs; flowers crowded at the tops of the branches; petals ob-
cordate, mucronulate, shorter than the calyx.  h. S. Native of Brazil; in that part of the province of Minas Geraes called Minas Novas, near Nossa Senza da Penha. Flowers yellow, surrounded by hairs and crowded leaves.

*Larrotte's Purslane*. Shrubs ½ to 3 foot.

9 P. euribacalis (H. B. et Kuntx, nov. gen. amer. 6. p. 73.) stems ascending, corymbose branched above; leaves lanceolate, acute, nerveless; upper leaves in whorles; axils pilose; flowers 4-8, crowded into a head.  O. F. Native of South America, in sandy places and on dry mountains on the sea-shore near Laguna. Pedals 5, ovate-oblong, emarginate, orange-coloured. Stamens 27-30. Style 6-8-cleft. Said to be allied to P. halimoides.

Red-stemmed Purslane. Pl. ascending ½ foot.

10 P. hirsutissima (St. Hil. fl. bras. 2. p. 121. t. 114.) stem suffrutescent at the base, pilose at the axes of the leaves; leaves opposite, oblong-lanceolate, flat, tapering to both ends, acute, shorter than the flowers; flowers crowded at the tops of the branches; petals obcordate, mucronulate, a little longer than the calyx.  h. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, near Bom-Tim and Nossa Senza da Penha, and also near Tejucu. Flowers yellow, surrounded by a whorl of the upper leaves and axillary hairs.

Very hairy Purslane. Shrub ½ to 1 foot.

11 P. mucronata (Link, exm. hort. berol. 2. p. 2.) stem erect; leaves oblong, with a short taper point; floral leaves 8, constituting an involucrum; axils pilose; flowers terminal, sessile.  O. F. Native country unknown.

** ** Flowers purple; axils pilose, or perhaps sometimes naked.

13 P. pilosa (Lin. spec. 639.) stem diffuse; joints beset with long hairs; leaves alternate, linear-lanceolate, convex on the back, bluish, about equal in length to the axillary hairs; floral leaves in whorles; flowers crowded at the tops of the branches, sessile, surrounded by long hairs; petals ovate, acute, a little longer than the calyx.  O. F. Native of South America, about Curassao, in Brazil, Martinique, Jamaica, &c. in sandy places near the sea. Gaertn. fruct. 2. p. 212. t. 128. f. 4. Haw. misc. p. 137. Ker. bot. reg. 792.—Wolk. norib. 341. with a figure. Herm. par. 215. Comm. hort. anat. 1. t. 5. Flowers 5-parted, pale purple, expanding from 10-12 o'clock in the morning, if the sun is out. Stamens about 20. Root tuberous.

14 P. lana'ta (Rich. act. soc. hist. nat. par. 1792. p. 109.) stems diffuse; leaves linear-subulate, flat; hairs of the axilla and joints longer than the leaves; flowers terminal, surrounded by hairs and a whorl of leaves.  O. F. Native of Cayenne. Petals red, obcordate. Stamens 15 and more. Perhaps only a variety of P. pilosa.

Wolly Purslane. Pl. ½ to ½ foot.

15 P. pilosissima (Hook, bot. misc. 2. p. 221.) plant annual? small; stems branched, decumbent; leaves terete, oblong; fascicles of hairs twice or thrice longer than the leaves.  O. H. Native of Peru, at Yazo, in the valley of Canta. The flowers are concealed by long white solitary tufts of hairs. It comes nearest to the P. lanata, Rich.

Very pilose Purslane. Pl. ½ to ½ foot.

Shaded Purslane. Pl. ½ to ½ foot.

17 P. pusilla (H. B. et Kuntth, l. c.) stems branched; axils naked? leaves scattered, elliptic, nerveless, rounded at both ends; flowers solitary, almost sessile.  O. F. Native on the Orinoco, among rocks near Maypures, and of Trinidad. Flowers rose-coloured, 4-5-petalled. Stamens 11-14. Style triad.

18 P. Hilaireana (stem trailing, herbaeous, pilose in the axils of the leaves linear-lanceolate, convex on the back, flat in front, acute, longer than the axillary pili; flowers crowded on the tops of the branches; petals obcordate, much longer than the calyx.  O. F. Native of Brazil, in the province of St. Paul. P. grandiflora, St. Hil. fl. bras. 2. p. 192. but not of Hook. Flowers purple, surrounded by crowded leaves and hairs.

St. Hilaire's Purslane. Pl. ½ to ½ foot. trailing.

19 P. grandiflora (Hook, in bot. mag. 2883.) stems diffuse, branched; leaves scattered, cylindrical, acute, with pilose axes; flowers 3-4 together, terminal, crowded, surrounded by a whorl of leaves and crowded hairs; petals longer than the calyx; style 8-9-cleft at the apex.  O. F. Native of Chili. There are varieties of this plant with either purple or yellow large flowers. Root tuberous.

Var. a, major? (Hook, in bot. misc. 3. p. 241.) leaves an inch or an inch and a half long.—Bot. mag. t. 2885.

Var. b, microphylla (Hook. et Arn. l. c.) leaves hardly half an inch long. P. Mendocienensis, Gill. mss. Both varieties are found between Rio Saladillo and Mendoza.

the calyx, obovate-roundish. 2 G. Native of Chili, in the plains near Mendoza. Plant stout, in proportion to its height. Flowers large, bright reddish purple.

Gillies's Purslane. Pl. 1 to ½ foot.

21 P. teretifolia (H. B. et Kunth, l. c.) stems creeping, corymbose branched; axils rather pilose; leaves scattered, terete, acutish; flowers 3-5 in a head, sessile, involucrated, and surrounded by hairs. O. F. Native of South America, on the sandy banks of the river Orinoco and Rio Negro, near Car- chana, Maypures, San Carlos, &c. Very like P. rubiculoides, but differs in the flowers being purple. Stamens 18-24.

Terete-leaved Purslane. Pl. creeping.

22 P. axilliflora (Pers. ench. 2. p. 6.) stems procumbent; leaves oblong, fleshy, in young plants they are opposite; flowers solitary, axillary. O. F. Native country unknown. Meridiàna axillifóra, Schrank. bot. zet. 1804. p. 354. Corolla and stamens rose-coloured.

Axil-flowered Purslane. Pl. pr.

† Species not sufficiently known.

23 P. imbriátá (Forsk. deser. 92.) leaves crowded, ovate, acute, flat beneath, and convex above, opposite; joints hairy at the base; flowers sessile, terminal. O. H. Native of Arabia. Flowers yellow, large. Usually as if they were tetragonal, from the leaves being imbricated on them in 4 rows.

Imbricate-leaved Purslane. Pl. pr.

24 P. Cañera (Thunb. fl. cap. p. 399.) stem weak, branched, glabrous; leaves linear-oblong, alternate; flowers axillary, pedicellate; pedicels bibracteate. O. F. Native of the Cape of Good Hope. Corolla yellow, 6-petalled. Style trifid. Capsule probably 2-celled and 2-valved.

Caffriana Purslane. Pl. pr.

25 P. Arabica (Forsk. deser. 92. no. 81.) calyx of 4 permanent sepals.—Native of Arabia. The rest unknown.

Arabian Purslane. Pl. ?

26 P. Flavia (Forst. fl. esc. p. 72.). O. F. Native on the shores of the Society Islands, where it is booted and eaten by the natives, and called by them Aturi. This plant has not been described, and is probably nothing else but P. oleracea.

Yellow-flowered Purslane. Pl. pr.

27 P. Wightiana (Wall. cat. no. 6845.) plant diffuse; leaves small, intermixed with numerous soft leathy stipulas; flowers sessile, terminal, almost hidden by the white bracteas. š. S. Native of the East Indies, at Sadras, in moist sand. A singular species.

Wight's Purslane. Pl. ½ foot.

Cult. Being mostly annual plants, growing naturally in sandy soil near the sea, the seeds should be sown in dry warm situations in spring; or it is perhaps better to sow them on a hotbed in spring, and plant them out towards the end of May into the open border; or they may be grown in pots and set in the greenhouse or in a frame.

IV. GRAHAMIA. V. ANACAMPseros.

IV. GRAHAMIA (in honour of Mrs. Maria Graham, a great traveller in South America, particularly in Brazil, Peru, and Chili.) Gill. ms. ex Hook. et Arn. in bot. misc. 3. p. 241.

Lin. syst. Jovibudia, Monogynia. Calyx of 2 permanent, oblong-lanceolate, mucronate, concave, still sepals, propped by 8 or 9 imbricate bracteae, similar to the sepals. Petals 5, obo- vate, mucronate. Stamens numerous, about 40; filaments filiform, monadphous at the base; anthers erect, 2-celled. Ovarium oblong, 1-celled. Style filiform, thickened upwards; stigmas 4, but usually 5, linear. Capsule 1-celled, 5-valved. Seeds numerous, compressed, broadly winged, each fixed by a podosperum to the central axis.—A smooth branched shrub, with alternate, oblong, obtuse, fleshy leaves, bearing hairs in the axils. Flowers solitary, terminating short or elongated branches, with white sepals and petals; and having the filaments purple at the base, and the anthers and stigmas yellow.

1 G. africana (Gill. ms. ex Hook. et Arn. l. c. p. 242.). š. D. G. Native of Chili, among bushes, in the Travésia between San Louis and Mendoza, especially near the river Desaguarero, at the altitude of 1500 feet. Xeranthus salicosis, Miers, to. 2. p. 539.

Africana-flowered Grahamia. Sitrub 1 foot.

Cult. See Portulacca for culture and propagation.

Lin. syst. Dodecandra, Monogynia. Calyx of 2 sepals (f. 16. a.); sepals opposite, oblong, rather concrete at the base. Petals 5 (f. 16. b.), very fugacious. Stamens 15-20 (f. 16. d.), filaments distinct, inserted in the bottom of the calyx along with the petals, and adhering a little to them. Style filiform, trifid at the apex (f. 16. d.). Capsule conicol, 1-celled, 3-valved (f. 16. c.), with the valves cleft longitudinally in the middle, and therefore the capsule appears as if it was 6-valved (f. 16. c.). Seeds numerous, winged, fixed to a central placenta. Very dwarf herbs or subshrubs, natives of the Cape of Good Hope. Leaves ovate, fleshy. Axils bearing filamentous subscarsious stipulaceous hairs. Bractes membranous, usually lobed into setaceous segments. Pedicels 1-flowered, elongated, disposed in racemes. Flowers of a rose-purple colour or white, expanding only in the heat of the sun.

2 A. intermediá; leaves very numerous and dense, expanded, flat, convex on the outside, retusely deltoid at the apex; axillary threads twisted, brown. š. D. G. Native of the Cape of Good Hope. Rulingia intermediá, Haw. in plit. mag. march 1828. Very like A. polypophyllum, but almost one half smaller, but taller; also like A. filaments, but broader; the leaves more numerous, leaves crowded, paler; and the axillary threads yellow, not white.

4 A. rubens (D. C. prod. 3. p. 556.) leaves ovate, acuminate, dilated, shining, dark green, somewhat reflexed at the

**FIG. 16.**

**LIN. SYST.** Deca-Dodecandria, Monogynia. Calyx of 2 ovate sepals, deciduous. Petals 5 (f. 17. 6.), hypogynous, or inserted in the bottom of the calyx, distinct or joined a little way at the base. Stamens 10-20, inserted along with the petals, and generally adhering a little to them, and joined together at the base. Style filiform, cleft at the apex into 3 spreading or close stigmas. Stigmas bearing papillae inside. Capsule 3-valved, 1-celled, many-seeded. Seeds wingless, kidney-shaped, scabrous, fixed to the central placenta.—Fleshy herbaceous, or suffrutescent plants. Leaves alternate, quite entire, exstipulate. Flowers very fuscous, expanding only in the heat of the sun, cyanose or racemose. Cymes or racemes usually forming terminal panicles.

2. **T. NAPFORME** (D. C. Prod. 3. p. 357.) root tuberous; radical leaves terete, subulate, fleshy, cymes terminal, dichotomous, corymbose; stamens 3, alternating with the petals. \( \gamma \). F. Native of Mexico. Claytôния tuberosa, Moc. et Sesse, fl. mex. icon. ined. Root tuberous, turnip-formed. Stems numerous from the neck of the tuber, almost leafless at the base, but cymose and dichotomous at the apex. Flowers white. This species from habit and inflorescence agrees with the preceding, but differs materially in having only 5 stamens, not 3, a tuberous root. It is not a Claytôния, but a Claytonia alternans, with the petals, not opposite them; nor a Calandria from the calyx not being deciduous.

**Turnip-formed-rooted Talinum.** Pl. ¾ to 1 foot.

**Var. \( \beta \), albilorum** (D. C. prod.

**FIg. 17.**
PORTULACEÆ. VI. TALINUM. VII. LEWISIA.

3. p. 357.) flowers white. ¹ D. G. Native of South America, by
syst. vég, but not of Thunb. Portulaca paniculata, Lin. spec. 2.
p. 640. Talinum fruticosum, Willd. spec. 2. p. 864. The
calyx is said to be of 5 sepals, but this assertion we suspect to
be erroneous.

5 T. TETANDRIA (Willd. spec. 2. p. 862.) stem shrubby, erect;
leaves flat, channelled, wedge-shaped, emarginate, mucronate;
racemes simple; racis triquetrous. ¹ D. S. Native of the Antilles, on the sea shore.
Portulaca triangulāris, Jaq. obs. 1. p. 35. t. 23. Rulingia tri-
angulāris, Ehrh. beitr. 3. p. 134. Flowers yellow, size of those
of the preceding species.

5 T. FÄTENS (Willd. spec. 2. p. 863. var. a.) stem suffruti-
cose, erect; leaves flat, glabrous, lower ones obovate, obtuse,
upper ones lanceolate, acute; panicle terminal; peduncles alter-
nate, dichotomous, bracteal; petals oblong, acute, 3 times
longer than the calyx. ² D. S. Native of Martinico, St.
Domingo, Mexico, New Granada, and Brazil, on rocks by the sea;
or of Buenos Ayres. Portulaca paniculata, Jaq.
amer. p. 148. Portul. pāntes, Jaq. hort. vind. 2. t. 151. Ru-
língia pāntes, Ehrh. beitr. 3. p. 135. T. paniculatum, Gaertn.
fr. 2. p. 219. t. 128. but not of Mench. nor of Ruiz et Pav.
Flowers small, red, 3 lines in diameter. The leaves of the plant
are used in the same manner as common purslane in Brazil.

1 to 2 feet.
6 T. ANDREWSI (Sweet, hort. p. 170.) stem suffruti-
cose, erect; leaves glabrous, ovate-lanceolate, sessile; panicle
branched, terminal; petals oblong, obtuse. ³ D. S. Native of the
West Indies. T. pāntes, Andr. bot. rep. t. 255. Flowers
large, red.

7 T. REFLIEXUM (Cav. icon. 1. p. 1. t. 1.) stem suffruti-
cose, erect; leaves flat, lanceolate or oval, obtuse, usually opposite;
panicle terminal; peduncles usually opposite, dichotomous,
barrel-shaped. ³ D. S. Native of South America. Sims. bot.
p. 141. T. pāntes β, Willd. spec. 2. p. 863. T. dichótomum,
Ruiz et Pav. syst. fl. per. p. 118. This species is very nearly
allied to T. pāntes, but differs in the flowers being yellow, not
red or purple, as in that plant, and the plant is probably biennial.

8 T. CUCNTOLOUM (Willd. spec. 2. p. 864.) stem shrubby,
erect; leaves flat, wedge-shaped, obtuse, mucronate; panicle
terminal; lower peduncles 3-flowered. ⁴ D. G. Native of Arabian
Felix, by Suridud and Hadie; also of the East In-
dies. Portulaca cuncfíola, Vahl. symb. 1. p. 333. Origia portu-
lacifíolia, Forsk. descrip. p. 103. Flowers of a reddish violet-
colour.

9 T. POLYGALOIDE (Gill. ms. ex Arnott, in Cheek, edinb.
journ. vol. 3. p. 354.) stem shrubby, erect, branched a little;
branches striated, angular; leaves flat, linear, mucronate (when
dry very narrow, with revolute edges); peduncles bitrackate at
the base, when bearing the fruit deflexed, axillary, emulating a
simple raceme. ⁵ D. G. Native of Chili, in the Jarihal, and
along the foot of the mountains near Mendoza, at an elevation
of 3000 to 4000 ft above the sea. Flowers about a fourth of
an inch in diameter, yellow, fading to red. The stem appears
not to be at all fleshy, according to the dried specimens.

Polygala-like Talinum. Pl. ½ to 1½ foot.

Sect. III. TALINÉLÜM (a diminutive of Talinum). D. C.
prod. 5. p. 358.—Talinum, Ruiz et Pav. syst. fl. per. p. 65.
Style thick. Stigmas 3, thick, flatish.—Generally annual
herbs; and probably should have been joined with the genus
Calandrinia.

10 T. REVOLUTUM (H. B. et Kunth, nov. gen. amer. 6. p.
76.) stem shrubby, simple; leaves glabrous, lanceolate, obtuse,
narrowed at the base, with revolute margins; peduncles terminal,
somewhat dichotomous, few-flowered; petals awned, glaucular
towards the base. ⁶ F. Native of South America, in shady
places near Cunuma. Flowers yellow. Stamens about 48.
Fruit unknown.

Revolute-leaved Talinum. Pl. ½ foot.
11 T. MUCRONÁTUM (H. B. et Kunth, l.c.) stems erectish;
leaves glabrous, oblong or oblong-lanceolate, obtuse, somewhat
mucronate, cucurred, and narrowed at the base; peduncles ter-
minal, 2-3-cleft, many-flowered; flowers racemose; petals mucronate. ⁷ D. F. Native of New Andalusia, near Bor-
dones, in shady humid places. Petals yellow, length of calyx.
Stamens about 56.

Mucronate-leaved Talinum. Pl. ½ to 1½ foot.
12 T. POLYAINDERUM (Ruiz et Pav. syst. fl. per. p. 115.) leaves
roundish-obovate, acuminate; flowers racemose, polyandrous;
petals obcordate, quite entire. ⁸ F. Native of Peru, on the
hills called Lomas towards Pongo. Herb a foot high, and
noxious to cattle. The rest unknown.

Polyandrous Talinum. Pl. 1 foot.
13 T. CRENA'TUM (Ruiz et Pav. l.c.) leaves roundish-
oblave, acuminate; flowers racemose; petals eremulatad; sta-
mens about 20.—Native of South America, on hills about
Pongo in the province of Atiquipa. Herb a foot high, and
called by the natives Langua de Faco, as the preceding
plant. The rest unknown.

Crenated-pelted Talinum. Pl. 1 foot.
14 T. MENSIEIUS (Hook. fl. amer. bot. 1. p. 225. t. 70.)
cauliscent; leaves linear-spatulate; lower ones on long petioles;
margins naked; superior ones and sepals acutely keeled, glan-
dularly ciliated on the back; flowers pedulcuate, axillary. ⁹
H. Native of the north-west coast of America, south of Col-
bumbia. The habit is that of a species of Talinum, without hav-
ing seen the flowers; it may, however, when better examined
turn out to be a species of Calandrinia. Root annual, rather
fusiform.

Menzies’s Talinum. Pl. ½ foot.

Cult. Pretty succulent plants, most of which require the
heat of a stove; a mixture of loam, peat, and sand, or any
light soil will suit them; and cuttings of them are very readily
rooted. The seeds of the annual species may be reared on a
hot-bed, and afterwards planted out in the open border about
the end of May.

VII. LEWISIA (in honour of Captain M. Lewis, who accom-
panied Captain Clarke to the Rocky Mountains of North Amer-
p. 345. t. 70. fl. bor. amer. 1. p. 223.

Lan. syst. Dodecandria, Monogynia. Calyx of 5 sepals;
sepals rather membranous. Petals 9-12, inner ones gradually
the smallest. Stamens 13-16, hypogynous; anthers linear.
Ovarium globose. Ovula many, fixed to a free central recep-
tacle. Style deeply 6-parted; segments filiform; stigmas ob-
tuse.—Plant herbaceous, stemless. Roots fascicled. Leaves
terete, fleshy. Sepals 1-flowered.

1 L. REDIVIVA (Pursh. l.c. Hook. l.c.) ¹ Y. H. Native of
North America.

Fur. a; root blood-coloured; flowers white. Native on the
banks of Clarke’s river.
Var. β; root white; flowers rose-coloured. Native of the subalpine regions of the Rocky Mountains, on the west side, and abundant at the junction of the Spokane river with the Columbia, on dry stony rocks; also of the Flathead and Salmon rivers, in similar situations. The roots of this variety are gathered in great quantities by the Indians on the west side of the Rocky Mountains, and highly valued on account of their nutritive qualities. They are boiled and eaten as sapsap or arrow-root, and are admirably calculated for carrying on long journeys; two or three ounces a day being quite sufficient for a man, even while undergoing great fatigue. Perfect flowers of the plant have not yet been seen by any botanist, and therefore the genus is not well known, and probably may hereafter verge into Tacamahac.

Cult. A mixture of loam and brick-dust will be a good soil for this plant; and it may be propagated by dividing the plant at the root, by cuttings, or by seeds.

Linn. syst. Dodécandria, Monógynia. Calyx permanent, bi-partite (f. 18, a.), sepals roundish-ovate. Petals 3-5 (f. 18, b.), hypogynous, or inserted in the bottom of the calyx, distinct or connected together at the very base, equal. Stamens 4-15, inserted in the torus or base of the petals, distinct, generally alternating with the petals. Style 1, very short, tripartite at the apex; lobes collected into a clavately capitate stigma (f. 18, c.). Capsule oblong-elliptic, 1-celled, 3-valved, many-seeded. Seeds adhering by capillary funiculus to the central placenta.—Successor or fleshy glabrous American herbs, having the habit of Salm. Leaves quite entire, radical or alternate. Pedicels 1-flowered, axillary or opposite the leaves. This genus hardly differs from Tacamahac, as far as its characters are yet known.

* Stemens 10-15.

1 C. PANICULATA (D. C. prod. 3, p. 358.) plant caulescent, branched; leaves obovate-oblong, acuminate; flowers panicled; pedicels 5 times longer than the bracteas. O. F. Native of Peru, in the province of Chancay, commonly called Losa, on sandy hills; and in the province of Atiquipa, at Pango, where the plant grows a foot high, and is called there Oréjas de Perro and Castanuelas. Tacamahac paniculatum, Ruiz et Pav. syst. fl. per. p. 115. Portulaca carnosa, Domb. herb. Leaves glabrous, fleshy. Stem erect, paniculately branched at the apex. Sepals 2, ovate, permanent. Stamens 10-15. Capsule 3-valved, length of the calyx. Flowers purpureus.

Tongue-leaved Calandrini. Pl. 1 foot.

3 C. CISTIFLORA (Gill. miss. ex Arnott, in Check, edibm. journ. 3. p. 355.) glabrous; stem ascending, suffruticosum; branches leafy at the base, and nearly naked towards the apex; leaves linear-lanceolate, acutatus; raceme terminal, few-flowered; pedicels elongated; bracteas minute, foliaceous; sepals ovate, acute; stamens numerous. O. F. Native on the Andes of Mendoza and Chili, in many places at an elevation above the sea, from 9,000 to 10,000 feet. The flowers are pretty large, and purple. It ranks near C. lingulata.

Rock-rose-flowered Calandrini. Pl. ascending.

4 C. AFINNUS (Gill. miss. ex Arnott, in Check, edibm. journ. 3, p. 355.) plant glabrous and stemless; leaves elongated, linear, obtuse, attenuated into the petiole; indurated bases of petioles imbricated and dilated; peduncles radical, 1-flowered, naked, one-half shorter than the leaves. O. D. G. Native on the Andes of Chili, at El Serro de San Pedro Nolasco. This species is closely allied to C. acaulis, but differs in the flowers having numerous stamens.

Alced Calandrini. Pl. 1/4 foot.

5 C. CAPITATA (Hook. et Arn. in bot. misc. 3. p. 244.) root annual; stems erect, smooth, and nearly simple; leaves linear, smoothish, ciliate; racemes capitate, many flowered, terminal, and axillary, pedunculate; flowers nearly sessile; sepals roundish, truncate at the apex, beset with long pili on the back. O. F. Native on the Cordillera of Chili, and near Collina.

Capitate-flowered Calandrini. Pl. 1/2 foot.

6 C. RAMOSSIMA (Hook. et Arn. in bot. misc. 3. p. 244.) root annual; stems many from the same neck, leafy, branched; axillary branches horizontal; leaves linear, pilose, ciliate with long hairs at the base; racemes short, few-flowered; sepals roundish, truncate, bluntly tridentate at the apex, beset with long pili on the back. O. F. Native of Chili, about Valparaiso.

Much-branched Calandrini. Pl. 1/2 to 1 foot.

7 C. CUSINGII (Hook. et Arn. in bot. misc. 3. p. 244.) root slender, annual; stems many from the same root, procumbent, leafy, dichotomously branched; leaves linear, attenuated at the base, beset with adpressed hairs; racemes few-flowered, terminal; sepals roundish, tridentate at the apex, pilose on the back. O. F. Native of Chili, about Valparaiso; and on the Cordillera of Chili. The upper part of the stems, racemes, and calyces are beset with glandular viscid hairs. The whole plant has a purplish hue. In this character this species approaches near to C. ramosissima, but in habit they are very distinct.

Cuming’s Calandrini. Pl. procumbent.

Umbellate-flowered Calandrini. Pl. 1/2 foot.

9 C. PICTA (Gill. miss. ex Arnott, in Check, edibm. journ. 3. p. 356.) plant caulescent, sparingly branched, perennial, glabrous; leaves obovate spatulate, attenuated into the petiole at the base, glaucous; corymb cy- mose, terminal, many-flowered; pedicels much exceeding the bractees, which are roundish, membranous, and edged with purpure; sepals roundish, reticulated by purpure; stamens numerous. O. F. Native on the Andes of Men- doza, in many places at the elevation of 10,000 feet above the sea. This is one of the most beautiful of the species; and according to habit comes near C. glauca, but differs in the stamens being numerous.

Painted Calandrini. Pl. 1 foot.

10 C. ARENA (Cham. miss. ex Hook, et Arn. in bot. misc. 3. p. 246.) plant glaucescent; stems numerous, prostrate, glabrous, leafy; leaves linear; common peduncle terminal, naked, simple or branched; racemes corymbose; pedicels a little longer than the bractees; bractees oval, membranous, painted by a dark purple branched middle nerve; seeds glabrous. O. F. Na- tive of Chili, about Valparaiso. Closely allied to C. pietà, Gill. but very distinct from it.
79

PORTULACEÆ. VIII. CALANDRINIA.

Sand Calandria. Pl. prostrate.
11 C. linearłoża (D. C. prod. 3. p. 350.) stem ascending, a little branched at the base; branches erect, radical and caulein leaves linear, glabrous, bluntish; corymb terminal, a little branched; calyx glandular. ȳ. D. G. Native of South America. Perhaps the same as Talinum lineare, H. B. et Kunth, nov. gen. amer. 6. p. 77, which is found in the arid valleys of Mexico.

Linear-leaved Calandria. Pl. ascending.

13 C. seric^a (Hook. et Arn. in bot. misc. 3. p. 244.) root petioles, woody, with a multiple neck; stems erectish, very leafy at the base; leaves linear, acute or subulate, clothed with silky hairs; racemes few-flowered, corymbose; upper pedicels hardly equal in length to the bracteas; sepals ovate, tridentate at the apex, clothed with long silky villi; stamens numerous. ȳ. D. G. Native of Chili.

Var. a. longipes (Hook. et Arn. l. c.) lower pedicel elongated, slender, much longer than the rest and the bractea. On Sierra Bella Vista, and Acancunga; and on the Cordillera of Chili.

Var. β, a'quipes (Hook. et Arn. l. c.) pedicels all nearly equal. Near Colliná and Queonta. In both varieties the leaves vary much in length, from 1 to 2 or even 3 inches.

Silky Calandria. Pl. 1 foot.
14 C. tenellâ (Hook. et Arn. in Beech. bot. p. 24.) stems ascending, branched at the base; leaves narrow-linear, glabrous; racemes terminal, branched; sepals glabrous, triangular, coriaceous, acuminate. ȍ. G. Native of Chili, at Valparaiso. Very closely allied to C. pilosissima, but differs from it in being quite glabrous and in its smaller size. This is said to be only a variety of C. pilosissima. Hook. et Arn. in bot. misc. 3. p. 245.

Weak Calandria. Pl. ascending.

* * * Stamineas from 1 to 9.

Caulescent Calandria. Pl. pr.
17 C. procumbens (Moris. hort. taur. sem. 1831.) glabrous, caulescent, filiform, procumbent, branched; leaves succulent, linear, obtuse, alternate; pedicels axillary, and opposite the leaves; sepals triangular; flowers triandrous or hexandrous; capsule 3-celled. ȳ. H. Native of South America. This species differs from C. compréssâ of Schrad. in being glabrous, in the stems being procumbent, in the stamens being 3-6, and in the sepals not being corolate at the base, &c.

Procumbent Calandria. Pl. pr.
18 C. compréssâ (Schrad. in litt. ex D. C. l. c.) plant caulescent and succulent; leaves linear, ciliated; flowers racemose; calyx compressed; sepals triangular, coriaceous, unequal, acuminate. ȍ. F. Native of Chili. Plant a span high, erect, simple, or somewhat divided, with short hairs on the peduncles and calyces. Leaves obtuse, marked with a longitudinal line above, somewhat keeled beneath: radical ones 1½ or 2 inches long. Pedicels an inch and a half long. Flowers small, purple. Stamens 3-4. Capsule 3-4-valved. Schrad. ms.

Var. β, adscéndens (D. C. l. c.) plant smaller; stem ascending. Talimuin adscéndens, Hort. berol.

Compressed-calvad Calandria. Pl. ¼ foot.
19 C. dentículâta (Gill. ms. ex Hook. et Arn. in bot. misc. 3. p. 243.) plant glabrous; stem suffruticoso, leafy; leaves lanceolate, acute, suboblong at the base; raceme terminal, 1-3 or few-flowered; pedicels elongated; sepals rounded-ovate, with denticulately-serrate margins. ȳ. D. G. Native of Chili, along with C. andicola. The lower part of the stem is much branched.

Denticulated-calvad Calandria. Shrubs 1 foot?
20 C. andicola (Gill. ms. ex Hook. et Arn. in bot. misc. 3. p. 242.) plant wholly glabrous; stem suffruticoso, leafy towards the apex: leaves cuneate-oblong, acute, attenuated at the base; raceme terminal, 1-3 or few-flowered; pedicels elongated; sepals roundish, hardly mucronulate at the apex, with quite entire margins; petals a little longer than the calyx; flowers with few stamens. ȳ. D. G. Native of Chili, on the eastern side of the Cumbre, and at El Alto de la Laguna. Closely allied to C. cistidóföra, but apparently quite distinct. From C. dentículâta it can only be distinguished by the entire margins of the sepals.

Andes Calandria. Pl. ½ to 1 foot.
21 C. acu'tus (H. B. et Kunth, l. c.) plant stemless; leaves elongated, linear, obtuse; peduncles radical, 1-flowered, bibracteate in the middle, one half shorter than the leaves. ȳ. D. G. Native of Quito, on Mount Rucu-Pichincha, in humid places. Cósma prostrata, Domb. herb.

Stemless Calandria. Pl. ½ foot.
22 C. tuffîda (Hook. et Arn. in bot. misc. 3. p. 243.) root annual, slender; stems erectish, simple, rather leafy, pilose; leaves linear, acute, pilose; radical ones elongated; upper cauline ones edged with long hairs, embracing a few flowers in their axils; raceme corymbose, dense, terminal; bracteas ciliated with long hairs; lower ones exceeding the racemes; sepals ovate, trifid at the apex, with a few hairs on the back, but more numerous on the margins; stamens 5. ȍ. H. Native of Chili, about Valparaiso. This and C. Gillíésì and C. sericea seem closely allied to C. umbellâtâ.

Tßffîd-bracteate Calandria. Pl. ½ foot.
23 C. Gillíésì (Hook. et Arn. in bot. misc. 3. p. 243.) plant perennials, woody, with a multiple neck; stems erectish, simple, very leafy at the base, but sparingly so at the apex; leaves oblong-linear, beset with adpressed hairs; raceme corymbose; lower bracteas hardly equal in length to the pedicels; sepals ovate, somewhat tridentate at the apex, and beset with long pili on the back; stamens 5. ȳ. D. G. Native of the Andes, of Mendoza, and Chili; Cordillera of Chili; and Los Ojos de Agua. C. umbellâtâ, Gill. ms.

Gillíés Calandria. Pl. ½ foot.
24 C. diffusâ (Gill. ms. ex Arnott, in Check, edinb. journ.
Portulaceae. VIII. Calandrinia. IX. Portulacaria. X. Ullucus. XI. Claytonia.

3. p. 355.) plant caulescent, glabrous, diffuse; branches leafy at the base and nakedish at the top, 1-2-flowered; leaves spatulate-lanceolate, acute, quite entire; flowers terminal; sepals orbicular, quite entire. \( \text{\textdollar} \). D. G. Native of the Andes of Chili, near El Paso de los Pequenos, at an elevation above the sea of 10,000 feet. The number of stamens in the flowers of this species has not been determined.

Diffuse Calandrinia. Pl. 1 foot.

25 C. glauca (Schrad. in litt. ex D. C. l. c.) plant caulescent, glabrous; leaves spatulate-lanceolate, acute, fleshy, glaucous; racemes few-flowered; fruit-bearing peduncles, 1½ inch long, reflexed; bracteas ovate, acute, membranous, and spotted with purple. \( \text{\textdollar} \). D. G. Native of Chile. Stem a foot high. Leaves an inch and a half long, thick, tapering into the petioles. Flowers a little larger than those of C. compacta. Sepals broadly ovate, purple, concave, reticulated with black. Capsule larger than the calyx, 5-valved. (Schrad. ms.)

Glaucous Calandrinia. Pl. 1 foot.

26 C. densiflora (Gill. ms. ex Arnott, in Cheek, edinb. journ. 3. p. 356.) plant caulescent, perennial, glabrous; branches numerous from the neck of the root, simple, leafy at the base, nakedish towards the apex; leaves narrowly spatulate, glaucous; racemes crowded, terminal; pedicels hardly longer than the bracteas; sepals broadly ovate; flowers with few stamens, 3-4. \( \text{\textdollar} \). D. G. Native on the Andes of Mendoza, at El Portezuela del Valle Hermosa.

Crowded racemed Calandrinia. Pl. 1 foot.

27 C. cespitosa (Gill. ms. ex Arnott, in Cheek, edinb. journ. 3. p. 356.) plant tufted, stemless; leaves linear-spatulate; peduncles radical, 1-flowered, naked, 9-times longer than the leaves; sepals broadly ovate; flowers with few stamens; stigmas 1-5; capsule 4-5-valved. \( \text{\textdollar} \). D. G. Native on the Andes of Mendoza and Chili, and many places, at the elevation above the sea of from 9000 to 11,000 feet.

Ciliated-leaved Calandrinia. Pl. ½ foot.

30 C. l'yea (D. C. prod. 3. p. 359.) leaves spatulate-lanceolate; flowers axillary, solitary, peduncled. \( \text{\textdollar} \). F. Native of Peru, about Chancay and Lima, among rocks. Herb a foot high. Talinum album, Ruiz et Pav. l. c. Flowers white.

White-flowered Calandrinia. Pl. 1 foot.

31 C. nitida (D. C. l. c.) stems ascending, glabrous, leafy; leaves oblong-spatulate, acute, glabrous, attenuated at the base; peduncles axillary, solitary, shorter than the leaves; sepals roundish, obtuse, pilose on the backs; stamens 1-9. \( \text{\textdollar} \). F. Native of Chili, in fields and waste places, at Conception, in the tract of Huaipey and Moquita; also about Valparaíso and Quillota. Herb half a foot high. Talinum nitidum, Ruiz et Pav. l. c.

Niiid Calandrinia. Pl. ½ foot.

32 C. monandra (D. C. l. c.) leaves spatulate-lanceolate; flowers in spikes, secund, monandra. \( \text{\textdollar} ? \). F. Native of Chili, on arid hills about Concepción, near the river Andalien. Talinum monandra, Ruiz et Pav. l. c. Herb a hand and a half high.

Monandra Calandrinia. Pl. ½ foot.

Cult. Calandrinia is a fine genus of succulent plants; their culture and propagation are the same as that recommended for the species of Talinum, p. 77. The seeds of annual species may be sown in a hot-bed in spring, and the plants planted out into the open border, in a dry sheltered situation, about the end of May.

Cult. This plant will grow in any dry light soil; and young cuttings will root readily in sand under a hand-glass.

X. ULLUCUS (Uullo o Melloco is the name of the plant in Quito). Lozano, in senan. nov. gran. 1809, p. 185. D. C. prod. 3. p. 360.

1 U. tuberosus (Loz. l. c.) \( \text{\textdollar} \). D. G. Native of South America, in the province of Quito, growing in gardens, where it is called Ulluco o Melloco. The root is mucilaginous and edible.

Tuberos-rooted Ullucus. Pl. 1 foot.

Cult. For the culture and propagation of this succulent plant see Anacampseros, p. 76.

XI. CLAYTONIA (in honour of John Clayton, who collected plants, mostly in Virginia, and sent them to Gronovius, who published them in his Flora Virginica). Lin. gen. 287.
PORTULACEE.

LIN. SYST. Petúndária, Monogynía. Calyx of 2 oval, opposite, permanent sepals (f. 20. a. f. 19. b.). Petals 5, obcordate (f. 20. b.), or obovate (f. 19. a.), hypogynous, equal, unguiculate; claws connate at the base. Stamens 3 (f. 20. b.), inserted at the claws of the petals. Ovary sessile. Style 1, trilobed at the apex; locules stigmatic inside. Capsule 1-celled, 3-valved, 8-seeded, pedicels sessile.—Herbs glabrous, rather succulent, usually perennial. Leaves quite entire; radical ones petiolate; upper usually opposite and sessile, and sometimes connate. Racemes terminal. Flowers white or rose-coloured.

§ 1. Scape with 2 opposite leaves, which are sometimes connate.

* Roots fibrous, annual.

1 C. perfoliáta (Donn, hort. can. p. 25.) leaves without nerves; upper ones connate or perfoliate, forming a roundish disk; radical leaves petiolate, oval—rhomboid; lower pedicels of raceme in bundles; petals entire or somewhat emarginate. O. H. Native of Mexico, on the mountains of St. Augustin; and on the rocky mountains in North America; also of Cuba, if C. Cubáesi, Bonpl. ann. mus. 7. p. 82. t. 6. pl. equin. t. 26. be the same.—Sims, bot. mag. 1366. Líonia perfoliáta, Haw. syn. p. 12. Flowers small, white. Root fibrous. Leaves edible, and used like those of the Purslane.

2 C. alsínóides (Sims, bot. mag. 1566.) root fibrous; leaves reticulately veined, rhomboid, acute; upper leaves opposite, sessile, ovate, mucronate; radical ones petiolate, ovate, acuminate; pedicels of raceme for the most part solitary, braceless; petals emarginate. O. H. Native of the north-west coast of America, at the sources of the Columbia; particularly plentiful about Indian villages, where it seems to hold the place of chickweed in our country. Flowers white.

Var. β, rósea (D. C. prod. 3. p. 361.) flowers rose-coloured; leaves almost nerveless. O. H. Native of Nootka Sound. C. Síbúrica, Sims, bot. mag. 2243. Sweet, br. fl. gard. t. 16. but not of Pall.

3 C. unaschénsis (Fisch. in Rüm. et Schult. syst. 5. p. 434.) leaves curved; upper ones opposite, sessile, rhombovate; radical ones petiolate, ovate—lanceolate, acuminate; racemes twin; bracteas ovate; pedicels solitary, twice longer than the bracteas; petals emarginately bifid. O. H. Native of the Island of Unashenka, in humid sandy places. C. bifida, Wild. Wild.-floral. The petals are said to be white in the dried state.

4 C. parvifólia (Doug. ann. ex Hook. fl. bor. Amer. 1. p. 225. t. 73.) root fibrous; radical leaves numerous, linear—spatulate, 3-nerved, with anastomosing veins, on long petioles; the 2 cauleine ones joined into a perfoliate, ovate leaf, which is reticulately veined; racemes solitary, rather compound, unibraceate. O. H. Native of North America, abundant along the course of the Columbia, in open parts of the forest, VOL. III.

FIG. 19. where wood has been burnt, or the ground turned up by deer. Flowers rose-coloured and white. This species differs from C. perfoliáta in its linear—spatulate radical leaves, ovate bracteas, and profusion of small flowers. (f. 19.)

Small-flowered Claytonia. Pl. 1/4 foot.

5 C. spatula élata (Doug. ann. ex Hook. fl. amer. bor. 1. p. 226. t. 74.) plant minute; root fibrous; radical leaves numerous, narrow, linear—spatulate; the 2 cauleine ones ovate, acute, and sessile; racemes solitary, unibracteate; petals entire. O. H. Native of the north-west coast of America, in the valleys of the Rocky Mountains. Corolla longer than the calyx. Stems many from the same root. This is the smallest of all the species. Spatulate-leaved Claytonia. Pl. 1/4 foot.

6 C. sarmentósa (Meyer, nov. pl. in mem. acad. de Mouron. vol. 17.) sarmentose; leaves narrowed: radical ones oblong, obtuse, petiolate; cauleine ones ovate, somewhat cordate, stem clasping, but distinct; racemes terminal, solitary, braceless; petals emarginate.—Native of St. George, one of the Antillean Islands.

Sarmentose Claytonia. Pl. sarmentose.

* * *

* Roots tuberous or fusciform.

7 C. virginíca (Linn. spec. 394.) leaves all narrow, linear, oblong, 3-nerved, with anastomosing veins; radical leaves very few; racemes solitary, nodding; pedicels elongated; lower ones bracteate; petals emarginate. O. H. Native of North America, in New England, Virginia, and Carolina, in humid woods; and of Kotzebue's Sound. The leaves of the plant, from the last-mentioned habitat, are remarkable for their broadness. Pluk. alm. t. 102. f. 3. Flowers white.

8 C. grandifólia (Sweet, fl. gard. 216.) root tuberous; leaves linear—lanceolate, attenuated at both ends; racemes solitary, many—flowered; petals oval, obtuse, entire; sepals very blunt. O. H. Native of North America, near Montreal, and on the Sasachewan. C. Virginica, var. β, média, D. C. prod. 3. p. 361. D. C. pl. grass. t. 131. Flowers pink or rose-coloured, with darker branched veins, and a yellow spot on the claw.

9 C. acutifólia (Sweet, hort. brit. edit. 2.) root tuberous; leaves all long, linear—lanceolate, 3-nerved, with anastomosing veins; racemes solitary, nodding; pedicels elongated; lower ones bracteate; petals elliptic, entire, acute at both ends; sepals acutish. O. H. Native of North America, in humid parts of woods. C. Virginica, Sims. bot. mag.ir. 941. C. Virginica, var. a, acutifólia, D. C. prod. 3. p. 361. Flowers white.

11 C. lanceolátá (Pursch, fl. bor. amer. 1. p. 175. t. 5.) root tuberous; radical leaves very few, oblong, on long petioles; cauleine ones elliptic, sessile, all 3-nerved, with anastomosing veins; racemes solitary, nodding; pedicels elongated; lower ones bracteate; petals deeply emarginate. O. H. Native of North America, in the valleys of the Rocky Mountains, in a rich soil; and perhaps in Eastern Siberia. Flowers large, white. It is very nearly allied to C. tétaná da Fisch.

12 C. Aéctica (Adams, aust. nes. 5. p. 94.) leaves nerve-
less, fleshy; cauline ones sessile, ovate; radical ones petiolate, subspatulate; racemes secund; petals obvate, somewhat emarginate. 2. H. Native of Arctic Siberia, towards the mouth of the Lena. C. Chunissöö, Led. ex Spreng. syst. 1. p. 790. Flowers large, white, or pale yellow, with an orange throat.

Arctic Claytonia. Pl. ¼ to ½ foot.

15 C. Veštěna (Fisch. in litt.) root tuberous; leaves veined; radical ones oblong; cauline ones opposite, nearly sessile; stem diclinotomous; peduncles long, somewhat corymbose; petals entire. 2. H. Native of Siberia. C. Joannisina, Roem. et Schultes, syst. 5. p. 436. This species differs from the true C. Siberica in the leaves being narrower, in the petals being white, and in the inflorescence. Flowers secund, at first nodding. Callyclic lobes obtuse. Corolla appearing as if it were pedicellate.

Tuberosous-rooted Claytonia. Pl. ¼ to ¼ foot.

16 C. Sibirica (Lin. spec. 294.) root fusiform; leaves veined: radical and cauline ones ovate; raceme secund; petals bifid. 2. H. Native of Siberia, in boggy places. Linnia. Lin. act. holm. 1746. t. 5. Radical leaves quite glabrous, petiolate; cauline ones 2, opposite, sessile. Stamens inserted in the petals. Flowers rose-coloured.

§ 2. Stem leaffy. Leaves all alternate. Plants resembling Calandrinia in habit.

17 C. Linearius (Doug. miss. ex Hook. fl. bor. amer. 1. p. 224. t. 71.) stems branched; leaves narrow-linear, obtuse, 3-nerved; racemes terminal, secund, bracteate at the base; petals entire. 2. H. Native of North-west America, in moist rocky places; on the Great and Little Falls of the Columbia, abundant. Stems filiform, leafy. Petals obvate. (f. 20.)

Linear-leaved Claytonia. Pl. ¼ to ½ foot.

18 C. Filiculbis (Doug. miss. ex Hook. fl. bor. amer. 1. p. 224. t. 72.) stems branched at the base: lower leaves obvate, acute, reticulately veined, running into petioles; cauline leaves linear-spatulate; racemes terminal; flowers bracteate; petals entire. 2. H. Native of the north-west coast of America, on rocks in Nootka and Queen Charlotte’s Sound; plentiful on moist rocks of the Columbia, near the ocean. Flowers largeish.

Thread-stemmed Claytonia. Pl. ¼ foot.

19 C. Stolonifera (Meyer. 1. c.) stem erect, branched, bearing stolons at the base; leaves nearly sessile, oblong-spatulate, acute, a little nerved; racemes subcorymbose, lateral, bracteless; petals entire. 2. H. Native of Unalaska.ka

Stoloniferous Claytonia. Pl. ¼ foot.

20 C. Paryphilia (Moc. icon. pl. nook. ined. ex D. C. prod. 3. p. 861.) leaves nervess; cauline ones alternate, elliptic, acute, attenuated at the base; radical ones like the cauline ones on short petioles; racemes few-flowered; pedicels solitary, bracteate; petals acutely emarginate. 2. H. Native of North-west America, at Nootka Sound. Flowers rose-coloured.

Small-leaved Claytonia. Pl. ¼ ½ foot.

A very doubtful species.

21 C. nemorosa (Willd. rel. in Roem. et Schultes, 5. p. 436.) leaves ovate; superior ones tern; racemes twin. 2. H. Native of South America, in the shady woods of Javita. Perhaps this plant ought to be removed from the genus. ex H. B. et Kunth, nov. gen. amer. 6. p. 80. The plant, according to Bonpland, has a quadrangular stem; opposite petiole leaves; terminal dichotomous spikes; a 5-parted calyx; a semi-5-left corolla; a short style, 2 stigmas, and a 1-celled, many-seeded capsule.

Grace Claytonia. Pl.?.

Cult. The greater part of the species of Claytonia are very delicate little plants, especially those with tuberous roots: these grow best in a border of peat soil, and are increased by seeds, which sometimes ripen plentifully. The fibrous-rooted kinds, being all annual, the seeds of them only require to be sown in the open border, in a rather moist shaded situation; and if they are allowed to scatter their seeds, plants will rise every year in abundance.

Lin. syst. Triandria, Trigynia. Calyx of 2, rarely of 3 sepals. Petals 5, connected a little way at the base, 3 of which are smaller than the other 2. Stamens inserted in the claws of the petals, usually 3 in front of each of the smaller petals, very rarely more. Ovarium sessile. Style very short, 3-parted; divisions sparingly reflexed. Capsule 1-celled, 3-valved, 3-seeded.—European, glabrous, aquatic, or bog herbs. Leaves opposite. Flowers axillary, small; this genus is hardly distinct from Claytonia.

1 M. Fontana (Lin. spec. p. 129.). 2. W. H. Native of Europe and North America; also of South America, in bogs, ponds and ditches.

Fountain or Water-chickweed. Fl. April, May. Brit. Pl. ¼ to ¼ ½ foot.

Cult. This plant will grow in any moist soil, or in water.

Lin. syst. Triandria, Trigynia. Calyx 3-parted; lobes elliptic, obtuse, petals wanting. Stamens 3, alternating with the parts of the calyx, and hypogynous. Ovarium 1, oval, Styles 3, short, acute. Capsule 1-celled, 3-valved, 3-seeded.
Seeds fixed to the central placenta.—A small smooth herb, native of North America. Radical leaves 3, entire, linear-lanceolate, acute. scape 1-flowered, length of leaves. This genus is hardly known, but it only appears to differ from *Mollugo* in the want of petals.

*Autumnal Leptrina.* Pl. 1/2 to 3/4 foot.

*Cult.* The seeds of this plant only require to be sown in the open ground, in a moist situation; and if the plant is allowed to scatter its seeds, there will be plenty of plants each year.

XIV. *COLOBANTHUS* (from *kolobos*, kolobos, maimed, and *anthos*, anthos, a flower; in reference to the want of petals). Presb. in reliq. Haenk. 2. p. 13. t. 49. f. 2.

*Lin. syst.* *Tetra-Hezändria, Tetra-Pentagyinia.* Calyx 4-5-parted. Petals wanting. Stamens 4-5, alternating with the segments of the calyx. Sigmas 4-5. Capsule 4-5-valved, many-seeded. Both Bartling and Kunth insert this genus in the order *Caryophyllaceae*, while the stamens are decidedly perigynous, and therefore ought to come among the Portulaceae.

1. *C. Aretioides* (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 246.) root perennial, with a multiple neck; calyx 5-parted; segments ovate; capsule 5-valved. 2. *F.* Native of Chili, at Los Hornillos, El Paramillo San Isidro, and on the Andes of Mendoza.

*Arethusa-like Colobanthus.* Pl. 1/2 foot.

*Quito Colobanthus.* Pl. 1/2 foot.

*Cult.* See *Portulaca* for culture and propagation, p. 75.

XV. *GINGINSIA* (in honour of M. Gingins, who has written upon the genera *Viola* and *Lacunula*). D. C. prod. 3. p. 362.—Pharmacæum species of authors.

*Lin. syst.* *Pentandria, Trigynia.* Calyx 5-parted; lobes oval, permanent, petaloid on the inside and at the margins. Petals wanting. Stamens 5, inserted in the bottom of the calyx, and alternating with its lobes; anthers 2-celled, inserted by the base. Ovarium surrounded at the base by a 5-lobed fleshy scale. Style wanting. Stigmas 3, crest-formed. Capsule 3-valved, 1-celled. Seeds numerous, fixed to the central placenta.

—Cape shrubs. Leaves irregularly verticillate, opposite or alternate, filiform or linear, furnished with scarious stipulas at the base. Peduncles axillary, elongated, bearing umbels of pedicellate flowers at the apex; branches of umbels numerous, divided, many-flowered. This genus differs from *Pharmacæum* and all the other Caryophyllaceae genera in the stamens being perigynous, and in the leaves being usually alternate; and from all the genera in the order *Parenchyma* in the stamens alternating with the sepalis, not opposite them.

§ 1. Leaves linear.

*Short-stemmed Ginginsia.* Pl. 1/2 foot.

2. *G. Elocauta* (D. C. l. c. with a figure; prod. l. c.) leaves alternate, linear, crowded at the tops of the branches; stipulas linear-elongated, ciliately jagged; peduncles more than 3-times longer than the stem. 5. G. Native of the Cape of Good Hope. Pharmacæum incaicum, Lin. mant. p. 358. but not of others. Pharmacæum lineare, Andr. bot. rep. t. 329. Flowers whitish.

*Orange-flowered Ginginsia.* Pl. 1/2 to 3/4 foot.

§ 2. Leaves filiform.

4. *G. Albens* (D. C. l. c.) plant caulescent; leaves filiform, mucronate, irregularly whorled or alternate; stipulas small. 5. G. Native of the Cape of Good Hope. Pharmacæum albens, Thumb. fl. cap. p. 274. 5. *Pharm. lineare* of Thum. bot. rep. t. 329. but the leaves are linear in Andrews's plant, not filiform. Flowers greenish on the outside, but yellowish inside and on the edges.

*Whith Ginginsia.* Pl. 1/2 to 3/4 foot.

5. *G. Conferta* (D. C. l. c.) plant caulescent; leaves opposite, crowded, terete, mucronate; stipulas cut into many seatacous hairs, one half shorter than the leaves. 5. G. Native of the Cape of Good Hope. Lam. ill. t. 214. f. 8. Pharmacæum incaicum, Thum. fl. cap. 273. Sims, bot. mag. 1883 but not of Lour.

*Small-leaved Ginginsia.* Pl. 1/2 to 3/4 foot.

*Terete-leaved Ginginsia.* Shrub 1 foot.

*Cult.* A mixture of loam, peat, and sand will answer the species of this genus; and the pots in which they are grown should be well drained with shreds. The best way of propagating them is by seeds.

XVI. *AYLMERIA* (in honour of Aylmer Bourke Lambert, F.R.S. F.S.A. and V.P.L.S. the celebrated botanist, to whom we owe many obligations in the prosecution of the present work).

Lin. syst. Monadelphía, Pentándria. Calyx 2-parted, coloured. Petals 5. Stamens 10, joined into a membranous hypogynous tube; the 5 outer ones abortive; and the 5 inner ones opposite the petals, bearing 3-celled anthers. Style 1; stigma depressed, capitated. Utriculus membranous, valveless. Seeds numerous, lenticiform, in the bottom of the cell.—Australian perennial herbs. Stems terete, joined, dichotomous upwards. Leaves linear, opposite, or in whorls. Stipulas scarious. Flowers beautifully coloured, in terminal corymbs. According to Martius, the genus is related to Paronychieæ, but this is doubtful, in consequence of the stamens being hypogynous, and also particularly so in their being opposite the sepals. The calyx is of 2 sepals, as in Portulaca, and the petals are 5, as in most of the order, and the stamens are 10, as in Trianthéa.

1 A. rosea (Mart. l. c.) stems straightish, and are, as well as the leaves, glabrous; stipulas ciliate serrulately; corymb compact. 9. G. Native of New Holland, on the western coast. Flowers rose-coloured.

Rosic-coloured flowered Aylmeria. Pl. 1 foot.

2 A. violacea (Mart. l. c.) stems diffusely dichotomous, and are as well as the leaves glabrous; stipulas quite entire; corymb loose. 9. G. Native of New Holland, on the west coast. Flowers violaceous.

Fioiacceus-flowered Aylmeria. Pl. 1 foot.

Cult. See Ginginias for culture and propagation, p. 83.

XVII. HYDROPYXIS (from ὑδρός, ὑδάς, water, and πνεῦμα, ἀναθήμα, a box; the plant is an inhabitant of water, and the capsule resembles a box, from its opening transversely). Rafin. fl. lud. p. 49. D. C. prod. 3. p. 364.

Lin. syst. Tetrandria, Morogynia. Calyx permanent, 5-parted, bibratecre on the outside; the two inner lobes the smallest. Corolla peripetalous (perhaps inserted in the calyx), crateriform, unequally 5-loped. Stamens 4, didynamous, inserted in the corolla; anthers hasteate. Ovarium superior. Style simple, crowned by a capitate 5-loped stigma. Capsule 1-celled, many-seeded, triangular, opening transversely. Central placenta free. This genus is likely to be nearer related to Utriculária than to any other.

Marsh Hydrophyxis. Pl. creeping.

Cult. This plant should be grown in a pot filled with peat, and placed in a deep pan of water. It is easily propagated by separating the runners.

Calyx of 5 sepals (f. 21. a. f. 22. a.), seldom of 3-4; sepals sometimes separate to the base, sometimes joined to the middle (f. 22. a.), and sometimes nearly to the apex (f. 24. a.). Petals small, scale-formed (f. 22. a.), emulating sterile stamens, inserted upon the calyx between the lobes, occasionally wanting (f. 23. a.), or converted into superabundant stamina. Stamens perigonous, exactly opposite the sepals (f. 22. a.), if equal to them in number, but sometimes fewer by abortion; filaments distinct; anthers 2-celled (f. 21. c.). Ovarium free. Styles 2-3, either distinct (f. 24. a.), or partially combined (f. 22. d.). Fruit small, dry, 1-celled, usually membranous, either valveless and indinchis, or opening with 3 valves. Seeds either numerous, fixed to a free central placenta, or solitary and pendulous, upon a funicle, arising from the base of the cavity of the fruit. Albumen farinaceus. Embryo cylindrical, lying on one side of the albumen, curved more or less, with the radicle always pointing towards the hilum. Cotyledons small.—Herbaceous or half-shrubby branching plants, with opposite or alternate, often fascicled, entire, sessile leaves and scarious stipules. Flowers small, usually whitish green, sometimes sessile and axillary, and sometimes variously disposed in terminal cymes. Bracteas scarious, analogous to the stipulas.

This order comes very near Portulaceæ, Amaranthaceæ, and Caryophyllaceæ, from which it is distinguished with difficulty. By excluding the section Sclerántheæ, their scarious stipula will distinguish them from the two last-mentioned orders, and there is scarcely any other character that will; for there are Caryophyllaceæ that have perigonous stamens, as Lárrea and Adenaria; and Paronychieæ which have hypogynous ones, as Poly- carpaea, Stipulácidea, and Ortégia. From Portulaceæ it is scarcely to be known with absolute certainty, except by the position of the stamens before the sepals instead of the petals. With Grassulaceæ, particularly Tillea, they agree very much in habit, but their concrete carpella will always distinguish them. De Candolle comprehends in the order various plants without stipulas; but as the latter organs seem to be an essential part of their character, the tribes Queríaceæ and Minuartiæ are excluded, and will be found elsewhere.

Synopsis of the genera.

Tribe I.

Teóphi'n. Calyx 5-parted (f. 21. a.). Petals and stamens 5, inserted in the bottom of the calyx (f. 21. b.). Styles 3 (f. 21. c. e.), free, or connected together a little at the base. Leaves alternate, stipulaceous.

1 Telephium. Styles 3, spreadingly reflexed, concrete at the base. Capsule pyramidal, trigonal, 3-valved, 3-celled at the base, and 1-celled at the apex. Seeds numerous, fixed to the central placenta, in 6 rows.

2 Corrióia. Style short; stigmas 3 (f. 21. c.). Capsule 1-seeded, indischis, covered by the calyx. Seed suspended by a funicle, originating at the bottom of the capsule.

Tribe II.

Illece'bre. Calyx 5-parted (f. 22. a.). Petals 5 or wanting. Stamens 2-3, inserted in the bottom of the calyx (f. 22. a.). Styles free or somewhat concrete at the base (f. 22. d.). Capsule indischis, 1-seeded. Funicle long, rising from the bottom of the capsule, bearing a subependulous seed at the apex.—Herbs, rarely shrubs. Leaves opposite, acute, with scarious stipulas.

3 Hernía. Calyx almost 5-parted. Scales or petals 5, filiform, entire, but sometimes wanting or very small. Stamens 5, or only 2-3 from abortion. Styles 2, short, distinct, or concrete at the base. Capsule covered by the calyx.
‡ Gymnocalcium. Calyx almost 3-parted. Petals 5, emulating sterile filaments. Stamens 5. Style 1; stigma simple. Capsule valveless, covered by the indurated calyx.

6 Illecebrum. Calyx 5-parted, or nearly 3-sepalled, ending on the back at the apex, in an awned horn. Petals wanting, but there are 5 subulate scales in place. Stamens 2-5. Style hardly any; stigmas 2, capitate. Capsule covered by the calyx, divisible into 5 at the stripes.

7 Paronychia. Calyx 5-parted (f. 22. a.). Petals or scales 5, linear. Stamens 5 (f. 22. a.). Style 1; stigmas 2 (f. 22. d.). Capsule indehiscent or 5-valved, covered by the calyx.

8 Pentacema. Calyx 4-parted; segments very unequal, outer 3 spiny at the apex, inner 3 navicular, armed on the back. Stamens 5. Stigmas 2, short. Capsule 1-seeded.

9 Cardonea. Calyx 5-parted; lobes drawn out on the back at the apex into a straight horn. Petals wanting. Stamens 5, 2 sterile ones obcordate, flat. 3 fertile ones obcordate at the base, bearing each an antheriferous filament in the recess. Styles 2, hardly concrete at the base, long, revolute. Fruit oval-oblong.

Tribe III.

Polycarpeae. Calyx 5-parted (f. 23. a.). Petals 5, or wanting. Stamens 1-5, inserted in the bottom of the calyx. Styles 2-3, sometimes distinct, sometimes concrete. Capsule 1-celled, many-seeded. Seeds fused to the central placenta.—Herbs or subshrubs. Leaves opposite. Stipules scarious. The stamens in this tribe are almost hypogynous, and truly so in some genera, as in Polycarpa, Stipulacida, and Ortégia, and therefore verge closely on the order Caryophyllaceae.

13 Averbia. Lobes of calyx thickened in the middle, keeled. Petals 5, or only 3 from abortion. Stamens 5, inserted in the bottom of the calyx. Style 1, trifid at the apex. Capsule 1-celled, 3-valved, many-seeded.

14 Ortegia. Lobes of calyx keeled a little. Stamens 5, 3 fertile, inserted in the torus, the other 2 scale-formed and sterile. Style 1, capitate at the apex or bifid. Capsule 3-valved, many-seeded.

16 C'herdia. Lobes of calyx petaloid inside, ending in a bristle each at the apex. Petals wanting. Stamen one, in front of one of the sepals. Style filiform, bifid at the apex. Capsule 1-celled, many-seeded.

Tribe IV.

Polliechiæ. Calyx 5-toothed; tube urceolate. Stamens 1-2, inserted in the throat of the calyx. Petals wanting. Stigma bifid. Utriculus or fruit valueless, 1-seeded. Bracteas and calyx increasing after flowering, and becoming fleshy, so as to form something like a berry.—Suffrutaceous herbs, with opposite or subverticillate stipulaceous leaves.

17 Polliechia. Character the same as that of the tribe.

† Genera belonging to Paronychieæ, but are not sufficiently known.

18 Lithophila. Calyx 3-parted, acute. Petals 3. Scales or abortive stamens 2, opposite the sepals. Stamens 2, placed at one side of the ovary. Style thick, bluntly emarginate at the apex. Fruit unknown. A very minute glabrous herb.

19 Sellówa. Calyx urceolate, 5-cleft, membranous, 10-ribbed. Petals 5, alternating with the lobes of the calyx. Stamens fixed in the middle of the segments of the calyx, and shorter than them; anthers didymous. Style 1; stigma obtuse. Capsule 5-valved, 1-celled, 1-seeded. A smooth herb, with the habit of Illecebrum verticillatum.

Tribe I.

Telephieæ (plants agreeing with the genus Telephium in important characters). D. Č. prod. 3. p. 366. Calyx 5-parted (f. 21. a.). Petals and stamens 5 (f. 21. b.), inserted into the bottom of the calyx. Styles 3 (f. 21. c.), distinct, or somewhat concrete at the base.—Leaves alternate, stipulaceous.

Lin. syst. Pentandria, Monogynia. Calyx 5-parted, permanent; lobes oblong, concave. Petals 5, inserted in the bottom of the calyx, and alternating with its lobes, and about equal in length to them. Stamens 5, opposite the sepals, and inserted in their bases. Styles 3, spreading reflexed, concrete at the base. Capsule pyramidal, trigonal, 3-valved, 3-celled at the base, and 1-celled at the top from the dissepiments not being extended so far. Seeds numerous, disposed in 6 rows on the central placenta. Embryo lateral, curved, but not annular. Albumen mealy.—Subshrubby, procumbent, many-stemmed, glabrous, glaucous herbs. Leaves alternate, rarely opposite, stipulaceous. Flowers white or greenish white.

2 T. Oppositifolium (Lin. spec. 388.) leaves opposite; flowers in racemose corymbs, crowded. 2. H. Native of Barbary.
Paronychiea. I. Telephium. II. Corrigiola. III. Herniaria.

Shaw, spec. p. 572, with a figure. Flowers white. Perhaps only a variety of the preceding.

**Opposite-leaved Orpine.** Pl. tr.

3. **T. laxiflorum** (D. C. prod. 3. p. 366.) leaves alternate; peduncles opposite the leaves, trifid at the apex; middle pediceil 1-flowered, lateral ones elongated, and usually 3-flowered. 2. G. Native of the Cape of Good Hope. Herb glaucous. Leaves alternate, distant, obovate, mucronate; petiole short, margined, with a membrane. Capsule subglobose, 5-celled nearly to the apex. Perhaps a proper genus, but the habit is truly that of *Telephium*.

**Loose-flowered Orpine.** Pl. tr.

**Cult.** All the hardy species of *Orpine* grow well in any light soil; and may either be increased by cuttings or parting at the root; they are well adapted for ornamenting rock-work. The last species being a native of the Cape of Good Hope, requires the protection of a green-house in winter.

**Lin. syst. Pentändria, Trigýnia.** Calyx 5-parted (f. 21.a.), permanent. Pedals 5 (f. 21. b.), equal to the calyx and inserted in it, and alternating with its lobes. Stamens 5, opposite the sepals. Style short; stigma 5 (f. 21. c.). Capsule 1-seeded, indehiscent, covered by the calyx. Seed suspended by a funicle, which rises from the bottom of the capsule.—**Procumbent glaucous herbs, with alternate stipulaceous leaves, and terminal racemose corymbs of small flowers.** Habitat of *Telephium*.

3. **C. deltòdea** (Hook. et Arnott, in Beech, bot. p. 24.) stems prostrate; leaves deltoid, long, spathulate; racemes lateral, furnished at the base by a spatulate bractea. 2. G. Native of Chili, about Concepción and Valparaíso. This plant bears a strong resemblance to *C. littorális*. Flowers white.

**Deltoid-leaved Corryiola.** Pl. prostrate.

4. **C. squamosa** (Hook. et Arn. in bot. misc. 3. p. 247.) can- dex perennial, a little branched, very sealy at the apex, from which many stems issue; stems prostrate; leaves linear, oblong; racemes corymbose, leafless. 2. G. Native of Chili, about Valparaíso, Vina de la Mar, and Playa Ancha. The lower part of the stem, which is here called a caudex, from its resemblance to that part of ferns, is to be seen in no other species of the genus; the scaly appearance at its summit is obviously caused by a congeries of stipulas. Flowers white.

**Scaly Strap-wort.** Pl. prostrate.

**Cult.** The seeds of the annual kinds should be sown in dry light soil. The culture of the perennial kind is the same as that recommended for the hardy species of *Telephium*.

**Tride II.**

**I. LECCÉRÉE** (this tribe contains plants agreeing with *LLécecrum* in some particular characters). D. C. prod. 3. p. 367. Calyx 5-parted (f. 22. a.). Petals 5, or wanting. Stamens 2-5, inserted in the bottom of the calyx. Styles distinct, or somewhat concrete at the base. Capsule indehiscent, 1-seeded. Funicle long, rising from the bottom of the capsule, bearing a somewhat pendulous seed at the top.—Herbs, rarely subshrubs. Leaves opposite, acute, with scarious stipulas.

**Lin. syst. Pentándria, Degýnia.** Calyx nearly 5-parted, somewhat coloured inside. Scales or petals 5, filiform, quite entire, alternating with the sepals, sometimes wanting or very small. Stamens 5, or only 2-3 from abortion, opposite the sepals. Styles 2, short, distinct, or concrete at the base. Capsule 1-seeded, indehiscent, covered by the calyx.—Prostrate suffrutícosa small herbs, with branched stems. Leaves opposite, stipulaceous: stipulas solitary between the leaves, broad at the base. Flowers glomerate in the axils of the leaves. Bracteas small.

§ 1. **Herniáriæ vera** (true species of *Herniaria*). Stems prostrate, small; flowers glomerate in the axils of the leaves, pubescent or hairy on the outside.

1. **H. cine'rea** (D. C. fl. suppl. p. 375. mem. par. t. 3.) plant of many stems, herbaceous, clothed with cinerose hairs; branches ascending; leaves oval, acute at both ends; flowers crowded, axillary. 2. H. Native about Montpelier, Narbonne, plentiful in Spain in dry gravelly or sandy places. In Spain the plant is called *Quenrantapéridas*. H. annua, Lag. gen. et spec. p. 12. and perhaps H. latifolia, Lapeyr. abr. p. 127.

2. **H. viré'scens** (Salzm. pl. exsic. ex D. C. prod. 3. p. 367.) herb ascending, many stemmed, smoothish; leaves oval, cili- ated; bundles axillary; few-flowered; calyx rather pilose. 2. H. Native of Mauritania, about Tangiers. It differs from *H. cine'rea* in the greenish habit, nearly as *H. kirsitæ* does from *H. glàbra*, or as *H. alpína* does from *H. incana*.

**Greenish Rupture-wort.** Pl. tr.

4. **H. nins'ta** (Lin. spec. p. 317.) plant herbaceous, prostrate, hairy; leaves oval-oblong; bundles sessile, few-flowered.
2. H. Native throughout Europe, in gravelly places. In England, near Barnet; and in Cornwall. Smith, engl. bot. 1579. Mor. hist. sect. 5. t. 29. f. 2. Pettit, brit. t. 10. Tandich, icon. t. 284. This plant is in every respect the same as H. glabra, except in the hairiness.

Var. \( \beta \), pubescent (D. C. prod. 3. p. 368.) leaves ciliated, smooth; stipulas larger. Paronychia pubescens, D. C. fl. fr. 3. p. 403.

Hairy Rupture-wort. Pl. tr.

6 H. Bessei (Fisch. ex Horn. suppl. p. 127.) stems shrubby at the base, somewhat ascending; branches elongated; leaves oblong-lanceolate, pubescent; bundles axillary, many flowered, rather loose. 2. H. Native of Tauria and Podolia. H. incana, Bieb. suppl. p. 173. H. hirsuta, D'Urv. enum. p. 28. H. Millegrâna, Pall. ex Spreng. and perhaps H. microcarpa of Presl. del. prag. which was collected on the mountains of Sicily.

7 H. macrocarpa (Sibth. et Smith, fl. gracc. t. 252.) stems fruticosulous at the base, ascending; branches sessile, pubescent; leaves ovato-lanceolate, hairy on both surfaces, as well as on the calyces; bundles few-flowered. 2. H. Native of Laconia, and by the way side between Smyrna and Bursa; also in the Balkarian Islands.

Large-fruited Rupture-wort. Pl. tr.

8 H. alpina (Vill. dauph. 2. p. 556. exclusive of the synonyme) root becoming woody at length; stems prostrate, tufted, densely leafy, suffruticosus; leaves oval, rather villous, ciliated; flowers few towards the tops of the branches, somewhat glomerous. 2. H. Native of Providence, Dauphinny, and Savoy on the Alps. D. C. fl. fr. suppl. p. 375. H. alpêsirius, Lam. dict. 3. p. 125. This plant is distinguished from H. incana at first sight by its greenish habit, not hoary.

American Rupture-wort. Pl. pr.

10 H. seti'gera (Gill. miss. ex Hook. et Arn. in bot./misc. 3. p. 247.) plant perennial, herbaceous, puberulous, many-stemmed, prostrate; leaves oblong-lanceolate, furnished with spiny bristles at the apex; flowers almost sessile, axillary, and usually solitary, puberulous on the outside; stems 3; styles united at the base. 2. F. Native of Chili, at El Aquadita, near La Punta de San Luis. This species has no scales or abortive petals, but only one style, and stigmas have been perceived.

Bristle-bearing Rupture-wort. Pl. prostrate.

11 H. Fruticosa (Linn. amen. 4. p. 269.) stem shrubby, very humble, much branched, tufted; branches short, villous; leaves small, obovate, thickish, crowded; flowers glomerous, hairy, 4-cleft. 2. H. Native of Spain, in dry exposed places; and of Mauritania, near Mascar. Desf. fl. atl. 1. p. 213.— Lob. icon. t. 85.—Barrel. icon. t. 713.

§ 2. Polygonoidea (plants with the habit of Polygonum). Stems erect, dichotomous at the apex. Flowers glabrous, disposed in loose cymes. Perhaps a proper genus.

12 H. polycosoides (Cav. icon. 2. t. 137.) erect, glabrous, shrubby; branches dichotomous at the apex; leaves ovate, cuspitate, distant. 2. H. Native of Mauritania, near Mascar; and on the hills of Spain, in Valenti, as well as in Provence. Illicecarum suffruticosum, Lin. spec. p. 298. Paronychia suffruticosum, Lam. fl. fr. 3. p. 239. Herniaria erecta, Desf. alt. 1. p. 214. H. Joançêma, Roum. et Chultes, syst. 6. p. 297. This species differs from Paronychia, in the fruit being indeliscent. The habit is very dissimilar from the other species of Herniaria, but emulates Anychia and Paronychia.

† Species not sufficiently known.

13 H. ditcho'roma (D. C. prod. 3. p. 368.) stems erect, numerous, dichotomous, herbaceous; leaves distant, oblong, mutic, and are, as well as the branches, powdery from short down; flowers cymose. 2. H. Native country unknown. Paronychia dichotoma, D. C. in Lam. dict. ency. 5. p. 25. Illiccecarum dichotomum, Pers. ench. 1. p. 261. "Calyx glaucescent, striated at the base and pubescent, profoundly 5-cleft; segments blanched, with scarious margins; sterile threads 5, alternating with the sepals, and 5 antheriferous ones opposite them, hardly shorter than the sterile ones. Style bidentate at the apex. Ovarium attenuated at the base. Ovulum one, pendulous, suspended from the top of a thread, which arises from the bottom of the capsule." Adr. Juss. in litt. 1827.

Dichotomous Rupture-wort. Pl. 2 foot to 3 foot.

14 H. lenticulata (Thunb. fl. cap. p. 245.) suffruticosus, hairy, decumbent, clothed with cinnereous villi; leaves ovate, fleshy, 2. H. Native of the Cape of Good Hope. H. incana Capeïnsis, Pers. This is a very obscure species. The Linnean plant under this name, according to Vahl and Smith, is Crēsia Crētica; but we know not what Thunberg's plant is.

Lenticular Rupture-wort. Pl. procumbent.

Cult. All the species are weedy looking plants, most of them with the habit of wild-thyme, and therefore are only worth cultivating in botanic gardens. The plants grow best in dry light sandy soil, and are increased by seeds.

Lin. syst. Pentadnria, Monogynia. Calyx almost 5-parted, permanent; segments coloured inside. Petals 5, emulating sterile filaments. Stems 5, inserted in the bottom of the calyx. Style one, crowned by a simple stigma. Capsule valveless, 1-seeded, covered by the indurated calyx.—Diffuse subshrubs, with opposite stipulaceous leaves, usually bearing fascicles of rameal leaves in the axils. Pedicels axillary, solitary, opposite, appearing crowded at the tops of the branches, from the internodes being short. The name of this genus is spelt variously by authors, viz. Gymnocarpus (Forsk.), Gymnocarpos (Viv.), Gymnocaracrum (Pers.), Gymnocarpmum (Stout.).

Shrubby Gymnocarpmum. Shrub 1 foot.

Cult. This shrub will require to be protected from frost in
winter, and for this purpose it should be grown in a pot. A mixture of sand and loam will suit the plant very well, and it may either be increased by seeds or cuttings.

L. syst. Di-Pentântridia, Digynia. Calyx 5-parted, nearly 3-sepaled; sepals subcapsulate, thickened, ending in an awn-like horn at the apex on the back. Petals wanting, or 5 subulate scales in place of the petals, alternating with the lobes of the calyx. Stamens 3-5, opposite the sepals, and inserted in their base. Style hardly any; stigma 2, capitate. Capsule covered by the calyx, 5-valved, or divisible into 5 at the stripes. Seed solitary from abortion, inserted in the side of the capsule. Embryo hardly curved, placed on one side of the albumen, which is farinaceous.—A small trailing herb, with opposite leaves, furnished with scarious stipules at the base. Flowers axillary or cymose. Bracteas scarious, smaller than the flowers.

*Whorled Knot-grass.* Fl. July, Aug. England. Pl. tr. Cult. The seeds of this plant should be sown in a moist situation, where the plants will thrive and flower freely; and if the seeds be allowed to scatter themselves, the plants will rise regularly every season. It is worth cultivating, being a small delicate beautiful plant.

L. syst. Pentântridia, Monogynia. Calyx 5-parted (f. 22. f.) lobes concave, cucullate, generally mucronate at the apex (f. 22. b.). Petals or scales 5, subulate, alternating with the lobes of the calyx. Stamens 5 (f. 22. a.). Style one, entire or bifid (f. 22. d.); lobes papiliferous inside. Capsule 1-seeded (f. 22. c.), membranaceous, indehiscent or 5-valved, covered by the calyx.—Herbaceous or suffrutescent much branched plants. Leaves opposite, stipitate; stipules scabrous, twin on both sides between the leaves. Young leaves frequently in fascicles in the axils of the old leaves. Flowers cymose or glomerate, but usually crowded in the axils of the leaves.

Sect. I. CHATONRYCHIA (from *chaton*, a head, or *onyx*, onyx, a claw; in reference to the lobes of the calyx ending in a bristle each). D. C. prod. 3. p. 370. Lobes of calyx equal, dilated at the apex, membranous, ending in an awn on the back. Scales or petals, or abortive stamens perhaps wanting. Flowers cymose.

1 P. cymosa (D. C. in Lam. dict. 5. p. 26. fl. fr. 3. p. 409.) stems erect, branched, divaricate, puberulous; leaves linear, nearly *linear*; glabrous, awned; flowers cymose, ultimate ones in fascicles. E. H. Native of Spain, Greece, Mauritania, in sandy places. Illecereum cymosum, Lin. spec. 299. exclusive of Bocc. syn. Vill. in Schrad. journ. 1801. p. 408. t. 4. Flowers greenish. This plant is allied to Illecereum, but is probably a distinct genus.

Sect. II. EUNYCHIA (altered from Paronychia). This section is supposed to contain the genuine species of the genus). D. C. prod. 3. p. 370. Lobes of calyx equal, awned, mucronate or nearly unawned, not dilated at the apex. Flowers crowded in the axils of the leaves.

3 P. brasiliâna (D. C. in Lam. dict. 5. p. 23.) stems trailing, puberulous; leaves oblong-lanceolate, narrowed both at the base and apex, mucronate, pubescent on both surfaces; flowers crowded in the axils of the leaves; calyx glabrous, deeply 5-parted; lobes ending in a long mucron each. G. Native of Buenos Ayres and Monte Video, by road sides. P. Bonaireïa, D. C. prod. 3. p. 370. Flowers white.

*Brasilian* Paronychia. Fl. May. Clt. 1820. Pl. tr. 4 P. composita (St. Hil. fl. bras. 2. p. 156.) stems trailing, puberulous; leaves oblong-lanceolate, narrow at the base and the apex, mucronate, pubescent on both surfaces; flowers crowded in the axils of the leaves; calyx turbinate, pubescent; lobes equal, ending in short points. G. Native of Brazil, in pastures in that part of the province of St. Paul called Cam-
pos Geraea, and by the sea side in the province of St. Catherine. Flowers deep brown.

**Common Paronychia.** Pl. tr.

5 P. **Chile**nsis (D. C. prod. 3. p. 370.) stems diffuse, tufted; leaves crowded, oblong-linear, mucronate, smoothish; flowers crowded in the axils of the leaves; lobes of calyx hardly mucronate at the apex. **Q. H.** Native of Chile, about Concepcion and Valparaiso. Leaves of the younger branches subspineous at the apex, of the adult ones acute. *Stipulas oblong, scarious.*

**Chili Paronychia.** Pl. ½ foot.

6 P. **Camphorosmoide**s (St. Hil. fl. bras. 2. p. 187.) stems diffuse, pubescent; leaves linear-subulate, keeled, mucronate, puberulous; flowers crowded in the axils of the leaves; calyx turbinate, smoothish: lobes equal, acutish. **O. H.** Native of Brazil, in that part of the province of St. Paul called Campos Geraes, near Engreja Velha.

**Camphorosa-like Paronychia.** Pl. diffuse.

**Arabian Paronychia.** Pl. diffuse.

8 P. **Polygonifolia** (D. C. fl. fr. ed. 3. vol. 3. p. 403.) stems trailing, branched; leaves oblong-linear, smoothish, acute, not mucronate; flowers rather crowded in the axils of the leaves; lobes of calyx ending in a short mucron each. **Q. H.** Native of Dauphiny, Spain, and Balearic Islands. Illicébrum polygonifólium, Vill. in Schrad. journ. 1801. p. 410. t. 4. Illicébrum verticillátum, Wild. spec. 1. p. 1205. Illicébrum alpinum, Vill. dauph. 1. p. 296. This plant hardly differs from *P. argéntea,* unless in the leaves being narrower.

**Knot-grass-leaved Paronychia.** Pl. tr.

**Tar, β, Mauritianæa** (D. C. prod. 3. p. 371.) leaves broader; heads large, distant. **Q. H.** Native of Mauritania and the Archipelago. Illicébrum Mauritanicæum, Willd. rel. in Rœm. et Schults, syst. 5. p. 516.

**Silvery Paronycha.** Pl. tr.

**Capitata-flowered Paronycha.** Fl. June, Aug. Ch. 1833. Pl. ½ to ¾ foot.

11 P. **Serpyllifolia** (D. C. in Lam. dict. 5. p. 26. fl. fr. ed. 3. vol. 3. p. 404.) stems prostrate, creeping, knotted, branched; leaves oblongate, flat, rather fleshy, with ciliated margins; flowers terminal; bracteas acuminate; lobes of calyx awnless. **Q. H.** Native of the south of Europe, in arid places. Illicébrum serpyllifólium, Vill. in Schrad. journ. 1801. t. 4. Flowers white.

**Silvery-tufted Paronycha.** Pl. procumbent.

12 P. **Sessiliflora** (Lam. c. p. 100.) plant densely tufted, much branched, glabrous; leaves linear-subulate, acute: superior ones longer, recurved; stipulas about equal in length to the leaves, bifid; flowers terminal, sessile; lobes of calyx arched on the inside at the apex, and ending in a long awn each on the N
outside. 2. H. Native of North America, on the more elevated hills about the Missouri, near Fort Mandan; on the dry banks of the north branch of the Saskatchewan, between Carlton House and Edmonton House. Hook. f. bor. amer. 1. p. 227. t. 75. (f. 22.)

**Sessile - flowered Paronychia.** Pl. $\frac{1}{4}$ foot.

**Sect. III. Acanthonychia** (from acana, acincba, a spine, and oö, oöz, a claw; in reference to the 3 outer lobes of the calyx, being each furnished with an awn-like spine at the apex). D. C. prod. 3. p. 372. Lobes of calyx unequal, 3 outer ones furnished each with an awn-like spine at the apex, 2 inner ones small, and nearly unarmed. Stigmas 2, sessile.

20 P. Roșe't'a (St. Hil. fl. bras. 2. p. 188. t. 113.) stems trailing, woolly; leaves linear-subulate, mucronate, smoothish; lobes of calyx unequal, 3 outer ones the largest, and furnished with a long mucron each; 2 inner ones smaller, and nearly awnless. Flowers crowded in the axis of the leaves. 2. G. Native of Brazil, in the province of St. Catharine, in sand by the sea side, where it is called by the inhabitants Rosetta. Probably a species of *Pentace'na.*

**Rosetta Paronychia.** Pl. tr.

† *Species not sufficiently known.*

22 P. sedi'fólia (Salt. init. abyss. ed germ. 1. p. 476. ex Röm. et Schultz, syst. 5. p. 523.) This species is not described.

**Stone-crop-leaved Paronychia.** Pl.

† *Plants referred by authors to the genus Paronychia, which are to be excluded.*

1 P. laun'gi'na (Poir. suppl. 4. p. 302.) is probably a species of Gomphéra.

2 P. Bengal'ënis (Röm. et Schultz, syst. 5. p. 521, but not of Juss.) is probably a species of Achyránthes.

3 P. tenell'a (Hortul. or Illicébrum tenellum of DeSf.) is perhaps a species of Alternéthia.

4 P. dichó'toma (D. C. in Lam. dict. but not of Nutt.) is Her'miária dichótoma.

5 P. subul'ata is Polycarpéa's spédisca.

6 P. linearí'sifólia is now Polycarpéa's linearí'fólià.

**Cult.** All the species of this genus are well adapted for ornamental rock-work, from their dwarf stature, and generally trailing habit. Most of them, however, grow best in small pots in sand and loam, filling the pots half way with sherdz; and they are easily increased by dividing the plants at the root, or by cuttings under a hand-glass, or by seeds. The seeds of the annual species only require to be sown in the open border or on rock-work. Some of the species are marked green-house and frame; these require to be protected from frost in winter.

**FIG. 22.**

   akaina, a thorn; in reference to the 5 spiny lobes of the calyx). Bartling in reliq. Henk. 2. p. 5. t. 49. f. 1.

**Lin. syst. Pentándria, Dígyüia.** Calyx 5-parted; segments very unequal: 3 outer ones spiny at the apex, and woolly on the margins: 2 inner ones much shorter, boat-shaped, and armed on the back. Stamens 5, without any sterile filaments; anthers 2-celled. Stigmas 2, short. Fruit 1-seeded.

1 P. ramosí'ssima (Hook. et Arn. in bot. misc. 3. p. 248.) stems trailing, woolly; leaves linear-subulate, mucronate; lobes of calyx unequal, all linear and hood-formed, ending each in a very long point on the back; flowers sessile, axillary, crowded. 2. G. Native of Brazil, on the confines of the province of Rio Grande de St. Pedro do Sul, and of the province of Cisplatin, and among rocks about Monte Video; of Chili, in Las Acharias, province of Cordova, Valparaiso, and Buenos Ayres; also of Mexico, at the foot of Mount Orizaba. Paronychia ramosí'ssima, D. C. prod. 3. p. 372. mem. paron. p. 12. t. 4. Loe'fingia ramosí'ssima, Weinm. in bot. zet. p. 608. Pent. polychémo'noïdes, Bartl. in Presl. reliq. Henk. 2. p. 5. t. 49. f. 1. Stipulas scarious, woolly.

**Much-branched Pentace'na.** Pl. tr.

Cult. See *Paronychia* for culture and propagation.

**IX. CARDIONEMA** (from ka'péa, cardia, the heart, andymph, nema, a filament; in reference to the sterile filaments being obcordate). D. C. prod. 3. p. 372. - Bivone'a, Moc. et Sesse, fl. mex. ined. but not of D. C. nor Spreng.

**Lin. syst. Pentándria, Dígyüia.** Calyx 5-parted; lobes connivent, rather coloured inside, and rather concave, drawn out on the back at the apex into a long straight conical horn each. Petals wanting. Stamens 5, opposite the lobes of the calyx, and inserted in their base; 2 of which are sterile, obcordate, and flat: and 3 fertile, obcordate at the base, bearing each a slender antheriferous filament in the recess; anthers roundish, 2-celled. Styles 2, hardly concrete at the base, long, revolute. Fruit 1-seeded, ovate-oblong. - A small many-stemmed herb. Leaves opposite, crowded, rather distich, linear, acute. Flowers sessile, axillary, small, greenish white, each furnished with 5 bracteas, 4 of the bracteas linear and entire, the fifth larger and serrulate.

1 C. multica'e'te (D. C. prod. 3. p. 373. mem. par. t. 1.) 2 G. Native of Mexico. Bivone'a multica'tis, Moc. et Sesse, fl. mex. ined.

**Many-stemmed Cardionema.** Pl. small.

Cult. This plant is to be cultivated and propagated in the same manner as that recommended for the species of *Paronychia.* It will require protection in winter, by placing it in a frame or green-house.

**Tribe III.**

**POLYCARPÆÆ** (this tribe contains plants agreeing with *Polycarpéa* in important characters). D. C. prod. 3. p. 373. Calyx 5-parted (f. 23. a). Petals 5 (f. 23. d.) or wanting. Stamens 1-5, inserted in the bottom of the calyx. Styles 2-3, sometimes distinct from the base, and sometimes connected. Capsule 1-celled (f. 23. e.), many-seeded. Seeds fixed to the central placenta. - Herbs or subshrubs. Leaves opposite. Stipulas scarious. The stamens in some of the genera are nearly hypogynous, as in *Polycárpin*, and altogether so in *Polycárpin* a, *Stiplicédia*, and *Ortégia*, and therefore these genera verge very closely on the order Caryôphylleæ, but are distinguished from them in the presence of stipulas, and number of stamens: the habit agrees with *Paronychia*.

**X. POLYCARPÆÆ** (from πολύ, poly, many, and καρπός, carpos, a fruit; a name, however, only indicating its affinity with *Polycarpus*). Lam. journ. hist. nat. 2. p. 8. t. 25. D. C. prod. 3. p. 373. St. Hil. fl. bras. 2. p. 132. — Hage's, Vent. tabl. 2.
Var. a, incisa (D. C. prod. 3. p. 374.) stems and leaves clothed with grey tomentum.

Breitlie Polycarpa. Pl. prostrata.

7 P. stella'ta (D. C. prod. 3. p. 374) stems diffuse, much branched, suffruticose; leaves usually 6 in a whorl, linear, flat, and are, as well as the branches, rather pilose; cymes terminal, many-flowered, corymbose; calyces scarious. F. Native of Guine. Achyrères stellata, Wildl. spec. 1. p. 1195. Mollia stellata, Wildl. hort. berol. Lahaya stellata, Schultes, syst. 5. p. 403 Root perpendicular, simple. Habit of P. Tererife, but differs in the leaves being linear.

8 P. corymbosa (Lam. ill. no. 2798.) stems erect, herbaceous, tomentose; branches diffuse; leaves opposite 6 in a whorl, linear, awned; cymes corymbose, loosish; calyces scarious, acuminate. F. Native of Ceylon. Achyrères corymbosa, Lin. spec. p. 296. (exclusive of the synonyme of Plukenet, which is referable to Celosia Mammontia.) Wildl. spec. 1. p. 1196. (exclusive of the synonyme of Lourie, which is referable to Polyparca spadicea.) Lahaya corymbosa, Schultes, syst. 5. p. 404. Pol. Indica, Lam. journ. hist. nat. 2. p. 8. Celosia corymbosa, Roxb. fl. ind. 1. p. 310. Bocc. mus. 44 t. 39. good.—Burn. zeyl. t. 65. f. 2. Flowers white.

9 P. spado'cea (Lam. l.c. no. 2799.) stems ascending, diffuse, branched, suffruticose at the base; branches tomentose; leaves linear, blunish, when young rather tomentose; cymes terminal, corymbose; calyces scarious. 2 Pl. 7 S. Native of the East Indies, on the coasts of Malabar and Tranquebar.—Rhed. mal. 10. t. 66. Celosia corymbosa, Wildl. spec. 1. p. 1200. exclusive of the synonyme of Rezt. Mollia spadicea, Wildl. hort. berol. Lahaya spadicea, Schultes, syst. 5. p. 405. Pólia are'nária, Lour, coch. p. 164. Allied to P. corymbosa, but is more diffuse in habit; leaves broader and shorter, in more distant whors; lobes of calyx less acuminate. Perhaps Paronychia subulata, D. C. in Lam. dict. 5. p. 25. or Illecebrum subulatum, Pers. ench. 1. p. 261. is referable to this species.

Chestnut-brown Polycarpa. Pl. 1 foot, diffuse.

10 P. Brasilia'sis (St. Hil. fl. bras. 2. p. 183.) stems erect, puberulous; leaves linear-subulate, with revolute margins, mucronate, puberulous; cymes corymb-form'd; calyce lobes very acute, puberulous; petals ovate-oblanceolate, one-half shorter than the calyx. 2 S. Native of Brazil, in that part of the province of St. Paul called Campos Geraes, near Fazenda de Jaquiraliba. Flowers densely clothed with white tomentum. Petals at first white, but at length of a dirty yellow-colour. Root fusiform, with many stems rising from the neck.

Var. β, ramosissima (St. Hil. l.c.) stems much branched; leaves setaceous; cymes branched; flowers a little smaller than those of the species. Native of Brazil, in the province of Goyaz, on the sandy Mountain called Serra dos Pyrenos; also on the road to Campo Allegre, in the province of Minas Geraes.

Brazilian Polycarpa. Pl. 3/4 to 3/2 foot.

2
12. **Polycarpus** (D. C. L. c. and mem. par. t. 5.) stems erect, branched, suffruticos; branches pubescent; leaves glabrous, oblong-linear, bluntish, twice the length of the stipulae; cymes terminal, dense, many-flowered, in crowded heads. 

13. **Triandria**, Monogynia. Calyx 5-parted; lobes ovate, with membranous margins. Petals 5, cuneate-oblong, entire. Stamens 3, inserted with the petals into the disk or torus. Style short; stigmas 3. Capsule 1-celled, 3-valved. Seeds few, fixed by funicles to the central placenta. —Small perennial dichotomous herbs, native of North America. Radical leaves almost like those of *Polycarpus* Tenoreff, ovate, petiolate; canine leaves sessile, opposite, small. Stipulas jagged. Flowers small, terminal. An intermediate genus between *Polycarpus* and *Polycarpus a, from the sepals being flatish as in *Polycarpus a,* and in the stamens being 3, as in *Polycarpus:* but differs from both in the petals and stamens being expressly hypogynous according to Richard in Michx. l. c.; the genus therefore perhaps ought to have been placed in Caryophyllaceae.

Setaceous Stipulicida. Pl. 1/2 foot. Cult. See *Ortigia,* p. 92, for culture and propagation.

XII. **Balaardia** (in honour of M. Ballard, of Montpellier, who was the first to detect a new chemical principle called borneol). St. Hil. fl. bras. 2. p. 180.

1 B. **Plateania** (St. Hil. fl. bras. 2. p. 181. t. 111.) leaves linear, about equal in length to the internodes, mucronate; cymes branched, many-flowered. Also of Buenos Ayres.

Plate *Balaardia.* Pl. 1/2 foot. Cult. The seeds of this plant should be sown on a hot-bed in spring, and the plants may be planted out in the open border in the month of May, in any warm dry situation. Not worth cultivating, excepting in a botanical garden.

XIII. **Aversia** (in honour of M. Avers, D. M. P., who has written a dissertation on the *Nicotiana Tabacum,* in which he treats of its various qualities). St. Hil. fl. bras. 2. p. 184.

1 A. **frankenioides** (St. Hil. l. c. t. 112.) stems trailing, branched; leaves lanceolate, bluntish, narrowed into the petiole, pubescent; cymes many-flowered; segments of calyx obtuse, pubescent; petals and stamens one half shorter than the calyx. —A trailing branched herb, with opposite stipulate leaves; young leaves or abortive branches in fascicles in the axils of the older leaves. Cymes branched, many-flowered.
Frankenia-like Aversia. Pl. trailing. ½ foot.

Cult. See Balárdia above for culture and propagation.

Lin. sylv. Triandria, Monogynia. Calyx of 5 sepals, or 5-parted; sepals erect, oblone, a little keeled. Petals wanting. Stamens 5, 3 of which are fertile, inserted in the torus in front of 3 of the sepals; the other 2 almost vanished, or small, sterile, and sessile-formed. Ovarium ovate. Style 1, capitate at the apex, or bifid. Capsule 3-valved. Seeds numerous, fixed to the central placenta. Embryo straight, placed on the back of the albumen.—Erect, much-branched herbs. Leaves opposite, linear, with 2 black dots at the sides, from which the stipules have fallen. Cymes dichotomous, many-flowered. Flowers greenish-white. Stamens hypogynous, as in Stipulicida and Polycarpae. 1. O. Hispánica (Lin. spec. ed. 1. p. 560.) stigma capitate. 2. H. Native of Spain, about Madrid and many other places. Cav. icon. 1 t. 47.—Clus. hist. 2. p. 174. f. 2. Vahl. enum. 2. p. 23.

2. O. dichotoma (Lin. mant. p. 175.) stigma trifid. 2. H. Native of Italy and Piedmont, about Giavena. All. act. taur. 3. p. 176. t. 4. f. 1. D. C. fl. fr. ed. 3. vol. 4. p. 726. Vahl. symb. 2. p. 25. Calyx more than that of the first species, and therefore it is more distinctly dichotomous, but divided in a similar way.

Cult. The species thrive best in light soil; and are increased by cuttings or seeds. They are well fitted for rock work, or to be grown in small pots among other alpine plants.

Lin. sylv. Tri-Pentandria, Trigynia. Calyx deeply 5-cleft (f. 23. a.), permanent; segments concave, keeled, mucronate at the apex. Petals 5 (f. 23. b.), emarginate, inserted in the tube of the calyx. Stamens 3-5, inserted in the tube of the calyx. Style trifid; lobes papilliferous inside. Capsule 1-celled, 3-valved (f. 23. e.), many-seeded. Seeds nearly ovoid, a little curved, fixed to the central placenta.—Annual, branched, dichotomous herbs. Leaves opposite, or 4 in a whorl; young ones usually disposed in fascicles in the axils of the old leaves. Flowers in cymose corymbs. Stipulas and bracteas small, scarioius.—This genus agrees with Adcnärium, but differs in the stamens being equal in number to the petals, not as in Caragphyllace, double that number.

* Flowers triandrous.

1 P. Apure'se (H. B. et Kunth, nov. gen. amer. 6. p. 40.) flowers triandrous; petals emarginate; leaves 5-10 in a whorl.

Apures All. syl. PI. 10. 1872.

2 P. tetraphyl'iurn (Lin. fl. suppl. 116.) flowers triandrous; petals emarginate; lower leaves 4 in a whorl; rameal ones opposite, obovate-oblong, rounded at the apex, mucronulate, shorter than the internodes.

O. H. Native of Europe, Canary Islands; Brazil on walls, about the town of St. Paul. In England, on the west coast; on various parts of the coast of Devonshire, Somersetshire, and Portland Island.—Smith, engl. bot. t. 1031. Krock. fl. siles. t. 42. Mollugo tetraphyla, Lin. spec. 1. p. 89.

Var. β, diaphyl'um (D. C. prod. 3. p. 387.) leaves all opposite.

** Flowers pentandrous.

4 P. petrfoo1ios (D. C. prod. 3. p. 387.) flowers pentandrous; petals quite entire; leaves opposite, obovate; flowers crowded into terminal cymes. 2. F. Native of Sicily; France about Perpignon. Hagea polycarpoideae, Biv. manjip. 3. p. 3. Mollía polycarpón, Sproeg. nov. prod. 2. p. 38. Lahiyā polycarpón, Sich. fr. 5. p. 404. Arenaria petrfoo1ios, Lapey. abr. p. 251. but not of Lin. Very like P. tetraphyllum, and, as in it, the leaves are sometimes 4 in a whorl; but besides these characters, it differs in the leaves being rounder; cymes denser; flowers a little larger, and pentandrous, &c.

Water Parsley-like Polycarpón. Pl. ⅔ foot.

Cult. The seeds of the annual species of the genus only require to be sown in the open border in spring. The last species being perennial, should be grown in a small pot, and placed among other alpine plants.

1 C. vire'scens (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 377.) leaves opposite.

2. G. Native of Mexico. D. C. mem. par. t. 2. Flowers greenish-white inside.

Greenish-flowered Cerdia. Pl. pr.

2 C. purpur'a'scens (Moc. et Sesse, 1. c.) leaves 4 together in
a kind of whorl. 2. G. Native of Mexico. Flowers purplish inside.

Paronychie. Pl. pr. 5.G.

Cult. These plants will grow well in a mixture of loam and sand, and are easily increased by dividing at the root, by cuttings, or by seeds.

Tribe IV.

Lin. syst. Monandria, Monogynia. Calyx campanulate, 5-toothed, permanent. Petals wanting, unless the scales at the throat are to be taken for them. Stamens 1 (ex Moench, rarely 2) inserted in the throat of the calyx. Style filiform; stigma bifid. Capsule valveless, 1-seeded, inclosed in the thickened tube of the calyx.—A suffrutescent branched herb. Leaves linear, opposite, but at first sight appear verticillate, in consequence of 2 rameal leaves rising in each axil, furnished with scarious acute stipules. Flowers small, aggregate, sessile, bracteate.

1 P. campestris (Ait. l. c. Smith spicil. 1. t. 1). 5. 2. 1. F. Native of the Cape of Good Hope. Neckiria campestris, Gmel. l. c. Meerbürgia glomerata, Moench. l. c. Flowers greenish. Bracteas mixed with the flowers, cilated; scales full of sweet juice.

Field Pollichia. Fl. Sept. Cht. 1780. Pl. ½ foot. Cult. The seeds of Pollichia must be raised on a hot-bed; and when the plants are 2 inches high, they may be planted out singly into pots, placed among the greenhouse plants, and afterwards treated like them.

*Genus placed in Paronychiae, but are not sufficiently known.

XVIII. Lithophila (from lithos, a stone, and philo, to love; this plant delights to grow among stones). Swartz, fl. ind. occ. 1. p. 47. t. 1. D. C. prod. 3. p. 380.

1 L. muscoideus (Swartz, l. c. p. 48.)—Native of the desert island of Navaza, among rocks.

Miss-like Lithophila. Pl. 1 inch. Cult. This plant is not worth cultivating, unless in botanic gardens. Should it ever be introduced to our gardens, we would recommend its being grown in a pot filled with broken stones, having the crevices filled with vegetable mould. It may probably be propagated by seeds.

XIX. Sellowia (in honour of Frederick Sello, a German botanist, who was lately drowned in some creek of the Amazon; and who has sent home many fine collections of Brazilian plants). Roth. nov. spec. p. 162. D. C. prod. 3. p. 880.

Lin. syst. Pentandria, Monogynia. Calyx urceolate, 5-cleft, membranous, 10-ribbed; lobes short, lanceolate; ribs bearing alternately a petal and a stamen. Petals 5, oval, alternating with the calycine lobes. Stamens 5, fixed in the middle of the calycine lobes, and shorter than them; anthers didymous. Style 1; stigma obtuse. Capsule 3-valved, 1-celled, 1-seeded.—A quite glabrous herb, with the habit of Illecebrum verticillatum. Leaves opposite, oblong-oval. Flowers 1-2 in the axils of the leaves, small, white, and somewhat pedicellate. It is not known whether the leaves are stipulate or naked.

1 S. utricula (Roth. l. c. p. 163.)—Native of the East Indies, in bogs.

Bog Sellowia. Pl. proc. Cult. Place a pan of water under the pot in which this plant is grown.

Flowers hermaphroditic. Calyx 4-5-parted (f. 24. a.). Stamens from 1 to 10, inserted in the orifice of the tube (f. 24. a.). Ovary simple, 1-seeded. Styles 2 (f. 24. c.) or 1, emarginate at the apex. Fruit a membranous tube, inclosed within a hardened calyx. Seed hanging from the apex of a funicle, which arises from the bottom of the cell. Embryo cylindrical, curved round farinaceous albumen.—Small herbs. Leaves opposite, without stipulas. Flowers axillary, sessile. This order has been referred by De Candolle to Paronychieae, from which it differs in the absence of petals and stipulas, and therefore appears to constitute a distinct order, more nearly related to Chenopodiaceae than Paronychieae, from which the plants chiefly differ in the indurated tube of the calyx, from the orifice of which the stamens proceed, and in the number of the latter exceeding that of the divisions of the calyx. The tribe Minuartioe is probably not distinguishable from Scleranthaceae, notwithstanding the supposed presence of petals, which would perhaps be more properly called abortive stamens. All the plants contained in this order are uninteresting weeds, of no known use. 

Synopsis of the genera.

Tribe I.

Sclerantha. Calyx 4-5-toothed (f. 24. a.), with an urceolate tube. Petals none. Stamens 1-10, inserted in the throat of the calyx (f. 24. a.). Styles 2 (f. 24. c.) or 1, emarginate at the apex (f. 24. b.). Fruit an utricle, covered by the indurated tube of the calyx, 1-seeded. Seed hanging by a funicle, which arises from the bottom of the capsule.

2 Sclerantus. Calyx 5-cleft (f. 24. a.), with an urceolate tube. Stamens from 2 to 10. Styles 2 (f. 24. c.)

3 Guilleniæ. Calyx 3-cleft, with a campanulate tube. Stamens 5. Style 1, emarginate at the apex.

Tribe II.

Queriaeæ. Calyx 5-parted. Petals none. Stamens 10,
inserted in the bottom of the calyx. Capsule 3-valved. Seed hanging from a long funicle, which arises from the centre of the cell.

4 QUÆRIA. The character is the same as that of the tribe.

TRIBE III.

MINUARTEM. Calyx 5-parted. Petals wanting or very minute. Stamens 3-10, inserted in the bottom of the calyx. Styles 3. Capsule 1-celled, 3-valved. Seeds numerous, fixed to the central placenta.

5 MINUARTEM. Lobes of calyx quite entire. Styles 3. LEÆLIÆ. The 3 outer lobes of calyx bisetose at the base. Style 1, trifid at the apex.

TRIBE I.

SCLERANTHEæ (plants agreeing with Scleranthus in important characters). Paronichae, Tribe V. Sclerâanthæ. D. C. prod. 3. p. 377. Calyx 4-5-cleft, with an urceolate tube. Petals wanting. Stamens 1-10, inserted in the throat of the calyx. Styles 2 or 1, emarginate at the apex. Fruit 1-seeded membro-uous utricle, covered by the indurated tube of the calyx. Seed hanging from a long funicle, which arises from the bottom of the cell, and which is recurved at the apex.—Herbs, with opposite exstipulate leaves.

LIN. SYST. Monândria, Digynía. Calyx 4-cleft, permanent, with an urceolate tube. Petals wanting. Stamen one, inserted in the throat of the calyx. Ovarium free, 1-seeded. Styles 2. Capsule valveless, membranous, covered by the indurated tube of the calyx. Seed one, as in Scleranthus.—Australian herbs. Leaves opposite, subulate. Peduncles axillary, bearing 4 bracteas and 2 flowers at the apex, becoming after flowering elongated and stiff. The ovarium, according to Forster, is sometimes 2-seeded.

1 M. BIELOREM (Forst. 1. c.) stems tufted; branches quite glabrous; leaves denticulated at the base, the rest quite entire.

2 M. FASCICULÆTEM (R. Br. prod. p. 412.) stems many from the same neck, procumbent, branched; branches clothed with fine pubescence; leaves denticulated their whole length.

2. G. Native of Van Diemen's Land.

Fascicled Mniarum. Pl. procumbent.

Cult. A mixture of loam, peat, and sand, will suit the species of Mniarum, and they may be propagated either by seeds or cuttings.

LIN. SYST. Penta-Decândria, Digynía. Calyx 5-cleft (f. 24 a.), permanent, with an urceolate tube. Petals wanting. Stamens inserted in the throat of the calyx, 10 (f. 24 a.), rarely 5 or 2. Ovarium free, 2-seeded. Styles 2 (f. 24 c.). Capsule very thin, valveless, covered by the indurated tube of the calyx. Seed one, hanging from a long funicle, which arises from the bottom of the capsule, and is recurved at the apex.—Small herbs, with opposite linear leaves, which are rather connate at the base. Flowers small, greenish white, sessile in the axils of the forks of the branches.

1 S. PERENNIS (Linn. spec. p. 580.) flowers decandrous; lobes of fructiferous calyx closed, obtuse, with white and membranous edges. Y. H. Native of Europe and the Levant, in dry sandy fields. In England, on high open sandy fields, rare; as about Eldon, Suffolk, and plentifully near Snettington, Norfolk; near Bury St. Edmunds; and Scotland, on a gravelly bank near Forfar. Schkuhr, hantb. t. 129. Fl. dan. t. 562. Smith, engl. bot. t. 352.—Ray, syn. p. 160. t. 5. f. 1. The Polish cochineal (Coccus Polonicus) is found upon the roots in the summer months.

2 S. POLYCARPUS (Linn. spec. p. 581.) flowers subdecandrous; lobes of the calyx when in fruit rather spreading, and without any margin, acute, shorter than the tube. O. H. Native in sandy fields about Montpelier, but never gathered elsewhere in France; also of Italy, according to Linnaeus.—Column. cephr. t. 1. t. 294. It differs from S. annuus at first sight, in the flowers being one-half smaller; but it is probably merely a variety of it.

Many-fruited Knawel. Pl. procumbent.

3 S. ANNUS (Linn. spec. p. 580.) flowers subdecandrous; lobes of fructiferous calyx spreading, immarginate, acutish, about equal in length to the tube. O. H. Native of Europe, the Levant, also of North America, in dry sandy cultivated fields; plentiful in some parts of Britain. Fl. dan. 504. Smith, engl. bot. t. 351. Knawel annuus, Scop. carp. p. 501. There is a variety, according to Leers, which has only 5 or 7 stamens to each flower. The Swedes and Germans receive the vapour arising from a decoction of it into their mouths to cure the tooth-ache.

4 S. HIRÆTÆN (Presl. del. p. 65.) flowers with 3 petals and 5 stamens; calyces conniving, obtuse; stamens equaling the calyx in length; anthers hairy; stamens pubescent. O. H. Native on Mount Etna, in the open regions. Leaves subulate, glabrous. Flowers capitate.

Hairy Knawel. Pl. prostrate.

5 S. PUSÆNÆNS (R. Br. prod. p. 412.) flowers pentandrous, particularly having 5 fertile and 5 sterile stamens; lobes of fructiferous calyx spreading; leaves subulate, triquetrous, mucronate, pungent, rough on the keel and margins. O. ? H. Native of New Holland, on the south coast.

6 S. BRÝSER (R. Br. prod. p. 412.) flowers diandrous; stamens mixed with scales; lobes of fructiferous calyx erect; leaves subulate, keeled, mucronulate, almost naked on the keel and margins. O. H. Native of Van Diemen's Land.

Diandrous Knawel. Pl. procumbent.

Cult. The seeds of these plants only require to be sown in the open border. None of the species are worth cultivating except in botanic gardens.

LIN. SYST. Pen'entändria, Monog'ynia. Calyx 5-cleft, with a campanulate tube; lobes equal. Petals wanting. Stamens 5, inserted in the top of the tube, opposite the calyceal lobes, short: anthers 1-celled. Style 1, somewhat emarginate at the apex. Fruit an indelible 1-seeded utricle, covered by the calyx. Seed hanging by a funicle, which arises from the bottom of the capsule.—A South American trailing herb, with opposite branches. Stems woolly. Leaves glabrous, oblong, opposite, exstipulate, but the petioles are connate at the base. Flowers capitate, axillary. Bracteas under each flower.

1 G. IJLICERIÓIDEIS (H. B. et Kunth, l. c.) 2 G. Native of South America, near Quito, in the valley of St. Jago. Illecæbrum-like Guilleminea. Pl. 1r.

Cult. Any common light soil will suit this plant, and it may be propagated from cuttings or seeds.

Tribe II.

QUERIA/CEÆ (this tribe contains nothing but the genus Queria). Calyx 5-parted. Petals wanting. Stamens 10, inserted in the bottom of the calyx. Capsule 5-valved. Seed 1, on a long funicle, which rises from the centre of the capsule.—Herbs, with opposite exstipulate leaves.

LIN. SYST. Dec'cándria. Trig'nynia. Stamens 10, slender, unequal, sometimes 5 of which are sterile. Styles 3, very slender. Capsule membranous, 1-celled, 3-valved. Seed reniform when mature.—Small stilt annual herbs. Leaves opposite, crowded, sessile, connate, recurved at the apex. Flowers in the axils of the upper branches and superior leaves, sessile, solitary. This genus is hardly distinct from Minuartia, unless in the styles being 3; in the valves being 3, and form of the seeds, which are evidently solitary from abortion.

1 Q. HI'SPÁ'NICA (Lin. spec. p. 123.) O. H. Native of Spain, in dry exposed places. Quer, fl. esp. 6. t. 15. f. 2. Ort. cent. t. 15. f. 1.

† A doubtful species.

2 Q. DICHO'TOMA (Thumbl. in Lin. soc. trans. 2. p. 529.) O. H. Native of Japan. Ribbs, Thumbl. fl. jap. p. 337. Stem dichotomous. Flowers racemose. Corolla cylindrical, below the fruit, Thumbl. This plant does not probably belong to the order.

Dichotomous Queria. Pl. ½ foot.

Cult. The seeds only require to be sown in the open ground in any dry situation.

Tribe III.

LIN. SYST. Pen'entándria, Trig'nynia. Sepals 5, hardly joined at the very base, quite entire. Petals or abortive stamens 5, small, alternating with the sepals. Stamens 5, opposite the sepals, and longer than the petals. Styles 3, filiform. Capsule 1-celled, 3-valved. Seeds few, fixed to the central axis.—Small annual herbs. Leaves opposite, sessile, 3-5-nerved at the base, quite entire. Flowers in the forks of the branches, and in the axils of the upper leaves, solitary, small, sessile, or on short pedicles; constituting a leafy, dense, dichotomous cyme. Petals bifid, or rather nectaries. (ex Lcefl.) Stamens 10, 5 abortive. (Steven.) Petals and stamens 10. (St. Hil.) According to several specimens examined, the stamens are 10, and the 5 alternate ones are sometimes converted into petals. The genus differs from Lobelia in the sepals being quite entire, and from Queria in the fruit being many-seeded.

1 M. CAMPEST'RIS (Lcefl. itin. p. 122.) flowers distinctly pedicellate, equal in length, or a little longer than the floral leaves; sepals very unequal, 3 large and 2 smaller. O. H. Native of Spain, in dry sandy fields. Habit almost of But'fonia. Act. holm. 1758. t. 1. f. 3.

2 M. DICHO'TOMA (Lcefl. l. c. p. 121. t. 1. f. 3.) flowers almost sessile, in fascicles, shorter than the floral leaves; sepals nearly equal; mucrone of leaves oblique. O. H. Native of Spain, on hills. Act. holm. 1758. t. 1. f. 5. Plant stiff, dusky.

3 M. MON'TÁ'NA (Lcefl. l. c. p. 122. t. 1. f. 4.) bundles of flowers about equal in length to the bracteas; sepals nearly equal; mucrone of leaves straight. O. H. Native of Spain, Tauria, and Iberia, on dry hills.—Biebl. fl. taur. l. p. 90.

LIN. SYST. Pen'entándria, Monog'ynia. Sepals 5, connected at the base, 3 outer ones bisectate at the base. Petals 5, small, conniving, inserted in the bottom of the calyx. Stamens 5, alternating with the petals, or 3, 2 of them being abortive? Style 1, trifid at the apex, or divided into 3 from the base. Capsule 1-celled, 3-valved. Seeds numerous, fixed to the central placenta.—Small, annual herbs. Leaves opposite, exstipulate, margined on both sides at the base, and appendiculated, these appendages probably supply the place of stipulas. Flowers in the forks of the branches, and in the axils of the upper leaves, solitary, sessile.

1 L. HI'SPÁ'NICA (Lin. spec. p. 50.) flowers triandrous; style 1, trifid at the apex. O. H. Native of Spain, Mauritania, and South of France, in dry sandy places. Lcefl. itin. l. t. 1. f. 1. Cav. icon. 1. t. 94. L. prostrata, Wurmb. Herb clammy, pubescent. Corolla white; petals obovate, emarginate.

2 L. PEN'TÁ'NDBRA (Cav. icon. 2. t. 148. f. 2.) flowers pentandrous; styles 3, distinct from the base. O. H. Native along
the Mediterranean Sea, in the sand; and of Spain, near Valencia. Perhaps sufficiently distinct from the first.

*Pentandrous* Laeflingia. Fl. Ju. Jul. Cit. 1829. Pl. $\frac{1}{2}$ to $\frac{1}{2}$ ft.

† *Species not sufficiently known.*

3 *L. Ca$f$pi$a* (Gmel. syst. 1. p. 105.) plant smooth in every part. Found on the shores of the Caspian Sea, by Gmelin. Gmel. itin. 3. p. 310. t. 35. f. 1.

*Casp$ia$ Leeflingia.* Pl. $\frac{1}{2}$ foot.

4 *L. x *sen$i$fol*ia* (Lag. gen. et spec. p. 2.) flowers pentan-
drous; leaves orbicularly reftorn. Q. H. Native of Mexico.

*Kidney-leaved* Leeflingia. Pl. $\frac{1}{2}$ foot.

*Cult.* The seeds only require to be sown in the open border in any dry lightish soil.

**Order CXIII. CRASSULACEÆ (plants agreeing with Crá$ssula$ in important characters).** D. C. bull. philom. 1801. no. 49. p. 1. fl. fr. ed. 3. vol. 4. p. 382. prod. 3. p. 381.—Semp$	ext{-}$

**Synopsis of the genera.**

** Tribe I.**

*Crass$	ext{-}$ula* c*ele*st*es,* Carpella distinct, opening when nature by a longitudinal fissure in front (f. 26. b.).

1 *Tille*'$a$.* Divisions of calyx, petals, and stamens 3-4 (f. 25. a. b. c.). Nectariforous scales none or very small. Carpels 3-4 (f. 25. d.), constricted in the middle, 2-seeded.

3 *Das$y$t*emon. Sepals 3-7, filiform, unequal, hardly joined at the base. Petals 3-7, often 5, hardly joined at the base, rather revolute at the apex. Stamens 3-7; filaments thick. Carpels 3-5.

4 *Ske$pt$as. Calyx 5-9-parted. Petals 5-9, stellately spreading. Stamens 5-9; filaments slender. Scales 5-9, small, roundish. Carpels 5-9, many-seeded.

6 *Pur$go$lia.* Calyx 5-parted. Petals 5, imbricating at the base. Stamens 5; scales 5, emarginate. Carpels 5, gibbous on the outside, and flat inside, many-seeded.

8 *Cun$to$gyne.* Calyx 5-parted. Petals united into a 5-

10 *Ró$che.* Calyx 5-lobed. Petals 5, united into a gamopetalous corolla, with a spreading 5-lobed limb. Stamens 5. Glands and carpels 5.

11 *Kal$os$nthes.* Calyx 5-lobed (f. 26. b.). Petals united into a 5-parted corolla (f. 26. a.), with the tube cylindrical, 2 or 3 times longer than the spreading limb. Stamens 5, inserted in the tube of the corolla. Glands and carpels 5.

12 *Kal$anche.$ Calyx 4-parted; sepals hardly united at the base. Corolla gamopetalous, with a 4-parted, spreading
border. Stamens 8, adnate to the base of the tube of the corolla. Scales 4, linear. Carpels 4; styles filiform.

14 Cotyledon. Calyx 4-parted. Corolla gamopetalous, with a 5-lobe, spreadingly reflexed limb. Stamens 10, adnate at the base to the tube of the corolla. Scales oval. Carpels 5, each drawn out into a subulate style.

15 Pistorinia. Calyx 5-parted. Corolla gamopetalous, with a 5-parted spreading border. Stamens 10, adnate their whole length to the tube of the corolla. Scales 5. Carpels 5, ending each in a long filiform style.

17 Echeyeria. Calyx 5-parted (f. 27. a.); sepals erect. Petals 5, united at the base (f. 27. b.), thick, and erect. Stamens 10 (f. 27. c.), united to the petals at the base. Scales 5. Carpels 5, each ending in a subulate style.

19 Sempervivum. Calyx 6-20-parted (f. 30. a.). Petals 6-20 (f. 30. b.). Stamens twice the number of the petals (f. 30. c.). Scales toothed or jagged. Carpels equal in number to the petals.

Tribe II.

CRASSULACEÆ ANOMALE. Carpels united at the base into a many-celled capsule.

21 Penthorum. Calyx 5-parted. Petals 5. Stamens 10. Scales wanting? Carpels 5, united at the base into a 5-beaked, 5-celled capsule, which is pentagonal at the apex, and opening under the beaks. Seeds small, numerous.

Tribe I.

CRASSULACEÆ or CRASSULACEÆ LEGITIMÆ (this tribe contains the legitimate plants of the order). Carpels distinct; when mature opening on the inside by a longitudinal fissure.

Lin. syst. Tri-Tétraédrées, Tri-Tétragynias. Calyx 3-4-parted (f. 25. a.). Petals 3-4 (f. 25. b.), oblong, acuminate. Scales none, or very small. Carpels 3-4, somewhat constricted in the middle, 2-seeded.—Small, glabrous, annual herbs, inhabitants of exposed sub-humid places. Leaves opposite. Flowers small, white, for the most part axillary.—Many of the exotic species may probably belong to Bulliardia.

1 T. muscosa (Lin. spec. 186.) stems branched at the base, decumbent; leaves connate; flowers axillary, sessile, tridit. (H. Native of Europe in many places, in dry, barren, sandy, and gravelly soil; plentiful in Britain, on the most barren sandy heaths; frequent in Norfolk and Suffolk. It is a troublesome weed in the gravel walks of Holkham. Bocc. mus. t. 22. Mich. gen. t. 20. Lam. ill. t. 90. D. C. pl. grass. t. 73. Smith, engl. bot. 116. Reich. icon. t. 191. Bocc. sic. t. 29. In exposed situations. this plant becomes reddish; but in that state it is not the T. rhabdo of Gouan.

Simple-stemmed Tilliera. Pl. ½ foot.

3 T. moschata (D. C. prod. 3. p. 382.) stem prostrate at the base; branches ascending; leaves connate, oval-oblong; flowers 4-cleft, sessile in the axis of the superior leaves. (H. Native of the Straits of Magellan, on the mountains; and of the Maelove Islands. Crassula moschata, Forst. in act. soc. gott. 9. p. 26. Bulliarda Magellánica, D. C. bull. philom. no. 40.

4 Musk Tilliera. Pl. prostrate.

4 T. minima (Miers, chil. 2. p. 530.) stems diffusely branched; leaves minute, connate at the base, oval-oblong; flowers 4-cleft, crowded into whorls in the axis of the leaves, on short pedicels; petals 4, acuminate, shorter than the calyx; carpels 1-2-seeded. —Native of Chili, about Concepcion and Coquimbo. T. erécta, Hook et Arnott, in Beech. voy. bot. 1. p. 24. Allied to T. moschata and verticillaris.

Least Tilliera. Pl. ¼ foot.

5 T. verticillaris (D. C. l. c.) stems prostrate at the base, rooting; branches ascending; leaves opposite, oblong-linear; flowers 4-cleft, crowded in whorls in the axis, some of which are sessile and others pedicellate. (H. Native of New Holland. Tilliera pedunculata, Sieb. pl. exsic. nov. holl. no. 173. but not of Smith. Petals acuminate, longer than the calyx. Habit almost of Hèéchrum verticillatum.

Verticillare-flowered Tilliera. Pl. pr.

6 T. pedunculaiis (Smith, in Rees' cyc. vol. 35. no. 4.) stem erect, simple; leaves rather connate, lanceolate, acute; pedicels axillary, solitary, twice or thrice longer than the leaves; carpels truncate at the apex. (H. Native about Monte Video and Buenos Ayres, in humid places. Bulliarda Bonairensis, D. C. bull. philom.

Peduncled-flowered Tilliera. Pl. ¼ foot.

7 T. redescens (H. B. et Kunth, nov. gen. amer. 6. p. 43.) stems branched, prostrate; leaves oblong-lanceolate, ovate, mucronate, rather fleshy, connate at the base; flowers 4-cleft, on long pedicels; petals shorter than the calyx. (H. Native about Quito, near Quito. Flowers white. Carpels 2-seeded. T. comata, Ruiz et Pav. f. fl. per. 1. p. 70. t. 106. f. 6, which was found in Peru, about Chancay, on humid hills, appears to differ from Kunth's plant in the stems being rather erect.

FIG. 25.
Reddish Tillaea. Pl. pr.  
Cult. Sow the seeds among gravel, and keep it moist, either in pots or in the open ground.

LIN. SYST. Tillaeæ. Tillaeæ. Tetragyna. Calyx 4-parted. Petals 4, oval or oblong, acute. Stamens 4. Scales 4, linear. Carpels 4, many-seeded.—Small, glabrous, annual, subaquatic herbs. Leaves opposite. Flowers small, white, axillary, sessile, or pedicellate. The parts of the flower are sometimes quinaria, and therefore differ from Crassula in the form of the scales, and from Tillaea in the many-seeded carpels, as well as in the number of the parts of the flower.

1 B. VAILLANTII (D. C. pl. grass. t. 74.) stem erect, dichotomous; leaves oblong, acute; pedicels longer than the leaves. O. H. Native of France, at Fontainbleau, in humid shady places, &c. Vaill. bot. t. 10. f. 2. Tillaea aquatica, Lam. ill. t. 90. but not of Till. Vaillantii, Willd. spec. 1. p. 720. Corolla pale flesh-coloured. Stems sometimes erect and sometimes prostrate, generally rooting at the lower nodes. T. prostrata, Poir. dict. t. 7. p. 674. is perhaps referable to this plant.

Var. β. prostrata (D. C. prod. 3. p. 382.) stems procumbent. Tillaea prostrata, Schkuhr, in Ust. ann. 2. p. 21. t. 5. Horn. fl. dan. t. 1510. Stuck. p. 21. t. 3. In Horrnemman's plant the flowers are either sessile or on short pedicels.

III. DASYSTEMON (from ĉauve, dasys, thick, and πτθμων, stemen, a stamen; in allusion to the thick filaments). D. C. prod. 3. p. 382.

LIN. SYST. Tri-Heptandria, Tri-Pentagynia. Sepals 3-7, leaf-formed, unequal, hardly united at the base, equalling the corolla in length. Petals 3-7, but generally 5, erect, hardly united at the base, and revolutely spreading at the apex. Stamens 3-7, alternating with the petals, and longer than them; filaments thick; anthers erect. Carpels 3-5.—An Australian herb, covered all over with scaly papulate. Root fibrous. Stem branched at the apex. Leaves opposite, connate, linear.

IV. SEPTAS (from septem, seven; the number 7 prevailing in the fructification). Lin. gen. 463. Haw. syn. 61. D. C. prod. 3. p. 383.—Crassula species of Thunb and Willd.

LIN. SYST. Penta-Eneandria, Penta-Eneangynia. Calyx 5-9-parted, shorter than the corolla. Petals 5-9, stellately spreading. Stamens 5-9; filaments slender, acuminate; scales 5-9, small, roundish. Carpels 5-9, many-seeded.—Herbs, native of the Cape of Good Hope. Roots tuberous, quiescent in winter; tubers roundish; fibres capillary. Stems simple, terete. Leaves of 2 opposite pairs, and the pairs sometimes approximate so near as to make the leaves appear in whorls. Flowers white, disposed in something like umbels. The habit of the plants is referable to some Saxifragaceae.

1 S. CAPESSIS (Lin. amen. 6. p. 87.) leaves roundish, broadly crenated, tapering into the petioles; and the base of the petioles is rather connate; petals spreading. D. D. G. Native of the Cape of Good Hope. Andr. bot. rep. 90.—Plum. amm. 340. f. 9. bad. Lam. ill. t. 575. Crassula Septas, Thumb. fl. cap. p. 291. There are varieties of this plant, differing in the number of the floral parts from 5-9, but generally 7; and with few-flowered or many-flowered umbels; and with leaves more or less stalked, having the crenatures either simple or subcrenated. Flowers white or red.

Umbellate Septas. Fl. July. Clt. 1800. Pl. ⅓ foot. Cult. A mixture of sand, loam, and pent suit the species of this genus; and they should be watered but sparingly when not in a growing state. They are readily increased by separating the tubers of the roots.

LIN. SYST. Pentandria, Pentagynia. Calyx 5-parted, much shorter than the corolla; sepals flatish. Petals 5, stellately spreading, distinct. Stamens 5; filaments subulate. Scales 5, ovate, short. Carpels 5, many-seeded.—Fleshy shrubs or herbs, generally natives of the Cape of Good Hope. Leaves opposite, quite entire, or sub-crenated. Flowers white, rarely rose-coloured.

§ 1. Latifolia (from latus, broad, and folium, a leaf; leaves broad). Shrubby. Leaves broader, flat, with the surface and margins smooth.

CRASSULACEÆ. V. CRASSULA.

4 C. ARGENTEA (Lin. fil. suppl. p. 188.) leaves connate, ovate, entire, fleshy, glabrous, silvery; stem shrubby; corymb supra-decompound; D. G. Native of the Cape of Good Hope. Thunb. f. cap. p. 289. Flowers white; anthers black. Stem a foot or more in height. Leaves obtuse, with an acum. Silvery Crassula. Shrub 1/2 foot.

5 C. TELEPHOIDES (Haw. rev. succ. p. 5.) stems herbaceous; erect; leaves obovate-oblong, stem-clasping, minutely and punctately crenated below; flowers cymose. D. G. Native of the Cape of Good Hope. Leaves 6 inches long and 18 lines broad. Petals pale rose-coloured. Scales square. Habit almost of Sodom Telephium, but smaller and more humble; and differs in the stems being 6. D. C. Perhaps Acanthaceae, Burm. aff. t. 25. f. 2. is referrible to this plant.

6 C. RAMOSA (Ait. hort. kew. 1. p. 390.) shrubby, glabrous, branched at the base; leaves subulate, flat above, connate perfoliate, smooth, much spreading; peduncles elongated, cymosely corymbose. D. G. Native of the Cape of Good Hope. Haw. syn. p. 51. according to whom it is nearly allied to C. perfoliata. C. dichotoma. Lin. fil. suppl. p. 188. ex Wild. Flowers pink.

7 C. FRUTICULOSA (Lin. mant. p. 61.) stem shrubby, smooth; leaves opposite, subulate, acute, much spreading, and a little recurved; peduncles solitary, subumbellate. D. G. Native of the Cape of Good Hope. Flowers small, white, campanulate; anthers purple. Very like C. perfoliata, according to Thunberg; but it differs in the leaves being reflexed.

8 C. REVOLVENS (Haw. phil. mag. 1824. p. 188.) stem suffrutiaceous, slender, a little branched; branches erect; leaves linear, lean, acute, revolutely reflexed, and arched, rather distant. D. G. Native of the Cape of Good Hope. Flowers small, white, in dense terminal heads. Perhaps not distinct from C. fruticulosa.

10 C. BIPLANATA (Haw. phil. mag. 1824. p. 186.) stem suffrutiaceous, erect, with spreading branches; leaves erectish, smooth, subulate, acute, flat on both surfaces, channelled beneath. D. G. Native of the Cape of Good Hope. Very like the following. Bracteas larger. Flowers white; anthers reddish.

12 C. BIRRACETÁTA (Haw. in phil. mag. 1824. p. 187.) plant effuse, decumbent, rootling; leaves subulate, expanded, flat or furrowed above; bracteas two on each peduncle. D. G. Native of the Cape of Good Hope. Flowers white; anthers sulphur-coloured, but at length becoming brown. Allied to C. acutifolia.

Var. a, minor (Haw. I. c.) plant usually tufescent; leaves less furrowed above or flat, full of rufous dots beneath.

Var. b, major (Haw. I. c.) greenish; leaves usually furrowed above, and often dotted with brown; branches longer than in var. a.

13 C. FILEUCLAIS (Haw. in phil. mag. 1824. p. 188.) plant effusely dichotomous; leaves spreadingly recurved, lanceolate-subulate, smooth, convex beneath; branches rooting, filiform. D. G. Native of the Cape of Good Hope. Flowers white, disposed in a kind of cyme; anthers yellow. Allied to the two preceding species.

14 C. SCA'BR' (Lin. spec. p. 405.) stem suffrutiaceous, erect, terete, branched, covered with retrograde rugosities; leaves opposite, spreading, connate, linear-lanceolate, acute, scabrous, ciliated; flowers corymbose, terminal. D. G. Native of the Cape of Good Hope. Dill. hort. elth. t. 99. f. 117. Mart. cent. t. 24. Segments of flowers spreading, or a little revolute, white at first, but becoming at length brownish.

17 C. BULLU'ATA (Haw. rev. succ. p. 11.) leaves lorate-lanceolate, and are, as well as the stems, roughish from whitish blisters; flowers cymose. D. G. Native of the Cape of Good Hope. Cotylédon, &c. Mart. cent. t. 24. Flowers said to be yellow. Allied to C. scabra, according to Haworth.

Prunose Crassula. Shrub 1 foot.
19. *C. muricata* (Thunb. prod. p. 55. fl. cap. p. 283.) stem frutescent, erect; branches tetragonal; leaves connate, trinodal, searobously ciliated, obtuse; flowers subumbellate. ʝ. D. G. Native of the Cape of Good Hope. It differs from *C. tetragona* in the stem being erect, and in the leaves being searobuous.

*Muricatula* Crassula. Shrub 1 foot.

*Columnar* Crassula. *C. columnalis*. *C. thyrse*.

*Club-moss-like* Crassula. Shrub tr.

*Perforated* Crassula. Shrub 1 foot.

26. *C. marginata* (Ait. hort. kew. 1. p. 306.) stem perennial, herba cious, glabrous, pellucid; leaves connately perfoliate, roundish-ovate, ending in a recurved mucron, flat, spreading, glabrous, dotted within the margin; flowers disposed in umbel late corymbs. ʝ. D. G. Native of the Cape of Good Hope.

### Jacobsen'sia

Jacq. *scehnbr*. 4. t. 471. *C. marginata*, Thunb. prod. p. 56. fl. cap. 287. Stems prostrate, jointed, rooting. Leaves reddish beneath, quite entire, with cartilaginous margins, which are at first redish, but at length becoming white from farina. Peduncles terminal, with two lateral ones, rising from the axis of the upper leaves. Flowers white; petals lanceolate, acute. The characters and synonyms are taken from the manuscript of the Prince de Salm-Dyèk.

*Marginal-leaved* Crassula. *Fl. July, Aug. Clt. 1774.* Pl. cr. 27. *C. pellucida* (Lin. spec. p. 406.) stems nearly herbaceous, flaccid, creeping; leaves opposite, obovate, attenuated at the base, glabrous, glabrously toothed, crowded at the tops of the branches; cymes subumbellate. ʝ. D. G. Native of the Cape of Good Hope. *Dill. hort. elth. t. 100. f. 119. Jacobs, fragm. t. 44. f. 3. Thunb. Fl. cap. p. 283. Very like *C. spatulata*, but differs in being more herbaceous, in the leaves not being petiolate, in the flowers being a little larger, and more crowded; the rest similar, according to the figure of Jacquin. *Flowers* pink.

*Prostrate* Crassula. *Pl. prostrate.*

29. *C. centaurioides* (Lin. spec. p. 404.) stems herbaceous, dichotomous, prostrate; leaves opposite, sessile, flat, oblong-ovate, glabrous, punctately toothed on the margins; peduncles axillary, 1-flowered. ʝ. D. G. Native of the Cape of Good Hope. *Sims, bot. mag. t. 1765. C. pellulicida, Jacq. fragm. t. 44. f. 3.* *Flowers* rose-coloured, nearly like those of *C. spatulata*; the ultimate ones somewhat coriaceous.

*Centuary-like* Crassula. *Pl. prostrate.*

Leaves almost like those of *Mesembryanthemum deltoides*. Cormyrs few-flowered; pedicels angular. Root fusiform.

**Deltoid-leaved Crassula.** Pl. 4 foot.

33 C. corrallina (Lin. fil. suppl. p. 188.) leaves opposite, deltoid, obtuse, approximate, dotted; flowers in umblellate corymb; stems erect, dichotomously branched.  

The Habit orbicularis, Corymbs tuse, glabrous; stems, long, small, ovate, white. f. vigs petals white, Thunb. Zb. Oric/M/ar § Glomerillce G. Glomerata, Mill. dict. no. 9. Herb 4-5 inches high. Petals greenish white, rose-coloured at the apex. Stigmas purple.

36 C. rosularias (Haw. rev. succ. p. 13.) leaves radical, oblong, obtuse, minutely ciliated, flat, rosulate; runners or twigs rising from the root; scape nearly naked; bundles of flowers opposite, pedunculate.  

2. D. G. Native of the Cape of Good Hope. Very like *C. orbicularis*, but differs in the plant being 3 times the size, destitute of runners, and in the flowers being 4-5-cleft and white; it is, however, probably only a variety of it.

35 C. oreikulaæ (Lin. mant. p. 361.) radical leaves oblong, obtuse, carlinegiously ciliated, flat, rosulate; runners or twigs rising from the root; scape nearly naked; bundles of flowers opposite, pedunculate.  

**Pubescent Crassula.** Pl. ¼ foot.

37 C. glomerata (Lin. mant. p. 60.) stems herbaceous, scabrous, dichotomous; leaves linear-lanceolate; flowers solitary in the forks of the stems, ultimate ones glomerate.  

28 C. glabra (Haw. syn. p. 58. rev. p. 12.) stems herbaceous, glabrous or rather pubescent, dichotomous; leaves linear-lanceolate; flowers solitary in the forks, ultimate ones glomerate.  

29 C. strictaæ (Lin. ancom. p. 56.) stems herbaceous, erect, rather hispid, dichotomous; leaves obovate, obtuse, strigose; pedicels 1-flowered.  

D. G. Native of the Cape of Good Hope. Lam. dict. 2. p. 174. Petals ovate, length of the calyx.

**Strigose Crassula.** Pl. ½ foot.

§ 10. *Tilleoidae* (plants with the habit of *Tillea*). Small subaquatic glabrous herbaceous plants, having 4-cleft flowers.

40 C. natans (Thumb. prod. p. 54. fl. cap. p. 281.) stems erect, dichotomous; leaves connate, linear-oblong, obtuse; pedicels axillary, opposite, shorter than the leaves; petals obvolute, a little longer than the calyx.  

D. G. Native of the Cape of Good Hope. Tillea's perfoliata, Lin. fil. l. c.

**Dwarf Crassula.** Pl. ½ foot.

42 C. umbellataæ (Thumb. l. c.) stem simple, erect; leaves on short petioles, ovate, obtuse; flowers umbellate.  

D. G. Native of the Cape of Good Hope. Tillea's umbellata, Wildl, spec. l. p. 721.

**Umbellate-flowered Crassula.** Pl. 43 C. decumbens (Thumb. l. c.) stem erect or decumbent; leaves connate, terete, subulate; flowers pedicellate, fastigate at the tops of the branches.  

G. Native of the Cape of Good Hope. C. Thunbergiana, Schultes, syst. 6. p. 733. The stems are said to be decumbent in the diagnosis, but in the description erect. Scales very short, red.

**Decumbent Crassula.** Pl. decumbent.

† *Species not sufficiently known.*

* Leaves opposite.

44 C. neglectaæ (Schultes, syst. 6. p. 722.) stems herbaceous; leaves petiolate, cordate, and are as well as the branches glabrous; flowers solitary.  

**Neglected Crassula.** Pl. ½ foot.

45 C. expansaæ (Ait. hort. kew. l. p. 390.) stems herbaceous, dichotomous; leaves semicylindrical, subulate, channelled above, spreading; peduncles axillary, solitary, 1-flowered.  

G. Native of the Cape of Good Hope. Whether the leaves are opposite or alternate.

46 C. diffusaæ (Ait. hort. kew. ed. 1. vol. 1. p. 395.) stems herbaceous; leaves oblong, attenuated at the base, crenulated; peduncles opposite the leaves and axillary, solitary.  

G. Native of the Cape of Good Hope. Flowers pink? The rest unknown.

47 C. subulætaæ (Lin. mant. p. 360.) stems herbaceous, branched; leaves opposite, terete, spreading; flowers capitata.  

G. Native of the Cape of Good Hope. Herb. lugd. bat. 552, with a figure. Flowers white, ex Herm. and Petiv. gaz. t. 89. f. 8.

48 C. sylvaæticaæ (Licht. in Schultes, syst. 6. p. 726.) stems herbaceous, dichotomous, beset with strigose hairs; leaves obovate-oblong, with the margin and base beset with strigose hairs; flowers terminal and axillary, solitary.—Native of the Cape of Good Hope. The rest unknown.

**Wood Crassula.** Pl. 2.
and naked; leaves connate, triquetrous, entire, spreading, glabrous; corymb compound.  ḡ. D. G. Native of the Cape of Good Hope. This plant is omitted in Thunberg's flora, cap. and prod., and is therefore doubtful.

Ascending Crassula. Pl. decumbent.

50. C. ? ALEA (Forsk. descr. 60, but not of Hortul.) stem simple; leaves opposite, crowded, sheathing, lanceolate, cartilaginous ciliolate; peduncles dichotomous; flowers corymbic. — Native of Arabia, on the mountains of Hadije and Boka. Flowers white, 5-parted.

White-flowered Crassula. Pl. ½. foot.

51. C. ? LINEOLATA (D. C. prod. 8. p. 390.) stem herbaceous; leaves cordate, sessile; peduncles nearly terminal, axillary, approximate, umbel-formed. ḡ. D. G. Native of the Cape of Good Hope. Sims, bot. mag. 1765. Flowers yellow. Mr. Haworth has placed this species between C. rétroflexa and C. centaurioidés; but C. rétroflexa is now referable to Grammánthes, and therefore this species is probably a species of that genus.

52. C. ? AGARDHIANA (Schultes, syst. 6. p. 718.) stem suffruticose; leaf-twisted, branched; branches naked; radical leaves ovate, imbricated; cauline ones remote, alternate. ḡ. D. G. Native of the south of Spain. According to the description this is a species of Sédum or Sempervivum.

Agardh's Crassula. Pl. ½. foot.

* * Alternifólie. The leaves being alternate in the following plants, they are probably species of Sédum.

53. C. ? MICROCARPA (Sibth et Smith, fl. gréc. prod. 1. p. 217.) leaves oblong; stem thickened; capsule angular, dotted, mucil. Ṣ. H. Native of the island of Cyprus, among rocks.

Small-fruited Crassula. Pl. ½. foot.

54. C. ? FULCHELLA (Ait. hort. kew. ed. 1. vol. 1. p. 392.) leaves ovate-oblong, fleshy, reflexed; stem herbaceous, dichotomous; flowers pedunculate in the forks; peduncles turbinate. Ṣ. G. Native of the Cape of Good Hope. Haw. succ. p. 12. Lobes of calyx leaf-formed, spreading, 2 short, and 3 about equal in length to the petals, which are ovate and acute. Flowers pink.

55. C. ? SVA!S!R-SA (Ait. l. c. p. 395.) stems herbaceous; leaves alternate, rather spatulate, acute, quite entire; racemes compound. ḡ. D. G. Native of the Cape of Good Hope. Flowers white?

N. B. Plants formerly included in the genus Crassula, but are now to be excluded from the order.

1. C. ? ALTERNIFOLIA (Lin. hort. cliff. p. 497. according to the figure in Burm. afr. p. 58. t. 24. f. 1.) is probably a species of Borráginea, and perhaps B. ciliata.

2. C. ? PINNA!A! (Lour. coch. p. 182.) is a plant far separated from Crássula, and most probably belonging to the order Terebinthéseae. C. pinnata of Dum. Cours. is a species of Bryophyllum or Kalanchoe. The C. pinnata of Lin. fil. suppl. 191. is probably the same plant as Loureiro's.

Cult. Crassula is an extensive genus of rather ornamental plants, and some of which are rather grotesque. A mixture of loam, sand, and brick rubbish, is the best soil for them. Cuttings root very readily if dried for a few days, after being cut off from the plants before being planted. The seeds of the annual species should be sown in pots, and when the plants have grown a little may be separated, and planted into other pots. All the species are well fitted for a dry stove, or to be placed on shelves erected in a green-house.

Lin. syst. Pentádria, Pentágyna. CALYX 5-parted, much shorter than the corolla. Petals 5, imbricating at the base, mucronulate beneath the apex. Stamens 5; filaments subulate. Scales 5, flat inside, and gibbous on the outside. — Herbaceous half naked plants. Leaves for the most part radical. Inflorescence spicate thyrsoid. Flowers in whorles, almost sessile. The species are probably all biennial.

§ 1. Linguéfolia (from lingua, a tongue, and folium, a leaf; form of leaves). Leaves lorately tongue-formed, thick, acutit. Haw. l. c.

1 P. LINGUEFOLIA (Haw. rev. succ. p. 14.) lower leaves distinct, opposite, tongue-formed, ciliated, pubescent; stem leafy; flowers verticillate, cored, sessile. Ṣ. or ḡ. D. G. Native of the Cape of Good Hope. Crassula linguéfolia, Haw. misc. nat. p. 175. Stem simple, a foot high. Corolla ampulliform, from green to white. Perhaps only a variety of P. tomentosa.

4 P. PERTUSULA (Haw. in phl. mag. 1828. p. 184.) leaves lanceolate, recurved, beset with impressed dots on both surfaces; upper bracteas cordate, entire; scape panicled. ḡ. D. G. Native of the Cape of Good Hope. Corolla snow white.

5 P. HIRTA; radical leaves lanceolate, hairy; stem herbaceous, erect, nearly naked, rather pubescent; heads of flowers verticillate. ḡ. D. G. Native of the Cape of Good Hope. Crassula hirta, Thumb. fl. cap. 284. Like P. spicáta. Leaves fleshy, white, erect, acute. Flowers white.

Hairy Purgosia. Pl. ½. to 1 foot.

Head-bearing Purgosia. Pl. ½. foot.

Crenulated Purgosia. Pl. 1 foot.
2. Ovatifolius (from ovatus, ovate, and folium, a leaf). Leaves ovate, oval, or obovate.

8 P. Ciliata: stem succulent, sparingly branched, terete; leaves oval, oblong, flatish, distinct, ciliated; corollas terminal.

9 P. concinna: leaves oblong, ciliated, rather imbricated.

2. D. G. Native of the Cape of Good Hope. Crassa cincinna, Haw. rev. succ. This is a much larger plant than the preceding, to which it is nearly allied. Flowers white.

10 P. concinna: leaves oblong, with densely ciliated silky margins.

2. D. G. Native of the Cape of Good Hope. Crassula concinna, Haw. in phil. mag. 1823. p. 381. Allied to P. concinna, but weaker, and 4 or 5 times smaller in every part, densely ciliated. Leaves rather imbricated, and appearing as if they were disposed in 2 compressed rows. The rest unknown.

11 P. cotyledon: radical leaves connate, oblong, oblong, tomentose, ciliated; stem nearly naked, herbaceous, somewhat tetragonal; flowers disposed in a corymb composed of fascicles.

Cotyledon Purgosia. Pl. 1 foot.

12 P. capitellata (Haw. rev. p. 17.) leaves connate, oblong, glabrous, cartilaginous ciliated, spreading, longer than the internodes; flowers in whorled heads.

13 P. alpestre: leaves connate, ovate, acute, imbricating in 4 rows; heads pedunculated; stem leafy, glabrous.

2. D. G. Native of the Cape of Good Hope. Crassula alpestre, Lin. fil. suppl. p. 190. Thumb. fl. cap. 286. nov. act. nat. cur. p. 6. p. 336. f. 56. f. 4. Allied to Crassula montana, but differs in the leaves being more acuminate, not ciliated, in the stem being thicker, and clothed with leaves, and in the flowers being larger.

Alp Purgosia. Pl. ½ foot.

14 P. hemisphærica: lower leaves connate, roundish, imbricating into a round head, cartilagiously ciliated; stem nearly naked; flowers rising in fascicles from the axis, forming a panicled spike. 2. D. G. Native of the Cape of Good Hope. Crassula hemisphærica, Thumb. prod. p. 57. fl. cap. p. 292. Floral leaves very short. Flowers small, white.

Hemisphærical Purgosia. Pl. ¾ foot.

15 P. thyrsiflora (Haw. rev. succ. 17.) leaves perfoliolate, ovate, obtuse, ciliated, glabrous, erectly spreading; thyrse branched, spicate.

Thyrse-flowered Purgosia. Pl. ¼ foot.

16 P. obovata (Haw. rev. succ. p. 16.) leaves opposite, deciduous, ovate, ciliated, full of minute impressed dots; stem rather hispid; flowers axillary, in a thyrsoid spike.

leaves obliquely cuneate-ovate, dark purple; sepal or flower bearing stem, very long, and panicked. D. G. Native of the Cape of Good Hope. Crássula obliqua, Haw. rev. succ. p. 203. It approaches very near G. cultrata, but differs in the inflorescence. Flowers white.

**Dark purple-leafed Globulea.** Fl. Aug. Clt. 1823. Shrub \( \frac{1}{2} \) to 1 foot.

§ 2. *Linguáter* (from lingua, a tongue; form of leaves). Leaves lobate, obtuse, convex beneath, or narrow tongue-formed, imbricating exactly in 4 rows. Stem very short or herbarious. Scapes or floriferous stems naked. Haw. in phil. mag. 1824. p. 191.

4 G. *Linguá* (Haw. in phil. mag. 1824. p. 28.) leaves elongated, lorate, ventricosely semi-lanceolate, culturate, and are as well as the calyces ciliated. D. G. Native of the Cape of Good Hope. Leaves without dots. Flowers panicked, white; anthers yellow.

5 G. *Linguá* (Haw. l. c. p. 29.) leaves rather elongated, ventricosely semi-lanceolate, culturate, thin, flaccid. D. G. Native of the Cape of Good Hope. Very like the preceding, but much smaller.

6 G. *Capitáta* (Haw. rev. succ. p. 17.) leaves ventricosely lanceolate, culturate, rather convex beneath, imbricately decussate, when young hoary. D. G. Native of the Cape of Good Hope. Crássula capitáta, Salm-Dyck, cat. 1820. p. 14, but not of Lam. Very like G. *obvalláts*, but larger, and the leaves are more acinaciform, usually an inch and a half broad.

**Capitate-flowered Globulea.** Fl. June, Jul. Clt. 1819. Pl. \( \frac{1}{2} \) to 1 foot.

**Canescens Globulea.** Fl. Jul. Aug. Clt. 1800. Pl. \( \frac{1}{2} \) foot.

**Naked-stemmed Globulea.** Fl. May, Sept. Clt. 1732. Pl. \( \frac{1}{2} \) to \( \frac{3}{4} \) foot.

10 G. *Sulcátáts* (Haw. rev. p. 18.) stemless; leaves incurved, subulate, semi-terete, deep green, shining, broadly channelled. D. G. Native of the Cape of Good Hope. Very like G. *nudicaláts*, but differs in being glabrous, and in the leaves being broadly furrowed above.

**Furrowed-leaved Globulea.** Fl. Ju. Sept. Clt. 1818. Pl. \( \frac{1}{2} \) ft.
4. Loríce (from loratus, large; shape of leaves). Leaves long, narrowest at the apex, convex beneath, tubed, incrusting in 4 rows. Stems hermaphroditic. Scapes leafy.

11 G. IMPRESSA (Haw. in phyl. mag. 1824. p. 189.) plant stemless; leaves long-lanceolate, green, full of impressed dots; dots large, scattered, numerous. D. G. Native of the Cape of Good Hope. Leaves cespitose, decussate, rather ciliated at the base. Flowers small, pale.

Var. β, minor (Haw. l. c.) smaller; dots on leaves more obsolete.

14 G. MESEMBERYANTHEMOIDES (Haw. l. c. p. 190.) stems suffruticose, bushy, erect; leaves subulate, and are as well as the branches, branches, and calyces hispid. D. G. Native of the Cape of Good Hope. Flowers glomerate, in dense fascicles, cream-coloured. Var. β; plant a little taller; flowers not so crowded.

Fig-marigold-like Globulea. Fl. Aug. Sept. Clt. 1820. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

15 G. subincana (Haw. l. c.) stem suffruticose, erectly decumbent; leaves semiterete, subulate, acute, a little incurved, and are as well as the branches covered with soft hoary down. D. G. Native of the Cape of Good Hope. Flowers white. There are decumbent and erect varieties of this plant.

Cult. Globulea is a very pretty genus of succulent plants. Sandy loam and brick rubbish is a good soil for them; and the pots should be well drained. Cuttings root easily if laid to dry a few days after cutting off, before they are planted, to dry up the wound, that they may not rot. A good situation for the plants is on the shelves of a greenhouse.

Lin. syst. Pentándria, Pentagynía. Calyx 5-parted, much shorter than the corolla. Petals 5, united at the base into 5-parted corolla. Stamens 5. Scales 5, short. Ovary 5, terete-oblong, gibbous at the apex, ending each in a long sublateral style.—Subshrubs, natives of the Cape of Good Hope. Leaves opposite, flat, rather fleshy, cartilaginously ciliated, ovate. In-

2 C. undulata (Haw. rev. p. 9.) leaves conuate, ovate, expanded, cartilaginously crenated: superior ones ovate-elliptic, undulately incurved; styles dichotomous. D. G. Native of the Cape of Good Hope. Curtogyne undulata, Haw. syn. p. 58. Similar to the first species, but differs in all the parts being much smaller and more branched. Flowers white.

Waved-leaved Curtogyne. Fl. Jul. Aug. Clt. 1824. Sh. 1 ft. Cult. The culture and propagation of the species of this genus are the same as that recommended for Globulea, above.

A pretty succulent genus.

IX. GRAMMANTHES (from γραμμα, gramma, a writing, and ανθος, anthos, a flower; in consequence of the segments of the corolla having some supposed resemblance to the letter V marked on them; hence also its synonymous name Vauvantage). D. C. prod. 3. p. 392. mem. crass. t. 1. f. 6. Vauvantage, Haw. rev. p. 18.—Crassula species of Lin. and others.

Lin. syst. Pentándria, Pentagynía. Calyx campanulate, 5-cleft, erect. Corolla gamopetalous, having the tube the length of the calyx; and the lobes 5-6, oval, expanded. Stamens 5-6, alternating with the lobes, inserted in the tube of the corolla, and inclosed within it. Scales wanting. Carpels 5.—Herbs annual. Leaves opposite, ovate-oblong, remote, flat, sessile. Flowers disposed in cymose corymbs.

Chloroflora-flowered Grammanthies. Fl. Jul. Clt. 1774. Pl. $\frac{1}{4}$ ft. 2 G. Gentianoides (D. C. prod. 3. p. 393.) leaves ovate-oblong. D. G. Native of the Cape of Good Hope. Crassula gentianoides, Lam. dict. 2. p. 175.—Phuk. mant. 89. t. 415. f. 6. Flowers pale blue, ex Phuk. and Lam. but the flowers are more likely yellow, and have become bluish on drying. Perhaps sufficiently distinct from the preceding.

Gentian-like Grammanthies. Fl. 1 ft. Cult. Sow the seeds thinly in pots filled with a mixture of gravelly sand or lime rubbish and loam, draining them well with shers. The species are singular succulent plants.

LIN. SYST. Pentáudria, Pentágynia. Calyx 5-lobed. Petals 5, united into a gamopetalous hypocrateriform corolla; with a short tube, equal in length to the spreading limb, or shorter than it. Stamens 5, alternating with the petals, a little exerted. Glands and carpels 5.—Tall, fleshy, simple, succulent shrubs. Leaves opposite, connate at the base, thick, white. Flowers disposed in terminal corymbs, without any bracteas.

**var. albiflóra** (Haw. l. c.) flowers white. Crássula perfoliáta, D. C. pl. grass. t. 13.—Dill. hort. elth. f. 118. Mill. fig. t. 108. Comm. pral. t. 23. without any flower, and is therefore referrible to *Aloe petiáta*, Haw. in Lin. trans. t. 7. p. 25.

3 R. albiflóra (D. C. prod. 3. p. 398.) leaves distinct, ovate, acuminate, spreading, cartilaginosely ciliát. ² D. G. Native of the Cape of Good Hope. Crássula albiflóra, Sims. bot. mag. t. 2391. Flowers white, disposed like those of *R. falcata*, but larger than those of *R. perfoliáta*. Anthers blackish, and a little more exserted than those of the other species.

**Cult.** Large, succulent plants, elegant when in flower. Their culture, propagation, and treatment are the same as that recommended for *Globularia*, p. 106.

**XI. KALOSANthes** (from *kalos*, kalos, beautiful, and *anthos*, anthos, a flower; flowers elegant). Haw. rev. succ. 1821. p. 6. but not of Blume.—Dietrichia, Tratt. tab. t. 449. arch. gev. (1818.) no. 449. but not of Rausch.—Rochea, sect. 2. Franciscoce, D. C. prod. 3. p. 393.

LIN. SYST. Pentáudria, Pentágynia. Calyx 5-lobed (*f. 26. a.*). Petals 5, united into a gamopetalous hypocrateriform corolla (*f. 26. a.*), with a cylindrical tube 2 or 3 times longer than the spreading limb (*f. 26. a.*). Stamens 5, alternating with the petals; anthers in the throat of the tube of the corolla. Glands and carpels 5.—Succulent shrubs. Leaves opposite, oval, or oblong, connate, flat, cartilaginosely ciliát. Flowers disposed in cymose umbels or heads, involucrated with numerous bracteas.

1 K. coccínea (Haw. rev. p. 18.) leaves connate and ciliát at the base; ovate-oblong, acutish. ² D. G. Native of the Cape of Good Hope. Larochêa coccínea, Haw. syn. p. 50. Crássula coccínea, Lin. spec. Curt. bot. mag. t. 495. Dietrichíá coccínea, Tratt. th. t. 19.—Comm. rar. t. 24. Bradl. succ. t. 50. Burm. afr. t. 23. f. 1. Flowers scarlet; tube an inch long. According to Bryen. prod. 3. t. 20. f. 1 there is a variety with flesh-coloured flowers; and according to Bradl. succ. t. 50. and Haw. rev. p. 8. there is a variety with white flowers, but in the gardens it is not to be found but with scarlet flowers.

**Scarlet-flowered Kalosanthes.** Fl. June, Aug. Clt. 1710. Shrub 1 to 3 feet.

**Middle Kalosanthes.** Fl. Ju. Jul. Clt. 1810. Shrub 1 ft. 3 K. versicolor (Haw. rev. p. 7.) leaves oblong-lanceolate, acute, connate and sheathing at the base; stem erect, branches; flowers in umbellate heads. ² D. G. Native of the Cape of Good Hope, on the Table Mountain. Crássula versicolor, Dürch, ex Ker. bot. reg. t. 320. *Roechea versicolor,* D. C. prod. 3. p. 394. Flowers about the size of those of *K. coccínea,* having the tube white, and the segments of the limb ovate, white in the middle, edged with scarlet. *Calyx* as long as 3 of the tube of the corolla.

4 K. odoratíssíma (Haw. rev. p. 7.) leaves linear-lanceolate, gradually acuminate, connately stem-clasping; flowers in umbellate heads; segments of the corolla oblong, acutish. ² D. G. Native of the Cape of Good Hope. Crássula odoratíssíma, Andr. bot. rep. t. 26. Jacq. hort. schmbr. t. 434. *Larochêa odoratíssíma,* Haw. syn. p. 51. Dietrichíá odoratíssíma, Tratt. *Roechea odoratíssíma,* D. C. prod. 3. p. 394. The flowers are yellow, according to Andrews; yellowish, Haworth; but with red claws and white lamina, according to Jacquin; they have the scent of those of *Polýántus tubérous,* or Tube-rose.

**var. b, albí (D. C. prod. 3. p. 394.) flowers white.** ² D. G. Native of the Cape of Good Hope. Crássula capitáta, Lodd. bot. cab. t. 1029. Leaves less ciliát, according to the figure, than those of the species.

**Sweet-scented Kalosanthes.** Fl. Ju. Jul. Clt. 1793. Sh. 1 ft. 5 K. nícolor (Haw. rev. p. 7.) flowers capitae, sessile, yellow, and scarlet. ² D. G. Native of the Cape of Good Hope. Very like the preceding species, but larger and more rigid, and the leaves are more acute.

**Yellow-flowered Kalosanthes.** Shrub 1 to 2 feet!

Röchea jasminea, D. C. prodr. 3. p. 394. Flowers white at first, but becoming reddish as they fade, very like those of the common jasmine, scentless. Tube of corolla almost 3 times longer than the calyx. Heads containing 2-4 flowers.

Shrub decumbent.

10 K. fasciculata (Schultes, syst. 6. p. 709, under Larochéna,) leaves connately sheathing at the base, linear-lanceolate; flowers in fascicles; segments of the calyx lancelolate, acute, ciliated. ꞵ. D. G. Native of the Cape of Good Hope. Crassula fasciculata, Lam. dict. 2. p. 171. Leaves glabrous, carillaginously ciliated. Corolla almost as in K. coeca, but is a little shorter.

Fascicle-leaved Kalosanthes. Shrub 1 to 2 feet.

Cult. Elegant succulent shrubs, worth cultivating in every collection for the beauty of their flowers. The culture, propagation, and treatment they require are the same as that recommended for Globularia, p. 106.

XII. KALANCHOE (Chinese name of one of the species). Adans. fam. 2. p. 248. D. C. pl. grass. no. 64. D. C. prodr. 3. p. 394. Haw. in phil. mag. 1829. p. 301.—Crassulaeanae, Pers.—Veronica, Andr. bot. rep. t. 21, Véres, Wild. Lin. syst. Octandria, Tetrágamma. Calyx 4-parted (rarely 5-parted); sepals united only at the very base, lorate, acute, spreadingly recurved at the apex. Corolla gamopetalous, hypocrateriform with an obversely clavate tube, and a 4-parted (rarely 5-parted) spreading limb. Stamens 8, 4 of which are adnate to the tube, nearly to the middle, the other 4 almost to the apex. Scales 4, linear, but almost obsolete in the K. varians, Carpels 4, continuous, with the filiform styles.—Succulent sub-shrubs, from 1 to 2 feet high, erect, a little branched. Leaves opposite, fleshy, more or less irregularly impari-pinnate, or ovate, toothed or serrated, and often of a glaucous hue. Flowers disposed in loose cymose terminal panicules, yellow, or rufescence, rarely white, scentless. This is a very natural genus.

* Leaves pinnatifid.

* Leaves simple; but in K. varians some of them are tricuspidate.

3 K. varians (Haw. in phil. mag. 1829. p. 303) smooth, glaucous; leaves oval, broadly toothed; upper ones sometimes tricuspidate. ꞵ. D. S. Native of the East Indies. Flowers yellow, sometimes 3-clawed.

6 K. lanceolata (D. C. prodr. 3. p. 392.) leaves lanceolate, crenated at the apex; stem, peduncles, calyces, and corollas, villous; cymes panicled. ꞵ. D. G. Native of Arabia. Cotyledon lanceolata, Forsk. desc. p. 89. Flowers said to be reddish yellow, that is, probably brownish.

Lanceolate-leaved Kalanchoe. Shrub 1 to 2 feet.

7 K. brasiliensis (St. Hil. fl. bras. 2. p. 196.) puberulous; lower leaves roundish; middle ones obovate-lanceolate; upper ones linear; all crenately serrated; cymes dense; lobes of corolla very acute. ꞵ. D. S. Native of Brazil, near Rio Janeiro by the sea side. Corolla with a yellow tube, and a rose-coloured limb. This plant seems to be an exception from the exciting and acid properties peculiar to the rest of Crassulaceae, it being used by the Brazilians in their domestic medicine.

Brazilian Kalanchoe. Shrub 1 to 2 feet.

Alternating Kalanchoe. Shrub 1 to 2 feet.

9 K. rotundifólia (Haw. in phil. mag. July, 1823. p. 81.) plant straight and slender; leaves thick: lower ones roundish; upper ones obovate, and almost entire; flowers small. ꞵ. D. G. Native of the Cape of Good Hope. Flowers rufescence or yellow.

Cult. The species of Kalanchoe being succulent, require very little water unless when growing freely; and the pots in which they are grown ought to be well drained with sherds. A mixture of loam and sand appears to be the best soil for them. The species are easily increased by cuttings. A leaf taken off any
of the species, and laid on the pot of mould, or on a tan-bed, will shoot out young plants from the notches on the edges of the leaf.

XIII. BRYOPHYLLUM (from βρυον, bryo, to sprout, and φυλλον, phyllon, a leaf; plants spring from the notches on the edges of the leaves when taken off the plant, and placed in a moist situation). Salisbury. par. 3. D. C. prod. 3. p. 395.—Crassouvia, Comm. miss.—Physocalyxium, Vest. in fl. 1829. p. 409.—Cotyledon species, Lam.—Calanchœ species, Pers.

LIN. Syst. Octádria, Tetrágyminia. Calyx inflated, bladdery before flowering, hardly 4-cleft to the middle; lobes 4, valvate. Corolla gamopetalous, hypogynous, having a long cylindrical tube, which is bluntly tetragonal at the base; and the lobes of the limb triangular and acute. Stamens 8, adnate to the base of the tube. Glands 4, oblong.—A fleshy, erect, branched, glabrous shrub. Leaves opposite, thick, petiolar; some impari-pinnate, with one or 2 pairs of segments, the terminal segment large; solitary others, all ovate and crenate; crenate bearing an opaque dot in each, which is easily made to evolve into a plant. Cymes panicked, terminal. Flowers yellowish red, or green and red. Calyx almost like that of Silene inflata.

Cult. See Kalanchœ above for culture and propagation.

LIN. Syst. Decándria, Pentágyminia. Calyx 5-parted, much shorter than the tube of the corolla. Corolla gamopetalous; tube ovate-cylindrical; limb 5-lobed, spreadingly reflexed or revolute; lobes obtuse. Stamens 10, adnate to the base of the tube of the corolla; the upper part free, exserted or almost inclosed. Scales ovate. Carpels 5, continuous, with the styles, which are subulate.—Fleshy shrubs, native of the Cape of Good Hope. Leaves usually scattered. Flowers loose, panicked, purplish or orange-coloured. This genus has been divided into sections from the form of the corolla by the Prince Salm-Dyck, but the corolla being unknown in a great many of the species we cannot follow these divisions.

* Leaves opposite.

1 C. undulata (Haw. suppl. 20. rev. 20.) leaves opposite, rhomboid-ovate, with an acumen, pale green; older ones large and very thick, margined with red at the apex: when young lean and waved. Ɣ D. G. Native of the Cape of Good Hope. Flowers unknown. Very similar to C. orbiculata, but the stem is more humble, and the leaves longer, and less obtuse at the apex. Salm-Dyck in litt.

2 C. orbiculata (Lin. spec. 614.) leaves opposite, flat, obovately-spatulate, obtuse, with an acumen, glaucous, and mealy, margined with red; flowers panicked; caudex erect, branched. Ɣ D. G. Native of the Cape of Good Hope. D. C. pl. grass. no. 76. Ait. hort. kew. ed. 2. vol. 3. p. 108. Flowers reddish.

Var. φ, rotundifolia (D. C. prod. 3. p. 396.) leaves roundish.

Var. β, obovata (D. C. l. c.) leaves obovate, margined with red.—C. ovata, Haw. l. c. C. orbiculata var. a, D. C. pl. grass. t. 76. Curt. bot. mag. t. 321.—Mor. oxon. sect. 12. t. 7. f. 59. Herrn. lugd. bat. 551. with a figure.

Var. γ, oblonga (D. C. l. c.) leaves oblong.—C. oblonga, Haw. l. c. C. orbiculata β, Ait. l. c.

Var. ε, clata (Salm-Dyck. in litt.) leaves orbiculare obovate, white, and mealy; stem tall, firm, a little branched. C. clata, Haw. suppl. p. 20.

Var. τ, ramosa (Salm-Dyck. in litt.) leaves ovate-spatulate, white, and mealy; caudex much branched; branches effuse. C. ramosa, Haw. suppl. p. 20. C. ramosissima, Mill. dict. C. orbiculata γ, Ait. hort. kew.

3 C. crassifolia (Haw. in phil. mag. 1826. p. 272.) stem erect, shrubby; plant white from meallness; leaves rhomboid, obtusely, thick. Ɣ D. G. Native of the Cape of Good Hope. Leaves distant, decussately opposite, edged with brownish purple on the margin above the middle. Flowers not seen. Thick-leaved Cotyledon. Ct. 1824. Shrubs 1½ to 3 ft.

4 C. viridis (Haw. in phil. mag. 1826. p. 272.) stem shrubby, erect, nearly simple; leaves obovato-cuneated, green. Ɣ D. G. Native of the Cape of Good Hope. Leaves middle-sized, lean. In habitat it follows C. crassifolia.

Green Cotyledon. Shrubs 2 to 4 ft.

5 C. ramosissima (Haw. suppl. p. 25.) leaves oblong-obovate, farinose, margined with red at the apex; caudex much branched; young branches erect; old ones twisted, and crowded. Ɣ D. G. Native of the Cape of Good Hope. C. paniculata, Lin. fil. suppl. Flowers unknown. Leaves not half the size of those of the smallest variety of C. orbiculata, hardly 15 lines long, and 9 lines broad.

7 C. ungulata (Lam. dict. 2. p. 130.) leaves opposite, semi-cylindrical, channelled, glabrous, purple, and furnished with a callous point at the margin near the apex; flowers in a kind of panicle, glabrous; caudex erect. Ɣ D. G. Native of the Cape of Good Hope. Burm. afr. dec. 3. p. 24. t. 22. f. 1. Flowers purplish, pendulous. Very like C. orbiculata.

Claw-leaved Cotyledon. Shrubs 1 to 2 ft.

9 C. tricuspidata (Haw. in phil. mag. 1825. July. p. 32.) plant white from meallness; leaves narrow, usually deeply tricuspidate. Ɣ D. G. Native of the Cape of Good Hope.
Very like C. papillaris, but differs in the leaves being tricuspidate.

Triecispinate-leaved Cotyledon. Clt. 1833. Shrub 1 ft. 10 C. furtvrea (Thomb. fl. cap. p. 296.) leaves opposite, linear-oblong, fleshy, concave; glabrous; flowers panicled, gla- brous; caudex erect, nearly herbaceous. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Corolla purple, an inch long. Purple-flowered Cotyledon. Shrub 1 ft. 11 C. teretifolia (Thomb. prod. p. 83. fl. cap. p. 597. but not of Lamm.) leaves opposite, nearly terete, fleshy, hairy, obtuse, with an acumen; flowers panicled, hairy; cædix erect, simple. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Terete-leaved Cotyledon. Shrub 1 ft. 12 C. cuneiformis (Haw. in phil. mag. March, 1828. p. 155.) stems short, branched; leaves crowded, obovate, mucronate, rather white from mealliness. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Like C. crassifolia, but much more humble. Wedge-leaved Cotyledon. Shrub 1 ft. ** Leaves alternate, narrow-ovate. 13 C. curviflora (Sims, bot. mag. t. 2044.) leaves scattered, semicylindrical, glabrous; cædices of the stem, where the old leaves have fallen off, rather prominent; flowers panicled, nodding; calyxes loose; tube of corolla pentagonal, in- curved. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Flowers of a dirty yellow-colour, almost reddish, about an inch long. Styles longer than the stamens. Curve-flowered Cotyledon. Fl. Oct. Clt. 1818. Sh. 1 to 2 ft. 14 C. tuberculosa (Lamm. dict. 2. p. 139.) leaves scattered, subcyllindrical, linear-oblong, acute; cædices of the old leaves tubercular; flowers subpanicled, erect; peduncles and calyxes pubescent. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope.—Burman. afr. t. 20. f. 1. 15 C. grandiflora, N. L. Burman. prod. fl. cap. 13. C. tuberculosa, D. C. pl. gras. 1. t. 86. Flowers showy, orange-coloured, tubular, an inch or more long; limb spreading, not replicate. Tuberculosa Cotyledon. Fl. June, Aug. Clt. 1820. Shrub 1 to 2 feet. 15 C. cacaloides (Lin. fls. suppl. p. 242.) leaves scattered, terete, acute; cædices of the old leaves pitted; flowers panicled, erect, seated on a long, elongated, nearly naked stem. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Burman. afr. t. 20. f. 2. Flowers yellow, rather villous, half an inch long. Leaves deciduous when the plant is in flower; hence Burmann called it C. aphyllos. Cacalia-like Cotyledon. Fl. May. Clt. 1818. Sh. 1 foot. 16 C. ventricosa (N. L. Burman. prod. fl. cap. p. 13.) leaves scattered, linear-oblong, acute at both ends; cædices on old stems tubercular; flowers in loose racemes, pedicellate, erect; tube ventricose, pentagonal; lobes acute. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Burman. afr. dec. 3. p. 51. t. 21. f. 1. Flowers greenish, almost like those of C. hemispherica. Leaves like those of C. tuberculosa, according to Burman. Ventricosa-flowered Cotyledon. Shrub 1 to 2 feet. 17 C. sivaria (Lin. spec. p. 614.) exclusive of the synony- mous. leaves almost radical, terete, oblong, fleshy, obtuse, narrower at the base; cædix very short, thick; flowering stem erect, naked; flowers somewhat panicled. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Burman. afr. p. 43. t. 19. f. 1. Plunk. altn. t. 323. f. 1.—Willd. spec. 2. p. 754. C. teretifolia, Lamm. dict. 2. p. 139. but not of Thomb. Spurious Cotyledon. Fl. July, Aug. Clt. 1731. Shrub 1 ft. 18 C. fascicularis (Ati. hort. kew. ed. 1. vol. 2. p. 106.) leaves scattered, but in fascicles at the tops of the branches, cuneiform, obtuse, flat, thick; cædix thickened, branched; flowers panicled, pendulous, with revolute limbs. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Burman. afr. p. 41. t. 18. C. paniculata, Thumb. fl. cap. p. 396. ex Burman. syn. C. tardiflora, Bonpl. nav. t. 37. Corolla with a short, greenish, broad, subpentagonal tube, and a reddish revolute limb. Fascicled-flowered Cotyledon. Fl. July, Sept. Clt. 1759. Shrub 1 foot. * * * Leaves alternate, permanent. 19 C. trigloera (Thomb. prod. p. 83. fl. cap. p. 396.) leaves scattered, oblong-spataculate, obtuse, fleshy, of a greyish shining colour; flowers by threes, in spikes, approximate, with replicate limbs; stem suffrutescent. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope, near Zehorivier. Salm-Dyck. obs. p. 6. C. elata, Haw. suppl. Corolla with a green tube, and an acute limb, variegated with white and purple. Three-flowered Cotyledon. Fl. May, July. Clt. 1821. Shrub 1 to 2 feet. 20 C. maculata (Salm-Dyck, obs. p. 5.) leaves scattered, ovate-spataculate, somewhat suriicate at the base, fleshy, shining, marked with dark red spots on both surfaces; flowers spicate, almost alternate; limb spreading; stem suffrutescenc. \( \frac{1}{2} \). D. G. Native country unknown. C. alternans, Haw. suppl. ex Salm-Dyck. but not of Vahl. Spike terminal, generally simple. Tube of corolla green, subventricose, with the segments of the limb acute, variegated with white and purple. Spotted-leaved Cotyledon. Fl. July, Aug. Clt. 1816. Sh. 1 ft. 21 C. homoroflora (Haw. in phil. mag. 1825. July, p. 33.) leaves approximate, obovate-rahmboioid, mucronate, white and mealy; stem branched, strong, decumbent. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Allied to C. hemispherica, but more humble and branched, and the leaves are rhomboid, and more acuminate. Flowers unknown. Rhomb-leaved Cotyledon. Clt. 1823. Shrub decumbent. 22 C. jassimiflora (Salm-Dyck, obs. Haw. rev. p. 20.) leaves rather crowded, green, rhomboid-spatulate, fleshy; stem humble; peduncle terminal, branched; flowers erect, with a green tube, and a revolute limb, variegated with white and purple; pedicels long, thickened. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Allied to C. hemispherica, but the stems are more humble, thickened from the root; the leaves longer, and the flowers with the tube and limb more ample, and more like a jasmine flower. Salm-Dyck in litt. Jasmine-flowered Cotyledon. Fl. July, Aug. Clt. 1818. Sh. 1 foot. 23 C. hemispherica (Lin. spec. p. 614.) leaves scattered, ovate-rounded, thick dotted, glabrous; flowers nearly sessile, erect, along an elongated peduncle; lobes of corolla spreading. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope.——Dill. 2. t. 95. f. 111. C. hemispherica, D. C. pl. gras. 1. t. 87. Flowers small, with a green tube, and the limb variegated with white and purple. Hemispherical Cotyledon. Fl. Ju. July. Clt. 1731. Sh. 1 ft. 24 C. kotundiflora (Haw. in phil. mag. 1826. p. 273.) shrubby, dwarf; leaves straight, crowded, roundish, dirty green; branches short, decumbent. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope. Leaves flat, convex beneath, mealy. Allied to C. hemispherica. Round-leaved Cotyledon. Shrub decumbent. 25 C. macillaris (Lin. fls. suppl. p. 243.) leaves scattered, crowded into something like whorls, terete, ovate, obtuse, glabrous; flowers spreading on short pedicels, which are seated on an elongated peduncle; stem creeping. \( \frac{1}{2} \). D. G. Native of the Cape of Good Hope, near Olyants Bad. Thomb. fl. cap. p. 397. Haw. rev. p. 21. suppl. 22. Corolla tubular, glabrous, with a green tube, and a spreadingly reflexed limb, which is variegated with white and purple.
26 C. cuneata (Thunb. fl. cap. p. 352) leaves radical, cuneated, fleshly, hairy, with purple margins; stem erect, somewhat herbaceous, pubescent, viscid; corolla hairy.  fl. D. G. Native of the Cape of Good Hope.

27 C. intermedia (Haw. in phil. mag. March, 1828, p. 185,) leaves glanscent, narrow-oblong, acute, incurved; stem short, strong.  fl. D. G. Native of the Cape of Good Hope. Very like C. spinosa, but differs in being higher, in the leaves being shorter, thicker, and narrower, more channelled, and without doubt incurred.

29 C. mucronata (Lam. dict. 2, p. 112.) leaves nearly radical, oval, flat, with undulated margins, mucronate at the apex; stem branched, very short; floriferous stem naked; flowers erect, in loose panicles.  fl. D. G. Native of the Cape of Good Hope. Burm. afr. p. 44. t. 19. fl. 2. C. undulata, Haw. Lobes of corolla acute.

30 C. reticulata (Thunb. fl. cap. p. 393,) leaves scattered at the tops of the branches, terete, acute, erect, soft, glabrous; stem erect, shrubby, fleshy; flowers erect, in dichotomous panicles.  fl. D. G. Native of the Cape of Good Hope.

Dichotomous Cotel.  Shrubs ½ to 1 foot.
31 C. pinnata (Burch. cat. geogr. no. 1818, ex toy. cap. 1, p. 240.) leaves oval, rather composed, thick; panicle dichotomously branched; pedicels erect, very long, capillary; stem erect.  fl. D. G. Native of the Cape of Good Hope. Plant 6-9 inches high.

Small Cotel.  Pl. ½ to 1 foot.
33 C. trigyna (Burch. tr. fl. aff. 2, p. 226,) stemless; leaves glabrous, flattened, fleshy, cuneate-oval or nearly orbicular; flowers erect, alternate on an elongated simple scape, rarely on a bifid one.  fl. D. G. Native of the Cape of Good Hope. Corolla cylindrical, purplish, with a short reflexed limb, and a purple throat. Carpels 3.

Trigyna Cotel.  Pl. ½ to 1 foot.
34 C. cristata (Haw. phil. mag. 1827, April 1, p. 123,) leaves petiolate, cuneately triangular, curved and crested at the apex.  fl. D. G. Native of the Cape of Good Hope. Herb succulent, leafy, evergreen. Stem short, with the succulent densely clothed with fleshy hairs. Leaves erect, an inch long, thick, purplish at the apex, beset with dots of seryu1 down. Spikes terminal. Flowers small, open in the morning.

35 C. clavifolia (Haw. 1. c.) leaves petiolate, club-formed, incurved, acuminated, and rather curled at the apex.  fl. D. G. Native of the Cape of Good Hope. Allied to the preceding species; but the flowers are about twice the size, and purple.

Cult. Cotel. is a genus of pretty succulent plants. The culture, propagation, and management of the species are the same as that for Globulica, p. 106.

CULT. PISTORINIA (meaning unknown to us).  D. C. prod. 3. p. 399. mem. crass. p. 25. t. 10. f. 5.—Cotel. species of authors.

Cult. Sow the seeds in any dry situation in a light soil in the open border, or on rock-work.

CULT. UMBILICUS (from umbilicus, the navel; hollow leaves of some species).  D. C. in bull. phil. 1801, no. 19. prod. 3. p. 399. Lin. Syst. Decandria, Pentagynia. Calyx 5-parted. Corolla gamopetalous, campanulate, 5-cleft; lobes ovate, acute, erect, about the length of the tube. Stamens 10, inserted in the corolla. Scales 5, obtuse. Carpels 5, attenuated at the apex. Styles subulate.—Herbs, indigenous to the south of Europe and the Levant. Leaves rosulate or alternate, quite entire, or a little toothed. Flowers white or yellow, in branched or simple terminal racemes, never in cymes.

SECT. I. ROSULÀRIA (from rosus, a rose; in reference to the leaves being rosulate, or disposed like the petals in the flower of a rose).  D. C. prod. 3. p. 399. Sepals equal to the tube of the corolla. Leaves radical, rosulate. Scapes subpanicled, annul.—Perennial herbs, natives of the Levant, with the habit of Sempervivum.
1 U. Libanòticus (D. C. prod. 3. p. 399.) leaves radical, rosulate, cuneated, thickish, papillosé; scape naked; panicle racemose, loose. 2. H. Native of Mount Libanon, and near Damascus. Cotel. Libanòtica, Labill. synr. dec. 3. p. 3. t. 1. Flowers yellow?

Libanò Libanon Navel-wort.  Pl. ½ foot.

Houseleek-like Navel-wort.  Pl. ½ foot.
3 U. pubescens (Meyer in verz. pflanz. p. 150, under Cotel.) plant pubescent; leaves linear-oblong, bluntish; radical ones rosulate, cauleine ones scattered, erectly spreading; racemes corymbose; corolla twice the length of the calyx, with the segments of the limb acute and spreading at the apex; stem herbaceous, simple. 2. H. Native of Caucasus, among rocks in shady places on the mountains of Talush, at the altitude of 1200 to 2700 feet. Sédum pilosum, Bieb. fl. taur. 1. p. 332. Flowers reddish.
4 U. Sánchez (D. C. l. c.) radical leaves narrow, spatulate-lanceolate, long, fleshy; cauleine leaves sessile, linear; stem simple, glabrous, leafy; flowers racemose, pedicellate, usually twin.

7 U. pendulíneus (D. C. pl. grass. t. 156.) lower leaves petallate, concave, repeatedly crenated, roundish; bracteae entire; flowers tubular, pendulous, or spreading. O. H. Native of Europe, among stones and rocks, on walls and under hedges; in Britain, on moist dripping rocks and old walls. Cotyledon Umbilikus, Lin. spec. 615. var. ov. Sow. engl. bot. t. 325. Cotyledon umbilíca, Lam. C. rúpéstris, Salisb. Cotyledon Umbilikus vénéris, Blackw. herb. t. 2935. Root tuberous. Flower-bearing stem branched; with its branches bearing racemes. Flowers yellow.

Sect. IV. Pteróniáidæ (plants intermediate between Pistorínia and Umbilikus). Roots perennial, thick, woody. Leaves terete, subulate. Stems numerous, erect, simple, fistular, densely leafy, for the most part naked below, in consequence of the leaves having fallen.

11 U. lievërii; glabrous; stems herbaceous, erect, simple; leaves scattered, crowded, nearly terete, glabrous; flowers yellow; limb of corolla erect. 2. H. Native of Altai, between the river Irtsch and Lake Nöör. Stem in dry sandy fields; in fields on the mountain of Kuttchem, Arkau, and at the rivulet called Urnëchka, near Buchtornitz. Cotyledon lievërii, Led. fl. ross. alt. t. 57. fl. alt. 2. p. 197. Corolla fine red. Carpels 5-6.

12 U. subuléata; plant quite smooth, glaucescent; leaves all scattered, terete, subulate, acute, erectly spreading; racemes corymbose; corolla twice the length of the calyx, with the segments of the limb acute and erect; stem herbaceous, very simple. 2. H. Native of Caucasus, among stones, on the mountains of Taulsch, at the altitude of 2700 to 3300 feet. Cotyledon subulátula, Meyer. in varz. plznz. p. 150. Very nearly allied to U. lievërii, but the leaves are acute and erectly spreading, and the corolla is white, twice the length of the calyx, not rose-coloured, and 4 times longer than the calyx.

Flowers yellow, 5-parted, on short pedicels, collected into a cylindrical spike.  

**Spartum** (Led. fl. alt. 2. p. 200.) spikes numerous, rising from the axils of the radical or cauline leaves, somewhat fastigate.  

H. Native of Dahuria, among mountain rocks. Cotyledon malachophylla, Pall. itin. 3. append. t. O. f. 1. ed. gall. 8vo. p. 312. t. 70. f. 1. Orrostachys malachophylla, Fisch. cat.  

Flowers white, 5-parted, crowded into a dense cylindrical spike.  

16 U. thyrsifló- (D. C. l. c.) leaves oblong, quite entire, ending each in a soft spine; radical ones rosulate; stem spicate, simple.  

H. Native of the mountains of Siberia, at Aga. 

Flowers white and flesh-coloured (ex Fisch), 5-parted. Allied to U. malachophyllus.

*Thyrsiflorous Navel-wort.* Pl. 3/2 to 3/4 foot. 

17 U. leuca'ôtha; leaves terminated by a spine; radical ones rosulate, spathulate, convex beneath towards the apex; cauline ones teretily trinodal; corolla thric the length of the calyx: peduncles all 1-flowered; anthers discoloured.  

*Cult.* The hardy perennial species of this genus thrive well on rock-work, or on old walls; they will also grow freely in pots, in a soil composed of loam, peat, and sand, which should be placed among other alpine plants; these are propagated by offsets from the roots or by seeds. The seeds of annual and biennial kinds should be sown on rock-work, or in the open border, in a sandy or gravelly soil.

---

**XVII. ECHEVERIA. XVIII. SEDUM.**  

Flowers yellow, 5-parted, on short pedicels, collected into a cylindrical spike.  

**V. D. G. Native of Mexico. Sweet, fl. gard. 275. Lower leaves rosulate, all white or glaucescent. Corolla of a reddish orange-colour, with a tinge of purple. Stamens white.**  

2 E. gí-bè-blô (D. C. prod. 3. p. 401. mem. crass. p. 29. t. 5.) leaves flat, cuneiform, acutely mucronate, crowded at the tops of the branches; panicle spreading; flowers on short pedicels along the branches of the panicle.  

3 E. coccínea (D. C. prod. 3. p. 401.) plant soft, pubescent; leaves spatulate lanceolate; spikes of flowers axillary, elongated, leafy.  

4 E. racemosá (Schlecht. et Cham. in Linnea 2. p. 55.) plant quite glabrous; radical leaves thickish, elliptic, acute, awnless, rosulate; scapes simple, naked; scales of scape alternate, and bracteas scale-like and caducous; racemes spike-shaped and elongated; flowers alternate, erect, on short pedicels.  

**Racemose-flowered Echeveria.** Pl. 3/2 to 1 foot.  

5 E. tere'tiófílla (D. C. prod. 1. c. mem. crass. p. 29. pl. 1. f. 1.) leaves terete, acute, scattered, almost loose at the base; spikes second, few-flowered.  

**Scarlet-leaved Echeveria.** Shrub 1 to 2 feet.  

6 E. lu'û'û'da (Haw. in phl. mag. 1831. p. 416.) plant rather tufted; lower leaves lanceolate-euncated, of a livid colour: superior ones lanceolate; flowers disposed in racemose spikes.  

**Lurid-leaved Echeveria.** Fl. Clt. 1830. Pl. 1 foot.  

**Plant subherbaceous. Flowers subgynous, yellow.**  

7 E. cespí-tósá (D. C. prod. 3. p. 401.) leaves rosulate, narrow, tongue-formed, obuncuated at the apex, and rather mucronate; flowers cyneous.  

**Cult.* Fine glaucous, succulent plants, which deserve to be cultivated in every collection. Their culture, propagation, and treatment are the same as that recommended for *Globularia,* p. 106.**  

---

**XVIII. SEDUM (from seco, to sit; manner of growth, upon stones, rocks, walls, and roofs of houses). D. C. in bull. phil. no. 49. mem. crass. t. 1. f. 1. Sédium and Rhodiola, Lin. spec.  

**Lin. syst. Decândria, Pentágynia.** Calyx 5-parted (f. 29. a.); sepals ovate, usually turgid, leaf-formed. Petals 5 (f. 29. b.);
CRASSULACEAe. XVIII. Sedum.

114

generally spreading. Stamens 10. Nectariferous scales entire, or hardly margined. Carpels 5.—*Herbs or subshrubs. Stems usually branched from the base. Sterile stems or surculi usually crowded with leaves. Leaves alternate, rarely opposite, fleshy, terete or flat, quite entire, rarely toothed. Flowers cymose, white, purple, or blue, but usually yellow; in some species the flowers are 4 or 6-petalled, and the stamens always double that number.

* Leaves flat. Flowers yellow.

1 S. RHODIOLA (D. C. fl. fr. ed. 3. vol. 4. p. 386. pl. grass. t. 143.) leaves oblong, serrated at the apex, glabrous, glaucous; root rather tuberous; stems simple; flowers corymbose, usually of 4 petals, ovoid, and diocious from abortion. 2 H. Native of middle Europe, on the mountains; of Siberia, and of North America, on the Arctic Sea shore, and Islands; of Newfoundland and Labrador; and on the Rocky Mountains, Kotzebue's Sound, &c.; in Britain, in the north of England, Scotland, and Wales, on the mountains. Rhodiola rosæ, Linn. spec. 1465. Smith, Engl. bot. t. 508. fl. dam. t. 185. Plant glaucous. The flowers are yellow, and are said to be sometimes hermaphrodite, but are usually of different sexes on different plants. The root is sweetish when dried; in this state a fragrant water may be distilled from it. The inhabitants of the Farro Island use it as a remedy for scurvy.

A cataplasme of the fresh roots, applied to the forehead, is said to relieve the headache, and to heal malignant ulcers. The specific name is from ρέδων, a rose; in reference to the fragrant of the roots.

Asiatic Rose-root. Pl. ½ foot.

3 S. ELOG ARMATUM (Linn. fl. alt. 2. p. 193.) leaves scattered, oblong, almost quite entire, glabrous, hardly glaucifolent; root rather tuberous; stems simple; flowers in cymose corymb; pedicels hardly exceeding the flowers in length; nectariferous scales 3 times longer than broad; carpels recurved. 2 H. Native of Altai, in alpine humid places, on the edges of rivulets. Plant glaucous. Flowers yellow? hermaphrodite, but sometimes dioecious or polygamous from abortion, as in S. RHODIOLA. Stamens 8 or 10.

4 S. ALTAR'TUM; leaves scattered, obovate-lanceolate, serrated at the apex, glabrous, glaucous; root rather tuberous; stems simple; flowers in cymose corymb; pedicels hardly exceeding the flowers in length; nectariferous scales about as long as broad; carpels recurved. 2 H. Native of Altai and Siberia. S. Rhodiola, Led. fl. alt. 2. p. 194. Rhodiola Sibirica, Hortl. Flowers yellow, ovoid, dioecious or polygamous.

5 S. HIMALAYENSIS (D. Don, prod. fl. nepr. p. 213.) stem erect; leaves oval-lanceolate, flat, acute, toothed, glaucous, smooth; corymbbs almost simple; root thick. 2 H. Native of Gosainthang, in the alpine regions of the Himalaya or Emoli. Habit of S. Rhodiola. Flowers yellow.

Himalaya Stonecrop. Pl. ½ foot.

6 S. AZIO'ON (Linn. spec. 417.) leaves lanceolate, flat, serrated, alternate, glabrous; stems erect; cymes terminal, crowded. 2 H. Native of Siberia, in woods; on shady rocks, at Lake

Teletzkoï. D. C. pl. grass. t. 101.—Amm. ruth. no. 96. t. 11. Perhaps Anacampseros Aizoon, Haw. syn. p. 112.? Flowers yellow, varying with from 4–6 petals and 8–12 stamens. Root branched, fascicled, thickish.

Ever-living Stonecrop. Fl. Jul. Sept. Ch. 1757. Pl. 1 ft. 7 S. MYHRIBUS (Linn. spec. 417.) leaves cuneiform, rather concave, bluntly serrated, rather crowded, alternate, glabrous; those of the branches crowded; stems ascending, rooting at the base; cymes terminal. 2 H. Native of Altai and Tartary, at the bottom of the ural mountains; on the upper irish. Murr. nov. comm. goét. 6. p. 35. t. 5.—Gmel. fl. sib. 4. p. 171. no. 851. t. 62. f. 1. Anacampseros hybrida, Haw. 1. c. Flowers sulphur-coloured. This is not a hybrid, but a true species. S. Altaiëca, Bess. enum. sem. cerm. 1828.

Hybrid Stonecrop. Fl. May, Jul. Ch. 1766. Pl. 1 to 2 ft. 8 S. SPATULIFOLIUM (Hook. fl. bor. amer. 1. p. 228.) glabrous; stem erect; leaves obovate-spatulate, flatish, acute; upper ones linear; cyme terminal, leafy, trichotomous; flowers pedicelled, decandrous; petals linear-spatulate, much longer than the calyx. 2 H. Native of the north-west coast of America; common on dry rocky places of the Columbia river. Flowers yellow, very like those of S. stenopetalum. Lower parts of stems decurved.

Spatulate-leaved Stonecrop. Pl. ½ to 3/5 foot.

9 S. Doughl's (Hook. fl. bor. amer. 1. p. 228.) stem erect, profliferous above from recurved branches; leaves linear-subulate, very acute, flat on the inside, and a little keeled on the back, with dry membraneous edges; cymes dichotomous; flowers sessile, decandrous; petals narrow-lanceolate, twice the length of the calyx. 0 H. Native of North America; common on rocky places on the Columbia to the mountains. Flowers yellow, like those of S. stenopetalum.

Doughl's Stonecrop. Pl. ½ foot.

10 S. a'LANDUM (Led. fl. ross. alt. ill. t. 418.) leaves scattered, linear, quite entire, flat, glabrous; root thick, of many necks; stems numerous, simple; corymb terminal, simple; pedicels about equal in length to the flowers; breadth of nectariferous scales exceeding their length; petals longer than the stamens. 2 H. Native of Altaïa, on the higher alps, about the fountains of the rivers Inja, Uba, and Sentelek, and on the mountains Kokoâs, at the sides of rivulets. Flowers at first yellow, but fading to a dirty red. Allied to S. quadrifidum.

** Leaves flat. Flowers white.

11 S. involucratum (Biebl. fl. taur. 1. p. 532.) leaves cuneiform, crenated, opposite, pubescent, ciliated; stems decinate, hairy; corymbbs crowded, involucrated; petals subulate. 2 H. Native of Caucasus, among stones, at the foot of Mount Kaischaur. Flowers white, about the size of those of S. hybridum.

Involucrated Stonecrop. Pl. 1 foot.

12 S. LATTIFOLIUM (Bert. amon. linn. p. 366.) leaves ovate, cordate, very blunt, serrated, glabrous, usually opposite; corymbbs cymose, on long peduncles; stems longer than the corolla. 2 H. Native of Switzerland, on the mountains; Germany, Italy, France, &c.—Clus. hist. 2. p. 66. f. 1. S. Teléphium, var. maxiamum, Linn. spec. 616. S. maximum, Hoffm. germ. 1. p. 156. Flowers greenish-white. Anacampseros maxima, and probably A. albicans, Haw. syn. p. 111.

13 S. OBRUSIFOLIUM (Meyer. verz. phanzz. p. 150.) plant glabrous, green; stems erect; leaves orbicularly-ovate, obtuse, nearly quite entire, with scirrous margins; lower ones opposite; rays of cyme elongated, spreading at an angle; petals nearly sessile; petals acute, longer than the calyx. 2 H. Native of Caucasus, on the Talusch mountains, towards Perim-
CRASSULACEÆ.

115

stems
CRASSULACEÆ. XVIII. SEDUM.

stems simple; leaves flat, nearly linear, entire, sessile; cymes leafy. *H.* Native of Eastern Siberia. Flowers blue.

*Blue-flowered Stonecrop.* Pl. 3/4 foot. 29 *S. deltoides* (Tenn. cat. 1819, p. 483.) stems erectish; leaves alternate, flat, deltoidly-cuneiform, unequal, crenated, and toothed; cymes lateral. *H.* Native of the kingdom of Naples, on Monte Novo and Goats' Island. Flowers purple. The rest unknown.

*Huscleck-like Stonecrop.* Pl. Jul. Aug. Cit. 1823. Pl. 3/4 ft. 31 *S. hemato'des* (Mill. dict. no. 15.) stems erect, fleshy; leaves ovate, quite entire; upper ones stem-clasping; corymb terminal. *H.* Native of Louisiana. There are two varieties of this plant, one with white and another with purple flowers. Said to be allied to *S. Telphium* and *S. Anacampseros.*

*Anacampseros* or Evergreen Orpine. Pl. July, Aug. Cit. 1586. Pl. trailing. 33 *S. fulchristum* (Michx. fl. bor. amer. 1, p. 277.) stems assurgent, glabrous; leaves scattered, linear, obtuse; cymes of many spikes; flowers sessile, of 4 petals and 8 stamens. *H.* Native of the mountains of Virginia, Carolina, and Georgia, on the banks of the river Ohio. Flowers purple. Allied to *S. re-fluxum,* according to Pursh, but according to Nutt, to *S. ternatum.*

*Spruious Stonecrop.* Fl. July, Sept. Cit. 1816. Pl. 3/4 foot. 38 *S. Euclea's* (Lind. fl. alt. fl. t. 58. fl. alt. 2, p. 191.) leaves opposite, absolutely denticulately, adnate; inferior ones broadly-elliptic; superior ones sessile, coriace; corymb terminal, compound; petals lanceolate, acute, a little longer than the stamens. *H.* Native of Altaiä, at the rivers Uba, Buchtorn, and Kokoryo; and at the Golden Lake Teletz'-ko Oseo. Flowers purple. Stem rooting at the base.

*Orpine-like Stonecrop.* Fl. July, Sept. Cit. 1810. Pl. 1 to 2 feet. 40 *S. Telphium* (Lind. spec. 616. a,b,c, ety.) leaves oblong or oval, attenuated at the base, flat, toothed, glabrous; stems erect; cymes corymbose, terminal; stamens not exceeding the corolla. *H.* Native of Europe, in exposed places; in Britain on the borders of fields, or in hedges or bushy places, on a gravelly or chalky soil. Smith, eng. bot. 1319. Curt. lond. 3, t. 25, 210, Oed. fl. dan. 866. Blackw. 191. There are several varieties of this plant:—1, leaves opposite (Anacampseros albidus, *Haw. syn. p. 111.)*—2, leaves in a whorl (Anacampseros trochilla, *Haw. syn. p. 111. Sédum triphyllum, *Haw.)*—3, leaves alternate; flowers purple (*D. C. pl. gr. t. 92. Anacampseros purpurea,* Haw. syn. p. 111. Fuchs, hist. 801, with a figure), and white (*Fuch's hist. 1, c. t. 800. Anacampseros vulgaris,* Haw. syn. p. 111.)*—4, leaves oblong-lanceolate, sharply toothed (Anacampseros arguta, *Haw. Sédum argutum, *Haw.)*—5, leaves cuneately obovate, slightly 4-toothed towards the apex; stamens decumbent (Anacampseros paeidens, *Haw. rev. p. 24.)* All these are referable to this species. A decoction of the leaves in milk is a forcible diuretic. It has been given with success in the cure of haemorrhoids.

*Common Orpine.* Fl. June, Sept. Cit. ? Pl. 1 to 2 feet. 42 *S. verticillatum* (Linn. amoen. 2, p. 532, t. 4, f. 14, exclusive of the synonyme of Raby,) stem erect; leaves 4 in a whorl, lanceolate, serrated; racemes axillary, few-flowered, shorter than the leaves. *H.* Native of Kamtchatska. Leaves a finger in length. Flowers small, purple? or pink? This species is allied to *S. Telphium* according to Steven.

43 *S. Moræne'se* (H. B. et Kunth, nov. gen. 6, p. 44.) stems branched, creeping at the base, ascending, glabrous; leaves scattered, loosely seated at the base, thick, fleshy, obtuse; cymes few; flowers nearly sessile; petals 5, oblong-linear, bluish. *H.*
Native of Mexico, near Real de Moran. The colour of the flowers is unknown, but the plant is said to be very like *S. Anglicum*, and the flowers are therefore perhaps white.

**Moran Stonecrop.** Pl. ¼ foot.

46 *S. atratum* (Lin. spec. 1673.) stem erect, branched at the base; leaves scattered, alternate, brown, or brownish, loosened at the base; cymes corymbose fastigate; petals ovate, partly mucronate; cymes stellate spreading. *S. arenaireum*, plant large, rather downy, stems slender, elongated; leaves crowded, cyme sessile, petals white, with a red keel. *S. cymosum* var. *anglicum*, petals white, with a red keel. *S. cymosum* var. *anglicum*, white, with a red keel. Carpels downy, white.

**Var. β:** lower branches lying on the ground. *S. cymosum* var. *anglicum*, petals white, with a red keel.

47 *S. glaucum* (Walld. et Kit. pl. rar. Hung. 2. p. 198. t. 181.) stems erectish, puberulous; leaves nearly terete, glaucous, alternate; sterile branches crowded, erect; cymes trifid, few-flowered; petals 6, mucronate. *H. Native of Hungary, on sandy hills. Willd. enum. p. 486. S. Hungaria, Poir. S. Anderssoni, G. Don in Lond. hort. brit. p. 181. According to Willd. this species differs from *S. saxifirmum* in the stem being a little branched at the base, in the petals being 1-nerved, not finely 3-nerved. Flowers sometimes hexandrous.

48 *S. saxifirmum* (Bieb. fl. taur. suppl. no. 574.) stem erectish, branched, when young rather procumbent; leaves nearly terete, scattered, spreading, glaucous, glabrous; cymes somewhat panicled; flowers sessile along the branches; petals 6, acuminate. *H. Native of Caucasus, on rocks. Willd. enum. 487. Flowers white; anthers bay-coloured. The flowers contain also 12 stamens, and are allied to *S. rubens*. The petals are said to be 3-nerved, the lateral nerves very fine.

**Six-leafed Stonecrop.** Pl. June, July. Chil. 1816. Pl. ½ foot.

49 *S. Andegavense* (D. C. prod. 3. p. 406.) stem erect, simple at the base, trichotomous at the apex; leaves ovate, ovate, crenate, crenate, fleshy, glabrous; lower leaves opposite, the rest alternate; flowers pentandrous in the form, and scattered and sessile along the branches; petals ovate, acutish. *H. Native of Andegavany, on walls and on schistous rocks. S. atratum*. Bost. ass. fl. p. 167. exclusive of the synonyme. *Crassula Andegavensis*, D. C. suppl. fl. fr. p. 522. Truly distinct from *S. atratum*, but perhaps only a pantropical species of *S. dasyphyllum*, and the flowers are probably white like it.

**Andegavany Stonecrop.** Pl. ¼ foot.

51 *S. brevifolium* (D. C. rapp. voy. 1808. p. 79. suppl. no. 3615. a. membr. crass. t. 4. f. A.) stems fruticulose, glabrous, twisted at the base; leaves opposite, ovate, obtuse, short, thick; cymes quite glabrous, loose, terminal; petals bluish. *H. Native of the Pyrenees and of Corsica, among rocks in dry pastures. S. spiciferum*, Lapeyr. abr. 1813. p. 239. Scapels of calyx thin, but as in *S. dasyphyllum* (to which species it is nearly allied) the red thick.

**Short-leaved Stonecrop.** Pl. ¼ foot.

52 *S. Coisius* (Duby, in D. C. syn. fl. fr. ed. 2.) stems ascending, branched at the base, twisted; leaves ovate, obtuse, hispid; sterile shoots crowded; cymes terminal, few-flowered, glabrous; petals acutish. *H. Native of Corsica, where it was detected by Ph. Thomas, on the walls of the city of Corte; and of Sardinia, at the town of Jessu. Flowers smaller than those of *S. dasyphyllum*, appearing of a dirty pale purple in the dried specimen; but white in the recent state.

**Coriscan Stonecrop.** Pl. ¼ foot.

53 *S. hispanium* (All. peded. no. 1754. t. 65. f. 5.) floriferous stems erect, nearly naked; leaves remote, alternate, oblong-cylindrical, obtuse, hairy; sterile stems crowded; cymes terminal, few-flowered; petals acuminate. *H. ex All. Y. H. ex Pour. Native of the Alps of Piedmont, Provence, Cevennes, Pyrenees, and on the mountains of Lebanon and Corsica, especially among schistous rocks. S. globiferum*, Pourr. act. to. 3. p. 327. S. hispidum, Poir. dict. 4. p. 663. but not of Desf. Petals white, downy, marked with a purple line.

**Hairy Stonecrop.** Pl. ¼ foot.

54 *S. villosus* (Bieb. fl. taur. 1. p. 322.) stems ascending, leafy; leaves oblong, obtuse, rather fleshy, hairy, alternate; radical ones in fascicles; cymes terminal, corymbose; petals lanceolate, hardly twice the length of the sepals. *H. Native about the port of Caucasus, among rocks. Allied to *S. hispanium*, but differs in the leaves being flatter, in the sepals of the calyx being twice the length, and in the duration being perennial, not biennial.

**Pilos Stonecrop.** Pl. ¼ foot.

55 *S. hispanicus* (Lin. spec. 618.) stem erect, branched, glabrous; leaves scattered, terete, obtusish, glaucous; sterile stems rosulate, crowded; cymes branched; flowers sessile along the branches of the cyme; petals 6, acuminate. *H. Native of Spain, Switzerland, and the south of Germany. Jacq. ast. 5. t. 47.—Dill. hort. elth. 2. p. 332. S. aristatum*, Tenore, fl. neap. 1. p. 250. Petals white, with a dirty red keel. Carpels glabrous. Very like *S. glaucum* and *S. rubens*, but the root is perennial.

**Spanish Stonecrop.** Pl. June, July. Chil. 1792. Pl. ¼ foot.

56 *S. album* (Lin. fl. 619.) branches perennial, rooting, when young rather puberulous; leaves ovate club-shaped, green, nearly terete, glabrous; cymes branched, terminal, sub-
corymbose; petals bluish. 2. H. Native of Europe, in dry meadows, on walls and rocks. In England on walls and roofs, not common; at Kentish Town and Bromley, Middlesex; on rocks about Great Malvern, Worcestershire; upon walls at Peterborough; but rare in Scotland. Smith, engl. bot. t. 578. Curt. Lond. t. 1. t. 31. Oed. flan. t. 66. All. ped. 1751. t. 65. f. 2. S. álbum var. γ turgidum, D. C. prod. 3. p. 406. Flowers cyr
mose, white.

58 S. grácile (Meyer, verz. phanz. p. 151.) plant glabrous and green; stems herbaceous, diffuse; leaves subulate, bluish, loose at the base, those of the sterile branches imbricate. rays of cyme elongated, much spreading; flowers decandrous, almost sessile; petals acuminate, longer than the calyx; style rather longer than the breadth of the acute capsule. 2. H. Native of Caucasus. Flowers white.

Var. a, minus (Meyer, l. c.) flowers smaller. On Mount Gutgara at the altitude of 3200 feet.

Var. β, niúus (Meyer, l. c.) flowers almost twice the size of those of var. a. On the Talus Mountains, at the altitude of 1400 to 2700 feet.

Slender Stonecrop. Pl. diffuse.
59 S. teretifólium (Lam. fl. fr. 3. p. 84. Haw. in phil. mag. Sept. 1831, p. 415.) branches elongated, rooting, perennial, quite glabrous; leaves equally terete, rather elongated, a little depressed, green, glabrous; cymes branched, terminal, subcorymbose; petals bluish. 2. H. Native of Europe, on walls, rocks, and in dry pastures. In England near Hereford. S. álbym, D. C. prod. 3. p. 406.—Fuchs, hist. 35. with a figure. Oed. flan. t. 66. D. C. pl. grass. t. 22. S. teretifólium α, Lam. fl. fr. 3. p. 84. Flowers white.

60 S. ãthóum (D. C. prod. 3. p. 407.) stems erect, a little creeping at the base; leaves semi-cylindrical, short, remote, and are, as well as the stem, glabrous; cyme terminal, somewhat corymbose, many-flowered; petals acute. 2. H. Native on the top of Mount Athos. S. turgidum, D. Urv. enum. p. 51. exclusive of the synonyms. Flowers white, like those of S. álbum, but the petals are acute and distinct.

Athos Stonecrop. Pl. ½ foot.

* * * * * Leaves tetrate. Flowers red or blue.

61 S. ceřúleum (Vahl. symb. 2. p. 51.) stem flat on the ground at the base, ascending; leaves oblong, alternate, obtuse, loosened at the base; cymes bifid, glabrous; petals 7, obtuse. 2. H. Native of Tunis, in the fissures of rocks. Shaw, itin. 530. with a figure. Sims, bot. mag. 2224. Ker, bot. reg. 520. S. azúrimum, Desf. fl. atl. 1. p. 302. Flowers not blue, but at first purplish, and fading to blue (f. 28).

62 S. heptápetálum (Poir. voy. barb. 2. p. 169. dict. 4. p. 630.) stems erect, branched at the apex; leaves ovate-oblong, scattered, depressedly gibbous; cymes panicled; petals 7, acuminate. 2. H. Native of Barbary, Corsica, and Malta, on rocks by the sea-side. D. C. fl. fr. 4. p. 392. Flowers purplish as in S. cerúleum, fading to blue. S. heptápetálum, Horn. hort. bah. suppl. p. 138, said to be originally from the Russian empire, is perhaps distinct from this species, but is not sufficiently known.

Seven-petalled Stonecrop. Pl. ½ foot.
63 S. bracteátum (Viv. fl. lyb. 24. t. 8. f. 3.) stems erect, branched at the apex, beset with spreading hairs, as well as the leaves; leaves alternate, linear, thick, obtuse; cymes trichotomous; flowers on short pedicels along the branches of the cyme; petals 5, elliptic, keeled. 2. H. Native of the Great Syratus, in Lybia on the sea shore. The colour of the flowers agrees with that of S. cerúleum, but the habit is that of S. Hípáncum. Nectariferous scales emarginate.

Bracteated-flowered Stonecrop. Pl. ½ foot.
64 S. villósum (Lin. spec. 529.) stem erect, almost simple, beset with viscid hairs; leaves semi-terete, rather remote, erect, also beset with viscid pili; cymes terminal, few-flowered; petals acuicular. 2. H. Native of Europe, in boggy places. In England in wet mountainous pastures, and the cliffs of moist rocks; in the north of Westminster, Durham, and the north-west part of Yorkshire, not unfrequent. More abundant in Scotland.—Smith, engl. bot. t. 394. Oed. flan. t. 24. D. C. pl. grass. t. 70.—Mor. hist. sect. 12. t. 8. f. 48.—Petiv. brit. t. 42. f. 7. Flowers pale red.

Var. β, penta-ádrom (D. C. fl. fr. suppl. p. 524.) stems 5, (especially those that are epipetalous) are abortive) or 6; the 4 epipetalous ones of which having vanished.

65 S. ru'bem (D. C. prod. 3. p. 405.) stem erect, branched; leaves oblong, obtuse, nearly terete, sessile, spreading, glabrous; cymes branched, pubescent; flowers sessile, unilateral along the branches of the cyme, pentandrous; petals 5, acuminate. 2. H. Native of south and middle Europe, in cultivated sandy fields. Crásula rúben, Lin. syst. veg. p. 253. D. C. pl. grass. t. 55. S. ru'bem β pentádrom, D. C. prod. 3. p. 405. Flowers pale red. Mature carpels puberulous. The epipetalous stems are all for the most part abortive, and therefore the flowers are pentandrous.

66 S. pu'berulum (D. C. mem. crass. p. 33.) stems erect, branched, puberulous; leaves scattered, terete, scutell, glabrous; cymes branched; flowers sessile along the branches of the cyme; petals 6, acuminate. 2. H. Native of Calabria. This species comes very near S. póllidum and S. ru'bem.

Pu'berulous Stonecrop. Pl. ½ foot.
67 S. póllidum (Bieb. fl. taur. 1. p. 533.) stems erect, branched; leaves oblong, obtuse, nearly terete, spreading, glabrous; cymes branched, pubescent; flowers sessile, unilateral along the branches of the cyme, decandrous; petals acuminate. 2. H. Native of Caucasus. Flowers pale red or white. Mature carpels puberulous.

Crassulae. XVIII. Sedum.

* * * * * Leaves terete. Flowers yellow.

69 S. quadrifidum (Pall. tinn. 3. p. 730. append. no. 90. t. P. f. 1.) leaves scattered, terete, bluntish; root thick, of many necks; stems numerous, erect, simple; corymb terminal, few-flowered, simple; pedicels about equal in length; length of nectariferous scales exceeding the breadth; flowers ocreant, 4-leaf; stamens a little longer than the petals. 2.H. Native of Dahania, the Ural Mountains, and Altain, in humid stony places, on the tops of the Alps. Pall. ed. gall. in Svo. vol. 8. p. 311. t. 104. f. 4. S. quinquifidum and S. hexapetalum, Haw. rev. p. 26.? Flowers yellow.

Quadrifid-flowered Stonecrop. Fl. July. Clt. 1800. Pl. 3/4 ft. 70 S. âcre (Lin. spec. 619.) stems rather creeping at the base; branches erect; leaves ovate, adnate, sessile, gilbus, erectish, alternate, glabrous; cymes trifid; flowers sessile along the branches of the cyme; petals lanceolate, acuminated. 2.H. Native of Europe, common on walls, roofs of houses, rocks, and dry sandy ground; plentiful in Britain. Bull. herb. t. 30. D. C. pl. grass. t. 117. Smith, engl. bot. 859. Woodv. med. bot. t. 231. Curt. Lond. i. t. 32. Flowers yellow. The whole plant is Acrid, and chewed in the mouth has a hot biting taste; whence, and from its common place of growth, it has the name of wall-pepper. Applied to the skin it blisters, and taken inwardly it excites vomiting. In scrofulous cases and quartan agues, it is an excellent medicine under proper management. For the former, a handful of the herb is directed to be boiled in eight pints of beer till they are reduced to four, of which 3 or 4 ounces are to be taken every morning. Milk has been found to answer this purpose better than beer. Not only ulcerous simply scrobutic, but those of a scrofulous or even cancerous tendency, have been cured by the use of this plant. It is likewise useful as an external application, in destroying fungous flesh, and in promoting a discharge in gangrenes and carbuncles.

Var. ß, diminutum (Haw. in phil. mag. 1831. p. 416.) much smaller than the species, hardly an inch high; stem creeping. 2.H. Native of the higher Alps of Provence; also on Swithan Heath, Norfolk. S. âcre ß gracile, D. C. prod. 3. p. 407. S. gracile, Clarion in D. C. fl. fr. 4. p. 393.

Var. â, elongatum (Haw. i. c.) pendulous branches 7 inches high: erect ones 4 inches; leaves loosely imbricated.

71 S. sexangulare (Lin. spec. 620.) stems branched at the base, floriferous ones erect; leaves nearly terete, adnate-sessile, usually by threes on the flowering stems, and 3 in a whorl on sterile branches, imbricating in 6 spiral rows; cymes trifid; petals lanceolate, acuminated. 2.H. Native of Europe, in dry sandy ground, and on walls. In England, but not common; as near Northfleet, Sheerness, and on the Isle of Sheppey; on Greenwhich Park wall on the south side, near the western corner; on the famous rotten walls of Old Sarum; also of Cambridgeshire. D. C. pl. grass. t. 118. Curt. Lond. i. t. 33. Smith, engl. bot. 1646. S. âcre ß, Huds. Lam. fl. fr. 5. S. spirale, Haw. in phil. mag. 1824. no. 176.—Cam. epith. 856. with a figure. Flowers yellow. Habit of S. âcre.

72 S. Bolonâeëse (Lois. not. p. 71.) stem branched at the base; floriferous ones erect; leaves nearly terete, obtuse, loosened at the base, glabrous, imbricated on all sides; cymes trifoil; flowers sessile, along the branches; petals acuminated.

Stem-clasping Stonecrop. Pl. 1/2 foot. 74 S. reflèstre (Lin. spec. p. 618.) stems branched at the base, floriferous ones erect; leaves terete-subulate, glaucescent, loosened at the base; sterile stems cylin-drical, densely imbricated; flowers cymose, 5-7-petalled; sepals bluntest. 2.H. Native of Europe, on walls and rocks. In England on St. Vincent's rock, Bristol; on Cheddar rocks, Somersetshire, and upon walls about Darlington. Engil. bot. t. 170. —Dill. ethl. 2. f. 333. Reich. icon. 3. f. 439. S. minus, Haw. in phil. mag. 1825. p. 174.? S. reflexum, D. C. pl. grass. t. 116. Flowers yellow (f. 29.)

Whitish-leaved Stonecrop. Fl. July, Aug. Brit. Pl. 1/4 foot. 77 S. Forsteriæflaxm (Smith, comp. 71. engl. bot. 1802.) stems branched at the base; flowers erect; leaves semicylindrical, bluntish, green tinged with red; sterile stems short; leaves crowded, somewhat rosetate at the tops of the branches; flowers cymose, 5-7-petalled; sepals obtuse. 2.H. Native of Wales, on rocks at the falls of Rhuddall, near the Devil's bridge, Cardiganshire; on the rocks of Hisval, overlooking the little valley of Nant-Phrancon. S. Forsteriæ, Haw. syn. p. 117. S. ruptère, D. C. pl. grass. 115.? Flowers yellow.

78 S. reflèxum (Lin. spec. p. 618. Smith, fl. brit. p. 490.) stems branched at the base; floriferous ones erect; leaves terete-subulate, green, loosened at the base; sterile shoots somewhat
cylindrical, spreading; flowers cymose, 5-7-petalled; sepals bluish.

2. H. Native of Europe, in fields and on walls; in Britain on walls and thatched roofs, abundant. Smith, engl. bot. t. 235.—Park, theat. 1. t. 754. f. 1. Flowers yellow.

Var. β. recurvatum (D. C. prod. 5. p. 408.) leaves glaucous, sterile stems somewhat reflexed. S. recurvatum, Willd. enu. suppl. 23. Perhaps a variety of S. albescens, according to Haw.

Var. ε. cristatum (D. C. l. c.) sterile branches crowded somewhat fasiculate; leaves green, spreading. S. cristatum, Schrad. hort. gact. t. 10. S. Portlandicum, Lob. icon. 380.

Green Stonecrop. Fl. June, July. Cl. 1774. Pl. 3/4 foot. 80. S. viridescens (Willd. enu. suppl. p. 25.) stems branched; flowers sterile-subulate, those of the sterile branches spreading and glaucous; flowers spreading, compressed; branches of cyme crowded, erect. 2. H. Native of Siberia. The leaves, according to Haw. in rev. p. 29, are green, and the flowers nearly white; but according to Willd. l. c. the leaves are glaucous, and the flowers greenish-yellow, therefore two species are probably confounded under this name, and perhaps both are only varieties of S. reflexum.

Subclavate-leaved Stonecrop. Cl. 1830. Pl. 1/2 foot.

82. S. stenopetalum (Pars. fl. amer. sept. 1. p. 324.) stems assurgent, glabrous; leaves scattered, crowded, adnate-sessile, compressed, subulate, acute; cymes terminal, trichotomous, and dichotomous; spikes recurved; flowers sessile, decandrous; petals 5, linear, much longer than the calyx. 2. H. Native of North America, on the banks of Clark’s river, and the Kooskooxy; and frequent on the east side of the Rocky Mountains. Flowers golden yellow. Said to be allied to S. reflexum.

2. H. Native country unknown. Very like S. altitissimum, but not half the size, more bluish-glaucous; leaves more distant, petals more acute, pale yellow.

Bluish Stonecrop. Fl. June, July. Cl. 1820. Pl. 1/4 foot. 84. S. altitissimum (Poir. dict. 4. p. 633.) stem tristichous, branched at the base; floriferous ones erect; leaves nearly terete, acute, glaucous, glabrous; superior ones scattered, flattish above; those of the sterile branches imbricated; cymes branched, many-flowered; flowers sessile along the branches of the cyme, which are twisted at the apex; petals 6-8, lanceolate, acute, spreading. 2. H. Native of the south of Europe. D. C. pl. grass. t. 116. Semperivium sederiode, Jacq. hort. vind. t. 81. and var. monstrans misc. 1. p. 133. t. 5. S. fruticosum, Broth. fl. lus. 2. p. 206. S. ruifrons, Tenore, fl. neap. t. 41. S. Niccicó, All. ped. no. 1752. t. 90. f. 1. S. Jacquinii, Haw. in phl. mag. 1825. p. 174. S. rupestre a, Gouan. S. dioicum, Dom, hort. cant. Flowers cream-coloured. Lobes of calyx bluish. A large, strong, glaucous plant.

D’Ureille’s Stonecrop. Pl. 1/2 foot.

88. S. ürtulillae (Haw. in phil. mag. 1837. p. 183.) leaves erect, linear-subulate, green, somewhat mucronulate on one side. 2. H. Native country unknown. Very like S. circinensis, and S. recurvatum, Willd. but the leaves are a little larger and flatter, greener and blunter. It is less than S. anopetalum.

Sea-shore Stonecrop. Pl. 2 inches high.

91. S. tenellum (Meyer, verz. pfl. p. 152.) plant glabrous, glaucaceous; stems herbaceous, erectish; leaves subulate, blun-
rather shorter than the pedicels; petals acute, longer than the calyx; capsule truncate at the apex, and apiculate by the short styles.  

92 S. repens (Schleich. in D. C. fl. fr. suppl. 525.) stems ascending, creeping, and branched at the base; leaves scattered, serotere, obtuse; cymes few-flowered; petals ovate.  

93 S. montagense (Bals.) S. atratum, D. C. fl. fr. no. 3415. An intermediate plant between S. atratum and S. sarácte. Pedals pale yellow.

93 S. pubescens (Vahl. symb. 2. p. 52.) stem erect, branched, pubescent; leaves alternate, elongated, obtuse, rather pilose above; cymes trifid, many-flowered; petals lanceolate.  

94 S. hispidum (Desf. fl. atl. 1. p. 361. but not of Poir.) stem erect, branched above, hirsut; leaves scattered, nearly terete, depressed above, spreading; branches of cyme filiform, rather panicled; flowers pedicellate; petals 5-6, lanceolate, acute.—Native of the north of Africa, on Mount Atlas.  

Pubescent Stonecrop. Pl. 1/4 foot.

95 S. xérum (Ait. hort. kew. 2. p. 112.) stem shrubby, branched, erect; branches twisted, glabrous; leaves scattered, oblong-cylindrical, obtuse; cymes terminal, and are as well as the calyces glabrous.  

96 S. saxifragmum (D. C. prod. 3. p. 409.) stem shrubby, branched, ascending, glabrous; branches twisted; leaves scattered, ovate-cylindrical, thick, obtuse, glabrous; cymes loose, divaricate; flowers pedicellate, beset with glandular pubescence.  

97 S. oxyptaleum (H. B. et Kunth, nov. gen. amer. 6. p. 45.) stem shrubby, glabrous, branched; leaves alternate, flat, quite entire, obvolute-spatulate, rounded at the apex, and somewhat emarginate; cymes terminal, somewhat dichotomous; flowers secund, sessile; petals 5, linear, each ending in a narrow acumén.  

98 S. dentatum (Moc. et Sesse, fl. mex. icon. ind. ex D. C. prod. 3. p. 409. mem. crass. t. 9.) stem shrubby, branched, erect; leaves scattered or opposite, obvolute-cuneate, glabrous; those of the sterile branches rostrate; thyrse panicled, much divided; flowers secund, sessile, bractless; petals 5, lanceolate.  

99 S. erranteum (Moc. et Sesse, fl. mex. icon. ind. ex D. C. prod. 3. p. 409. mem. crass. t. 9.) stem shrubby, fleshy, twisted at the base, creeping; flowering stems erect; leaves scattered, glabrous, ovate, thick, obtuse; those of the flowering stems spreading, those of the sterile stems imbricated; flowers yellow. Very like a species of Sempervivum.

Trec-like Stonecrop. Shrub 1 to 2 feet.  

100 S. acúlpum (Clark, in Spreng. nec. entd. 3. p. 161.) floriferous stems erect; leaves lanceolate, acute, quite entire; racemes subjugitate; pedicels short, secund; petals 6, lanceolate.—Native of Palestine. The rest unknown.

High Stonecrop. Pl. 1 foot.  

101 S. obtusiperforatum (Bieb. fl. taur. suppl. p. 315.) stems arising at the very base; floriferous ones erect; leaves scattered, oblong, obtuse, nearly terete, loosened at the base; corymb simple, few-flowered; petals 5, lanceolate-subulate, twice the length of the calyx.  

Sedum. Shrub 1 foot.  

102 S. lineare (Thunb. fl. jap. 187.) stems glabrous, a little branched; leaves terete, linear, opposite, stem-clasping, acute, spreading; cyme trifid.—Native of Japan.  

103 S. hirsutum (Vill. dauph. 4. p. 680. t. 45.) stems lying on the ground at the base; floriferous ones erect; leaves terete, acute at both ends, loosened at the base; those of the sterile stems densely imbricated; cymes few-flowered; petals 5, acuminate-awned.  

104 S. pruinatum (Brot. fl. lus. 2. p. 209.) stem erect, branched at the base, glaucous, glaucous, pruinose; leaves fleshy, oblong, convexly flatish, loosened at the base; cymes bi-fid; sepals and petals 6, lanceolate, acuminated, spreading.  

105 S. cinerariifolium (Bieb. in Spreng. synst. 2. p. 167.) Colour of flowers unknown.

Sedum. Shrub 1 foot.  

106 S. confertum (Deliil. fl. eg. ill. no. 451.) leaves subulate, scattered, crowded.—Native of Egypt, about Cairo.  

Crowded-leaved Stonecrop. Pl. 3/4 foot.  

107 S. quinquefolium (H. B. et Kunth, nov. gen. amer. 6. p. 46.) stems herbaceous, glabrous; leaves alternate, flat above, convex beneath, spatulate-lanceolate, acute, quite entire; racemes elongated; flowers pedicellate; petals 5, oblong, acuminate.  

108 S. color (H. B. et Kunth, l. c. p. 43.) stems herbaceous, glabrous; leaves alternate, flat, obvolute-spatulate, acutish, quite entire; racemes terminal, flowers pedicellate; petals 5, oblong, acute.  

109 S. portulaca (D. C. prod. 3. p. 410.) stems naked, red.
erect; flowers yellow, disposed in short recurved spikes; leaves linear, scale-formed, reflexed.—Native of Spain, on the rocks called Borroquillos, in Sierra Nevada. Perhaps a species of *Sempervivum*, ex Bory. ann. gen. 3. (1820.) p. 14. The rest unknown.

*Bory's Stonecrop*. Pl. ¾ foot.  
110 S. *meltantherum* (D.C. prod. 3. p. 410.) stems weak; leaves ovate, attenuated at the apex; flowers in corimbous panicles.—Native of Spain, in Sierra Nevada, on the rocks of Borroquillos. Flowers small, densely panicked, rather sweet scented. Anthers black. The rest unknown.

Black-anthered Stonecrop. Pl. ½ foot.

† *Species only known by name.*  
1 S. *stoloniferum* (Gmel. itin. 3. t. 35. f. 2.)  
2 S. *liliocentra* (L. ex Steud. nom.)  
3 S. *procumbens* (Schrank, bav. p. 726.)  
4 S. *Montregealense* (Balb.).  
N.B. Rhodiola bicornata, Lour. coch. p. 627, is totally different from Rhodiola, Lin. and is perhaps a plant belonging to *Sedum*.  

Cult. The greater part of the species being quite hardy, and all succulent, they therefore succeed best on rock-work, for which they are well adapted. Some of the rarer kinds may be grown in small pots. They succeed best in light, sandy soil, or one composed of loam and brick rubbish. All are readily increased by cuttings. The seeds of the annual species only require to be sown on rockwork. There are a few of the species marked greenhouse; these will require the same treatment as that recommended for the species of *Globularia*, see p. 106.

**XIX. SEMPERVIVUM** (from *sempervivum*, to live for ever; the tenacity of life of the Houseleek tribe is well known). Lin. gen. no. 602. Lam. ill. t. 413. D. C. in bull. philm. no. 49. prod. 3. p. 411.  

**Lin. syst.**  
*Dodecanèria, Dodecangyra.* Calyx 6-20-parted. Petals 6-20, oblong, acute. Stamens double the number of the petals. Scales at base of carpels toothed or jagged at the apex. Carpels equal in number to the petals.—Herbs sometimes stemless, with young plants rising from the axils; or caulescent, without any young plants; or shrubby and fleshy. Leaves usually revolute. Branches of eyes sometimes disposed into a corymb, and sometimes into a panicle. Petals yellow, white, or purplish.  

**Sect. 1. Chroñorum (chrono, chronic, time, and βoòa, biao, to live; plants living only for a time, and are not so tenacious of life as those of the following section).** D. C. pl. rar. gard. gen. no. 21. Young plants, none from the axils. Flowers usually yellow, rarely white. Species all natives of the Canary Islands.

* Shrubby species.  

1 S. *aizoides* (Lam. dict. 3. p. 290.) stem frutescent, erect, branched; leaves scattered, obovate, flat, quite entire, glabrous; flowers corimbosely; petals 5-8, spreading.  

2 S. *tortuosum* (Ait. hort. kew. ed. 1. vol. 2. p. 148.) stem frutescent, erect, branched; leaves obovate-spatulate, scattered, rather convex beneath; petals 7-8, spreading; scales 2-lobed.  
3 D. G. *Native of the Canary Islands. Curt. bot. mag. t. 296. D. C. pl. grass. t. 156. Flowers yellow. Leaves 11-12 lines long and 4-5 lines broad.*  

3 S. *villosum* (Haw. syn. p. 166. rev. 65. but not of Ait.) stem frutescent, erect, twisted; leaves obovate, crowded, gibbous beneath, villous; scales of flower fringed.  
4 D. G. *Native of the Canary Islands. Flowers yellow. Leaves 5 lines long and 3 lines broad. S. villosum, Ait. is referrible to S. stellatum.*  

4 S. *ciliatum* (Wild. enum. 1. p. 508. mem. crass. t. 10.) stem frutescent, glabrous; leaves oblong-obovate, somewhat spatulate, mucronate, cartilaginosely ciliated; thyrse panicked, having the branches crowded, with flowers at the apex; petals 6-7.  
5 D. G. *Native of the Canary Islands. Coll. hort. rip. append. 4. t. 7. Flowers pale yellow.*  

**Ciliated-leaved Houseleek. Clt. 1815. Shrub 1 to 1½ ft.**  
6 S. *glandulorum* (Ait. l. c. p. 147.) stem frutescent; leaves cuneiform, viscid, rather scattered, fringed with adpressed, cartilaginosely ciliate; petals 8-10.  

8 S. *glandulosum* (Ait. l. c. p. 147.) stem frutescent; leaves cuneiform, viscid, rather scattered, fringed with adpressed, cartilaginosely ciliate; petals 8-10.  
9 D. G. *Native of Madeira. Sédum glandulosum, D. C. pl. grass. t. 156.*  

**FIG. 30.**

**Clammy Houseleek. Fl. July, Aug. Clt. 1777. Shrub 1 to 2 ft.**  
7 S. *vérum* (C. Smith, mss. Horn. suppl. p. 66. Haw. in phil. mag. 1827. p. 125.) stem frutescent, erect, leafy at the base; leaves broad, cuneiform, glabrous, cartilaginosely ciliate on the margins, running into the petiole at the base, broad and blunt at the apex, and ending in a small point.  
8 D. G. *Native of the Canary Islands, on the walls of towns and the roofs of houses. Leaves green. Flowers yellow. Perhaps the same as S. latifolium.*  

**City Houseleek. Fl. Ju. Aug. Clt. 1816. Shrub 1 to 2 ft.**  
8 S. *retusum* (Haw. in phil. mag. 1827. p. 125.) stem frutescent, simple, leafy at the apex; leaves broadly cuneate, expanded, smooth, ciliated, somewhat cuneate at the apex, truncate and retuse.  
9 D. G. *Native of the Teneriff, on walls and the roofs of houses. Flowers yellow. Very like S. vérum, but differs in the form of the leaves.*  

**Retuse-leaved Houseleek. Fl. June, Aug. Clt. 1824. Sh. 1 to 2 feet.**  
9 S. *ardéum* (Lin. spec. p. 66.) stem arborescent, smooth, branched; leaves cuneiform, glabrous, ciliated, spreading and rostrate at the tops of the branches; panicle loose; petals 9-11.  
Smith, fl. grac. 473. Shrub from 3-6 feet. Flowers golden yellow.

Var. β. variegatum; leaves margined with white or purple.

10 S. fruticorum (Haaw. fil. mag. 1827. p. 125.) stem shrubby, simple; leaves crowded in a rosulate manner at the tops of the branches, spatulate cuneately, green, ciliated. β. D. G. Native of Tenerife. Flowers yellow. Very like S. arborescum, but the plant is not above half a foot high.

11 S. tabuleforme (Haaw. suppl. p. 69. rev. 69.) stem frutoscens, erect, simple; leaves spatulate, flat, ciliated, attenuated at the base, crowded at the top of the stem, and forming a rosulate flat disk, in consequence of the stems being so closely imbricated over each other. β. D. G. Native of Madeira. Stems branching after the first time of flowering. Petals 10-12, linear-lanceolate, very pale sulphur-coloured. Glands minute, pedunculate.

12 S. canariensis (Lin. spec. p. 664.) stem short, frutescent; radical leaves expanded, rosalate, obovately-spatulate, villous, large; leaves scattered along the flowering stem, ovate; branches of panicle expanded; flowers pedicellate; petals 9-10. β. D. G. Native of the Canary Islands.—Comm. hort. amst. 2. t. 93. D. C. pl. grass. t. 141. Petals white, linear.

Var. β. hybrids (Sahn-Dyck. and Haw.) all parts of plant larger.

15 S. cespitosum (C. Smith, in hort. berol. p. 58.) stem frutescent, very short, at length a little branched, leafy at the apex; leaves oblong-linear, glabrous, stiffly ciliated, marked with brown lines on both surfaces, crowded in a rosulate manner, but the cauline ones are scattered; flowers in cymose corymb, with the branchlets dichotomous; petals 7-8, spreading. β. D. G. Native of the Grand Canary Island, on rocks on the highest mountains. D. C. rupp. jard. bot. 1825. no. 13. S. ciliare, Sims, bot. mag. t. 1798. but not of Wild. S. ciliare, Haw. rev. p. 64. S. Simsi, Sweet, hort. urbub. p. 230. S. barbarum, Horn. suppl. p. 61. but not of Smith. Flowers yellow. This plant survived 18 months in paper in the herbarium of C. Smith, and afterwards when put into the earth grew.

** Herbarious plants.

Dotted-leaved Houseleek. Pl. 1 foot.

20 S. achyranthoides (D. C. iord. gen. t. 21.) stem herbarious, terete, erect, dichotomous, beset with soft spreading hairs; leaves obovately spatulate, tapering into the petiole, dotted with soft villi; flowers in loose corymb, petals 6-9, spreading; scales of flower 2-lobed, small. β. D. G. Native of the Canary Islands, among rocks. S. laxum, Haw. rev. 65. Nearly allied to S. hisatum, ex Buch. cat. Flowers yellow. This plant is nearly allied to S. tortosum, but differs in being herbarious.

21 S. pygmaeum (C. Smith, in Buch. can. p. 155.) stem dichotomous, few-leaved, 1-flowered; leaves spatulate, attenuated at the base, retrorse, hairy; calyx villous; petals awned.—Native of the Island of Lancerotta. Flowers small, yellow. Plant hardly an inch high. The rest unknown.

Pygmy Houseleek. Pl. 1 inch.

Sect. II. Jovibara (Jupiter, Jovis, Jupiter, and barba, a beard; Jupiter’s beard; application not evident). D. C. pl. rar. gen. no. 21. obs. prod. 3. p. 415. Young plants rising from the axils of the lower leaves. Flowers purplish or pale yellow.—European species.

* Flowers yellowish.

23 S. glabrum (Lin. l. c.) leaves ciliated; offsets rather contracted; petals 15-20, spreading, very long. β. H. Native of Vallais, on rocks; and probably of Austria. Curt. bot. mag. t. 507. Schrad. icon. 95. t. 26. S. grandiflorum, Haw. rev. 66. Petals yellowish, 3 times longer than the calyx.

Var. β; offsets rather loose; petals 12. β. H. Sims, bot. mag. 2115. More villous than the species.

r 2
**CRASSULACEE.**

24 S. TECTUM (Lin. spec. p. 664.) leaves dilated; offsets spreading; petals 5-9, spreading; scales of flowers cuneiform, carunculate. ². H. Native of Europe, on rocks and roofs of houses; also in many parts of Britain, on walls and cottage roofs, but perhaps not properly indigenous. D. C. pl. grass. t. 104. Smith, fl. greæ. 1920. Curt. Lond. 3, t. 29. Oed. fl. dian. 601. Blackw. t. 366. Sédum tectum. Scop. cent. ed. 2, no. 539. Flowers purplish. Stamens sometimes changed into carpels according to Pet. Thouars, in bulbl. nov. 1807. The juice of the common house-leek either applied by itself, or mixed with cream, gives present relief in burns, and other external inflammations; it is also said to cure corns. With honey it is a useful application in the throat. Boerhavia found 10 ounces of the juice beneficial in dysenteries, and others have found it useful in gonorrhoeas; but it is not admitted into modern practice. The house-leek had several names formerly, as sengreen and aggreen, both translations of Sempervivum. It has also been called jupiter's eye, bullock's eye, and Jupiter's beard. In Germany it is called hauserwe; in French le grand joubarbe, and in Italian sempervirece maggiore.

25 S. FLAGELLIFORME (Fisch. in Link, Enum. p. 2. p. 20.) leaves ovate, mucronate, papillose, with papillously ciliated margins; offsets spreading, lateral; branches of cyme bifid. ². H. Native of Siberia. Allied to S. montanum, but differs in being larger, and in the offsets being at the ends of long flagellae. The leaves of the offsets terminate in a stiff brown point; caule leaves narrower. Corolla reddish.

26 S. MONTANUM (Lin. spec. p. 665.) leaves of the offsets obovate-oblong, shortly acuminated, beset with glandular pubescence on both surfaces, obsolescently ciliated, entire, pubescent; offsets rather contracted; flowers rotate; petals 10-14, lanceolate, acuminated, spreading, 3 times longer than the calyx, scales of flowers small, nearly quite entire; style discoloured at the apex. ². H. Native of the Pyrenees and the Alps of Europe, &c. on rocks. D. C. pl. grass. t. 105. Jacq. fl. aust. 5. append. t. 41. Flowers deep red. This species differs from S. tectum in the smaller stature, and in the nectariferous scales being almost wanting; and from S. arachnoideum in the absence of the cobwebbed wool. Scales of flower square and retuse.

**Mountain House-leek.** Fl. Ju. July. Clt. 1782. Pl. ½ to ¾ ft. 27 S. PUNIKI (Braun, in bot. zeit. Jan. 1832. p. 4. t. 1.) leaves of the offsets oblong, shortly acuminated, beset with glandular pubescence on both surfaces, with ciliated margins; flowers rotate; petals lanceolate, acuminated, about 3 times longer than the calyx; germen dilated, ovate; style discoloured at the apex. ². H. Native of the Alps of Europe, as in Switzerland, Piedmont, &c.

28 S. ARACHNOIDEUM (Lin. spec. 665.) leaves covered with interwoven cobwebbed hairs or wool; offsets globose; petals 3-9, spreading; scales of flower truncate, emarginate. ². H. Native of the Alps of Europe and the Pyrenees, &c. among rocks. D. C. pl. grass. t. 106. Curt. bot. mag. t. 68. Jacq. auct. 5. append. t. 32. Flowers purple.

**Cobwebbed House-leek.** Fl. Ju. July. Clt. 1699. Pl. ½ ft. 29 S. PUMILUM (Bieb. fl. taur. 1. p. 381.) leaves lanceolate, acute, ciliated by long hairs; offsets globose; stem few-flowered; petals 12, hairy. ². H. Native of Caucasus, at the torrent of Terek, on rocks. Flowers red. Very like S. arachnoideum, but differs in the hairs on the leaves being distinct, not cobwebbed.

**Fine-leaved House-leek.** Pl. ½ foot.

**Sect. III. MONA'NTHES (from poëe, mono, one, and an-55, anthos, a flower; flowers one on each peduncle.) Hav. rev. succ. p. 68. D. C. prod. 3. p. 414. Real offsets none. Leaves clavate, crowded in a somewhat rosulate manner. Flowers purple. Glands large, orbicularly cochléate, serrulata when examined through a lens, one-half shorter than the petals, but 4 times broader, and rufous. Haw.—A very small nearly stemless herb.

**† Species hardly known.**

32 S. AFRICANUM (Mill. dict. ed. 8. no. 7.) margins of leaves serrately toothed; offsets spreading. ². D. G. Native of the Cape of Good Hope. Hav. syn. p. 367. This species has never been seen except by Miller; it is therefore doubtful. Sprengel says it is the same as S. arbóreum.

**African House-leek.** Clt. 1768. Shrub.

33 S. ? SEGUE'RI (D. C. prod. 3. p. 414.) stem herbaceous, erect; leaves opposite, oblongate,—Native on Mount Baldo.

**Sédum perrà'num, &c. Scarella in Seg. ver. 2. p. 360. t. 17. S. stellátum, Poll. fl. ver. 2. p. 114. exclusive of the synonyme of Smith. It is probably a variety of Sédum dasyphyllum, but the flowers are said to be yellow. The plant is therefore very doubtful.

**Seguer's House-leek.** Pl. ½ foot.

34 S. ? HISPA'NICUM (Wildl. enum. p. 508.) leaves subulate, semi-terete, ciliated, imbricated; cymes bifid. ². H. Native of Spain. The rest unknown. Perhaps a species of Sédum.

**Spanish House-leek.** Pl. ½ to ¾ foot.

35 S. CLAVICULA'TUM, Sieb. ? These two species are only 36 S. MUTA'BLE, Schlecht. ? known by name.

**Cult.** The greenhouse kinds of house-leek are chiefly natives of the Canary Islands. A mixture of sand, loam, and brick-rubbish is a good soil for them; and care must be taken not to give them too much water when not in flower. Cuttings taken off the plants, and laid to dry a few days, will strike root freely without any covering of glass. Cuttings of some species are difficult to obtain, such as of S. tabulifíameae, &c.; the best way in such cases is to cut the top out, and, lateral shoots will be immediately produced. The hardy kinds are well fitted for rock-work, or to grow on walls; and they are easily increased by the offsets, which are issued in great abundance. A light soil suits them best.

**Tribe II.**

**CRASSULACE.E ANOMAL.E** (the plants contained in this
tribe are anomalous in the order, in consequence of the carpels being united in a many-celled capsule, and dehiscent on the outside. D. C. prod. 3. p. 414. Carpels united at the base into a many-celled capsule.

XX. DIA M O R P H A (from ἔκασφω, diamorphao, to de-

form; in reference to the fruit, which is formed differently and contrary to the rest of the order). Nutt. gen. amer. 1. p. 293. D. C. prod. 3. p. 414.

Small Diamorpha. Pl. 1 inch.

Cult. The seeds of this plant should be sown in a pot, filled with peat, and the plants need not be shifted into other pots; but be preserved through the winter by a frame.

XXI. PENTH OR U M (from πέντε, pente, five, and ἄφοι,

LIT. Syst. Decándria, Pentágyinia. Calyx 5-parted. Petals 5. Stamens 10. Scales wanting? Carpels 5, united at the base, in a 5-seeded 5-celled capsule, which is pentagonal at the apex, and opening under the beaks. Seeds numerous, small, fixed on every side of the broad placenta, and probably exalbuminous.—Erect perennial herbs, with scattered, membranous, oblong-linear, unequally serrated leaves: and unilamellar cymes, which are turned back at the points.

1 P. sedoidea (Lin. spec. p. 620.) stem a little branched; leaves lanceolate; cymes numerous, panicled, many-flowered; seeds scabiförm. \* H. Native of North America, in bogs, from New England to Carolina, and on La Grande Chaudière. Lin. act. ups. 1744. t. 2. Lam. ill. t. 390. Flowers white or pale yellow.

2 P. Chineñse (Pursh. fl. amer. sept. 1. p. 232. in obs.) stem simple; leaves long, linear-lanceolate; cymes few, corysmbose, few-flowered; seeds ovate, horny. \* H. Native of China. D. C. mem. crass. pl. 13. Very like P. sediæides, but the seeds are certainly distinct. Stems, as in it, terete at the base, and angular at the apex.

China Penthorum. Pl. 1 foot.

Cult. The species of this genus grow freely in light sandy soil, and are easily increased by dividing at the roots. Cuttings also strike freely under a hand-glass. P. Chineñse, if ever it should be introduced to the gardens, will require protection in winter until its hardiness be ascertained.

Calyx constantly of a definite number of sepals, usually 5, but varying from 4 to 8, more or less united at the base, either cohering with the ovary, or almost distinct from it, equal or unequal, quincuncial or valvate in stivation. Petals indefinite, coloured, narrow, a little combined at the base, sometimes wantig, but in that case the inside of the calyx is coloured. Stamens indefinite, arising from the calyx, distinct; anthers oblong, incumbent. Ovarium distinct, or adnate to the calyx, many-celled, crowned by numerous distinct stigmas. Capsule either girdled by the fleshy calyx or naked, usually many-celled, but often 5-celled, opening in a stellate manner at the apex. Seeds attached to the inner angle of the cells, definite or indefinite. Embryo lying on the outside of a mealy albumen, curved.—Shrubby or herbaceous plants, variable in habit. Leaves fleshy, opposite, simple. Flowers usually terminal.

The curved embryo and mealy albumen, along with the superior calyx, and distinctly perigynous stamens, characterise these among their neighbours, independently of their succulent habit. With Crassulacea, Chenopodiace, and Caryophyllaceae they are more or less closely related. Reuarruriace and Nittrariaceae are families different in affinity. The hottest sandy plains in the Cape of Good Hope nourish the largest part of this order. A few are found in the south of Europe, north of Africa, Chili, China, Peru, and the South Seas. The succulent leaves of a few of the species are eaten, as of Tetragynia expansa, Mesembryanthemum edule, and Scevola portulacoides; others yield an abundance of soda. Mesembryanthemum nodifórrum is used in the manufacture of Moroquin leather.

Synopsis of the genera.

1 MESEMBRYANTHEMUM. Calyx of 5, rarely of 2-8 sepals. Petals indefinite, linear. Stamens indefinite, inserted in the top of the calyx along with the petals. Capsule adnate to the calyx, from 4 to many-celled; cells many-seeded.

2 TETRAGÖNIA. Calyx 4, rarely 3-cleft; lobes coloured inside. Petals wanting. Stamens variable in number. Capsule 3-8-celled; cells 1-seeded.

3 SERVÚIUM. Calyx 5-parted; lobes coloured inside. Petals wanting. Stamens 15-30, inserted in the top of the tube of the calyx. Capsule 3, rarely 4-5-celled; cells many-seeded.

4 AZIÖN. Calyx 5-parted, coloured inside. Petals wanting. Stamens about 20, inserted in the bottom of the calyx, 3-5 in each fascicle. Capsule 5-celled; cells many-seeded.

5 GLIXUS. Calyx 5-parted, coloured inside, with 3 inner sepals and 2 outer ones. Petals 5-20, tongue-shaped, 2-4-cleft at the apex. Capsule covered by the calyx, 5-celled; cells many-seeded.

6 ORYÇIA. Calyx 5-parted. Petals numerous (20), lanceolate. Stamens indefinite. Capsule glbose, 5-celled, many-seeded.

1. MESEMBRYANTHEMUM (from μεσομπροφ, meso-

LIT. Syst. Icósandra, Tetra-Polygyinia. Calyx of 5, rarely of 2-8 sepals; sepals united to themselves, and to the ovarium even to the middle; lobes unequal, usually leaf-formed. Petals innumerable, in one, but more often in many series, united among themselves at the base. Stamens indefinite, disposed in many series, inserted with the petals at the top of the calyx. Ovarium adnate to the calyx, many celled inside (4-20), but usually 5-
celled. Stigmas 4-20, but usually 5. Capsule many-celled, opening stellately at the apex, adnate to the permanent calyx. Seeds numerous. Embryo curved at the side of a mealy albumen. Cotyledons thick, very blunt.—Subshrubs, rarely herbs, almost all natives of the Cape of Good Hope. Leaves usually opposite, thick, fleshy, flat, terete or trigonal. Flowers terminating the branches, white, yellow or purple, the greater part of which open in the heat of the sun, very few of them opening in the evening. Fruit opening in a humid atmosphere, and relaying the seeds, which are then dispersed by the wind along with the sand.

In consequence of this genus being very large, we think it necessary to give a synoptical table of the sections, in order to render a reference to the species more easy.

### Synoptical Table of the Sections.

### Subdivision I. Acaul'a (acaulis, without a stem; plants stemless or nearly so). Haw. rev. succ. p. 81. Stems wanting or very short. Root perennial. Leaves large, variable in form and thickness, but not flat.

§ 1. Spheroidea (from sphaira, sphaira, a sphere; in reference to the leaves being joined together into a globe). Salm-Dyck.—

| **M. Minutum** (Haw. obs. 126. misc. 21. rev. 82.) | Plant stemless, obconical, glaucous, without spots; flowers long, tubular. 2. D. G. Native of the Cape of Good Hope. Sims, bot. mag. t. 1376. Plant hardly the size of a common bean. Pedals pale reddish in the free part, spreading; tube slender, half an inch long, inclosing the ovary. |

**Minute Fig-marigold.** Fl. Sept. Nov. Pl. ½ inch.

| **M. Minutum** (Haw. obs. 126. misc. 21. syn. 203. rev. 82.) | Plant stemless, obconical, glaucous, with confluent rather branched spots; ovary inclosed. 2. D. G. Native of the Cape of Good Hope. Petiv. gaz. 18. f. 37; ex Haw. Flowers very pale yellow, almost white, sessile. The cultivated plants of this species are sometimes somewhat canescent. Offsets fewer from this species than from the other allied species. |

**Smallest Fig-marigold.** Fl. Sept. Dec. Cl. 1776. Pl. ½ inch.

| **M. Perpusillum** (Haw. rev. 82.) | Plant stemless, obconical, green, with strong confluent branched dots; ovary inclosed. 2. D. G. Native of the Cape of Good Hope. Very nearly allied to *M. minimum*, but the colour of the flowers is deeper, and the offsets more numerous. |

**Very-small Fig-marigold.** Fl. Sept. Dec. Cl. 1819. Pl. ½ inch.

| **M. Oboconellum** (Haw. misc. 21. syn. 203. rev. 82.) | Plant stemless, obconical, glaucous, with confluent branched dots; ovary inclosed. 2. D. G. Native of the Cape of Good Hope. Flowers straw-coloured. |

**Small-truncate Fig-marigold.** Fl. Feb. Oct. Cl. 1795. Pl. ½ inch.

| **M. Pipulliforme** (Haw. misc. 22. syn. 203. rev. 83.) | Plant stemless, rather canescent, and somewhat pubescent, very much depressed, and spotted. 2. D. G. Native of the Cape of Good Hope. |

**Button-shaped Fig-marigold.** Fl. Cl. 1795. Pl. ½ inch.

| **M. Turbiniforme** (Haw. rev. p. 84.) | Plant stemless, obconical, exactly truncate, and therefore top-formed, obscurely dotted. 2. D. G. Native of the Cape of Good Hope. |

**Top-shaped Fig-marigold.** Fl. 2 inches.
10 M. uveiforme (Haw. rev. p. 84). Plant stemless, nearly globose, green, form and size of a grape herry, with small, rather confluent deeper dots. 2. D. G. Native of the Cape of Good Hope. Burm. afr. t. 10. f. 2.?

Grape-formed Fig-marigold. Fl. Cl. 1820. Pl. ½ inch.

11 M. eucalytrum (Haw. obs. 129. misc. 22. syn. 204. rev. 84.) plant stemless, glaucous, without dots, nearly spherical; tops of leaves unequal, distinct, flat above. 2. D. G. Native of the Cape of Good Hope. Flowers unknown.

Nat-formed Fig-marigold. Cl. 1796. Pl. 1 inch.

§ 2. Subquadriifolia (the plants belonging to this section are usually furnished with about 4 leaves). Salm-Dyck, obs. 17.—

Semirotita and Obitita, Haw. rev. p. 85. Plants almost stemless. Leaves 4-6, decussate, quite entire, obtuse, flat above, convex beneath. Flowers nearly sessile, solitary. Calyx 4-6-cleft. Stigmas 4-6. The upper leaves are usually conuate, as in section Spheroideae, and at length separate, but more distinctly.

12 M. Gm. M. truncatum (Thunb. fl. cap. p. 412.) plant stemless; leaves spheroid-obconical, umbilicately truncate; peduncle solitary, 1-flowered, compressed; calyx 4-cleft. 2. D. G. Native of the Cape of Good Hope.

Truncate Fig-marigold. Pl. 1 to 2 inches.

Testiculare Fig-marigold. Fl. Nov. Cl. 1774. Pl. 1 inch.

14 M. octophyllum (Haw. rev. p. 85.) plant stemless; leaves 6-8, white, smooth, rather erectish, convex beneath, flat above. 2. D. G. Native of the Cape of Good Hope. M. testiculare γ, Haw. misc. p. 24. M. testiculare β et γ, Haw. syn. 205. M. testiculare β, Sims, bot. mag. 1573. Flowers yellow, and when expanded they are 8 or 10 lines in diameter. Calyx 6-cleft, furnished with two leaf-formed bracteae at the base. According to the Prince de Salm-Dyck, this is merely a variety of M. testiculare.

Eight-leaved Fig-marigold. Fl. Nov. Cl. 1819. Pl. ½ ft.

15 M. obtusum (Haw. misc. 25. syn. 206. rev. 86.) plant green, almost stemless; leaves unequal, semi-terete, acinaciform, obtuse; flowers almost sessile; calyx 6-lobed. 2. D. G. Native of the Cape of Good Hope. M. fusiformis, Haw. obs. 185. Old stem 2 inches high. Flowers pale red, bibracteate at the base; petals an inch long. Styles 4.

Blunt Fig-marigold. Fl. March, April. Cl. 1792. Pl. ½ ft.

16 M. Pissum (Haw. obs. 134. misc. 25. syn. 205. rev. 86.) plant almost stemless; leaves equal, half-terete, very blunt, glaucencet. 2. D. G. Native of the Cape of Good Hope. Old stem 1 or 2 inches high; branchlets very short, and alternate. Flowers unknown.

Cleft Fig-marigold. Cl. 1776. Pl. ½ foot.

17 M. Digitatrum (Thunb. fl. cap. p. 412.) plant stemless; leaves 3-4, terete, smooth, obtuse; flowers sessile, solitary, axillary. 2. D. G. Native of the Cape of Good Hope. M. digitatum, Ait. hort. kew. 2. p. 181. Flowers white, according to Thunberg. Leaves alternate. Perhaps belonging to a different section.

Finger-shaped Fig-marigold. Cl. 1775. Pl. 1 inch.

§ 3. Monifiorum (from monile, a bracelet, and forma, form; appearance of stems). Haw. and Salm-Dyck, l. c. Stems very short, moniliform, leafless in the summer. The two first leaves united even to the apex, and deciduous; the two following leaves elongated, and joined at the base, marcescent, and deciduous. Calyx 4-6-cleft, and is, as well as the leaves, full of crystaline papulae. Stigmata 7-8.

18 M. Piusiforme (Haw. misc. 23. syn. 205. rev. 93.) leaves full of crystalline papulae; the first two united into the form of a peak, the following 2 semi-terete; caudex much branched, and very dwarf. 2. D. G. Native of the Cape of Good Hope. The first leaves are produced in autumn, and the second in winter. Flowers unknown.

Peau-formed Fig-marigold. Cl. 1796. Pl. 1 inch.

19 M. moniliforum (Haw. obs. 132. misc. 24. syn. 207. rev. 93.) first leaves joined into a spherical form; the following ones half-terete, subulate, very long, green, and somewhat recurved. 2. D. G. Native of the Cape of Good Hope. Thumb. fl. cap. p. 413. Peduncles 2 inches long, terminal. Calyx 4-cleft. Petals snow white. Styles 7, ex Haw.

Necklace-formed Fig-marigold. Fl. March, April. Cl. 1791. Pl. ½ foot.

20 M. nobile (Haw. in phil. mag. 1823, p. 381.) plant rather caulescent; leaves coarsely and triquetrously ciliate, obtuse, somewhat recurved, rather concave above, marked by large elevated tubercules. 2. D. G. Native of the Cape of Good Hope. Flowers large, sessile, opening before meridian, yellow, scentless, bibracteate at the base. Calyx 6-cleft, according to Salm-Dyck.

21 M. magnipunctatum (Haw. rev. p. 86.) plant stemless; leaves perfect, usually about 4, large, elavately triquetrous, very thick, glaucencet, flat above, keeled beneath, obtuse at the apex, marked with very large and numerous dots. 2. D. G. Native of the Cape of Good Hope. M. magnipunctatum, Haw. suppl. p. 87. Flowers yellow, sessile.

Large-dotted Fig-marigold. Cl. 1822. Pl. ½ foot.

22 M. cylindrica (Haw. obs. p. 158, misc. 25. syn. 219. rev. 87. but not of Salm-Dyck,) plant stemless; leaves hoary, semi-terete at the base, attenuated, gibbously keeled at the apex. 2. D. G. Native of the Cape of Good Hope. Very like M. magnipunctatum, but is easily distinguished by its hoary aspect. Flowers unknown.

Hoary Fig-marigold. Cl. 1795. Pl. 1 to 2 inches.

23 M. aloides (Haw. suppl. 88. rev. 87.) plant stemless; leaves entire, semi-terete, green, marbled with white dots, acute upwards, rather concave above, carinate triquetrous at the apex. 2. D. G. Native of the Cape of Good Hope. Old plant tufted; root fusiform. Flowers sessile, central, yellow, middle-sized. Perhaps the same as M. compactum, no. 86. Perhaps M. aloides, Burch. trav. afd. p. 332.

Aloe-like Fig-marigold. Fl. Sept. Cl. 1819. Pl. ½ foot.

§ 5. Allinöta (from allus, white, and nota, a mark; plants marked with white). Haw. in phil. mag. Aug. 1826, p. 126. Plants almost without stems, tufted. Roots perennial. Leaves decussate, entire, obliquely incurred, green, spreading, full of large tubercular white dots, semi-terete at the base, acinaciformly triquetrous at the apex, or nearly equal-sided, more or less scattering. Flowers central, solitary, sessile, yellow. Stamenv erectly spreading, as in those of section Ringüinta.

24 M. alboïntum (Haw. in phil. mag. Aug. 1826. p. 126.) leaves acinaciformly triquetrous upwards, with a recurved
mucron, full of scattered, rather elevated whitish dots. 2. D. G. Native of the Cape of Good Hope. Flowers yellow.

White-marked Fig-margiold. Fl. Sept. Clt. 1824. Pl. 4/3 ft. 25 M. abtunatum (Haw. l. c.) leaves semi-terete, beset with white tubercular dots. 2. D. G. Native of the Cape of Good Hope. Flowers yellow. Very like M. albínotum, but the leaves are twice or thrice smaller, and more numerous. There is also a larger variety of this species mentioned by Haworth.

26 M. musculturum (Salm-Dyck and Haw. suppl. p. 87, rev. p. 89.) plant almost stemless, green, full of pellucid dots; leaves tripinuous, gradually thickening towards the apex, ciliately toothed, postulus-gibbous on the inside at the base; flowers on short pedicels; calyx 4-cleft. 2. D. G. Native of the Cape of Good Hope. Salm-Dyck, obs. 1829. p. 9. Flowers yellow, expanding in the evening, sweet-scented.

28 M. abtunatum (Haw. in phl. mag. Aug. 1826. p. 126.) plant almost stemless, canescent, wrinkled from dots; leaves semi-terete, serrulated from elevated dots, and hence somewhat toothed, postulate on the inside at the base. 2. D. G. Native of the Cape of Good Hope. Leaves with a large white postulate on the inside at the base. Flowers sessile, solitary, central, expanding in the evening.

Ter. 2. leaves more erect, entire.

29 M. musculúrum (Haw. obs. p. 165. misc. p. 30. syn. 217. rev. 90. phl. mag. 64. p. 111.) plant almost stemless, glaucous; leaves ciliately denticulated, 3 rows on each side, and full of tubercular dots, with the margins and keel ciliately denticulated at the apex; flower sessile. 2. D. G. Native of the Cape of Good Hope. Flowers small, yellow. Styles 5, very short, erect, green, a little thickened towards the apex.

Mouse-chop Fig-margiold. Fl. Sept. Clt. 1790. Pl. 4/3 ft.

31 M. lévium (Haw. in phl. mag. 64. p. 111.) plant stemless; leaves glaucenscent, marginal cilia very long, and very numerous. 2. D. G. Native of the Cape of Good Hope. Very like M. felinum, but differs according to Salm-Dyck in the leaves being narrower, more attenuated, and probably it is only a mere variety of it.

Wolf-chop Fig-margiold. Pl. 4/3 foot.

33 M. canínum (Haw. obs. p. 159. syn. 217. rev. p. 87.) plant almost stemless; leaves glaucous, carpinaceous triquetrous, rather club-shaped, incurved towards the apex, and somewhat toothed, as well as the bracteas; peduncles longer than the leaves. 2. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 33.—Brasi. succ. t. 18. M. ringens 2. Lin. spec. 698. Flowers of a yellowish orange-colour, opening after meridian.

34 M. vulgárum (Haw. syn. p. 417. rev. p. 88.) plant almost stemless; leaves glaucous, carpinaceous triquetrous, rather club-shaped, with large teeth at the apex or entire; old leaves horizontal; bracteas entire; peduncles longer than the leaves. 2. D. G. Native of the Cape of Good Hope. M. canínum 2. Haw. misc. p. 32. Very like M. canínum, but taller, and the leaves are longer and greener, with fewer teeth. It is, however, perhaps only a variety of it. Flowers yellow.

Fox-chop Fig-margiold. Fl. May. Clt. 1795. Pl. 4/3 ft.

35 M. nyánum (Haw. syn. 218. rev. p. 88.) plant stemless, smooth, white; leaves semi-terete, entire, carpinaceous triquetrous above, and a little thickened, ending in a recurved mucron each. 2. D. G. Raised in the gardens from the seeds of M. albidum, impregnated by the pollen of M. canínum.

Hybrid Fig-margiold. Fl. May. Oct. Pl. 4/3 foot.

36 M. musculúrum (Haw. in phl. mag. Nov. 1826. p. 328.) margins and keel of leaves usually bearing but one tooth each; branches prostrate, half a foot long. 2. D. G. Native of the Cape of Good Hope. Flowers yellow, opening in the morning, scentless. This plant is very like M. musculúrum, but differs in the prostrate branches, and in the teeth of the leaves being fewer. It comes perhaps nearest in habit to M. erínum, but differs in the petals being a line broad, not capilaceous.

37 M. albidúm (Lin. spec. p. 699.) plant stemless, smooth, whitish; leaves thick, subulate, triquetrous, obtuse, with an acumen, but semi-terete at the base: all quite entire. 2. D. G. Native of the Cape of Good Hope. Dill. hor. etd. f. 232. Brasi. succ. t. 43. Sims, bot. mag. t. 1824. Haw. rev. p. 85. Flowers large, yellow, opening early in the morning, but afterwards remaining expanded through the whole day, sweet-scented. Stigmas 11. This plant is intermediate between the section Ringénia and Rostríta.

38 M. denticulúrum (Haw. obs. 149. misc. syn. 30. rev. 91.) plant stemless; leaves very glaucous, subulate triquetrous, compressed, dilately keeled at the apex; keel usually
denticulated; scape hibracteate, 1-flowered; styles 15. 2. D. G. Native of the Cape of Good Hope. Flowers pale straw-colour, 3 inches in diameter.

Var. a, cinnam (Haw. obs. 149.) leaves canescent from minute down.

Var. b, glaucum (Haw. obs. p. 151.) leaves glaucous-white, rather dilated at both ends, a little toothed.

Var. c, candidissimum (Haw. l.c.) leaves white, elongated, a little toothed, compressed on both sides.

Denticulated Fig-margirol. Fl. April. Clt. 1793. Pl. ½ ft. 39 M. robustum (Haw. misc. p. 28. syn. 211. rev. p. 91.) stem robust, a little branched, short, decumbent; leaves obtuse, dotted, subulate, pubescent inside at the base. 2. D. G. Native of the Cape of Good Hope. Flowers unknown.

Robust Fig-margirol. Clt. 1793. Pl. ½ foot. 40 M. compactum (Alt. hort. kew. 2. p. 191.) plant stemless; leaves connate, dotted, semi-terete, triquetrous at the apex, rather reflexed, acute; flowers sessile; calyx subcylindrical, 6-cleft. 2. D. G. Native of the Cape of Good Hope. Haw. syn. 211. rev. 91. Flowers yellow. A very doubtful species, and probably the same as M. sibolé, no. 20.

Compact Fig-margirol. Fl. Nov. Clt. 1780. Pl. ½ foot. 41 M. quadrifidum (Haw. misc. 28. syn. 212. rev. 91.) plant almost stemless, at length branched; leaves subulate, obtuse, hoary-glaucous, marked by a few dots towards the apex; scape terminal, 1-flowered, longer than the leaves; calyx 4-cleft. 2. D. G. Native of the Cape of Good Hope. Old stems 2-3 inches long. Flowers yellow. Styles about the length of the stamens.

Four-cleft Fig-margirol. Fl. Nov. Clt. 1793. Pl. ¼ foot. 42 M. bifidum (Haw. misc. p. 29. syn. 212. rev. p. 92.) plant almost stemless; leaves subulate, glaucous, obtuse, with many dots; scape nearly terminal, 1-flowered; calyx bifid. 2. D. G. Native of the Cape of Good Hope. Flowers yellow. Lobes of calyx 2, unequal. Allied to M. quadrifidum, but weaker, and the leaves are shorter and blunter.

Bifid Fig-margirol. Fl. Nov. Clt. 1795. Pl. ¼ foot. 43 M. bifractatum (Haw. syn. p. 215. rev. 92.) plant almost stemless, branched; leaves elongated, subulate, dotted, very glaucous; bracteas 4, decussate, shorter than the scape; calyx 5-cleft. 2. D. G. Native of the Cape of Good Hope. Very like M. rostratum. Flowers yellow, expanding in the sun.

Bibracteate Fig-margirol. Fl. April, Nov. Clt. 1803. Pl. 3/8 ft. 44 M. perpraescens (Salm-Dyck, obs. bot. ann. 1822.) plant almost stemless, branched; leaves dotted, smooth, gibbosus inside at the base, of a bluish-glaucous-colour, obtuse, and triquetrous at the apex; keel usually extended; sheaths purplish. 2. D. G. Native of the Cape of Good Hope.

Purplish Fig-margirol. Pl. ¼ foot. 45 M. rostratum (Lin. spec. p. 686.) plant stemless; leaves subulate, elongated, acute, dotted; bracteas 2, longer than the scape; calyx 4-cleft. 2. D. G. Native of the Cape of Good Hope.—Dill. clth. f. 229. without a flower. Haw. obs. p. 152. misc. 29. syn. 214. rev. 95. Flowers yellow, expanding in the sun. Styles very short, approximate.

Var. β, tuberculatum (Mill. dict. ed. 8. no. 82.) leaves tubercular on the outside.

Beaked Fig-margirol. Fl. April. Clt. 1742. Pl. ¼ foot. 46 M. ramulosum (Haw. misc. 29. syn. 215. rev. p. 92.) young plant nearly stemless; old stem 3 inches high, branched, and decumbent; leaves subulate, obtuse, pubescent inside at the base: when old expanded; scape terete, bracteate at the base; calyx 5-cleft. 2. D. G. Native of the Cape of Good Hope. M. rostratoides, Haw. obs. 154. Flowers yellow. This is the smallest of all the section.

§ 8. Linguaria (from linguat, a tongue, and forma, a form; shape of leaves). Haw. misc. p. 32. rev. p. 95. Salm-Dyck, obs. 18. Plants stemless or nearly so. Leaves more or less tongue-shaped, flat above, and convex beneath, soft, and shiny, flowers solitary, large, sessile, or pedunculate. Calyx usually 4-cleft, rarely 5-cleft. Petals shining, yellow, broadish. Stigmas 8, rarely 10. Capsule 8-10-celled.

* Disticha (from disticha, distichos, having two rows, a distich; leaves disposed exactly in two opposite rows). Haw. misc. p. 32. —Linguaria, Haw. rev. p. 95.—Glossoidea, Spreng. syst. 2. p. 514. Leaves exactly distich. Perhaps all the plants contained in this division are nothing more than varieties of one species, and probably of garden origin. The whole have been collected under the name of M. linguariae in Lin. spec. p. 669, and D. C. pl. grass. no. 71.

48 M. fragraeus (Salm-Dyck, obs. 1820. p. 8.) plant almost stemless; leaves tongue-shaped, thick, one side rather convex, and obtuse at the apex, the other side thrown out into a keel; flower on a short peduncle. 2. D. G. Native of the Cape of Good Hope. Haw. rev. p. 95. Hoffmans. verz. 1. p. 229. Otto et Link, abh. gev. t. 48. Flowers fragrant, yellow, 3 inches in diameter. Calyx 5-cleft. Allied to M. scalpfreatum, but the leaves are narrower and thicker.

50 M. grandiflorum (Haw. in phil. mag. nov. 1826. p. 388.) leaves broad tongue-shaped, long, thick, having a large pubescent on the inside at the base; petals very broad. 2. D. G. Native of the Cape of Good Hope. Flowers yellow, almost scentless, large, sessile; petals 3-4 lines broad. Leaves 3½ inches long, and 15 lines broad. Capsule subconical. This is the largest species in the present section.

Var. γ (Haw. l.c.) leaves deeper green.

51 M. medium (Haw. suppl. p. 88. rev. p. 95.) plant almost stemless; leaves tongue-formed, sloping, culturate, deep green, without any claw-like point at the apex; peduncles longer than the flowers. 2. D. G. Native of the Cape of Good Hope. Leaves 4 inches long, and an inch broad. Peduncles an inch long. Flowers yellow.

52 M. cultratum (Salm-Dyck, obs. 1820. p. 7.) plant almost stemless; leaves distich, exactly tongue-shaped, culturate at the margin and apex; peduncles compressed, rather longer than the

Var. β, rufescens (Haw. syn. p. 221.) leaves very closely imbricated, rufescent.

57 M. latum (Haw. obs. 186. misc. p. 32. syn. p. 220. rev. p. 98.) plant stemless; leaves tongue-shaped, green, obtuse, thick, usually sloping, and somewhat excavated; flowers nearly sessile; calyx 5-cleft; capsule large, conical. 2. D. G. Native of the Cape of Good Hope.—Dill. clt. f. 225. M. lingueforme β, Lin. spec. 659. Flowers yellow.

Var. β, brevica (Haw. rev. p. 99.) leaves short, very blunt, depressed on the ground; capsule small, depressed.

Var. β, luteum (Haw. l. c.) leaves of a vivid rufescent colour.

** Cruicata (from cruix, a cross; leaves disposed crosswise more or less). Haw. syn. p. 222.—Cruicata and Difformia, Haw. rev. 100, and 101. Leaves more or less cruciate, usually obliquely decussate.

59 M. cruciata (Haw. obs. p. 173. misc. 35. syn. 224. rev. 35.) plant nearly stemless; leaves linear-tongue-shaped, semi-cylindrical, very soft, cruciate; peduncles 2-edged; calyx 4-cleft. 2. D. G. Native of the Cape of Good Hope. Old stems 3 inches high. Peduncles 1–2 inches. Corolla large, yellow.

Cross-leaved Fig-marigold. Fl. May, Nov. Clt. 1732. Pl. 3/4 ft. 60 M. taurinum (Haw. syn. p. 224. rev. 100.) plant almost stemless; leaves disposed in 2 rows, obliquely cruciate, semi-terete, obtuse, very thick, of a yellowish green colour, incurved; flowers sessile; calyx bifid. 2. D. G. Native of the Cape of Good Hope. Coriaceous segments unequal. Styles 8. Old stem branched at the base, half a foot high. Flowers yellow.

Ball's-horn Fig-marigold. Fl. Sept. Nov. Clt. 1795. Pl. 3/8 ft. 61 M. salmum (Haw. suppl. p. 89. rev. p. 100.) plant nearly stemless; leaves decussate, semi-cylindrical, attenuated and acute at the apex, or oblique and bluntish; flowers exactly sessile; calyx 4-cleft; capsule half closed. 2. D. G. Native of the Cape of Good Hope. Salm-Dyck. obs. bot. 1820. Link. et Otto. abb. gew. t. 44. Flowers large, yellow. Leaves pubescent at the base, according to Haworth.

Var. β, semi-cruicata (Salm-Dyck. l. e.) leaves obliquely distich, straight, and more tongue-shaped than the species.

Salm-Dyck's Fig-marigold. Fl. Sept. Nov. Clt. 1818. Pl. 3/4 ft. 62 M. subsectum (Haw. rev. p. 101.) leaves decussate, erectish, or spreading, more or less semi-terete, subulate, acute, soft, usually pubescent at the base; ovary exerted, somewhat pedunculate. 2. D. G. Native of the Cape of Good Hope. Flowers yellow.

Variable-leaved Fig-marigold. Clt. 1705. Pl. 3/4 foot. 64 M. angustatum (Haw. obs. 176. misc. p. 34. syn. 222. rev. p. 101.) plant almost stemless; leaves linear-tongue-shaped, semi-cylindrical, very long; flowers nearly sessile; calyx 4-cleft. 2. D. G. Native of the Cape of Good Hope. Flowers yellow, having the petals broader than any other species of this section. Calyx 4-cleft; stigma 10, according to Haworth.

Var. β, brevica (Haw. rev. p. 103.) Caudex shorter.

Difformia Fig-marigold. Fl. Aug. Clt. 1732. Pl. dec. 66 M. bigibbata (Haw. in phil. mag. nov. 1825. p. 329.) leaves obliquely somewhat cruciate, semi-cylindrical, pale green, varying at the apex, usually with 2 gibbosities; capsule depressed. 2. D. G. Native of the Cape of Good Hope. Very like M. difformia, but smaller and slenderer. Flowers yellow.

67 M. bidentatum (Haw. suppl. p. 89. rev. p. 103.) plant stemless; leaves semi-cylindrical, thick, soft, oblique at the apex, and difform, bearing 2 large, almost opposite, fleshy teeth in the middle. 2. D. G. Native of the Cape of Good Hope. Flowers large, yellow, on short peduncles; petals closely toothed at the apex. Capsule a little depressed.—The figure in Dill. hort. clt. f. 241. is referrible to this plant and not to the next.

with 1 obsolescent tooth on one side, and another stronger one on the other; flowers on short pedicels; calyx 4-cleft. 2. D. H. Native of the Cape of Good Hope.—Plum. mant. t. 325. f. 4. Flowers yellow, size of those of M. linguaformae. Styles 8.

69 M. dolabriforme (Lin. spec. p. 659.) young plant stemless, but as it grows old it becomes caulescent and erect; leaves glaucous, dotted, exactly dolabriform, i. e. depressed at the base, and compressed at the apex, obtuse, and somewhat emarginate; flowers on short pedicels. 2. D. G. Native of the Cape of Good Hope.—Dill. hort. elth. f. 287. D. C. pl. grass. t. 6. Curt. bot. mag. t. 32. Haw. obs. p. 366. misc. p. 37. syn. 1. p. 219. Flora, very short, opening in the evening. Styles 5, bilabiate, longer than the stamens.

Var. β, minus (Haw. i. e. c.). M. dolabriformoldeis, Haw. obs. 168.

70 M. carinans (Haw. rev. p. 90.) plant nearly stemless; leaves elongated, somewhat incurved and spreading, semiterete at the base, compressed at the apex, and dilated into a keel, whitish and dotted. 2. D. G. Native country and flowers unknown. M. eunae, Salm-Dyck. obs. p. 20. but not of Haw. Flowers by threes, yellow, expanding in the evening. Very like M. dolabriforme.

§ 10. Gibbonsa (from gibbons, crooked-backed or bunched; back of some of the leaves). Haw. rev. p. 104.—Abbreviata, Haw. misc. 1. p. 36.—I'maquioida gibbosa, Salm-Dyck. obs. p. 18. Plants nearly stemless. Leaves differentiated, conuate a great way at the base, large, unequal, one of which is short and gibbous, the other usually oblique. Flowers sessile, or on short pedicels, small, reddish. Calyx 6-cleft. Stigmas 6.

Obusulate-leaved Fig-marigold. Clt. 1796. Pl. ½ foot.

80 M. teretisculum (Haw. obs. 410. misc. 27. exclusive of the synonyms) plant stemless; leaves triquetrously terete, firm, thick, green, dotted. 2. D. G. Native of the Cape of Good Hope. Leaves 2 inches long. Flowers unknown, but probably red.

Narly terete-leaved Fig-marigold. Clt. 1794. Pl. ½ foot.

§ 15. Bellidiflora (from bellis, a daisy, and flos; a flower; the flowers bear some resemblance to those of the daisy). Haw. rev. p. 106. Plants stemless or caulescent. Leaves triquetrous, s 2
acute at the angles, toothed at the apex. Flowers solitary, pedicellate. Petals purple on the ribs and white on the margins.

Calycx 5-cleft. Capsule 5-celled. Stigmas numerous, small, hair-formed.

81 M. bellidiflorum (Lin. spec. p. 69.) caudex short, suffrutescent; leaves triquetrous, compressed, rather acinaciform, dentilicate at the apex; pedicels short. \( \ddot{\alpha} \). D. G. Native of the Cape of Good Hope. Petals red and white.

Var. \( \beta \), glaucéscens (Haw. rev. p. 105.) leaves rather glaucous, with the teeth in 3 rows at the apex.—Dill. elth. f. 253.

Var. \( \gamma \), viride (Haw. rev. p. 105.) leaves pale green, toothed beneath on the keel.

Daisy-flowered Fig-marigold. Fl. June, Aug. Cl. 1717. Pl. \( \frac{1}{4} \) foot.

82 M. subula'tum (Mill. dict. ed. 8. no. 10.) caudex branched; leaves rather glaucous, triquetrously subulate, dentilicate at the apex. \( \ddot{\alpha} \). D. G. Native of the Cape of Good Hope. Haw. syn. 208. M. bellidiflorum simplex, D. C. pl. grass. t. 41. Flowers reddish. The plant is very like \( M. \) bellidiflorum, but is much smaller and more branched.

Subulate-leaved Fig-marigold. Fl. Ju. Jul. Cl. ? Pl. \( \frac{1}{4} \) ft.

83 M. Bartramii (Haw. rev. p. 106.) flower-stems erect, simple; leaves triquetrous, with 3 rows of teeth at the apex; pedicels rather elongated. \( \ddot{\alpha} \). D. G. Native of the Cape of Good Hope.—Bartram. af. t. 25. This species is hardly known.

Bartram's Fig-marigold. Pl. \( \frac{1}{4} \) foot.

§ 14. \( \dot{A} \)cuta (from acutus, acute; leaves acute). Haw. rev. 107. Plants stemless or nearly so. Leaves semiterete, subulate, incurved, triquetrous at the apex, green, full of pellucid dots. Flowers pedicellate; petals deep purple. Calyx 5-cleft. Stigmas 10.

Acute-leaved Fig-marigold. Fl. Apr. Nov. Cl. 1793. Pl. \( \frac{1}{4} \) ft.

85 M. percutum (Haw. obs. p. 411. rev. 107.) plant smooth, stemless; leaves semiterete, triquetrous at the top, flat above, full of pellucid dots, pale green, furnished with a minute white point at the apex. \( \ddot{\alpha} \). D. G. Native of the Cape of Good Hope. Flowers unknown. Perhaps only a variety of \( M. \) diminutum.

Dotted-leaved Fig-marigold. Fl. April, Nov. Cl. 1793. Pl. \( \frac{1}{4} \) foot.

Var. \( \beta \), caduciflum (Haw. supp. 90. rev. 107.) stem half erect; leaves longer, and with larger dots, but is perhaps only an old plant.

Diminished Fig-marigold. Fl. Apr. Clt. 1789. Pl. \( \frac{1}{4} \) ft.

87 M. macrorhizon (Haw. i. c. D. C. 1. c.) stem very short; root large, tuberous; leaves connate, bluntly triquetrous, crowded, spreading; branches erect, bent; flowers 1-3 together, nearly terminal, pedicellate. \( \ddot{\alpha} \). D. S. Native of the Island of Bourbon, among scoria near the sea. Stems 3 inches high. Flowers small, white, numerous. The leaves have an acrid taste when eaten, as those of \( Salsola \). La Lavangere, Comm. and figure. Ficoide, De Pet. Th. mel. bot. p. 37.

Large-rooted Fig-marigold. Fl. Ju. Jul. Cl. 1823. Pl. \( \frac{1}{4} \) ft.

Subdivision II. Cephalophylla (from κεφαλη, cephalé, a head, and φυλλον, phyllon, a leaf; in reference to the leaves being collected in heads at the tops of the branches). Haw. rev. 108. Stems suffrutescent, decumbent. Leaves long, triquetrous, or nearly cylindric, disposed in heads. Flowers pedunculate, yellow. Calyx 5-cleft. Stigmas 10-20. —This division is perhaps not very natural.

88 M. \( \ddot{\alpha} \)tum (Haw. syn. p. 229. rev. 108.) stems prostrate, rather nodose: adult ones nearly terete; leaves crowded in heads, semi-cylindrically triquetrous, elongated, recurved, rather glaucous. \( \ddot{\alpha} \). D. G. Native of the Cape of Good Hope.—Dill. elth. f. 255. Peduncles solitary, an inch and a half long, bibracteate at the base. Flowers straw-coloured. Calyx 5-cleft. Styles 15-18.

Var. \( \beta \), congestum (Haw. l. c.) plant more greenish; lower pair of leaves very long.

Thong Fig-marigold. Fl. Sept. Cl. 1782. Pl. pr.

Var. \( \alpha \), glaucum (Haw. l. c.) leaves rather glaucous.

Var. \( \beta \), breceiflum (Haw. l. c.) leaves shorter than in any of the other variations.

Var. \( \gamma \), lecé-ctiricus (Haw. l. c.) leaves pale green.

Var. \( \delta \), atroviiicums (Haw. l. c.) leaves dark green.

90 M. decipiens (Haw. rev. p. 110.) stems prostrate, with rather distant nodi; leaves rather crowded, long, arcuately ascending, triquetrously semi-cylindric, green, shining, minutely and finely wrinkled. \( \ddot{\alpha} \). D. G. Native of the Cape of Good Hope. Flowers pale yellow.

Deceiving Fig-marigold. Fl. May. Cl. 1820. Pl. pr.

91 M. fucum (Haw. misc. p. 39. syn. 251. rev. 110.) stems prostrate, nearly terete, with the nodi contiguous; leaves rather crowded, longish, triquetrously semi-cylindric, ascending, green, shining; stigmas 12. \( \ddot{\alpha} \). D. G. Native of the Cape of Good Hope.—Brasil. succ. t. 40. Petiv. gaz. 77. f. 10. Leaves 2 inches long, but shorter than those of \( M. \) corniculatum. Peduncels terminal, shorter than the leaves. Petals sulphur-

Horned Fig-marigold. Fl. May. Clt. 1732. Pl. pr.

§ 17. Procumbentia (procumbens, procumbent; plants). Haw. in phil. mag. dec. 1826. p. 329. Old stems procumbent. Leaves connate at the base, long, semicircular or cylindrical.

93 M. procumbens (Haw. rev. 111.) stems flexuous, procumbent; leaves by pairs, recurved, connarum, semi-cylindrically triquetrous, glaucescent. γ. D. G. Native of the Cape of Good Hope. M. däbium, Salm-Dyck. obs. p. 22. Allied to M. tricolor, but the leaves are shorter and more expanded, etc.

95 M. purpureo-album (Haw. in phil. mag. dec. 1826. p. 329.) branches short, angular, prostrate, furrowed, yellowish; leaves green, triquetrous semi-cylindrical, full of little dots, upper ones crowded. γ. D. G. Native of the Cape of Good Hope. Peduncles filiform. Flowers showy; petals white, polished, naked, with a broad, dark, purple line. Styles 10, reddish.

§ 18. Capitata (from capitatus, headed; leaves crowded into heads at the top of the stems or branches). Haw. syn. 227. rev. 111. Salm-Dyck. obs. p. 30. Caespitose erect, much branched. Leaves crowded at the tops of the branches, alternate, very long, triquetrous, or semi-terete, without either dots or papule. Floriferous branches disposed in something like whorls, decumbent. Peduncles bracteate at the base. Flowers large, yellow. Calyx 5-lobe; lobes elongated. Petals ciliate at the base. Stigmas 10-20. The species are very nearly allied to each other.

96 M. pugioniforme (Linn. spec. 699.) stem suffrutescent, erectish; branches few, terete, decumbent; leaves alternate, crowded at the tops of branches, glandous, triquetrous; petals shorter than the calyx; stigmas 15, expanded. γ. D. G. Native of the Cape of Good Hope.—Breyn. bot. reg. f. 269. Bradl, succ. t. 14. D. C. pl. grass. t. 82. Haw. misc. 42. syn. 218, rev. 112. Flowers large, pale yellow. Perhaps the flesh-coloured and purple-flowered varieties mentioned in Breyn. cent. p. 164. belong to this species.

Var. β. rhagionginus (Haw. l. c.) stem a little branched.

Var. γ. minor (Haw. l. c.) corolla a little smaller; petals hardly ciliate. Ker. bot. reg. t. 493.

Elongated Fig-marigold. Fl. May. Clt. 1793. Sh. 1 foot.

101 M. gemeniflorum (Haw. rev. 114.) stem shrubby, diffuse; branches elongated, slender, creeping; leaves triquetrous, nearly equal-sided, rather connate at the base, acute, and a little hooked at the apex; pedicels twin or tern; stigmas 5. γ. D. G. Native of the Cape of Good Hope. M. geminatum, Jacq. fragm. t. 50. but not of Haw. Petals purple. Flowers hardly half an inch in diameter. Leaves 12-15 lines long, scabrous from elevated dots.

Twin-flowered Fig-marigold. Clt. 1819. Pl. creeping.

102 M. simplex (Haw. rev. p. 115.) stems shrubby, firm, procumbent; leaves triquetrous, equal-sided, glaucescent, full of very small dots, straight at the apex, longer than the internodes; margins not scurculated. γ. D. G. Native of the Cape of Good Hope. Flowers unknown. Allied to M. gemeniflorum, but the branches are shorter; and to M. laxum, but the internodes are shorter.

Similar Fig-marigold. Clt. 1819. Pl. pr.

103 M. laxum (Wildler. enm. p. 536.) stem loose, diffuse, shrubby; branches creeping, very slender; leaves connate, compressed, triquetrous, more green than the others, tubercularly dotted, usually shorter than the internodes: with the margins and keel finely dentilicate. γ. D. G. Native of the Cape of Good Hope. Haw. rev. 115. Flowers reddish.

Loose Fig-marigold. Fl. May. Clt. 1820. Pl. creeping.

104 M. sarmentosum (Haw. syn. 228. rev. 115.) stem shrubby, diffuse; branches prostrate, rooting, sarmentaceous; leaves crowded, compressed, triquetrous, pale green, roughish on the edges; peduncles club-shaped above; stigmas 5. γ. D. G.

**Twiggy Fig-marigold.** Fl. April. Clt. 1805. Pl. pr.

105 M. rigidicaule (Haw. rev. p. 116.) stem firm, procumbent, not pendulous; leaves long, triquetrous, equal-sided, straight, with roughish margins. h. D. G. Native of the Cape of Good Hope. The rest unknown.

106 M. validum (Haw. in phil. mag. dec. 1826. p. 329.) leaves long, pale green, with roughish margins; branches robust, stiff, succulent; flowers usually by threes; keel of bracteas entire. h. D. G. Native of the Cape of Good Hope. Flowers showy, rose-coloured, with a deeper coloured line in the middle.

**Strong Fig-marigold.** Fl. May. Ju. Clt. 1824. Pl. pr.

108 M. repens (Ait. horst. kew. vol. 2. p. 185.) stems filiform, very slender, creeping; leaves much crowded, triquetrous, acute, glaucous, scabrous from large succulent dots. h. D. G. Native of the Cape of Good Hope. Flowers reddish. (ex Ait.), yellow (ex Salm-Dyck.), rarely flowering (ex Haw. obs. p. 349. misc. 80. syn. 215. rev. 191.).

**Thick-leaved Fig-marigold.** Fl. May. Aug. Clt. 1727. Pl. cr.

110 M. Devil (Haw. in phil. mag. dec. 1826. p. 331.) plant smooth; branches filiform, a little compressed; leaves crowded about the knots of the creeping stems, bluntly and acicnofirnly triquetrous, glaucous. h. D. G. Native of the Cape of Good Hope. This species differs from *M. repens* in being smooth, not rough. Flowers unknown.

**Weak Fig-marigold.** Clt. 1824. Pl. creeping.

111 M. clavellatum (Haw. misc. 79. syn. 242. rev. 122.) branches angular, creeping; leaves crowded, expanded, oblong-ovates, triquetrous, firm, clavate, very blunt, mucronulate, green; peduncles rather compressed; stigma 5, very slender. h. D. G. Native of New Holland. Flowers like those of *M. crassifo-
lium, but more beautiful and of a deeper red. Calyx 5-stigma; stigmas sessile, green.

**Filamentous Fig-marigold.** Fl. Nov. Dec. Clt. 1795. Pl. pr.

114 M. tuberculatus (Haw. rev. p. 77. syn. 229. rev. 117.) stem shrubby, when young erect; branches eectly decumbent; leaves compressed, triquetrous, rather acicniform, and rather glaucous, usually longer than the internodes, with the margins minutely serrulato, but hardly cardulato; flowers solitary; stigma 5, expanded. h. D. G. Native of the Cape of Good Hope. Willd. enum. p. 536. Flowers middle-sized, pale purple. There is a more dense variety, and a greenish one.

116 M. edule (Lin. spec. 695.) branches expanded, with quite entire angles; leaves equally triquetrous, dotless, a little channelled, attenuated at both ends, with the keel serrulato; stigma 8. h. D. G. Native of the Cape of Good Hope.—Dill. edh. f. 274. Seb. thes. l. t. 19. f. 6. Haw. obs. 392. misc. 76. syn. 234. rev. 110. Flowers large, yellow. Calyx 5-stigma; capsule 5-celled, with the baccato calyx edible. Rarely flowering in the garden.

**Edible Fig-marigold or Hottentot Fig.** Fl. July. Aug. Clt. 1690. Shrub pr.

Flowers large, reddish. There are two varieties of this species, one with short and the other with longer branches.

**Scymnium-forsted-leaved Fig-marigold.** Fl. Aug. Sept. Cl. 1714. Shrub pr.

119 M. **rubrocostatum** (Haw. syn. p. 284. rev. 118.) stems rather procumbent, long; leaves aciciniform, with rough red edges and keel. p. D. G. Native of the Cape of Good Hope. There is a variety of this species with thicker and more compressed leaves.

Red-bordered-leaved Fig-marigold. Fl. May. Cl. 1811. Pl. pr.

120 M. **subalatum** (Haw. misc. 76. syn. 235. rev. 199.) branches 2-edged at the apex, somewhat undulate winged; leaves compressed, triquetrous, equal-sided, dotless, rather aciciniform, with cartilaginous margins, which are scabrous on both sides. p. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably reddish.

**Radder-winged Fig-marigold.** Cl. 1796. Shrub pr.

121 M. **lacereum** (Salm-Dyck. obs. 1820. p. 31.) stem shrubby, erect; branches erectly spreading, 2-edged; leaves rather aciciniform, acutely triquetrous, rather compressed, glaucous, full of pellucidal dots: with the keel lacerately toothed; stigmas 10, very short, approximate. p. D. G. Native of the Cape of Good Hope. *M. aciciniforme*, D. C. pl. grass. t. 80. M. diminutum, and probably M. lacereum, Haw. rev. 119. and 131. M. Milleri, Willd. enum. suppl. 31. and M. gladiatum, Jacq. ex Salm-Dyck. Flowers large, red, opening in the sun; petals linear, very numerous. Calyx 5-cleft; lobes leaf-formed. Stigmas for the most part 10, but sometimes even to the number of 20.

**Jagged-keeled Fig-marigold.** Cl. ? Shrub 1 to 2 feet.

122 M. **virens** (Haw. rev. 121.) stem erectish; branches at length spreading; leaves compressed, triquetrous, rather aciciniform, smooth, dotted, green, pustulate on the inside at the base, having the keel roughish at the apex. p. D. G. Native of the Cape of Good Hope. Flowers reddish, disposed by threes. This species hardly belongs to this section, according to Salm-Dyck.

*Green Fig-marigold.* Fl. June. Cl. 1821. Pl. 1 foot.

§ 23. Carnicaflora (from caro, carnis, flesh, and caulisc, a stem; stems fleshy while young). Haw. in phil. mag. dec. 1826. p. 330. Stems usually elongated, weak, prostrate, and creeping: when young thick and fleshy. Leaves triquetrous, with the sides nearly equal, thick, usually soft. Flowers solitary, terminal, reddish, large, showy, and hexagonal. Capsule pulpy on the outside, even when ripe.

123 M. **equilateral** (Haw. misc. 77. syn. 237. rev. 120.) stems weak, prostrate; leaves almost equally triquetrous, greenish; peduncles angular, thickening towards the top; calyx 5-cleft; stigmas 5, short, erect. p. D. G. Native of New Holland. Flowers showy, reddish.

*Var. beta, decuminatum* (D. C. prod. 3. p. 429.) stigmas 10; branches shorter.

Equal-sided-leaved Fig-marigold. Fl. Ju. Cl. 1791. Sh. pr.

124 M. **glaucescens** (Haw. syn. p. 236. rev. 120.) stems robust, decumbently prostrate; young leaves a little incurved, triquetrous, with the sides equal, soft, glaucous: with cartilaginous, smoothish margins; flowers solitary, sessile; stigmas 7. p. D. G. Native of New Holland. Branches furrowed at the top. Calyx 5-cleft. Petals pale purple.

**Glaucescens** Fig-marigold. Fl. July. Cl. 1804. Sh. pr.

125 M. **Rossii** (Haw. rev. p. 120.) stems decumbently prostrate; leaves aciciniform, or compressedly triquetrous, glaucous, with red, smooth, cartilaginous edges. p. D. G. Native of Van Diemen's Land. Flowers unknown. Very like *M. glaucescens*.

**Ross's Fig-marigold.** Cl. 1820. Shrub pr.

126 M. **abbevillanum** (Haw. in phil. mag. dec. 1826. p. 330.) plant tufted; stems short, coarse, and prostrate, crowded; leaves acutely triquetrous, thick, green, much longer than the internodes, which are short. p. D. G. Native of New Holland. This species comes very near to *M. glaucescens*, but the leaves are more crowded. Flowers not seen.

**Short-stemmed Fig-marigold.** Cl. 1823. Shrub pr.

127 M. **virens** (Haw. syn. p. 236. rev. 120.) stems decumbently prostrate; leaves triquetrous, with the sides nearly equal, greenish; peduncles terminal, solitary, 2-edged, winged; calyx 4-cleft; stigmas 5, filiform. p. D. G. Native of New Holland. Corolla showy, pale red; petals white at the base, and obtuse at the apex.

**Greenish Fig-marigold.** Fl. June. Cl. 1804. Shrub pr.

**Subdivisions IV. Pertolia A.** From per, through, and follicum, a leaf; stem running through the leaves. Haw. rev. p. 123. Usually erect shrubs, with erect or decumbent branches. Leaves opposite, connate, and sheathing at the base, usually triquetrous towards the top, and for the most part hooked at the apex. Flowers white, red, or reddish. Calyx 5-cleft. Stigmas 5.

§ 54. Forcicata (from forcis, a pair of scissors; form and disposition of leaves). Salm-Dyck. obs. p. 83.—*Forficata* Geminiata, &c. Haw. Stems stenodent; branches erect or decumbent. Leaves opposite, triquetrous, compressed, scissor-shaped, erect, with the carinal angle drawn out. Flowers reddish, solitary, on short peduncles. Calyx 5-cleft; petals very narrow. Stigmas 5, short, thick.

128 M. **heterophyllum** (Haw. misc. 67. syn. 294. rev. 128.) stem shrubby, short; branches crowded, ascending; leaves crowded, glaucous, compressed, triquetrous, rather aciciniform: with cartilaginous edges, and a jagged keel; petals unequal, shorter than the calyx, which is large and 3-horned; stigmas 5, very short. p. D. G. Native of the Cape of Good Hope. Willd. enum. suppl. 36. Petals white.

**Various-leaved Fig-marigold.** Fl. May, Aug. Cl. 1794. Shrub 1 to 2 feet.

129 M. **mutabile** (Haw. obs. 377. misc. 74. syn. 294. rev. 133.) stem shrubby, erect; branches 2-edged; leaves nearly distinct, crowded, triquetrous, dotted: with a cartilaginous, entire keel; petals subulate; stigmas 5, short, thick. p. D. G. Native of the Cape of Good Hope. Flowers reddish.

**Changeable Fig-marigold.** Fl. Jul. Sept. Cl. 1792. Sh. 1½ ft.

130 M. **glaucescens** (Haw. suppl. 97. rev. 132.) stem shrubby, erect; leaves much crowded, compressed, triquetrous, rather aciciniform, glaucous, entire, with subcartilaginous edges, a little dotted; petals subulate; stigmas 5, short, thick. p. D. G. Native of the Cape of Good Hope. Flowers reddish. Perhaps sufficiently distinct from *M. mutabile*.

**Glaucous Fig-marigold.** Fl. Jul. Aug. Cl. ? Shrub 1½ ft.

*White-edged-leaved Fig-marigold.** Cl. 1793. Shrub ½ ft.

132 M. **inclemens** (Haw. syn. 295. rev. 133.) stem shrubby; leaves triquetrous, rather deltoid, smooth, green, with a gibbous
136 FICOIDE.E. I. MESEMMERYANTHEMUM.

134 M. Geminatum (Haw. misc. p. 92. syn. 280. rev. 123.) stems suffrutescent, dwarf; branches dichotomous, ascending; leaves coarsely a long way, triquetrous, erect, glaucous, smooth, cartilaginous at the margins. ʒ. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably white.

Twin-shot Fig-marigold. Clt. 1792. Shrubb 1 foot.

Calyx 5-cleft. Stigmas 5.

135 M. Rostellatum (Haw. rev. 123.) stems branched, prostrate; leaves beaked, connate, semi-terete, subulate, recurved, dotted, green; peduncles claveate, bilabiate at the base; stigmas 5, spreading. ʒ. D. G. Native of the Cape of Good Hope. Calyx with 5 long lobes. Corolla expanded before meridian, whitish, tipped with red.

Calyx 5-cleft. Stigmas 5-7.

Var. ʒ. monacanthum (Brall. succ. f. 26.) keel of leaves furnished with only one tooth beneath.

Var. γ. cedileatum (Haw. rev. p. 125.) keel of leaves toothless. Burm. afr. t. 28. f. 3.

Perfoliate-leaved Fig-marigold. Fl. June, Aug. Clt. 1714. Shrubb 1 to 3 feet.

137 M. Uncinellum (Salsa-Dyck, in litt. and Haw. rev. p. 124.) stem shrubby, erect, with numerous branches; leaves connate and sheathing at the base, rather recurrent, triquetrous, thick, whitish, dotted, recurved at the apex; keel furnished with one tooth beneath. ʒ. D. G. Native of the Cape of Good Hope. — Dill. cthl. f. 239. Flowers reddish.

138 M. Semidentatum (Haw. suppl. 95. rev. 125.) stem shrubby, with simple striated branches; leaves connate and sheathing at the base, triquetrous, compressed, white, dotted; keel furnished with 1-4 teeth. ʒ. D. G. Native of the Cape of Good Hope. Salis-Dyck, obs. 1850. p. 9. Leaves 2 inches long. Flowers on short peduncles, reddish. Differs in the length of the leaves from M. perfoliatum.

139 M. Uncinatum (Mill. dict. ed. 8. no. 18.) stem shrubby; erect; leaves connate, and sheathing at the base, rather decurrent, green, dotted, triquetrous, furnished with 2 spines underneath at the apex. ʒ. D. G. Native of the Cape of Good Hope. Peduncles claveate, bilabiate, axillary. Calyx 5-cleft. Petals pale red, expanded both by night and by day.

141 M. Victoride (Haw. in phil. mag. Dec. 1826. p. 331.) plant depressed, stiff; branches crowded; leaves rather acuminated, white, with large dots; keel bearing one tooth near the top. ʒ. D. G. Native of the Cape of Good Hope. Leaves less perfoliate than any other of the section. Flowers not seen.

One-toothed Fig-marigold. Clt. 1824. Shrubb ½ to 1 foot.

142 M. Tumulatum (Haw. syn. p. 286. rev. 129.) stem erect, with spreading branches; leaves connate and sheathing at the base, remote, green, smooth, rather recurved at the apex; sheaths tundate at the top. ʒ. D. G. Native of the Cape of Good Hope. Leaves an inch and a half long. Flowers reddish.

Tufted sheathed Fig-marigold. Fl. March. Clt. 1802. Shrubb 2 feet.

143 M. Fuligulus (Haw. misc. 97. syn. 287. rev. 130.) stem erect, much branched; branches crowded, hardly erect; leaves connate and sheathing at the base, rather glaucescent, smooth, crowded, obtuse, ending in a rather recurved mucrone; sheaths thickened at the top. ʒ. D. G. Native of the Cape of Good Hope. Leaves an inch long. Petals reddish, with a deeper coloured line. Stigmas 5, expanded at length.

Leafy Fig-marigold. Fl. Sept. Clt. 1802. Shrub 2 to 3 ft.

144 M. Umbellatum (Lin. spec. 689.) stem erect, with erecely spreading branches; leaves connate and sheathing at the base, remote, nearly terete, and rather glaucescent, searros from dots, slender, recurved at the apex; sheaths tundate at the apex. ʒ. D. G. Native of the Cape of Good Hope. — Dill. cthl. f. 266. Haw. obs. p. 526. misc. 97. syn. 287. rev. 129. Leaves 1-2 inches long. Peduncles furnished with 2 bracteas. Flowers middle-sized, white.

145 M. Imbricatum (Haw. obs. p. 317. misc. 96. syn. 285.)
rev. 128.) stem and branches erect, subtetragenial; leaves connate and sheathing at the base, glaucous, remote, smooth, dotted, rather compressed, trigonous; calyx tubinate, much attenuated at the base. D. G. Native of the Cape of Good Hope. Peduncles bracteate even to the calyx. Corolla white, nearly an inch in diameter. Leaves nearly an inch long. 

Var. β, majus (Haw. syn. 285.) leaves green, an inch and a half long.

Imbricated-leaved Fig-margarild. Fl. July. Clt. 1792. Shrub 2 to 3 feet.

146 M. multiflorum (Haw. obs. p. 318. misc. 96. syn. 285. rev. p. 128.) stem and branches erect; leaves connate and sheathing at the base, remote, glaucous, somewhat compressed, trigonous, smooth, dotted; calyx cylindrical, hardly attenuated at the base. D. G. Native of the Cape of Good Hope. Peduncles bracteate even at the calyx. Flowers white, larger than those of M. imbricatum.—Plnt. phy: t. 117. f. 1.

Var. γ, rubrum (Haw. syn. 285.) flowers reddish; leaves greenish. Perhaps a proper species.

Var. ε, petens (Haw. l. c.) stem spreading; flowers solitary. M. petens, Willd. enul. suppl. p. 37.

Var. ω, nitens (Haw. l. c.) smooth; branches spreading; leaves green. Perhaps a proper species.

147 M. rigatum (Haw. misc. 95. syn. 283. rev. 127.) stem erect; branches very stiff, spreading a little; leaves connate, and sheathing at the base, horizontal, and are, as well as the sheaths, glabrous, but with the keel sebraous at the apex. D. G. Native of the Cape of Good Hope. Allied to M. feuilleum. Leaves 3 lines long. Peduncles bracteate nearly to the apex. Petals snow white, shining.

148 M. tendellum (Haw. obs. 315. misc. 94. syn. 283. rev. 127.) stem erect, bushy; branches filiform, decumbent; leaves connate and sheathing at the base, rather spreading, slender, and are, as well as the sheaths, sebraous at the margins. D. G. Native of the Cape of Good Hope. Flowers pinnate, snow white. Calyx 4-5-cleft. Stigmas 5, erect, subulate. Leaves 3 lines long, glau-}

Plum Fig-margarild. Fl. Aug. Clt. 1792. Shrub 1 foot.

149 M. cirtum (Haw. syn. p. 324. rev. 126.) stem erect, bushy; leaves connate and sheathing at the base, usually approximated, incurved, smooth, green, with the angles rough at the top. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably white.

Var. γ, minus (D. C. prod. 3. p. 432.) smaller in all its parts. M. hamatum, Willd. ex Haw. Perhaps a proper species.

Short-sheathed Fig-margarild. Shrub 1 to 1 1/2 foot.

150 M. acuta'sculum (Haw. in phil. mag. 64. p. 424.) stem erect, bushy; leaves connate and sheathing at the base, forming a kind of rectangle, trigonous, acuminate, incurved, green, with roughish margins. D. G. Native of the Cape of Good Hope. Allied to M. cirtum, but much more dwarf. Flowers unknown.

Acute-angled Fig-margarild. Clt. 1821. Shrub 3/2 to 1 foot.

151 M. vagnatum (Haw. misc. 95. syn. 284. exclusive of var. β, rev. 127. but not of Lam.) stem erect, bushy; leaves spreading, straight, remote, trigonous, rather recurved at the apex, and are, as well as the sheaths, green and glabrous, but

with the angles rough near the top. D. G. Native of the Cape of Good Hope. Flowers pinnate, white, small, numerous. Leaves an inch long.

152 M. fariniflorum (Haw. misc. 95. syn. 284. rev. 127. but not of Jacq.) stems and branches erect; leaves connate and sheathing at the base, glabrous, erectish; keel finely serrated. D. G. Native of the Cape of Good Hope. Peduncles bracteate even to the calyx. Corolla white, small. Leaves half an inch long.

Small-flowered Fig-margarild. Fl. Aug. Clt. 1800. Shrub 1 to 2 feet.

153 M. lineolatum (Haw. rev. p. 130.) stem short, depressed; branches spreading; leaves connate, incurved and a little recurved, obtuse, trigonous, with nearly equal sides, and having the keel roughish at the apex; sheaths with a short impressed line. D. G. Native of the Cape of Good Hope. Flowers small, terminal at the tops of the branches, solitary. Peduncles an inch long, compressed, smooth, bibracteate at the base. Calyx 5-cleft, wrinkled. Petals in one series, obtuse, reddish, with a deeper coloured middle line, expanded, rather incurved. Stamens collected; filaments white at the base, and reddish at the apex; anthers pale yellow. Styles 5, subulate, diverging in a stellate manner. This is rather an anomalous species, but it approaches nearest to the section Uncinata.

Var. γ, minus (Haw. l. c.) margins of leaves roughish.

Var. γ, nitens (Haw. l. c.) leaves shining, green.

preceding species, but smaller. Stigmas erect, hardly the length of the filaments. Capsule more depressed.

*Maricacate Fig-marigold. Fl. May. Clt. 1731. Sh. ½ foot.

* Flowers aggregate, reddish.

*a* "Lunate"-leaved Fig-marigold. Fl. July. Clt. 1812. Sh. 1 ft.

159 *M. falchoreum* (*Haw*. syn. 299. rev. 127.) stem suffrutico- us, at length decumbent; leaves much crowded, small, thick, falcate, acinaciform, glaucous, largely toothed; flowers somewhat fastigate. i. D. G. Native of the Cape of Good Hope. Flowers reddish, showy, an inch and a half in diameter.

* * Flowers solitary, rose-coloured or pale red.

163 *M. incurvum* (*Haw*. misc. p. 69, syn. 300. rev. 136.) stem suffruticosum, erect; branches slender, efluso, lefafs; leaves compressed, triquetrous, very glaucous, attenuated at both ends, acinaciform. i. D. G. Native of the Cape of Good Hope. Flowers pale red.

* Var. describe (Haw. syn. 300. rev. 137.) leaves gibbously dilated below, at length deflexed.
FICOIDE.E. I. MESEMERYANTHEMUM.

139

Var. β, revolutum (Haw. rev. p. 135.) branches second, recurved.

§ 32. Scabrida (a dim. of scaber, rough; rough or scabrous leaves). Haw. misc. 71.—Scabra, Salm-Dyck, obs. 27.—Asperifolia, Haw. rev. 138. Stems suffruticosum; branches expanded, flat-like. Leaves more or less triquetrous, rather compressed, scabrous from dots, usually a little incurred. Flowers pedunculate, reddish, middle-sized.

* Stamens collected.

171 M. scabrum (Lin. spec. 692.) stem shrubby, branched; leaves rather triquetrous, green, straight, very rough from shining warts; lobes of calyx ovate, acuminate; petals created at the apex; stamens collected. η. D. G. Native of the Cape of Good Hope.—Dill. eph. f. 251.—Haw. obs. 345. misc. 71. syn. 267. rev. 138. Flowers rose-coloured.

Var. β, purpureum; flowers purple.

Scabrous Fig-margold. Fl. July. Clt. 1731. Sh. 1 foot.

172 M. versicolor (Haw. misc. 71. syn. 268. rev. 139.) stem shrubby, branched; leaves almost triquetrous, glaucescant, scabrous from warts; lobes of calyx ovate, acuminate; petals somewhat bidentate at the apex; stamens collected. η. D. G. Native of the Cape of Good Hope. Petals variable, expanding in the heat of the sun, of a shining white or silvery colour, but when closed in the morning and evening they are pale reddish.

173 M. retroflexum (Haw. misc. 71. syn. 269. rev. 139.) stem suffruticosum; branches decrement; bark white; leaves rather triquetrous, very glaucous, scabrous; lobes of calyx retroflexed; petals distal; stamens collected. η. D. G. Native of the Cape of Good Hope. M. emarginatae, Haw. obs. 343. M. leptaleum, Haw. rev. 140. and perhaps M. elegans, Jacq. schornbr. 4. p. 18. which is referred to by the Prince de Salm-Dyck, and therefore it is M. deflexum of Salm-Dyck, obs. 27. but not of Hawthor. Petals reddish.

174 M. americana (Haw. suppl. p. 94.) stem erect, shrubby; leaves linear, obliquely triquetrous, smoothish, of a whitish glaucous-colour, imbricately crowded at the tops of the canescent branches. η. D. G. Native of the Cape of Good Hope. Flowers red. Said to be allied to M. retroflexum.

175 M. deflexum (Ait. hort. kew. 2. p. 187.) stems shrubby, rather crowded, deflexed; leaves rather triquetrous, glaucous, roughish, attenuated downwards; petals numerous, much imbricately; stamens collected. η. D. G. Native of the Cape of Good Hope. Haw. obs. 347. misc. 71. syn. 269. exclusive of the synonyms, rev. 140. There are two varieties of this species, the one having the petals pale reddish and purplish at the base, the other having the petals of a deeper colour.

* * Stamens expanded.

176 M. polyanthum (Haw. syn. 270. rev. 140.) branches bushy, expanded, crowded; bark on young stems fuscous; leaves small, glaucous, triquetrous, scabrous; flowers very numerous, panicled; petals imbricately. η. D. G. Native of the Cape of Good Hope. Flowers small, very pale red. M. flexile, Haw. rev. 141. is only a variety of this species in a younger state, which has been confirmed by Salm-Dyck.

Many-flowered Fig-margold. Fl. Aug. Clt. 1803. Shrub 1 to 1½ feet.

177 M. polyphyllum (Haw. rev. 141.) branches bushy, decumbent, assurgent; leaves much glomerated, rather robust, somewhat incurvedly recurved, clavately and bluntly triquetrous, compressed, scabrous from dots, glaucous. η. D. G. Native of the Cape of Good Hope. Flowers pale red. Stamens expanded, as in M. emarginatum. Like M. deflexum, but double the size.

178 M. violaceum (D. C. pl. grass. t. 84.) stem shrubby, erect; branches expanded; leaves triquetrously semi-terete, rough from dots, acute, glaucous; peduncles 1-flowered, naked or bracteate at the very base; lobes of calyx spreading, unarmed, but prickle-formed. η. D. G. Native of the Cape of Good Hope. Haw. rev. 141. M. parvifolium, Lam. dict. 2. p. 482. exclusive of the synonyms. M. punctatum, Jacq. schornbr. t. 442. Flowers flesh-coloured, expanding in the heat of the sun. Stamens not collected, but rather expanded.

179 M. emarginatum (Lin. spec. 692.) branches expanded; leaves triquetrous, scabrous, glaucescent; peduncles bibracteate; lobes of calyx unarmed, but spine-formed; petals deeply emarginated at the apex. η. D. G. Native of the Cape of Good Hope.—Dill. eph. f. 220.—Haw. obs. 340. misc. 70. syn. 268. rev. 142. Flowers pale red, like those of M. violaceum. Stamens expanded.

§ 33. Braeecta (braeectatus, bracteate; flowers girded by bracteae). Salm-Dyck, obs. 28. Haw. rev. 145.—Adonna Inclusa, Haw. syn. 288. Stamens erect; shrubby; branches much compressed. Leaves distinct, triquetrous, hooked at the apex, more or less scabrous from dots. Flowers girded by 2—4 broadly ovate keeled bracteae, which clasp the calyx, solitary, reddish, always expanded; inner petals thread-formed.

180 M. braeectatum (Ait. hort. kew. 2. p. 185.) stem shrubby; erect; branches compressed, of a reddish brown colour; leaves green, triquetrous; bracteae 4, broadly ovate, keeled, clasping the calyx. η. D. G. Native of the Cape of Good Hope. Haw. misc. 90. syn. 289. rev. 143. Lodd. bot. cab. 251. Petals reddish, white at the base.

181 M. aescens (Haw. syn. 289. rev. 143.) stem shrubby; branches decumbent, 2-edged, of a brownish canescent-colour; leaves acinaeiformly triquetrous; sides rather membranous below; dots large, pellucid, elevated. η. D. G. Native of the Cape of Good Hope. Flowers of a deep red colour.

Var. β, pallidum (Haw. rev. 143.) branches of a rufous corpaery colour; leaves rather incurved; petals pale reddish.

182 M. gracile (Haw. rev. 145.) stem shrubby; branches very slender, straight; leaves glaucescent, slender, rather scabrous; bracteae ovate, acute, almost clasping the calyx. η. D. G. Native of the Cape of Good Hope. M. stellatum, Haw. obs. 416. misc. 91. syn. 290. but not of D. C. There are varieties of this species with deep red, and pale red flowers.

183 M. radatum (Haw. obs. 232. misc. 90. syn. 289. rev. 144.) stem shrubby; branches crowded; bark canescent; leaves glaucescent, attenuated, and hooked at the apex; bracteae t 2
broadly ovate, clasping the peduncles above. v. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 249. Corolla reddish, larger than those of its allies.

184 M. compres'sum (Haw. obs. 326: not 416: misc. 91. syn. 239. rev. 145.) stem shrubby; branches rather compressed; leaves glaucous, tripetrous, with equal sides, very rough; bracts ovate, acute, clasping the tops of the peduncles. v. D. G. Native of the Cape of Good Hope. Flowers medium-sized, reddish. Perhaps M. compressum, Horn. hort. hafn. 2. p. 454, is the same species.

185 M. pa'tulum (Haw. syn. p. 334: rev. 145.) stem shrubby; branches hardly erect; leaves linear, half erect, glaucous, roughish from pellucid dots. v. D. G. Native of the Cape of Good Hope. This species comes near to M. compressum, but is less stiff, the leaves shorter and thicker, and the flowers are larger and paler.

186 M. as'perum (Haw. rev. p. 145.) stem shrubby; leaves compressed, tripetrous, longish, of a bluish green-colour, full of pellucid dots, very scabrous, hooked at the apex; keel furnished with one tooth. v. D. G. Native of the Cape of Good Hope. Flowers unknown. Perhaps this species does not belong to the present section.

Rough Fig-marigold. Clt. 1818. Shrub 1½ foot.

187 M. serrat'um (Lin. spec. 690.) stem erect, branched; leaves opposite, distinct, tripetrous, subulate, having the carinal angle serrated, with the serratures turned backwards. v. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 228. Flowers solitary, terminal, pedunculate. Calyx 5-cleft, attenuated at the base. Petals yellow, copper-coloured at the apex. Stigmas 5, short, obtuse, approximate. This species was formerly cultivated by Dillenius, but has now vanished from the gardens, and is therefore very little known.

Serrate-keeled Fig-marigold. Fl. June, July. Clt. 1707. Shrub 1 to 2 feet.

§ 34. Confôrtâ (from conferre, crowded thick together; branches). Haw. syn. 290. Salm-Dyck, obs. 29.—Eximia and Bländia, Haw. rev. 145-147. Stems shrubby; branches crowded, ascending. Leaves opposite, rather conuate, crowded, tripetrous, entire, acute, with the angles smooth. Flowers pedunculate, solitary or by threes, showy, expanding in the sun, reddish or pale rose-coloured.

188 M. am'num (Salm-Dyck in litt. ex D. C. prod. 3. p. 436.) stem branched, shrubby; leaves green, crowded, elongated, nearly tripetrous, bluntish, with a mucron; flowers terminal, showy, disposed by threes. v. D. G. Native of the Cape of Good Hope. Flowers red.

Pleasing Fig-marigold. Shrub 1 foot.

189 M. roûtânum (Haw. rev. 115.) stems suffruticoso, humpy; branches rather decumbent, elongated; leaves tripetrous, long, green, glittering in sunshine, much crowded, but more remote on the branches; flowers terminal, disposed by threes; stigmas 5-6, shorter than the filaments, rather lanceolate. v. D. G. Native of the Cape of Good Hope. Petals beautiful red, blunt.

190 M. spec'tâile (Haw. obs. 385: misc. 68. syn. 240. rev. 145.) stems rather humble; floriferous ones ascending or erect; leaves glaucous, tripetrous, and are, as well as the branches, crowded; stigmas 5, ovate, one-half shorter than the stamens, which are white. v. D. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 396. D. C. pl. grass. t. 153. Leaves rather connate, sometimes furnished with one tooth at the top of the keel. Flowers beautiful reddish, 2 inches in diameter.

191 M. cacatu'rum (Mee.) Haw. syn. 290. (Lin. rev. 146.) floriferous stems erect; leaves green, glittering in sunlight, tripetrous, and are, as well as the branches, crowded; stigmas lanceolate, length of the stamens. v. D. G. Native of the Cape of Good Hope. M. conspicuum, Spreng. nov. prov. 27, but the leaves are there said to be semi-terete. Flowers beautiful red.

192 M. tur'bu'tum (Jacq. hort. vind. t. 476.) stem shrubby, branched, diffuse; leaves glaucous, elongated, acute, tripetrous, crowded; flowers on long peduncles, reddish; ovariurn contracted into a neck beneath the calyx. v. D. G. Native of the Cape of Good Hope. Petals numerous, linear, spreading much. Salm-Dyck, in litt.

Turbinate Fig-marigold. Shrub 1 foot.

193 M. blàndum (Haw. suppl. 95. rev. 147.) stem shrubby; branches numerous, compressed, ascending; leaves compressed, tripetrous, crowded, narrow, acutish, smooth; peduncles equal, longer than the bracteas; stigmas 5, short, ramanteceous. v. D. G. Native of the Cape of Good Hope. Ker. bot. reg. 582. Lodl. bot. cab. 599. Flowers large, at first white, but at length rose-coloured or pale red. Branches of a rufous chestnut colour. There are varieties of this species with glaucous and green leaves.

194 M. cu'vifólium (Haw. rev. p. 47.) stem shruppy, branches robust, terete; leaves compressed, tripetrous, glaucous; peduncles elevate, length of bractees; petals incurved. v. D. G. Native of the Cape of Good Hope. Branches rufous or boy-coloured. Leaves twice the thickness of those of M. bländum, to which it is nearly allied, and the corolla is less open. It is, however, perhaps only a variety of it.

Curred-leaved Fig-marigold. Fl. Ju. Clt. 1818. Sh. 1½ ft.

195 M. tetra'gonum (Thum. prod. 91.) stem erect, tetragonal, shrubby; leaves e cylindrically trigonal. v. D. G. Native of the Cape of Good Hope. Haw. rev. 149. Corolla yellow. This species is omitted by Haworth.

Tetragonal-stemmed Fig-marigold. Shrub 1 foot.

196 M. stràctum (Haw. misc. 82. syn. 262. rev. 149.) stem woody, branched, very stiff, straight; leaves tripetrous, obtuse, expanded, glaucous, beset with large dots. v. D. G. Native of the Cape of Good Hope. This species grows 2 or 3 feet high in the gardens, but has never yet flowered. But from a specimen of it received from the Cape by Haworth, they are said to be showy and yellow.

Straight Fig-marigold. Clt. 1795. Shrub 2 to 3 feet.

197 M. cym'boforme (Haw. obs. 264. misc. 82. syn. 263. rev. 149.) stems suffruticoso; branches e erctissim, filiform, crowded; leaves tripetrous, boat-shaped, spreading, glaucous. v. D. G. Native of the Cape of Good Hope. Flowers unknown. Perhaps M. sessile, Thum. fl. cap. 419, belongs to this species, which Thumberg says has red flowers.

Boat-formed-leaved Fig-marigold. Clt. 1793. Sh. 1 ft.

198 M. molle (Ait. hort. kew. 2. p. 192.) branches crowded, 2-edged, decumbent; leaves spreading, turbidly tripetrous, firm, canescent, with the margins blunt, and lined with dots. v. D. G. Native of the Cape of Good Hope. Haw. obs.
misc. 83. syn. 201. rev. 149. Flowers solitary, red, small, and terminal.

199 M. Thunbergii (Haw. rev. p. 150.) stem decumbent, articulated; leaves coniate, trigonal, smooth, dotless, erect; flowers solitary, terminal. f. D. G. Native of the Cape of Good Hope. M. le'Ve, Thumb. fl. cap. 425. but not of Air. Flowers yellow. Calyx 4-cleft. Perhaps this species appears to be intermediate between M. aureum and M. cymboforme.

Thunberg's Fig-margiold. Shrub decumbent.

200 M. cymboforme (Haw. in phil. mag. 1824. vol. 64. p. 124.) stem shrubby, erectish; branches few, 2-edged, hoary; leaves trigonal, boat-shaped, pale green, beset with large dots. f. D. G. Native of the Cape of Good Hope. Flowers unknown. This species appears to be intermediate between M. aureum and M. cymboforme.

Boat-leaved Fig-margiold. Clt. 1822. Shrub 1 to 2 feet.

§ 56. Airaea (from aureus, of gold; in reference to the yellow flowers). Haw. rev. 148.—Æquatorvilà, Salm-Dyck, obs. 33.—Frequentiflora, Haw. syn. 263. exclusive of some species. Stems suffruticosum, and are as well as the branches erect. Leaves distinct, dotted, blunter or acutely triquetrous, elongated, glaucous. Flowers large, solitary, yellow, or copper-coloured, expanding in sun-shine. Stigmas thick.

Orange-coloured-flowered Fig-margiold. Fl. June, Aug. Clt. 1793. Shrub 1 to 2 feet.

Subdivision VI. Teretiuscula (a dim. of teres, cylindrical; leaves nearly cylindrical). Haw. rev. 150. Subshrubs. Leaves distinct, rarely connate at the base, nearly terete, without any papule. Calyx 5-cleft. Stigmas 5, except in one of the species, which vary to 7.

204 M. verruculum (Lin. spec. 696.) stem erect; leaves much crowded, very glaucous, cylindrical, hardly triquetrous, obtuse, and a little mucronate, sebaceous, longer than the internodes. f. D. G. Native of the Cape of Good Hope.—Dill. fl. 259. D. C. pl. gr. t. 56. Haw. obs. 260. misc. 81. syn. 258. rev. 155. Flowers small, yellow, subumbellate, expanding in the evening. The stigmas are said to be 5, but Dillenius has seen them varying from 5-7.

Warted Fig-margiold. Fl. May, Ju. Clt. 1731. Sh. 1½ ft.

§ 58. Creceia (from croceus, like saffron; colour of flowers). Haw. in phil. mag. aug. 1826. p. 128. Sub-shrubs with second branches. Leaves thick, of a bluish glaucous colour, semi-terete at the base, obsolescently triquetrous at the apex. Flowers terminal, solitary, small, or middle-sized, scentless, at first yellow, but as they become older change to a copper-colour. Peduncles succulent. Calyx succulent, unequal.

205 M. vultuum (Haw. in phil. mag. aug. 1826. p. 128.) leaves obtuse; flowers small; stem branched, erect, stiff, with the nodules tumid, and throwing out roots. f. D. G. Native of the Cape of Good Hope. This species comes very near M. verrucum, var. γ. florco-cróceus, but is taller, more slender, and more branched, and the leaves and flowers are much smaller. Corolla pale yellow, but becoming of a deeper colour as they fade.

Yellow-flowered Fig-margiold. Fl. June, July. Clt. 1820. Shrub 1 to 2 feet.

206 M. luteolum (Haw. l. c. p. 120.) leaves crowded, at the apex, and a little recurved; branches slender and dense; flowers small. f. D. G. Native of the Cape of Good Hope. M. le've, Thumb. prod. ? Flowers yellow, and more numerous than those of the last species. It differs from the last in the leaves and in the more dwarf stature.

207 M. croceum (Jacq. fragm. t. 11. f. 2.) stem erect; leaves crowded, semi-cylindrical, mealy, glaucous, bluish, shorter than the internodes, somewhat sebaceous; lobes of calyx somewhat unequal. f. D. G. Native of the Cape of Good Hope. Haw. rev. 156. Leaves evidently connate. Petals obtuse, copper-coloured.

Var. β. purpureo-creceum (Haw. obs. 257. misc. 81. syn. 259. rev. 155.) flowers copper-coloured, purple on the outside. M. insititum, Willd. enum. 336. Hardly distinct from the species, and ought probably to be joined with it, according to Salm-Dyck, in litt.

Var. γ. flavo-creceum (Haw. rev. 155.) flowers yellow on both sides, but as they fade become copper coloured.

§ 39. Tenuiflora (from tenuis, slender, and flos, a flower; slender flowers). Salm-Dyck, obs. 24. Haw. rev.—Frequentiflora, Haw. syn. 263. exclusive of the species. Stems shrubby; branches slender, effuse. Leaves opposite, distinct, nearly terete, rather triquetrous or somewhat compressed, without papule. Flowers solitary, pedunculate, expanding in the morning, yellow or scarlet. This section is nearly allied to Airaea.

208 M. cockiænx(eum (Haw. obs. 247. misc. 85. syn. 265. rev. 150.) stem shrubby, erect; leaves terete triquetrous, rather compressed, obtuse, glaucous; peduncles smooth at the base; lobes of calyx bluish, nearly equal. f. D. G. Native of the Cape of Good Hope. D. C. pl. gr. t. 83. Lodd. bot. cab. t. 1032. Curt. bot. mag. 59. M. bicolorânus minus, Haw. obs. 216. M. bicolórum coccieneum, Willd. spec. 2. p. 1059. Leaves shorter than in the following species. Petals scarlet on both surfaces. There are 2 varieties of this plant, the one with obtuse leaves and the other with acute leaves.

200 M. biocolor (Lin. spec. ed. 1. p. 485.) stem shrubby, erect; leaves rather triquetrous, acute, green; peduncles and calyces scabrous; calyceal lobes unequal. ʃ. D. G. Native of the Cape of Good Hope.—Dill. eth. f. 255. Haw. obs. 241. misc. 85. syn. 265. rev. 151. This species is usually confused with M. eccessum, but the leaves are longer and the petals are yellow inside and scarlet outside. Stigmas shorter than the filaments. There are 2 varieties of this plant, one with erect branches and the other with spreading branches.

210 M. inequalis (Haw. syn. 266. rev. 151.) stem shrubby, erectish; branches always decumbent; leaves rather triquetrous, deep green; fructiferous peduncles compressedly clavate; lobes of calyx very unequal. ʃ. D. G. Native of the Cape of Good Hope. Bradl. succ. t. 7. b. ex Haworth. Very like M. biocolor, but differs in the branches being effuse, the flowers being paler on the outside, and in the calyceal lobes being longer than the membranous.

211 M. tenutiforme (Lin. spec. 693.) stem shrubby, erectish; leaves semi-terete, rather compressed, subulate, green, glabrous, longer than the internodes; peduncles elongated, naked. ʃ. D. G. Native of the Cape of Good Hope.—Dill. eth. f. 236. D. C. pl. grass. t. 82. Bradl. succ. t. 9. Haw. obs. 239. misc. p. 86. syn. 267. rev. 151. Flowers of coppery red colour. There are varieties of this species with erect and procumbent stems.

212 M. varia (Haw. mis. syn. 85. syn. 266. rev. 152.) stem shrubby, effuse, rather decumbent; leaves somewhat triquetrous, compressed, glaucous, scabrous; lobes of calyx nearly equal. ʃ. D. G. Native of the Cape of Good Hope. Petals yellow, at length becoming reddish. There are varieties of this species with distant and crowded leaves and branches.

§ 40. Adulvium (from adunca, hooked; leaves hooked at the apex). Salm-Dyck, obs. 25. Haw. rev. 152.—Adulvium claudinum, Haw. mis. 87. Stems suffruticos, hardly half a foot high. Leaves nearly terete, subulate, usually incurved, acutely pointed. At the apex. Flowers solitary, expanding before meridian, and closing in the evening, small, reddish. Petals usually striated or white at the base.

213 M. spinifome (Haw. obs. 246. mis. syn. 87. syn. 291. rev. 152.) stem suffruticos, with erect branches; leaves cylindrical, subulate, spine-formed, erect, recurved at the apex; peduncles and keels of the bracteas rather scabrous. ʃ. D. G. Native of the Cape of Good Hope. Bark of branches dark. Flowers small, pale red, with the petals paler at the base.

214 M. subadiuncum (Haw. suppl. 96. ex rev. 152.). Leaves less hooked.

214 M. curvifolium (Haw. mis. p. 88. syn. 290. rev. 152.) stems suffruticos; branches firm, erectish, roughish, angularly compressed; leaves rather distant, expanded at the base, and incurvedly recurved at the apex. ʃ. D. G. Native of the Cape of Good Hope. Flowers numerous, middle-sized, pale red. Stigmas blackish. M. verrucosum, Willd. enum. suppl. p. 37. is referred to this species by the Prince de Salm-Dyck, but this is doubted by Haworth, who gives a different character to the plant.

215 M. flexifolium (Haw. suppl. 98. rev. 153.) stem suffruticos; branches filiform, compressed, flexuous, decumbent, crowded; leaves subulate, triquetrous, incurved below, recurved and rather flexuous above, and Haw. obs. 256. misc. 65. syn. 301. rev. 151. Axils usually bearing leaves, hence the metaphorical name of stipulatum, there being no stipules. Corolla light red, paler on the under side, 2 inches in diameter.

Stipulatum Fig-marigold. Fl. May, Ju. Clt. 1723. Sh. 1 ft.

221 M. Haworthii (Wild. enum. suppl. 36. Donn. hort. cant. ed. 6.) stem shrubby, erect; leaves crowded, compressedly cylindrical, attenuated at both ends, erect when young, but spreading and glaucous when old. (Salm-Dyck. in litt.) ʃ. D. G. Native of the Cape of Good Hope. Haw. syn. 302. rev.
154. Corolla purple, 2 inches in diameter. Bark of branches rufous or castaneous. Leaves distinct (ex Haw.), connate (ex Willd.), therefore perhaps there are 2 species confused.

_Haworth's Fig-margarid._ Fl. Ju. Jul. Clt. 1793. Sh. 1 ft. 222 M. _LEPIDUM_ (Haw. in phil. mag. 1826. p. 130.) leaves recurved at the apex, rather mucronate; segments of calyx acuminate, spreading, marcescent after flowering. § D. G. Native of the Cape of Good Hope. An erect, slender shrub. Leaves nearly as in _M. prostratum_. Flowers large, white, showy, opening before meridian, longer than the peduncles.

_Smooth Fig-margarid._ Fl. Jul. Sept. Clt. 1774. Sh. 1½ ft. 224 M. _CORALLINUM_ (Haw. rev. 154. but not of Thumb.) stem straight, much branched; leaves nearly terete, incurred, smooth, rather thicker in the middle, glaucous. § D. G. Native of the Cape of Good Hope. Very nearly allied to _M. hamorthii_, but the stems are one half taller and the flowers smaller (ex Salm-Dyck. in litt.). Bark dark and bay-coloured (ex Haw.).

_Corni-stemmed Fig-margarid._ Fl. May, June. Clt. 1820. Shrub 1 foot.

_Spinose Fig-margarid._ Fl. Ju. Sept. Clt. 1714. Sh. 1 ft. 226 M. _MICROSERUS_ (Haw. in phil. mag. 1829. p. 381.) stem shrubby, erect, straight; leaves glaucose, dotted, spreading, blantly triquetrous, mucronulate; flowers reddish, disposed by threes; peduncles permanent after flowering and spinose. § D. G. Native of the Cape of Good Hope._ M. _pulverulentum_, Willd. enum. 583. ex ill. Pr. Salm-Dyck.

_Subdivision VII. Papulosa (from papulosus, full of blisters; leaves beset with papulae)._ D. C. prod. 3. p. 140.—Papulosa-teretifolia, Haw. rev. p. 79. Shrubs, subshrub or herbs. Leaves opposite, very rarely alternate, distinct, nearly terete, or thick at one end, channelled above, narrow, more or less beset with glintering papille. Calyx 4-6, but usually 5-cleft. Stigmas just so many.

§ 43. _Barbata_ (from barbatus, bearded; points of leaves). _Salm-Dyck._ obs. 27. _Haw._ rev. 190.—_Barbifolia, Haw._ syn. 277. Stems suffruticosum, branched. Leaves nearly terete, distinct, rather papulous, thick, bearded at the apex by 3 pale hairs, which are 5-10, raged at the apex. Flowers flesh-coloured, rarely white, expanding in the sun. Calyx 5-8-cleft, with as many dark green tubercles on the torus. Stigmas 5-8.

227 M. _BARBATUM_ (Curt. bot. mag. t. 70.) stem erect; branches effusely proeminent; leaves rather remote, spreading, ending in 5-6 radiating hairs at the apex; base of calyx glabrous; lobes 5, nearly equal. § D. G. Native of the Cape of Good Hope.—Dill. elth. f. 234. _D. C. pl. grass. t. 28._ M. _barbatum_ a, Lin. spec. 691. M. _stelligerum_, Haw. syn. 278. rev. 190. but not of phil. mag. _M. barbatum_, Haw. phil. mag. 1824. p. 61. Tubercles 5, dark green within the flower. Stigmas 5. Flowers flesh-coloured.

_Beaned-leaved Fig-margarid._ Fl. June, Aug. Clt. 1705. Shrub ½ to 2½ feet.

228 M. _STELLIGERUM_ (Haw. in phil. mag. 1824. p. 61. but not of his syn.) branches proeminent, elongated; leaves remote, half erect, terminating in 5 radiating hairs at the apex; calyx glabrous at the base; lobes very unequal. § D. G. Native of the Cape of Good Hope. _M. barbatum_, Haw. syn. 277. rev. 190. but not of phil. mag. _Braddl. succ. t. 5._ Curt. bot. mag. 70. Perhaps merely a variety of _M. barbatum_.

_Start-bearing Fig-margarid._ Fl. May, Oct. Clt. 1793. Sh. ¼ to ½ foot.

229 M. _INTONSUM_ (Haw. in phil. mag. 1824. p. 62.) branches erectly decumbent, diffuse, hispid; leaves terminating in 10 radiating hairs at the apex; calyx girdled by a black beard. § D. G. Native of the Cape of Good Hope. Flowers reddish.

_Var. β, albus_ (Haw. l.c.) flowers at first white, but at length becoming reddish as they fade.

_Unshaped Fig-margarid._ Fl. July. Clt. 1824. Shrub ½ ft. 230 M. _BULBOSUM_ (Haw. in phil. mag. 1824. p. 428.) root tuberous; branches rather villous; leaves horizontal, crowded, terminating in 10 radiating hairs. § D. G. Native of the Cape of Good Hope. Root referrible to that of _M. tuberosum_, the rest of the plant comes nearest to _M. intonsum_. Flowers middle-sized, reddish.

_Bulbous-rooted Fig-margarid._ Fl. Aug. Clt. 1820. Sh. 1 ft. 231 M. _STALLATUM_ (Mill. dict. no. 14.) branches short, thick; leaves tufted, hoary, thick, scabrous from papulae, terminating in many radiating hairs at the apex, and ciliated at the base; greenish; peduncles very hairy; calyx hairy at the base, 6-8-lobed. § D. G. Native of the Cape of Good Hope._ D. C. pl. grass. t. 29.—Dill. elth. f. 235. M. _barbatum_ β, Lin. spec. 691. M. _hirsutum_, Haw. misc. 105. syn. 279. M. _stelligerum_, Haw. rev. 191. phil. mag. 1824. p. 62. but not of his syn. Flowers pale red.

232 M. _DESSUM_ (Haw. obs. p. 302. misc. 105. syn. 279. rev. 191. phil. mag. 1824. p. 62.) plant densely tufted; leaves semi-terete, scabrous from papulae, terminating in many radiating hairs, rather ciliated at the base, greenish; peduncles very hairy as well as the calyx, which is 6-cleft. § D. G. Native of the Cape of Good Hope.—Dill. elth. f. 226. without a flower. Sims. bot. mag. t. 1220. Old stem thick, branched, very short. Flowers expanding in the heat of the sun, purple, larger than those of _M. stelligerum_.

_Dense Fig-margarid._ Fl. May, Aug. Clt. 1732. Sh. ½ ft.

§ 41. _Echinata_ (from echiinatus, set with prickles; leaves). _Salm-Dyck._ obs. 27. _Haw._ rev. 189.—_Hipsofilla, Haw._ syn. 275. Stems suffruticosum, much branched. Leaves nearly terete, distinct, more or less hispid all over, as well as the branches. Lobes of calyx 5, leaf-formed. Corolla white or pale yellow. Stigmas 5.

233 M. _ECHINATUM_ (Ait. hort. kew. 2. p. 194.) stem erect, branched; leaves oblong-ovate, filled, rather triquetrous, gibbous, ramentaceous-echinatcd; lobes of calyx leaf-formed, unequal. § D. G. Native of the Cape of Good Hope.

Var. β, album (Haw. l. c.) flowers white.

Hedge-hog Fig-marigold. Fl. Jul. Oct. Clt. 1774. Sh. ½ to ¾ ft. 234 M. strumosum (Haw. rev. 190.) stems decumbent, branched; leaves crowded, depressely cylindrical, hispid all over; lobes of calyx nearly equal; root at length tuberous. γ. D. G. Native of the Cape of Good Hope. Corolla pale straw-coloured or white.

235 M. calyci'tum (Haw. rev. 187.) branches effuse; leaves cylindrical, rather filiform, obtuse, papillose; two of the calycine lobes are foliaceous, much exceeding the other three in length; stamens longer than the stigmas. γ. D. G. Native of the Cape of Good Hope. Flowers white.

Long-cylindrical Fig-marigold. Fl. Jul. Aug. Clt. 1819. Sh. 2 ft. 236 M. tuberculatum (D. C. in Pers. ench. 2. p. 44.) stems decumbent, much branched; branches ascending; leaves terete, acute, papillose, soft; branches, peduncles, and calyces hispid; calyx campanulate at the base; stamens hardly exceeding the stigmas. γ. D. G. Native of the Cape of Good Hope. M. hispidulum, Haw. suppl. 94. rev. 189. Petals rose-coloured, but purplish above, with a deeper-coloured middle line. There is also a variety of this with white flowers.

Tubercled Fig-marigold. Fl. Oct. Clt. 1818. Shrub dec. 237 M. attenuatum (Haw. rev. 188.) plant slender; branches decumbent, filiform; leaves semi-cylindrical, filiform, obtuse, or nearly terete, papillose; peduncles elongated; calyxes hairy at the base. γ. D. G. Native of the Cape of Good Hope. Petals at first white, or with a rose-coloured middle line, whence there is a rose-coloured circle in the flower.

238 M. striatum (Haw. obs. 280. misc. 188.) stem erect; leaves semi-cylindrical, subulate, papillose; calyx woolly; stamens collected, length of stigmas. γ. D. G. Native of the Cape of Good Hope. Capsule angular at the apex, with a spermatophorous tube.

Var. α, ruscum (Haw. rev. 188.) petals pale rose-coloured, with a deeper-coloured line in the middle.—Dill. clth. f. 281. Var. β, pallens (Haw. l. c.) petals white, each with a red line at the base. D. C. pl. grass. t. 132.

239 M. floribundum (Haw. misc. p. 100. syn. 274. rev. 157.) branches spreading, very numerous; leaves almost cylindrical, somewhat incurved, papillose, obtuse; calyxes hemispherical, beset with papillose pill; stamens not equalling the stigmas in length. γ. D. G. Native of the Cape of Good Hope. M. hispidum β, pallidium, Haw. obs. 373. Flowers numerous, pale red; with the petals white at the base.

Var. β, torquatum (Haw. rev. 187.) flowers fewer, larger and more remote; stamens exceeding the stigmas. According to Salub-Dyck this is not distinct from M. floribundum, which are both perhaps referrible to M. striatum, var. β.

Var. α, glauceosum (Salm-Dyck. in litt.) leaves glaucosecent. M. candens, var. α, minus, Haw. in phil. mag. dec. 1831. p. 422.

Var. β, viridescens (Salm-Dyck. in litt.) leaves greener; branches less elongated. M. candens β, viridescens, Haw. l. c.

Glittering Fig-marigold. Clt. 1820. Shrub pr. 241 M. hirtellum (Haw. obs. 284. exclusive of the synonyms, misc. 102. syn. 274. rev. 186.) stem erect, bushy; leaves crowded, cylindrical, very blunt, beset with glazing papule; calyx turbinated, beset with papillose pill; stamens equal in length to the stigmas. γ. D. G. Native of the Cape of Good Hope. Flowers larger than those of any other species of this section, showy; petals pale red, white at the base.

Var. β, minus (Haw. l. c.) plant not half the size of the species.

243 M. turfedulum (Haw. in phil. mag. Dec. 1851. p. 421.) shrub bushy; branches crowded, straightish, stiff, furfuraceous; leaves cylindrical, very blunt, and are, as well as the calyx, beset with obsolete crystalline papule; flowers small, numerous.

γ. D. G. Native of the Cape of Good Hope. Flowers terminating the branches, usually solitary, very pale red.

Furfuraceous Fig-marigold. Clt. 1826. Shrub 1 foot.

244 M. m'is'dium (Lin. spec. 691.) stem erect, bushy; leaves cylindrical, very blunt, green, glabrous, and covered with glazing papule, as well as the calyx, which is conical; stamens exceeding the stigmas. γ. D. G. Native of the Cape of Good Hope.—Dill. clth. f. 278. D. C. pl. grass. t. 66. M. hispidum α, Haw. obs. 277. M. hispidus, Haw. syn. 273. rev. 186. Flowers deep purple.

Hispid Fig-marigold. Fl. May, Oct. Clt. 1704. Sh. ½ to 1 ft. 245 M. subbispidum (Haw. in phil. mag. Dec. 1831. p. 421.) stem erect; branches and peduncles usually without hairs; leaves cylindrical, very blunt, and are, as well as the obconical calyx, glabrous, greenish, and covered with glazing papule. γ. D. G. Native of the Cape of Good Hope. M. hispidum β, platypetalum, Haw. rev. 186. Petals pale purple, whitish at the base, emarginate at the apex. Very like M. hispidum, but taller, less branched; but the branches are longer, more erect, and straight, and the flowers paler.

§ 46. Aspericalluma (from asper, rough, and caulis, a stem; stems rough). Haw. misc. 97. rev 182. Salm-Dyck. obs. 26. Stems shrubby, hardly a foot and a half high; branches filiform, scabrous. Leaves distinct, remote, nearly terete, glazing from papule. Flowers expanding before meridium; reddish or copper-coloured. Calyx 5-leaf. Stigmas 5, but in one of the species the calyx is 6-leaf, and the stigmas are 6.

* Flowers reddish.

246 M. pulvulcre'stum (Haw. obs. 265. misc. 89. syn. 272. rev. 185. but not of Willld.) stem erect; branches crowded; leaves cylindrically triquetrous, obtuse, dotted with white, powdery, scabrous; calyx 6-leaf. γ. D. G. Native of the Cape
papulose. ๑ D. G. Native of the Cape of Good Hope. Haw. obs. 25, misc. 58. (exclusive of the synonyme of Thunb.) syn. 234. rev. 178. but not of D. C. Flowers yellow.

Armed Fig-marigold. Fl. June, Aug. 1774. Sh. 1½ foot.

§ 48. Spinuliferum (from spinula, a little thorn, and fera, to bear; leaves, Virgating like little thorns, when old). Haw. rev. 176. Salm-Dyck, obs. 26. Stems suffruticose, usually stramose at the base; branches rather fleshy, papulose, when old they appear as if they were spiny from the permanent remains of the dried leaves. Leaves cylindriciform, papulose, opposite, somewhat channelled. Flowers expanding before meridian, fulvous or greenish red. Calyx 3-leaf. Stigmas 5.

263 M. Spinuliferum (Haw. obs. 266. and 443. misc. 57. syn. 232. rev. 176.) caudex and branches erect and thickened; leaves crowded, semi-terete, channelled, papulose; peduncles terminal, subumbellate. ๑ D. G. Native of the Cape of Good Hope. Corolla an inch in diameter, straw-coloured.

Spin-bearing Fig-marigold. Fl. Ju. Oct. Clt. 1794. Sh. 1 ft. 264 M. Longistylum (Haw. in phil. mag. Dec. 1824. p. 436.) branches few, procumbent, nodosely stramose at the base; leaves linear, channelled, and are, as well as the branches, papulose; old leaves permanent, long, hard, and spine-like; flowers usually solitary; peduncles strong, subclavate. ๑ D. G. Native of the Cape of Good Hope. Petals pale yellow or straw-coloured. Stigmas 5, erect.

265 M. Salmonium (Haw. rev. p. 176.) stems rather filiform, weak, elongated, prostrate; leaves linear, furrowed, longer than the internodes, beset with sordid papule; roots at length stramose above. ๑ D. G. Native of the Cape of Good Hope. Flowers trichotomous, small, at first, of a salmon colour, but afterwards becoming white inside. Stigmas 5, erect.

266 M. Canaliculatum (Haw. obs. 218. misc. 57. syn. 253. rev. 177.) stems procumbently prostrate, filiform; leaves linear-semiterete, covered with shining papule. ๑ D. G. Native of the Cape of Good Hope. Corolla pale rose-coloured. Old stems half a foot high.

Coarse Fig-marigold. Fl. Aug. Oct. Clt. 1774. Shrub 1 ft. 269 M. Telluriflorum (Jacq. fragm. t. 32. f. 3.) stems diffuse, weak, cinctuous; leaves semiterete, obtuse, channelled, spreading, beset with crystalline papule; flowers 1-2, terminal, on short peduncles. ๑ D. G. Native of the Cape of Good Hope. Petals linear-filiform, of a dirty red-colour.

270 M. Miitideum (Haw. obs. 412. misc. 57. syn. 243. rev. 177.) stem erect; branches slender, effuse, knotted; leaves semiterete, beset with glistering papule; flowers terminal, usually by threes. ๑ D. G. Native of the Cape of Good Hope. Flowers yellow. Salm-Dyck ex Spreng. nov. prov. 27. M. brachiatum, D. C. pl. grass. t. 129. M. pruiniosum, Thunbl. fl. cap. 425. ex Salm-Dyck and Spreng, but according to Haworth this species differs in the stem being decumbent, and in the branches being bent.

§ 49. Noctiflora (from noz, the night, and flos, a flower; flowers expanding at night). Haw. syn. 239. rev. 179. Salm-Dyck, obs. 25. Slender subshrubs, almost without leaves at the base, at length becoming thickened at the roots; with elongated branches. Leaves distinct, cylindriciform, glaucous, remote, doless, soon falling off. Flowers usually by threes, terminal, white, rose-coloured or straw-coloured on the outside, expanding in the evening. Calyx turbinate, 4-leaf. Stigmas 4.

271 M. Noctiflorum (Lin. spec. 688.) stems suffrutedicose; branches erect, with white bark; leaves rather remote, obsolescently cylindriciform, glaucous; peduncles alternately cymose. ๑ D. G. Native of the Cape of Good Hope. Haw. rev. 179. Lodd. bot. cab. 245.

Var. b. striatum (Haw. rev. 179.) but not of Wind. flowers white inside, and straw-coloured on the outside.—Dill. elth. f. 263.

Var. y. elatum (Haw. rev. 180.) leaves longer, semi-erect, from branches brownish-grey; leaves remote, nearly cylindriciform, glaucescent, exactly half erect; flowers by threes. ๑ D. G. Native of the Cape of Good Hope. M. striatun, Haw. obs. 252. (exclusive of the synonyme of Dillenius) misc. 63. syn. 261, but not of Wind. Flowers fulvous, but white on the inside. Ovarium top-formed. Perhaps distinct from the preceding species, according to the Prince de Salm-Dyck in lett.

Fulvous-flowered Fig-marigold. Fl. June, Aug. Clt. 1820. Shrub 1 to 2 feet.

272 M. Fulvum (Haw. rev. p. 180.) stem suffrutedicose; bark of branches brownish-grey; leaves remote, nearly cylindriciform, glaucescent, exactly half erect; flowers by threes. ๑ D. G. Native of the Cape of Good Hope. M. striatun, Haw. obs. 252. (exclusive of the synonyme of Dillenius) misc. 63. syn. 261, but not of Wind. Flowers fulvous, but white on the inside. Ovarium top-formed. Perhaps distinct from the preceding species, according to the Prince de Salm-Dyck in lett.

Fulvous-flowered Fig-marigold. Fl. June, Aug. Clt. 1820. Shrub 1 to 2 feet.

273 M. Clara (Jacq. hort. schenbr. t. 108.) stem erect, sparingly branched; leaves nearly terete, remote, horizontal; peduncles clavate, aggregate, cymose. ๑ D. G. Native of the Cape of Good Hope. M. deflatum, Haw. misc. 83. rev. 181. Flowers white.

Clavate-peduncled Fig-marigold. Fl. June, Aug. Clt. 1795. Shrub 1 to 2 feet.

§ 50. Geniculiflora (from geniculum, a little knee, and flos, a flower; from the flowers rising in the knees or forks of the branches). D. C. prod. 3. p. 445. Stems fusicose, erect. Leaves opposite, distinct, papulose, semi-terete. Flowers sessile in the forks of the branches, solitary, yellowish, exuding in the day time.

274 M. Geniculiflorum (Lin. spec. 688.) stem fusicose, erect; leaves distinct, semi-terete, papulose; flowers sessile and

§ 51. **Splendens** (from splendens, shining; in reference to the leaves, which are covered with glittering papule, which shine in the sun). D. C. prod. 3. p. 445.—Digitiflora and Crassuloides, Haw. rev. 170. and 172.—Tetraphis albidiflora, Salm-Dyck, obs. p. 23. Stems suffruticoso, branched, erect. Leaves opposite, distinct, somewhat cylindrical, when young furrowed above, beset with papillae more or less, which glitter in the sun. Flowers middle-sized, solitary, rarely by threes, white, expanding before meridian. Calyx generally 5-lobed, rarely 4 or 6-lobed, usually leaf-formed. Stigmas as many as there are calyx lobes. 275 M. **crassuloides** (D. C. prod. 3. p. 445) stem suffruticoso, branched, bushy; leaves crowded, rather ciliate; leaves crowded, thick, linear-lanceolate, channelled, almost without papule, green; flowers solitary; 3 of the segments of calyx membranous at the base, and 2 larger than the rest. \( \gamma \), D. G. Native of the Cape of Good Hope. M. crassuloides, Haw. rev. 170. Flowers expanding before meridian; petals 4 long, white, but at length becoming pale rose-coloured. Stigmas 5, which after anemization are very conspicuous above the anthers. **Crassula-like Fig-margoloid.** Fl. July, Aug. Clt. 1819. Sh. decumbent. 276 M. **incopitum** (Haw. suppl. 96. rev. 171) stem suffruticoso, branched, bushy; leaves crowded, rather papulose, erectly imbricating, semi-terete, firm, almost subulate; flowers by threes; peduncles clavate; lobes of calyx finger-shaped, acute. \( \gamma \), D. G. Native of the Cape of Good Hope. Plant half a foot high, pale green. Corolla snow white. Stigmas 5, ramotaceous, equal in length to the anthers. **Unadecked Fig-margoloid.** Fl. July, Aug. Clt. 1819. Sh. ½ ft. 277 M. **splendens** (Lin. spec. 689) stem shrubby, erect, much branched; leaves distinct, crowded, semi-terete, obtuse, spreading, somewhat recurved, dotted, rather papulose; flowers solitary; lobes of calyx finger-shaped. \( \gamma \), D. G. Native of the Cape of Good Hope.—Dill. elth. f. 260. D. C. pl. grass. t. 32. Haw. obs. 200. misc. 61. syn. 257. rev. 172. Flowers middle-sized, white, shining. Calyx 5-cleft. Stigmas 5, thick, but subulate at the apex. **Shining Fig-margoloid.** Fl. July, Aug. Clt. 1716. Sh. 1½ ft. 278 M. **sulcatum** (Haw. rev. p. 173) stem shrubby, erect; leaves crowded, linear-subulate, semi-terete, channelled, pale-green, adult ones expanded, semi-terete; lobes of calyx leaf-formed, acute. \( \gamma \), D. G. Native of the Cape of Good Hope. Flowers white. Stigmas 5, erect, not exceeding the stamens. Perhaps only a variety of M. **splendens**. **Furrowed Fig-margoloid.** Fl. Aug. Sept. Clt. 1819. Shrub 2 to 3 feet. 279 M. **acuminatum** (Haw. in phil. mag. 1824. vol. 64. p. 496) stem and branches erect; leaves crowded, semi-terete, acuminated, green; lobes of calyx 5, 2 of which are much more prolonged than the other 3. \( \gamma \), D. G. Native of the Cape of Good Hope. Allied to M. sulcatum, but differs from all the species of this section in the lobes of the calyx being very unequal. Corolla white, expanding before meridian. **Acuminated-leaved Fig-margoloid.** Fl. Aug. Sept. Clt. 1820. Shrub 1 to 2 feet. 280 M. **aldicauale** (Haw. in phil. mag. Nov. 1826. p. 331) stem and branches erect, slender, and whitish; leaves subulate, green, semi-terete, a little recurved, and mucronulated at the apex. \( \gamma \), D. G. Native of the Cape of Good Hope. Flowers white. Like M. acuminatum in habit, but three times smaller. **White-stemmed Fig-margoloid.** Fl. Aug. Sept. Clt. 1824. Shrub 1 foot. 281 M. **flexuosum** (Haw. misc. p. 61. syn. 257. rev. 172) stem suffruticoso, and is, as well as the branches, flexuoso, slender, and shining; leaves crowded, flexuously incurved, very green, semi-terete; lobes of calyx finger-shaped. \( \gamma \), D. G. Native of the Cape of Good Hope. Flowers white, reddish on the outside. Stigmas 4-5. **Flexuous-branched Fig-margoloid.** Fl. July, Aug. Clt. 1795. Shrub ½ ft.

§ 52. **Juncus** (from juncus, like, a bull-bush, slender; stems). Haw. rev. p. 175.—Articulata, Salm-Dyck, obs. p. 24. Stems suffruticoso or herbaceus, rather erect; branches slender, green. Leaves opposite, distinct, small, linear-subulate, slender, deciduous when dry, whence the stems appear to be articulated from the cicatrizes of the fallen leaves. Flowers small, pedunculate, white or reddish. Calyx 4-cleft. Stigmas 4. 283 M. **juncus** (Haw. misc. 175. syn. 255. rev. 59) stem shrubby, much branched; branches articulated, filiform; leaves subulate, semi-terete, acute, remote; flowers terminal, dichotomous; lobes of calyx 4, very unequal. \( \gamma \), D. G. Native of the Cape of Good Hope. Corolla small; petals reddish, but whitish at the base. Stigmas 4, erect, a little longer than the filaments. M. aphylum, Hort. M. articulatum, Thumb. fl. cap. 415. 7. **Rusby Fig-margoloid.** Fl. Aug. Oct. Clt. 1800. Sh. 1 ft. 286 M. **granulicauale** (Haw. in phil. mag. 1824. vol. 64. p. 424) stem very slender, suffruticoso; branches terete, dotted from numerous grains; leaves very narrow, obtuse, glaucous, semi-terete, longer than the internodes. \( \gamma \), D. G. Native of the Cape of Good Hope. Flowers unknown.
Granular-stemmed Fig-marigold. Clt. 1820. Shrub 1½ foot.

287 M. micranthuim (Haw. syn. 257. rev. 174.) stem suffruticose, slender, much branched; leaves linear, keeled, dotted, distinct; peduncles 1-flowered; calyx 4-cleft, having 2 of the lobes very long, and 2 very short. G. D. Native of the Cape of Good Hope. M. parviflorum, Jacq. hort. schenckbr. 3. t. 278. but not of Haw. Corolla small, snow-white, shorter than the calyx. Stigmas 4, spreading.

Small-flowered Fig-marigold. Fl. June, July. Clt. 1804.

288 M. teu'me (Haw. rev. p. 175.) stem suffruticose; branches effuse, very slender, rather second, articulated; leaves linear, ciliolled, erect, very slender. G. D. Native of the Cape of Good Hope. Leaves hardly half an inch long. Flowers unknown. Perhaps different from M. micranthum.

Weak Fig-marigold. Clt. 1819. Shrub 1 foot.

289 M. rapa'cum (Jacq. fragm. 43. t. 52. f. 1.) root tuberous; stem herbaceous; branches terete, and somewhat articulated; leaves distinct, terete, obtuse, dotted, spreading much; peduncles 1-flowered; lobes of calyx filiform; stigmas 5, spreading. G. D. Native of the Cape of Good Hope. Flowers snow white, 9-10 lines in diameter. Lobes of calyx nearly equal, or very unequal.

Turnip-like-rooted Fig-marigold. Pl. 1 foot.

§ 33. Nodiflora (from nodus, a knot, and flos, a flower; flowers rising from the knots of the stem, or axils of the leaves). D. C. prod. 3. p. 446.—Cylindracea, Haw. rev. 163. Salm-Deyck, obs. 15. Roots annual. Stems herbaceous, branched. Leaves nearly terete or linear, thick, opposite, rarely alternate, papulose. Flowers axillary, nearly sessile. Calyx 5-lobed, exceeding the petals, which are small and white. Stigmas 4-5.

290 M. sordi'torum (Lin. spec. 687.) stem erectish; leaves opposite and alternate, nearly terete, obtuse, ciliated at the base; flowers axillary, nearly sessile; lobes of calyx very unequal, exceeding the petals, which are small. G. D. Native of Egypt, Barbary, Corsica, and Naples, in sandy places by the sea side. D. C. pl. grass. t. 88. Smith, pl. grce. t. 480.—Moris. hist. sect. 5. t. 37. f. 7.—Haw. rev. 166.—Column. cephr. 2, t. 73. This species is often confused with the two following. Perhaps the calyx is 4-cleft, as mentioned by Haworth, but in some plants which have been examined it has been found to be 5-cleft.

291 M. Coticu'm (Lin. spec. 688.) stem nearly erect; leaves distinct, semi-terete, papulose; flowers sessile in the forks of the branches; calyx 5-cleft, exceeding the petals, which are small.

Coptic Fig-marigold. Pl. 1 foot.

Apetal us Fig-marigold. Fl. July, Aug. Clt. 1774. Sh. pr. 293 M. caud'u'm (Ait. hort. kew. 2. p. 179.) leaves semi-terete, filiform, distinct, best with ovate papule; flowers lateral, sessile, terminal, girded by a pair of leaves. G. D. Native of the Cape of Good Hope. The rest unknown.

300 M. crystallinum (Lin. spec. 688.) plant diffusely procumbent, herbaceous, covered with large glittering papule on every part, which makes the plant appear as if covered with ice; leaves ovate, alternate, stem-clasping, undulated; flowers axillary, almost sessile. O. H. Native of the Cape of Good Hope, Canary Islands; and of Greece, about Athens, in the sand by the sea side. Smith, fl. gracc. t. 481.—Dill. clth. f. 22. Bradd. succ. t. 48. D. C. pl. grass. t. 128. Haw. misc. 43. Flowers white. There are two varieties of this plant; one a biennial, which is said to be the true M. crystallinum; and the other an annual, which is the common ice-plant of the gardens, which is called by Haw. M. glaciate. The whole plant is covered with glittering white papule, that shine in the sun, whence it is called ice-plant; others name it the diamond-plant.

Crystalline Fig-marigold or Ice-plant. Fl. May, Aug. Crit. 1775. Pl. procumbent.

301 M. calycinum (Haw. misc. 44. rev. 157.) leaves alternate, ovate, petiolate, undulated; petals minute. O. H. Native of the Cape of Good Hope.—Petiv. gaz. t. 88. f. 5. M. crispatum, Haw. obs. 470. Flowers reddish. This species is hardly known.

Carved-leaved Fig-marigold. Pl. pr.

302 M. pinnatifidum (Lin. fl. suppl. 260.) stems diffuse; leaves opposite, oblong, bluntly pinnatifid, papule; petals shorter than the calyx. O. H. Native of the Cape of Good Hope, and also said to be a native of Chili. Curt. bot. mag. t. 67. D. C. pl. grass. t. 142. Haw. obs. 112. misc. 44. syn. 244. rev. 157. Stems reddish, papule. Petals small, yellow in one series. Stigmas 5, ascending. Flowers small in the forks of the branches, pedunculate.

303 M. sessiliflorum (Ait. Hort. kew. 2. p. 193.) branches divaricate; leaves flat, spatulate, and are, as well as the stems, beset with papule; flowers sessile. O. H. Native of the Cape of Good Hope. Flowers yellow. Haw. syn. p. 247. Var. β, album (Haw. rev. 158.) flowers white; leaves ovate, petiolate; upper ones alternate; flowers paniced, small. D. G. Perhaps a proper species, but is not sufficiently known. Sessile-flowered Fig-marigold. Fl. July. Crit. 1774. Pl. pr.

Var. β, rosæm (Haw. rev. 159.) flowers reddish; leaves lanceolate-spatulate.

Lance-leaved Fig-marigold. Pl. ½ foot.

306 M. papuliferum (D. C. prod. 3. p. 418.) stem very short; branches almost radical, somewhat fastigate, gradually thickened, and are as well as the leaves and calyces beset with papule; leaves connate, ovate; flowers terminal, sessile, 1-3 together; calyx 5-cleft. O. H. Native of the Cape of Good Hope, on hills in very dry places. M. fastigiatam, Thunb. fl. cap. 413. but not of Haw. Flowers white. Lobes of calyx purple. This species differs from M. réctum of Haw. in being annual, not shrubby.

Papule-bearing Fig-marigold. Pl. ½ to ¾ foot.

307 M. papulosum (Lin. fl. suppl. 259. exclusive of the synonymes) branches decumbent, terete; leaves opposite, spatulately oblong, papule; flowers pedunculate, rising from the forks of the stem; lobes of calyx linear. O. H. Native of the Cape of Good Hope. Haw. misc. 48. rev. 158. Corolla yellow, hardly longer than the calyx.

Papule Fig-marigold. Pl. dec.

308 M. clandestinum (Haw. in phyl. mag. aug. 1829. p. 128.) branches procumbent, papule; leaves acutely ovate, petiolate; flowers usually terminal, solitary or by threes, on a terete, elevate peduncle; petals very small. D. G. Native of the Cape of Good Hope,

309 M. pubèrulorum (Haw. in phyl. mag. sept. 1831. p. 419.) stems branches, procumbent, papule; floriflorous branches and margins of leaves pubescent; leaves opposite or alternate, obovate-spatulate, channelled, keeled; peduncles subbyindrical. O. D. G. Native of the Cape of Good Hope. Very like M. papulosum. Flowers white.

310 M. angulatæum (Thunb. fl. cap. 426.) stem herbaceous, decumbent, angular, branched; leaves opposite, obovate, sessile, papulo; calyx 5-cleft, angular. O. H. Native of the Cape of Good Hope. Flowers yellow, as in M. papulosum, but the stems are angular, not terete. The stems are angular, however, in M. Altonis, but the flowers are pale red, not yellow.

Angular-stemmed Fig-marigold. Pl. pr.

311 M. Altonis (Jacq. hort. vind. t. 7.) branches decumbent, angular; leaves opposite or alternate, ovate-spatulate, papule; pedicels short; calyxes angular. D. G. Native of the Cape of Good Hope. Haw. misc. 48. rev. 158. Flowers expanding in the evening, pale reddish, about the size of those of M. cordifólium. Lobes of calyx very unequal. Stigmas 5, erect, recurved at the apex.

Aiton's Fig-marigold. Fl. June, Crit. 1774. Pl. pr.

314 M. Varians (Haw. misc. p. 51. syn. 249. rev. 168.) branches prostrate; leaves opposite, lanceolate, acuminate, keeled, hence they are bluntly trinerved and channelled; peduncles very thick. \( \text{r. D. G.} \) Native of the Cape of Good Hope.—Pet. gaz. t. 78. t. 10. The whole plant is beset with papillose. Calyx 4-6-cleft. Corolla white on the outside and yellow on the inside; but according to Haworth it is white, and according to Petiver yellowish. Stignas 5, short.

316 M. concavum (Haw. rev. 168.) stem procumbent; leaves concave, ovate-lanceolate, acute; thick: flowers terminal, solitary. \( \text{r. D. G.} \) Native of the Cape of Good Hope.—Burm. sfr. dec. 3. t. 26. f. 1. Flowers yellowish. This is a very doubtful species.

Concave-leaved Fig-marigold. Shrub pr.

317 M. pallens (Ait. hort. kew. 2. p. 182.) stems diffuse; leaves stem-clasping, distinct, glaucous, oblong-lanceolate; in- flexedly concave, bluntly keeled, beset with minute papillose; lobes of calyx 5, ovate-oblong. \( \text{r. D. G.} \) Native of the Cape of Good Hope, Haw. obs. 197. misc. 52. syn. 250. rev. 168. M. expansum, D. C. pl. grass. t. 47. M. articulatum, Thumb. fl. cap. 411.7. Corolla white, rather longer than the calyx (ex D. C.), but according to Haworth shorter than the calyx.

Pale Fig-marigold. Fl. July, Aug. Cl. 1774. Sh. diffuse.

318 M. loratum (Haw. rev. 168.) stems diffuse; leaves lorate, cuneiformly-inflexed, obtuse, very glaucous, convex beneath; lobes of calyx oblong, attenuated, obtuse. \( \text{r. D. G.} \) Native of the Cape of Good Hope. Flowers white. Perhaps only a variety of \( \text{M. pallens.} \)

319 M. crassicaule (Haw. in phil. mag. 1824. p. 425.) canden very short and thick; branches expanded; leaves crowded, flat, lorate, acuminate, green, glabrous, a little incurved; peduncles furnished with 4-5 bracteas; lobes of calyx 5, one of which is smaller than the rest. \( \text{r. D. G.} \) Native of the Cape of Good Hope. Flowers pale yellow, expanding before meridian. Stignas very short.

Thick-stemmed Fig-marigold. Fl. May, July. Cl. 1815. Pl. 1/4 foot.

320 M. relaxatnm (Willd. enum. suppl. p. 36.) stems decumbent; terete, flexuose; leaves linear-lanceolate, obtuse, of a vivid glaucous colour, channelled, dotted from papillose, costately keeled; lobes of calyx 5, foliaceous, one of which is very small. \( \text{r. D. G.} \) Native of the Cape of Good Hope. Spreng. nov. prov. 28. Haw. rev. 169. Flowers purple (ex Willd.), rose-coloured (ex Spreng.), reddish or nearly scarlet (ex Haw.).

Relaxed Fig-marigold. Fl. July, Aug. Cl. 1815. Sh. dec.

321 M. anatonicum (Haw. misc. 50. syn. 249. rev. 168.) stems filiform, procumbent; leaves opposite, lanceolate-elliptic, full of crystalline papillose, when dead the nerve alone remains permanent. \( \text{r. D. G.} \) Native of the Cape of Good Hope.

Var. \( \beta. \) frangile (Haw. rev. 169.) leaves large, concave, greener than the species.

Var. \( \gamma. \) emeridium (D. C. prod. 3. p. 450.) stems erectish. M. emeridium, Thumb. fl. cap. 415. Perhaps a proper species.

322 M. ovatum (Thumb. fl. cap. 417.) stem decumbent, rather angular, papillose; leaves ovate, flat, obtuse, spreading; flowers terminal. \( \text{r. D. G.} \) Native of the Cape of Good Hope. Haw. rev. 170. Flowers white.

Ovate-leaved Fig-marigold. Shrub dec.

323 M. humifusum (Ait. hort. kew. 2. p. 179.) stems suffruticose, trailing; leaves stem-clasping, spatulate, keeled, scarious from conical papillose; petals very minute. \( \text{r. D. G.} \) Native of the Cape of Good Hope. Corolla white. The rest unknown.

324 M. tripolium (Lin. spec. 659.) stems herbaceous, loose, simple; radical leaves flat, crowded, rameal ones alternate; lanceolate, dotless, almost destitute of papillose; flowers pedunculate; calyx pentagonal, 5-cleft. \( \text{r. D. G.} \) Native of the Cape of Good Hope.—Dill. elth. f. 220.—Pluk. mant. 329. f. 4. Haw. obs. 152. misc. 49. syn. 247. rev. 167. Flowers middle-sized, white. There is no ally to this species, according to Haworth.

Var. \( \beta. \) glabrum (Haw. rev. p. 160.) plant more glabrous and naked; upper leaves a little ciliated; petals longer than the calyx. \( \text{r. D. G.} \) Andr. bot. rep. t. 57. Haw. misc. 44. but not of \( \text{Ait.} \) Perhaps a proper species.

326 M. helianthoides (Ait. hort. kew. 2. p. 198.) leaves flat, spatulate, smooth; peduncles very long; calyces flat and angular at the base; stigmas usually 10, connate at the base. \( \text{r. D. G.} \) Native of the Cape of Good Hope. Haw. rev. 161. Flowers yellow.

327 M. calendulaceum (Haw. rev. 161. but not of his misc.) leaves linear-lanceolate, hardly spatulate, ciliated; peduncles scarious; petals about equal in length to the lorately-linear, thick, ciliated, calyctic lobes; ovarium sparingly pubescent. \( \text{r. D. G.} \) Native of the Cape of Good Hope. Stem much branched. Hairs on the ovarium or tube of the calyx white and short. Flowers yellow. The rest unknown.

328 M. flaccidum (Jacq. hort. vind. t. 475.) leaves lanceolate, acute, flat, glabrous, quite entire; peduncles 1-flowered, erectish, glabrous, very long. \( \text{r. D. G.} \) Native of the Cape of Good Hope.
of Good Hope. Petals linear, acute at both ends, yellowish. Styles 5. Root biennial (ex Salan-Dyck. in litt.).

**Ficoidae. I. Mesembryanthemum. II. Tetragonia.**

151. Sterile petals.

331. M. glabrum (Ait. hort. kew. 2. p. 198.) leaves petiole, spatulate-lanceolate, dilated at the base, and are as well as the branches glabrous; base of calyx hemispherical, with linear, unequal lobes; stigmas usually 12, united into a tube at the base. G. D. G. Native of the Cape of Good Hope. Hymenogynia glabra, Haw. rev. 192. Corolla straw-coloured; petals rufescent at the base; sterile filaments copper-coloured. Habit almost of M. Candollii. Seeds winged.

† Species not sufficiently known.

332. M. Humile (Haw. misc. 80. rev. 192.) stems prostrate; leaves triquetrous, subulate; calyx 4-cleft. G. D. G. Native of the Cape of Good Hope. Leaves opposite, or probably ternate.

Var. a. räbrum (Haw. l. c.) flowers red.—Petiv. gaz. t. 83. f. 8. Haw. obs. 471.

Var. ß. luteum (Haw. l. c.) flowers yellow.—Petiv. gaz. t. 88. f. 8. Humble Fig-marigold. Pl. prostrate.

Tree-formed Fig-marigold. Shrub 1 to 2 feet.

Field Fig-marigold. Shrub 1½ foot.

335. M. luteifolium (Haw. obs. 470. misc. 49. rev. 157.) root fusiform; stem very flexuous; leaves opposite, cuneately obovate. G. D. G. Native of the Cape of Good Hope.—Petiv. gaz. 83. f. 4. Anthers and petals purple. Perhaps a species of Othôna.

Laurel-leaved Fig-marigold. Pl. 1 foot?

336. M. ciliatum (Ait. hort. kew. 2. p. 170.) leaves opposite, connate, semi-terete; stipulas membranous, reflexed, jagged, in the form of cilia. G. D. G. Native of the Cape of Good Hope. Corolla white. The rest unknown. Stipulas in all other species of Mesembryanthemum are wanting; it is then probably a species of Arctemia.

Ciliated-stipuled Fig-marigold. Clt. 1774. Pl. ¼ foot.

337. M. coriaceum (Burch. cat. geogr. 2487. ex trav. 1. p. 242.). G. D. S. Native of the Cape of Good Hope, where it is used in tanning leather. Said to be allied to M. unciniatum.

Hide Fig-marigold. Shrub

338. M. villosum (Lin. spec. 695.) stem shrubby, thickened at the base; branches prostrate; leaves connate, linear, semi-terete, channelled, pubescent; peduncles trichotomous; flowers apetalous. G. D. G. Native of the Cape of Good Hope. Haw. obs. 222. and 441. misc. 58. syn. 254. rev. 125. Calyx 5-cleft, purplish inside. Capsule fleshy, 5-6-celled. Perhaps a species of *Aizoon, Tetragonia*, or *Sesitrium*, but the description is not sufficient to decide this point.

Villous Fig-marigold. Shrub prostrate.

339. M. graminifórmis (Haw. misc. 82. syn. 263. rev. 149.) stems expanded, short, suffruticose; leaves distinct, rather triquetrous, ovate grain-formed; stamens collected. G. D. G. Native of the Cape of Good Hope. Bradl. succ. t. 20. Stems 3 inches high. Leaves 3 lines long. Flowers yellow, expanding in the evening. This species is entirely unknown at the present day, having been only known to Bradley. According to Haworth's opinion, it comes in section *Cyanoflorum*.

**Cult.** This is a vast genus of what are called succulent plants, that is, fleshy-leaved plants. The shrubby kinds should be grown in pots, in a very sandy or gravelly soil; they should be kept almost quite dry, while in a dormant state, but when growing freely and in the flowering season, they require a considerable supply of water. The poorer the soil is, the more dwarf the plants will grow, and bear flowers more abundantly. The shelves in a greenhouse are a good place to preserve them through the winter, however, a good dry frame will answer the purpose equally well, if not better, with a covering of mats in frosty weather. Cuttings of all of them strike root readily, if planted in pots of the same kind of earth recommended for the plants, and kept dry till they begin to wither, when they may have a little water given to them; and under this treatment they will root very soon. There are also several annual and biennial kinds, most of them handsome and curious. The seeds of these should be sown in pots early in spring, and raised in a frame, hot-bed, or greenhouse; and when the plants are of sufficient size, plant them singly in small pots, and set them in the greenhouse, until the warm weather commences, when they may be set out of doors along with the shrubby kinds, where they will flower and seed freely, if the summer proves fine. The same soil and treatment recommended for the shrubby kinds will also suit these well. The ice-plant, *M. crystalllum*, and also *M. pinnafloridum* do well if planted out on rockwork or among stones, where they will make a very curious appearance.

II. **TETRAGOНИA** (from *τετρα, tetra*, four, and *γώνια, gonia*, an angle; fruit of some of the species). Lam. gen. no. 627. Germ. fruct. 2. t. 127. and 179. Lam. ill. 437. D. C. prod. 3. p. 451.—Tetragonocarpus, Commel.

**Lin. syst.** *Iosindria*. *Tri-Otography*. Calyx 4-cleft, rarely 3-cleft, with the tube adhering to the ovarium, and 4-5-horned; lobes coloured on the inside. Petals wanting. Stamens variable in number. Ovarium 3-8-celled. Styles 3-5, very short. Nut bony, winged, or horned, indehiscent, 3-8-celled inside. Seeds solitary in the cells.—Herbs or sub-shrubs. Leaves alternate, flat, fleshy, undivided, usually quite entire. Flowers axillary, pedicellate, or sessile.

**Sect. 1.** **Tetragonoïdes** (altered from *Tetragonia*). D. C. prod. 3. p. 452. Stamens in fascicles, or solitary in the recesses of the calyx. Nuts usually horned.—Annual or biennial herbs. Flowers sessile or on short pedicels. Horns of calyx sometimes bearing acaceous flowers.

I. **EXPÁNSA** (Ait. hort. kew. 2. p. 178.) herbaceous leaves petiole, ovate-rhomboid; flowers sessile; fruit 4-horned, 6-8-seeded. G. D. II. Native of New Zealand and Japan, also of
Chili, about Conception, and Valparaiso. Murr. comm. goetz. 1783. t. 5. Sower inst. t. 14. D. C. pl. grass. t. 114. T. cornuta, Gearing. fruit. p. 179. f. 3. T. Japonica, Thumb. jap. 208. T. halimifolia, Forst. prod. p. 223. Roth. abb. t. 8. Demidovia tetragonoids, Pall. horl. dem. t. 1. Stamens 4-5 in each fascicle, 1 fascicle in every recess of the calyx. From all the species this differs in the cells of the pericarp being double the number of calycine lobes, not equal to them in number, as in the rest of the species. The New Zealand spinach is a spreading, rather prostrate plant, with yellow flowers, and leaves an inch and a half long. The whole plant is studded with very minute crystalline dots. It is a native of New Zealand, by the sides of woods, in musky sandy places, and though not used by the inhabitants, yet, being considered by the naturalist who accompanied Cook, as of the same nature as the Chenopodium, it was served to the sailors boiled every day at breakfast and dinner. It was introduced to this country by Sir Joseph Banks in 1772, and treated as a greenhouse plant; but it has been found to grow in the open garden as freely as the kidney-bean or nasturtium, and has been used as a spinach plant. In the Earl of Essex's family, at Cashmore, no other spinach was used during the whole summer of 1821, and it is now commonly cultivated for that purpose. It grows so fast that a few plants will suffice for a large family. There are three varieties of this species found in Chili: 1. with leaves smooth on both surfaces; 2. with leaves hoary beneath; and 3. a small gramineous variety. 

Expanded Tetragonia, or New Zealand Spinach. Fl. Aug. Sept. Cl. 1773. Pl. pr. 2. T. cristallina (Liber. stipr. nov. p. 81. t. 39.) plant herbaceous, pruinose; leaves ovate, sessile; flowers almost sessile; fruit tetragonal, incurved, 4-seeded. C. or ¥. F. Native of Peru and Chile, about Valparaiso and Coquimbo. D. C. pl. grass. t. 34. Calyx 3-4-lobe. Stamens 3-4 in each fascicle, 1 fascicle in each recess of the calyx. 

Crystalline Tetragonia. Fl. June. Cl. 1788. Pl. ½ foot. 3 T. echinata (Ait. hort. kew. p. 177.) plant herbaceous; leaves petiolate, ovate-throndoid; flowers on short pedicels; fruit echinatated, 3-4-seeded. C. or C. F. Native of the Cape Good Hope. D. C. pl. grass. t. 115. Calyx 3-4-lobe. Stamens 3-4, 1 in each recess of the calyx. Calyx beset with crystalline papule.

Sec. II. Tetragonoxa. Tetragonia, or (from tetra, tetra, four, gemina, an angle, and coccus, karpes, a fruit; in reference to the fruit being usually furnished with 4 wings). Comm. ex D. C. prod. 3. p. 432. Stamens disposed in 1 series at the base of the calycine lobes. Fruit usually winged.—Herbaceous, perennials, or suffruticosae plants. Flowers on long pedicels. 

4 T. urucuata (Linn. fl. suppl. 258.) plant herbaceous, decumbent; leaves ovate, villous, sessile; flowers 3 together, on short pedicels; fruit tetragonal, with a wing on each angle, 4-seeded. ¥. D. G. Native of the Cape of Good Hope. Thumb. fl. cap. 408. Stamens numerous, inserted in the middle of the calyx by bundles, as described by Thunberg. Perhaps not distinct from T. villosa, Poir. drit. 7. p. 604. 

Hairy Tetragonia. Pl. decumbent. 

5 T. specia (Linn. fl. suppl. 258.) plant herbaceous, erect; leaves petiolate, glabrous; lower ones ovate; upper ones lanceolate; flowers pedicellate, branched. ¥. D. G. Native of the Cape of Good Hope. Thumb. fl. cap. 409. Where it is called T. racemosa. Pedicels numerous, aggregate. 

6 T. headracea (Linn. spec. 487.) plant somewhat herbaceous, rather decumbent, smooth; leaves ovate, petiolate; flowers on long pedicels; fruit 4-winged, 4-6-seeded; root strumose. ¥. D. G. Native of the Cape of Good Hope. Thumb. fl. cap. 409. 

Decumbent Tetragonia. Fl. Jul. Sept. Cl. 1758. Sch. dec. 8 T. fructicosa (Linn. spec. 687.) shrubby, erect; leaves oblong, on very short pedicels; flowers 1 or 3 together, on short pedicels; fruit bluntly 5-angled, each angle furnished with a wing. ¥. D. G. Native of the Cape of Good Hope. —Comm. hort. amst. 2. t. 102.—Séba, thes. 2. t. 11. f. 8. Hav. misc. p. 120.—Mill. fig. t. 2263. f. 2. Calyx green without and yellow within. 

Four-winged-ruited Tetragonia. Fl. July, Sept. Cl. 1794. Shrub to 1 ½ feet. 10 T. linearis (Hav. rev. p. 75.) plant shrubby and diffusely decumbent; leaves linear, rather revolute at the sides, engraved above by a dorsal line; flowers terminal, racemose. ¥. D. G. Native of the Cape of Good Hope. Leaves greenish. 

Linear-leaved Tetragonia. Fl. Sept. Cl. 1819. Sch. dec. 11 T. obovata (Hav. rev. p. 75.) plant suffruticosae, decumbent, pruinose; leaves obovate or ovate; petals winged, stamens clasping, somewhat decurrent. ¥. D. G. Native of the Cape of Good Hope. Flowers unknown. Very like T. decumbens, but half larger leaves. 

Obovate-leaved Tetragonia. Cl. 1821. Shrub dec. 

Cult. The same culture, propagation, and treatment as that recommended for Mesembryanthemum will suit the species of Tetragonia. The T. expansa, when wanted for spinach, may be planted out in the open ground, about April or May. 

Linn. syst. Icosandra, Tri-Pentagynta. Calyx 5-parted, permanent; lobes coloured on the inside. Petals wanting. Stamens 15-30, inserted at the top of the calyce tube, which is short. Ovarium distinct, sessile. Style wanting. Stigmas 3-5. Capsule 3, rarely 4-5-celled, circumsised, having the plicate axis permanent. Seeds numerous. Embryo hooked. Smooth fleshy herbs, inhabitants of the sea-side; with opposite, quite entire, veinless leaves; and axillary, solitary, alternate flowers, which are either sessile or on short pedicels. Calyx purplish inside. 

1 S. portulacastrum (Linn. spec. 446. exclusive of the syn. of Rumphii) leaves linear or lanceolate-oblong, flat; flowers pedicellate. ¥. D. G. Native of the West Indies, Mexico, and Senegal, by the sea-side.—Plum. ed. Burm. t. 223. f. 2. —Jacq. amer. t. 95. Aizeon Camaricè, Andr. bot. rep. 201. Calyx green outside, and reddish within. Stamens 25-30. 

Var. a. pedunculatum; flowers pedicellate. S. pedunculatum, Pers. ench. 2. p. 39. Lam. ill. t. 139. f. 1. 

Var. b. sessile; flowers nearly sessile. S. sessile, Pers. ench.
long and bristly; leaves opposite, linear-lanceolate, glabrous, sessile; flowers sessile in the forks of the branches.

2. D. G. Native of the Cape of Good Hope. Thunb. f. cap. 410. Calyx hetise with white hairs on the outside, and coloured on the inside; when dry rather rose-coloured. Limb of leaves about equal in length to the pericarps.

**Leaves opposite.**

3 A. Hispáni cum (Lin. spec. 700.) stem herbaceous, erect, branched; branches spreading and erect, rather papulose at the apex; leaves opposite, linear, lanceolate, glabrous, sessile; flowers sessile in the forks of the stem. 

4 A. Tomentósum (Lin. dec. 3. p. 418.) stem suffruticosum, tormentosum, branched; leaves opposite, tormentosum, linear-lanceolate, narrowed at the base, rather spatulate at the apex; flowers sessile in the forks of the stem. 

5 A. Stellátum (Lin. dec. 3. p. 418.) stem suffruticosum, branched, hispid at the apex; leaves opposite, linear-spataulate, hairy; flowers paniculato; pedicels and calyces hairy. 

6 A. Perfoliátum (Lin. fil. suppl. p. 261.) stem suffruticosum, erect, tormentosum, branched; leaves opposite, comatum, obovato-oblong, full of crystalline dots; flowers axillar, pedunculato, solitary. 

8 A. Sarmentósum (Lin. fil. suppl. 264.) stem suffruticosum, erect, tormentosum, hispid, glaucescent; leaves opposite, linear; leaves sessile, racemose; clustered; leaves nearly sessile on trichotomous peduncles. 

9 A. Glinus (Lin. fil. suppl. 261.) stem suffruticosum, erect, branched; branches hoary; leaves ovato, acute, covered with glaucous tormentum; flowers sessile, alternate, succum, remote. 

† Species not sufficiently known.
whether the leaves are alternate or opposite. The leaves are said to be ovate in the diagnosis, and in the description obovate.

Stiff Aizoon. Shrub decumbent.

10. A. fruticosum (Lin. fil. suppl. 1. c.) stem shrubby, erect, glabrous, stiff; leaves lanceolate, glaucous, attenuated at the base; flowers sessile. $\varphi$. D. G. Native of the Cape of Good Hope. Thumb. fl. cap. 410. The description does not mention whether the leaves are alternate or opposite.

Shrubby Aizoon. Shrub 1 foot.

11. A. sectundum (Lin. fil. suppl. 1. c.) stem herbaceous, hairy, decumbent; leaves ovate, acute, rather petiolate, with silky villi; flowers sessile. $\varphi$. D. G. Native of the Cape of Good Hope. Thumb. fl. cap. 409. Leaves a line long; in the diagnosis they are said to be ovate, but in the description obovate.

Second-flowered Aizoon. Pl. decumbent.

Cult. This genus of succulent plants is not worth growing except in botanical gardens. The culture, treatment, and propagation recommended for the genus Mesembryanthemum will answer well for the species of Aizoon also.

Lin. syst. Icosandria, Pentagyinia. Calyx 5-parted, permanent, spreading, coloured. Petals wanting. Stamens 12, inserted in the bottom of the calyx; anthers standing. Ovarium roundish. Style wanting; stigmas 5, linear. Capsules 5, connate, each containing one seed.—A prosstrate shrub, with oblong, opposite, crowded leaves; and crowded lateral flowers. This genus differs from Glinus in the petals being absent in the spreading calyx, and the capsules being 1-seeded.

VI. GLINUS (a name given by Theophrastus to the maple). Lin. gen. no. 610. Juss. gen. 316. Lam. ill. 413. D. C. prod. 3. p. 455.—Rolofa, Adans. fam. 2. p. 256.

Lin. syst. Dodceandria, Pentagyinia. Calyx 5-parted, connivent, permanent, coloured inside, with 3 of the sepals exterior, and the other 2 interior. Petals strap-formed, 2-4-cleft at the apex, from 5 to 20 in number, shorter than the calyx. Stamens about 15. Ovarium distinct. Style very short or wanting; stigmas 5. Capsule covered by the calyx, 5-valved, 5-celled. Seeds numerous, minute, hanging by a very long involute funicle each. Embryo spiral.—Branched procumbent tormentose herbs, with alternate leaves or in unequal pairs. Flowers axillary, almost sessile. The plants have the habit of Aizoon, but the embryo is that of Caryophyllaceae.

VI. GLINUS. VII. ORYgia. NITRARIAE.CE.

2. G. dictamnoides (Lin. mant. 243.) plant clothed with white tomentum, prostrate, suffruticose; leaves orbicular, flat, on very short petioles; flowers axillary, nearly sessile. $\varphi$. G. Native of the East Indies. Vahl. symb. 3. p. 64.—Phuk. amalth. t. 306. f. 6. Petals yellow.

Dictamnus-like Glinus. Shrub prostrate.

Cult. These plants will grow well in a mixture of sand, peat, and loam; and young cuttings of the shrubby kinds will strike root readily in the same kind of soil. The seeds of the annual species had better be reared on the hot-bed, and when the plants are of a sufficient size, they should be planted out into a warm damp situation.

Decumbent Orygia. Pl. decumbent.

Cult. A gravelly or sandy soil will suit this plant, and cuttings will root readily in the same kind of soil.

Order CXV. NITRARIAE.CE (this order only contains the genus Nitraria). Lindl, introd. nat. syst. p. 163. Calyx inferior, 5-toothed, fleshy. Corolla of 5 petals, which arise from the calyx, inflexed, valvular in stivation. Stamens 3 times the number of the petals, perigynous; anthers innate, with 2 oblique, longitudinal lines of dehiscence. Ovarium superior, 3 or more celled, with a continuous fleshy style, at the apex of which are as many stigmatic lines as there are cells in the fruit; ovula pendulous, by means of a long funicle. Fruit drupaceous, opening by 3 or 6 valves. Seeds solitary, without albumen. Embryo straight, with the radicle next the hyalum.—Shrubs with deciduous, succulent, alternate leaves, which are
sometimes in fascicles. Flowers in cymes, or solitary. The affinity of *Nitraria* with *Ficoideae* is undoubtedly great, especially with *Tetragonia*; but its very different embryo, and the peculiar vexilation of the petals, which is much more like that of *Rhanneceae* remove it from that order.

**I. NITRARIA** (so named by Schreber, who first found it in Siberia, near the nitre works, with other marine plants). Lin. gen. no. 632. Lam. ill. t. 403. Gærtn. fruct. t. 1. t. 58. D. C. prod. 3. p. 436.

**Lin. syst. Dodecandria, Monogynia.** Character the same as that of the order.

1 N. Schöberli (Lin. spec. 638.) leaves cuneate, obtuse, mucronate, quite entire. $\gamma$. H. Native of Siberia, about the nitre works; and of the Soongarian desert, in salt fields everywhere, and about Lokoiskw, as well as on the borders of the Caspian Sea. Pall. fl. ros. I. t. 50. f. a and b. Lam. ill. t. 403. f. 1. Flowers white, disposed in panicked cymes. The Siberian and Caspian varieties are not different, unless in the more luxuriant growth of the Caspian kind, which is owing to its growing in a more humid situation than that of the Siberian variety.

**Tridentate-leaved Nitraria.** Clt. 1820. Shrub 1½ foot. 3 N. Senegalensis (Lam. ill. t. 403. f. 2. dict. 4. p. 493.) leaves obovate, obtuse, quite entire; drupes trigonal. $\gamma$. S. Native of Senegal. Flowers white, in panicked cymes. This species is easily distinguished from the rest by its pyramidal trigonal drupe.

**Senegal Nitraria.** Shrub 1 to 2 feet.

† A doubtful species.

4 N. Billardieri (D. C. prod. 3. p. 456.) leaves linear, attenuated at the base, acutish, quite entire; drupes ovate, acuminate. $\gamma$. G. Native of New Holland. Very nearly allied to N. Schobéri, Labill. ms.; but very different from it in the fruit being ovate conical, as well as from growing in a different part of the world.

La Billardier’s Nitraria. Shrub 1 to 2 feet.

**Cult.** This is a genus of singular shrubs: they thrive best in a sandy or gravelly soil, and should be occasionally refreshed with salted water, or they will not flourish; they may be increased by layers; or cuttings planted in sand, with a hand-glass over them, strike root readily. The *N. Senegalensis*, being a stoe plant, and *N. Billardieri* should be grown in pots, in order that they may be placed in their respective situations.

Calyx 5-parted (f. 31. a.), surrounded externally by imbricating bracteas. Petals 5 (f. 31. b.), hypogynous. Stamens definite or indefinite (f. 31.), hypogynous, with or without a hypogynous disk; anthers peltate (f. 31. d.). Ovarium superior. Styles several (f. 31. f.), filiform or subulate. Fruit capsular (f. 31. e.), with 2 or 5 valves, and as many cells, opening in the middle of the cells. Seeds definite, villous. Embryo straight, surrounded by a small quantity of mealy albumen, with the radicle next the hymen. Shrubs. Leaves fleshy, scale-like or small, and alternate, without stipulas. Flowers solitary. Dr. Ehrenberg suggests (ann. sc. 1. c.) that *Reaumuria* and Holobôcha, both of which have according to him hypogynous stamens, may constitute a little group to be called *Reaumuriœceae*. The order appears to be more nearly related to *Hyperiœceae* than to either *Ficoideae* or *Nitrariœceae*, and ought perhaps to have followed that order among the Thalamifôrœ in vol. I. From the former it chiefly differs in its succulent habit, and definite villous seeds, agreeing with *Reaumuria*, at least even in the obliquity of the veins of the petals, and in the leaves being dotted. From *Ficoideae* its hypogynous stamens and seeds distinguish it; from *Tamariscinceae*, its plurilocular ovary and distinct styles; from *Nitrariœceae*, its erect villous seeds, distinct styles, and hypogynous stamens. Saline matter is present in these plants in great abundance.

**Synopsis of the genera.**

1 **Reaumuria.** Calyx 5-parted (f. 31. a.), involucrated by crowded leaves on the outside. Filaments indefinite (f. 38.), joined at the base into 5 bundles.

2 **Hololancha.** Calyx 4-5-parted. Stamens 8-10, monadelphous.

**Lin. syst. Polyandria, Pentagynia.** Calyx 5-parted (f. 31. a.), involucrated by leaves on the outside. Petals 5 (f. 31. b.), furnished with a ciliated appendage on each side at the base. Ovarium distinct. Stigmas 5-6, filiform (f. 31. f.). Capsule 5-celled, 5-valved; dissepiments easily separated from the valves. Seeds 2 in each cell, very villous.—Oriental shrubs, with fleshy, alternate, glaucous, dotted leaves, exuding globules of a saline alkali. Flowers solitary at the tops of the branches.

1 R. vermiculata (Lin. spec. 754.) leaves subulate, semi-terete, imbricated, crowded on the branches. $\gamma$. F. Native of Sicily, Barbary, and Egypt, on the sea shore. Lam. ill. 489. f. 1. Desf. atl. I. p. 481.—Lob. icon. 380. Flowers white or pale red. Habit of *Chenopodium Fruticosum*. Hairs on the seeds rufous, and very stiff.

x 2

**FIG. 31.**
Cult. Elegant little shrubs of easy culture; they thrive best in a mixture of sandy loam and peat; and young cuttings readily strike root under a hand-glass.

II. **HOLOLA** CHNA. This genus having already been described under the order *Tanaracaceae*, it is only necessary here to refer to vol. II. p. 728, where all the details of the genus will be found.

Calyx composed of many sepals, usually indefinite in number, and conjoined with the petals, united and adnate a great length to the ovary; with the tube smooth in the genera *Mammillaria*, *Melocactus*, and *Rhizalis*; or with the lobes of the sepals crowning the fruit, and having the tube scaly as in the genera *Cereus*, *Opuntia*, and *Pereskia*. Petals disposed in two or more series, hardly distinguishable from the inner sepals, and somewhat united to them; sometimes irregular, and disposed in a long tube at the base, but distinct at the apex, as in the genera *Mammillaria*, *Melocactus*, and *Cereus*; sometimes equal and distinct to the very base, forming a rotate corolla, as in the genera *Opuntia*, *Pereskia*, and *Rhizalis*. Stamens indefinite, disposed in many series, more or less cohering with the petals or inner sepals; filaments slender, filiform: in the genus *Opuntia* they are irritable to the touch; anthers ovate, versatile, 2-celled. Ovary ovate, fleshy, 1-celled: with numerous ovula, arranged upon parietal placenta, which are equal in number to the lobes of the stigmas. Style filiform, sometimes full and sometimes fistular; stigmas numerous, either spreading or collected into a cluster. Fruit fleshy, 1-celled, many-seeded, either smooth and crowned by the calyx, or covered with scales, scars, or tubercles, and umbilicate at the apex. Seeds, when young parietal, but when mature imbedded in the pulp with which the cells are filled, oval or obovate, without albumen. Embryo either straight, curved, or spiral; with a short, thick, obtuse radicle; cotyledons flat, thick, foliaceous in *Opuntia* and other leaf-bearing genera, very small in *Melocactus*, and perhaps almost obsolete in *Mammillaria* and other leafless genera.

This order contains fleshy or succulent shrubs, very variable in habit. Steins usually angular, winged, or regularly beset with tubercles, rarely terete, usually jointed; joints compressed. Leaves usually wanting, but when present small, caducous, and terete, sometimes like those of *Sedum*, rarely flat and expanded, sometimes alternate and disposed in a spiral order, always glabrous and fleshy. Prickles or bristles disposed in fascicles, rising from the axils of the leaves; in the leafless genera the fascicles of spines are disposed on the angles of the stem, rising from tubercles. Flowers very variable, showy, or minute, usually solitary, sessile, rarely in fascicles, ephemeral, expanding by night or by day.

It has already been remarked, on more than one occasion in this work, that the state of that remarkable distention or increase of cellular tissue of vegetables, from which the name of succulent is derived, is no indication of natural affinity, but rather to be considered a modification of structure, which may be common to all tribes. Hence the immediate relationship of *Cactus* is neither with *Euphorbiaceae*, nor *Lawrencea*, nor any other tribe of succulent plants, but with *Grossulariaceae*, in which no tendency whatever to an increase of cellular tissue exists. Through *Rhipsalis*, which is said to have a central placenta, *Cactus* are connected with *Portulacaceae*, to which also the curved embryo of the section of *Opuntiaceae* probably indicates an approach. De Candolle further traces an affinity between these plants and *Piccióideæ*. For an elaborate account of this order, see his Memoir above quoted.

The fruit is very similar in properties to those of *Grossularia*, some being refreshing and agreeable to the taste, others muscilliginous and insipid; they are all, however, destitute of the excessive acidity of some gooseberries and currants. The fruit of *Cactus Opuntia*, has the property of staining red the urine of those who eat it. The juice of *Mammillaria vulgaris* is remarkable for being slightly milky, and at the same time sweet and insipid.

**Summary of the genera.**

**Tribe I.**

**Opuntiaceae.** Ovula, and therefore the seeds, fixed to the parietes of the fruit.

1 *Mammillaria*. Tube of calyx adhering to the ovarium; lobes 5-6, coloured, crowning the young fruit. Petals 5-6, hardly distinguishable from the calyx. Stamens disposed in many series. Stigma 5-7-cleft. Berry smooth.

2 *Melocactus*. Tube of calyx adhering to the ovarium; lobes 5-6, petaloid, crowning the young fruit. Petals 5-6, united into a long tube with the sepals. Stamens disposed in many series. Stigma 5-rayed. Fruit smooth.

3 *Echinocactus*. Sepals numerous, imbricate, adhering to the ovarium: outer ones in the form of an involucrem; inner ones petal-formed. Stamens numerous. Style multifid at the apex. Berry scaly from the remains of the sepals.

4 *Cereus*. Sepals very numerous, imbricate, adnate to the base of the ovarium, united into an elongated tube: outer ones shorter and like a calyx: middle ones longer and coloured, innermost ones petal-formed. Style multifid at the apex. Berry areolate, tubercular or scaly from the remains of the sepals.

5 *Ephiphyllum*. Tube of calyx very long, furnished with remote scales; limb of corolla multifid, roseaceous or ringent. Branches flat.

6 *Opuntia*. Sepals numerous, leaf-formed, adnate to the ovarium: upper ones flat and short: inner ones petal-formed, obovate and expanded, with no tube above the ovarium. Stamens numerous, shorter than the petals. Stigmas numerous,
erect, thick. Berry oval, umbilicate at the apex, either tubercled or spiny.

7 Pereskia. Sepals leaf-formed, numerous, adnate to the ovarium, and usually permanent above the fruit. Corolla rotate, almost as in Opuntia. Stamens numerous, much shorter than the petals. Stigmas aggregate, in a spiral manner. Berry globose or ovoid.

**Tribe II.**

*Rhipsalidaceae.* *Ovula,* and therefore the seeds fixed to the central axis of the fruit.

8 Rhipsalis. Tube of calyx smooth, adhering to the ovarium; limb superior, 3-6-parted, short. Petals 6, oblong, inserted in the calyx. Stamens 12-18, fixed to the petals. Stigmas 3-6, spreading. Berry roundish, pellucid, crowned by the dead calyx.

**Tribe I.**

*Opuntiaee.* (plants agreeing with *Opuntia* in important characters). D. C. prod. 3, p. 458. *Ovula,* and therefore the seeds fixed to the pericarya of the berry.

1. **Mammillaria** (from mamma, the nipple; the plants are covered with mammiform tubercles, spirally disposed, the mamme bearing radiating spines at the apex and deciduous tomentum). Haw. syn. 177. D. C. prod. 3, p. 458.—Cactus and Mammillaria, D. C. cat. hort. monsp. p. 83.—Echinocactus, Willd. enum. suppl. 30. exclusive of some species.—Cactus, sect. A. Link. enum. 2, p. 21.

*Link. syst. Iconotheca, Monogynia.* Tube of calyx adhering to the ovary; lobes 5-6, coloured, crowning the young fruit. Petals 5-6, hardly distinguishable from the calyx, and longer than it, united into a tube with the sepals. Stamens filiform, disposed in many series. Style filiform. Stigmas 5-7, radiating. Berry smooth. Seeds imbedded in the pulp. Corylons obsolete (ex Nutt.). Fleshy, succulent, shrubby plants, of a roundish or subcylindrical form, destitute of a woody axis (perhaps in all?), lacteose, leafless; bearing rather conical, mammiform, crowded tubercles, which are disposed in a spiral manner, terminating in radiating spines and deciduous tomentum. Flowers sessile at the base of the mamme, usually disposed in a transverse zone around the plant. Berries obovate, eatable, crowned by the mamecarystis calyx, which at length becomes deciduous. Tubercles of the stem very similar to the leaves of *Mesembryanthemum barbatum*.

1 M. magnifica (Haw. in phill. mag. vol. 63, p. 41.) plant nearly globose, depressed; tubercles or mammæ large, hard, and very green, when young woolly at the apex, but when old quite smooth, each terminated by 4 very stiff, radiating, recurved, yellow spines: the upper one of which is very minute, and the lower one much elongated. b. D. S. Native of Mexico. This is a very pretty species. The tubercles are large, tetragonal, and cylindrical, very broad at the base, and much depressed; the spines very strong and very stiff, broadish, recurved, furred longitudinally, when young pale brown and black at the apex, but when old wholly black, and with wool at the base; wool at the base of the spines vanishing.

**Large-tented Mammillaria.** Clt. 1823. Shrub ½ to ½ foot.

2 M. coronata (Haw. rev. p. 69.) plant simple, cylindrical, when young clavate; tubercles or mammæ large, ovoid, woolly, and spiny at the apex; spines stiff, rising from white tomentum, exterior ones white; interior ones brown. b. D. G. Native of Mexico. Cactus coronatus, Willd. enum. suppl. 30. Cactus cylindricus, Ort. dec. p. 128, t. 16, but not of Lam. This is a very beautiful species, and the tallest of all the genus; it is about 5 feet high, and half a foot in diameter. Flowers scarlet. Tubercles or mammæ at the top of the stem are the longest, and as if they were forming in a crown.

**Crown Mammillaria.** Fl. June, Aug. Clt. 1817. Sh. 5 feet. 3 M. discolor (Haw. syn. 177. D. C. diss. t. 2. f. 2.) plant globose, somewhat depressed, almost simple, with glabrous axes; tubercles or mammæ ovoid, hardly woolly at the tips, but bearing spines: outer spines setaceous and white, spreading and stiffish; inner ones fewer and brown, straight and more rigid. b. D. S. Native of South America. Colla, hort. ripul. append. 3, t. 11. Cactus depressus, D. C. cat. hort. monsp. p. 84. Cactus pseudomammillaria, Salm-Dyck. mss. C. Spanii, Colla antol. 6, p. 501. Plant 3-4 inches high. There are 13-15 series of tubercles, winding to the right. Flowers longer than the tubercles, more spreading at the apex than in *M. simplex,* white inside, but of a dirty reddish color on the outside.

4 M. lanigera (Haw. in phill. mag. vol. 63. p. 41. D. C. diss. t. 4.) plant simple, terete, obovate, clothed with woolly tomentum all over; tubercles or mammæ bearing 20 or more radiating, straight, spreading spines at the apex; outer spines smaller and white: inner ones strong and fulvous. b. D. S. Native of Mexico. Cactus canescens, Mec. et Sesse, fl. mex. icon. ned. Plant 3-4 inches high. Flowers red, longer than the tubercles (ex fl. mex.).

**Wood-bearing Mammillaria.** Clt. 1823. Shrub ½ foot.

5 M. flavescens (D. C. prod. 3, p. 459.) plant obovate, rather proliferous at the top; axils woolly; tubercles or mammæ ovoid, woolly at the apex, and bearing spines; spines stiff, long, straight, yellowish. b. D. S. Native of South America. Cactus flavescens, D. C. cat. hort. monsp. p. 83. M. straminea, Haw. ex Salm-Dyck. in litt. Cactus flavescens and C. straminea, Spreng. syst. 2, p. 494. Plant 4-5 inches high. The tubercles are disposed in 13-14 series, which wind to the right.

6 M. fulvescens (Haw. in phil. mag. oct. 1829. p. 106.) plant roundish; tubercles or mammæ bearing about 15 spines each at the apex, about 4 of which are a little longer than the rest; inner ones brownish. b. D. S. Native of Brazil. Flowers large, red, nearly like those of *M. rhodanthera* (Otto), but probably larger, and the spines are longer; lower spines 3 lines long, white, almost covering the whole plant; and the 4 upper ones spreading, and 2 or 3 times longer than the rest of a fulvous colour.

7 M. prolifera (Haw. syn. 177. suppl. 71.) plant obovate, proliferous at the base; axils woolly; spines long, straight, of a whitish straw-colour. b. D. S. Native of South America. Cactus mammillaris prolifera, Ait. hort. kew. ed. 2, vol. 3, p. 175. OFFSETs rising from the plant at the very base, from which it is easily known from *M. flavescens* (ex Salm-Dyck.).

8 M. densa (Link. et Otto, pl. rar. hort. berol. t. 35.) plant cylindrically, glance and brown; tubercles or mammæ conical, dense; spines numerous, yellowish, 1 of which in each fascicle is larger than the others. b. D. S. Native of Mexico, on the mountains.

**Dense Mammillaria.** Clt.? Shrub ½ foot.

9 M. nicolor (Lchm. in pl. nov. hort. hamb. ex bot. zeist. 1821, p. 132.) plant obovate, proliferous at top; axils woolly: mammæ twisted spirally, ovoid, pyramidal, woolly at the apex.
and bearing spines; spines setaceous, divaricate, white, 2 of which are erect in each fascicle, and much longer than the rest, spaced out at the apex. \( \text{ft.} \) D. S. Native of Mexico, on the mountains.

**Two-coloured Mammillaria.** Chl. ? Shrub \( \frac{1}{2} \) feet.

10 M. **simplex** (Haw. syn. 177-) plant simple, obovate; axes glabrous; tubercles or mammee ovate, bearing stiff, straight, radiating spines at the apex. \( \text{ft.} \) D. S. Native of South America, and the islands. Cactus mammillaris, Lin. spec. 666. D. C. pl. bristles-fascicles. 3. Cat. hort. musp. 83. Plant 6-8 inches long. There are about 18 or 20 series of tubercles, widening to the left. Spines shortish and red. Tomentum short, deciduous. Axes, when young, rather tomentose. Flowers white, berry red.

**Simple Mammillaria.** Fl. Ju. Aug. Chl. 1688. Sh. \( \frac{1}{2} \) to \( \frac{3}{4} \) ft.

11 M. **parkinsonii** (Haw. suppl. 72.) plant nearly globose, proliferous at the top; tubercles or mammee numerous, small, clothed with white tomentum at the apex, each terminating in 10 or 12 rather stiff, dark purple spines. \( \text{ft.} \) D. S. Native of South America. Cactus microtome, Spreng. syst. 2. p. 494. The character is from Salm-Dyck; in litt.

**Small-tubed Mammillaria.** Chl. 1817. Pl. \( \frac{1}{2} \) to \( \frac{1}{4} \) foot.

12 M. **elongata** (D. C. mem. cat. in mem. mus. vol. 17. p. 109.) plant usually multiple at the base, cylindrical, elongated, a little branched, with the axes broad and naked; mammee or tubercles very short, broad at the base, obtuse at the apex, with the areole of the younger ones rather tomentose; prickles bristle-formed, 16-18 in each fascicle, radiating, yellow, much longer than the mammee, without any central ones. \( \text{ft.} \) D. S. Native of Mexico, where it was discovered and sent to Europe by Dr. Coulter, as well as all the following species.

**Elongated Mammillaria.** Chl. 1830. Pl. \( \frac{1}{4} \) foot.

13 M. **echinaria** (D. C. l. c. p. 110.) plant usually multiple at the base, cylindrical, elongated, with the axes broad and naked; mammee or tubercles very short, broad at the base, and obtuse at the apex, with the areole of the younger ones rather tomentose; prickles bristle-formed, 16-18 in a fascicle, radiating, spreading recurved, yellow, much longer than the mammee, with the 2 central ones stiffer and brownish. \( \text{ft.} \) D. S. Native of Mexico. Flowers bearded at the base, sessile in the axils, small and pale.

**Hedgehog Mammillaria.** Chl. 1830. Pl. \( \frac{1}{4} \) foot.

14 M. **scrunquea** (D. C. l. c.) plant usually multiple at the base, cylindrical, with narrow, rather woolly axes; mammee ovate, short, with the areole of the younger ones rather tomentose; prickles bristle-formed, 16-18 in a fascicle, radiating, yellow, longer than the mammee, but when old becoming copper-coloured, without any central ones. \( \text{ft.} \) D. S. Native of Mexico. Coulter, no. 36. Flowers small, sessile, solitary in the axils of the mammee, forming a circle round the top of the plant. Style permanent; stigma many-cleft. Berry ovate, about the size of a pea, crowned by the floral remains. Plant 2-3 inches high, and 9-11 lines in diameter, with 12-15 mammee in each series, which series bend to the left.

**Subcrocea-spined Mammillaria.** Chl. 1830. Pl. \( \frac{1}{2} \) foot.

15 M. **tenue** (D. C. l. c.) plant multiple at the base, cylindrical, with narrow, naked axes; mammee ovate, with the areole of the young ones rather woolly; prickles bristle-formed, 20-25 in a fascicle, yellow, radiating, a little longer than the mammee, in any the central ones. \( \text{ft.} \) D. S. Native of Mexico. Coulter, no. 34. Plant 3-4 inches high, and 5 lines in diameter.

**Var. \( \beta \), minia** (D. C. l. c.) stem thicker; central prickles wanting or solitary. \( \text{ft.} \) D. S. Native of Mexico. Plant 10-12 lines in diameter. Perhaps a proper species, or perhaps \( M. \) extremiosa, Hort. berol. according to Salm-Dyck.

**Slender Mammillaria.** Chl. 1830. Pl. \( \frac{1}{2} \) foot.

16 M. **interrete** (D. C. l. c.) plant multiple at the base cylindric, with narrow axes; mammee ovate, much crowded hidden by the congeries of prickles, with the areole smoothish; prickles 20-25 in a fascicle, stiff, yellow, radiating, interwoven from the mammee being so close together. \( \text{ft.} \) D. S. Native of Mexico. Coulter, no. 57. Plant 4 inches high, and 1 inch in diameter. Prickles 3-4 inches long, sometimes somewhat elongated. According to a letter received from Dr. Coulter to De Candolle, this and the 4 preceding species will form, as he conceives, only one species; the appearance of these plants have a striking likeness to each other, but these differences appear to De Candolle real, and permanent, and he considers them as forming a small group of the genus, remarkable for the elongation of their stems, and for their yellow appearance.

**Interwoven-spined Mammillaria.** Chl. 1830. Pl. \( \frac{1}{2} \) foot.

17 M. **cylindrica** (D. C. l. c. p. 111.) plant simple, cylindric, with a few bristles in the axes; mammee ovate, with smoothish areole; prickles 20-25, in a fascicle, radiating, white, shorter than the mammee: the 2 central prickles stiff and diverging, twice the length of the surrounding prickles. \( \text{ft.} \) D. S. Native of Mexico (Coulter). This plant is easily distinguished from all the preceding, in the colour of the mammee being deep green, not yellow. Plant 5 inches high, and 1 inch in diameter. Prickles 1-2 lines long, and the central prickles 3-4 lines long.

**Cylindric Mammillaria.** Pl. \( \frac{1}{2} \) foot.

18 M. **legans** (D. C. l. c.) plant simple, obovate, somewhat umbilicate at the apex, with naked axes; mammee ovate, having the areole of the young ones rather tomentose; prickles 25-30 in each fascicle, white, radiating, stiltish, and with 1-3 stiff, erect prickles, which are a little longer than the bristles that surround them. \( \text{ft.} \) D. S. Native of Mexico. Coulter, no. 48. Plant 2 inches high and 2 inches in diameter.

**Var. \( \beta \), minor** (D. C. l. c.) plant exactly obovate, one half smaller than the species, but it is probably a young plant of the same.

**Var. \( \gamma \), globosa** (D. C. l. c.) plant larger, globose, with the upper axes bearded. Perhaps the same, but an old plant.

**Elegant Mammillaria.** Pl. \( \frac{1}{2} \) foot.

19 M. **radicans** (D. C. l. c.) plant simple, nearly globose, with naked axes; mammee ovate, large, with the areole smoothish; prickles 16-18 in a fascicle, radiating, white, stiff, when young rather tomentose, without any central ones. \( \text{ft.} \) D. S. Native of Mexico. Coulter, no. 35. There are varieties of this plant either with an obtuse or a depressed apex, and the spines either white or yellowish. Plant about 3 inches high, and the same in diameter. Prickles 0-6 lines long.

**Radiating-prickled Mammillaria.** Pl. \( \frac{1}{4} \) foot.

20 M. **irregularis** (D. C. l. c.) plant multiple, and rather tuberous at the base, with ovate offsets, and naked axes; mammee oblong, with smoothish areole; prickles 20-25 in each fascicle, white, little reflexed, without any central prickles. \( \text{ft.} \) D. S. Native of Mexico. Coulter, no. 31. Plant 2 inches high, with offsets an inch in diameter. Bristles 2 lines long.

**Irregular Mammillaria.** Pl. \( \frac{1}{2} \) foot.

21 M. **crebripinna** (D. C. l. c.) plant multiple at the base; offsets ovate; axes naked; mammee ovate, short, crowded, with the areole smoothish; prickles straight, outer 16-17 radiating and white, central 3 brown and erect. \( \text{ft.} \) D. S. Native of Mexico. Coulter, no. 14. Plant 2 inches high and \( \frac{1}{2} \) inch in diameter. The prickles, from the mammee being close, nearly hide the stem.

**Thick-spined Mammillaria.** Pl. 2 inches.

22 M. **cosoidea** (D. C. l. c. p. 112.) plant simple, ovate-conical, with the axes woolly in the young state; mammee ovate, crowded, with the areole rather tomentose while young; prickles straight, stiff, the outer 15-16 radiating, but the central 3-5 are erectly diverging, brown, and rather longer than the ray ones.
D. S. Native of Mexico. Coulter, no. 22. Allied to *M. crebrispina*, and is perhaps *M. cönus*, Haw. Flowers of a reddish-violet colour, few in number, rising near the top of the stem.

**Cowoid Mammillaria.** Pl. ½ foot. 23 M. *compressa* (D. C. l. c.) plant simple, cylindrically-clavate; axes when young woolly and bristly; mammæ ovate, short, angular at the base, and if they were compressed beneath, with the areole rather tomentose; prickles 5-5 in each fascicle, unequal, white, lower one the longest. D. S. Native of Mexico. Coulter. Plant 5 inches high, an inch broad at the base, and 1½ inch in diameter at the top.

**Compressed Mammillaria.** Pl. ½ foot. 24 M. *cornifera* (D. C. l. c.) plant simple, globose, with naked axes; mammæ ovate, thick, crowded, with the areole smoothish; outer prickles 16-17, radiating grey, with a strong, longer, erect, rather incurved one in the middle of each fascicle. Native of Mexico. Coulter. Plant 3 inches in diameter, 2¾ broad. Ray prickles 5-6 lines long, and the central one 7-8 lines long.

**Horn-bearing Mammillaria.** Pl. ½ foot. 25 M. *crisíșta* (D. C. l. c.) plant globose, depressed, multiple at the base; axes naked; mammæ ovate, thick, with the areole smoothish; bristles 15-20 in each fascicle, white, elongated, rather radiating; central prickles yellow, stiff, hooked at the apex, length of the bristles that surround them. D. S. Native of Mexico. Coulter, no. 28. Plant 1 inch high, 1½ inch in diameter. Bristles 8-9 lines long. *Var. β, paucisétæ* (D. C. l. c.) axes woolly; bristles 8-10 in a fascicle. Sometimes the bristles are nearly all deciduous. Coulter, no. 29.

**Hairy Mammillaria.** Pl. 1 inch. 26 M. *crusíæta* (D. C. l. c.) plant multiple at the base, tufted, aggregate, globose; axes naked; mammæ few, ovate, with the areole smoothish; bristles 15-20 in each fascicle, white, elongated, rather radiating; central prickles yellow, stiff, hooked at the apex, length of the bristles that surround them. D. S. Native of Mexico. Coulter. Plant 1 inch high, 1½ inch in diameter. Bristles 8-9 lines long.

**Tufted Mammillaria.** Pl. ½ foot. 27 M. *subangularis* (D. C. l. c.) plant simple or multiple at the base, nearly globose, depressed; axes for the most part woolly; mammæ ovate, thick, short, angularly tetragonal from pressing so close against each other, with the areole of the young ones tomentose; prickles 5-8 in each fascicle, erectly diverging, uncial, of a pale grey colour. D. S. Native of Mexico. Coulter. Plant nearly 3 inches high and 1½ broad. Prickles 5-10 lines long.

**Subangular-teated Mammillaria.** Clt. 1830. Pl. ½ foot. 28 M. *macracántɔ* (D. C. l. c. p. 113.) plant simple, globose, depressed, with some of the axes naked, and some of them bearded with wool; mammæ ovate, rather tetragonal, with the areole of the young ones rather tomentose; prickles 1-2, very long, pungent, white, or brownish. D. S. Native of Mexico. Coulter, no. 44. Perhaps the same as *M. magnumnema*, Haw.? Prickles 2 inches long. Plant 1½-2 inches high, and 3-6 inches in diameter. Prickles rather angular.

**Long-spined Mammillaria.** Pl. ½ foot. 29 M. *longoma'ima* (D. C. l. c.) plant simple, or rather multiple at the base, ovate, or nearly cylindrical; axes woolly; mammæ ovate-oblong, dense, with the areole tomentose; prickles 9-10 in each fascicle, pungent, of a greenish brown colour. D. S. Native of Mexico. Coulter, no. 30. Plant 3-4 inches high, and 2 inches broad. Prickles 6-9 lines long.

**Long-teated Mammillaria.** Pl. ½ foot. 30 M. *octacántɔ* (D. C. l. c.) plant simple, ovate-oblong, nearly cylindrical; axes naked; mammæ oblong, rather tetragonal, with the areole of the young ones rather tomentose; prickles stiff, the outer 7 in each fascicle radiating and white, with a central one, which is stiffer, longer, and of a fuscescent colour. D. S. Native of Mexico. Coulter, no. 39. Plant 3 inches high, 2 inches broad. Outer prickles 3-4 lines long; central one 6 lines long.

**Eight-spined Mammillaria.** Pl. ½ foot. 31 M. *leucacántɔ* (D. C. l. c.) plant multiple at the base, ovate; axes naked; mammæ few, ovate-tetragonal, with the areole of the young ones glabrous; prickles 6-7 in each fascicle, stiff, white, sometimes all radiating, and sometimes the one in the centre is erect. D. S. Native of Mexico, Coulter. Plant an inch and a half high, and hardly an inch broad. Prickles 4 lines long.

**White-spined Mammillaria.** Pl. ½ foot. 32 M. *divergens* (D. C. l. c.) plant multiple at the base, nearly globose, depressed; axes woolly and bristly; mammæ ovate, crowded, with the areole of the young ones woolly; prickles 5-6 in each fascicle, unequal, pungent, white, but brownish at the apex, diverging, and somewhat tetragonal. D. S. Native of Mexico, Coulter. Perhaps only a variety of *M. macracántɔ*. Tufts 6-7 inches broad, and 2 inches high.

**Diverging-spined Mammillaria.** Pl. ½ foot. 33 M. *triacaántɔ* (D. C. l. c.) plant simple, obovate, nearly cylindrical, bluntly truncate; axes hardly woolly, but with a few bristles; mammæ ovate, much crowded, with the areole of the young ones tomentose; prickles 3 in each fascicle, erect, white, lower one the longest, tending downwards, 2 lateral ones very short. D. S. Native of Mexico, Coulter, no. 46. Plant 3 inches high, and 1½ inch broad. Sometimes there is a fourth prickle in each bundle, but when this is present it is very short.

**Three-spined Mammillaria.** Pl. ½ foot. 34 M. *sémpervivé* (D. C. l. c. p. 114.) plant simple, attenuated at the base, depressed at the apex, disk-formed; axes woolly; mammæ erect, ovate-tetragonal, with the areole smoothish; bristles 3-4 in each fascicle, stiff, short, and white, and 2 thick, short, diverging prickles. D. S. Native of Mexico. Coulter, no. 57. Plant 2½ inches broad, and 1½ high. *Var. β, tetraçañáthia* (D. C. l. c.) plant densely bearded in the axes; bristles none; prickles 4, short, diverging. D. S. Native of Mexico.

**Semprevivum-like Mammillaria.** Pl. ½ foot. 35 M. *discipór'úmys* (D. C. l. c.) plant simple, depressed, disk-formed; axes naked; mammæ crowded, short, depressed, tetragonal, with the areole of the young ones rather tomentose, and of the adult ones somewhat unarm'd; prickles 5, in each central mamma, stiff, white, erect. D. S. Native of Mexico. Coulter, no. 50. Plant 3 inches broad, and hardly an inch high.

**Disk-formed Mammillaria.** Pl. 1 inch. 36 M. *latima'ima* (D. C. l. c.) plant simple, depressed, somewhat discoid: with the younger axes woolly; mammæ short, broadly ovate, at length depressed, transversely oblong, with the areole of the young ones woolly; prickles 16-17 in each fascicle, stiff, yellowish, rather fuscescent at the apex, diverging, unequal. D. S. Native of Mexico. Coulter, no. 54. Plant 5 and a half inches in diameter, and hardly an inch and a half high.

**Brick-teated Mammillaria.** Pl. 1 inch. 37 M. *gemiñipína* (Haw. in phil. mag. 63. p. 42. D. C. diss. t. 3.) plant simple, cylindrically columnar; axes very woolly; tubercles or mammæ small, very numerous; spines small, white, interwoven, 2 of which in each fascicle are much longer than the rest. D. S. Native of Mexico. *Cáctus columnáris*, Moc. et Sesse, fl. mex. icon. ined. Plant half a foot high. Flowers.
red, a little longer than the tubercles. Haworth’s plant appears
to be different from that of De Candolle.

38 _M. vivipara_ (Haw. suppl. p. 72.) plant multiple; offsets
globoso; tubercels or mammae cylindrically ovate, bearded,
covered by a profuse furrow above; flowers central, large,
exserted. — D. F. Native of Louisiana, on hills about the
flower or tuft of the plant in its native place of growth is 2 or 3 feet
in diameter. Flowers deep red, almost like those of _Cereus flagelliflorus_. Outer lobes of calyx ciliated. Berries about the size
of grapes, fusiform, greenish.

39 _M. glomerata_ (D. C. prod. 3. p. 459.) plant tufted;
tubercels or mammae clavate, glaucous, tomentose, furnished with
a stellate bunch of spines at each apex. — D. S. Native of
exclusive of the synonyme of Haworth. Flowers red.

_Glomerate_ Mammillaria. Shrub ½ foot.

40 _M. psulilis_ (D. C. diss. t. 2. f. 1.) plant multiple, round-
roundish, with a little beard; tubercels or mammae ovate, bearing
radiating spines at the apex, outer spines hair-framed and white,
inferior ones stiff and pale yellow, pubescent when examined under
a lens. — D. S. Native of South America. Mill. dict. no. 6.
Cactus psulilis, D. C. cat. hort. montp. p. 185.—Platt. phyt.
29. f. 27. Plant very small, rather glaucous, hardly 2 inches
high. The tubercels or mammae are disposed in 5 or 7 series,
which wind to the left. Flowers large, white or pale red, with
the backs of the petals reddish.

41 _M. stellata_ (Haw. in phil. mag. Feb. 1830.) plant irregularly tufted,
beet with radiating fascicles of white pubescent spines;
the lower ones of which are hair-framed, with a few of
the upper ones much stronger and more horizontal, and straw-
coloured at the apex. — D. S. Native of South America.
p. 72. Lodd. not. exhib. 79. but not _M. psulilis_, D. C.

42 _M. missouriensis_ (Sweet, hort. brit. p. 171.) mammae
or tubercels ovate, terete, bearded; flowers hardly exerted; berries
scarlet, about equal with the mammae. — D. F. Native of
Louisiana, on the high mountains about the Missouri. _Cactus mammillaris_, Nutt. gen. amer. 1. p. 295. Flowers white. Berries
scarlet. This is a much smaller plant than _M. simplex_, to
which it is nearly allied.

½ to 1½ foot.

† _Species not sufficiently known._

43 _M. helicteres_ (D. C. diss. t. 5.) plant simple, ovate, glabrous;
tubercels or mammae disposed in numerous, nearly vertical,
regularly spiral series, bearing spreading, straight,
spines at the apex. — D. S. Native of Mexico. _Cactus helicteres_, Moc. et Sesce, fl. mex. icon. ined. Plant 3-4
inches high. Flowers rose-coloured, a little longer than the
mammae.

_Screw_ Mammillaria. Pl. 6 to 1½ foot.

44 _M. nudis_ (D. C. prod. 3. p. 460.) plant simple, cylindrical,
circular, ascending, glabrous; tubercels or mammae unarmed. — D. S. Native of Mexico. _Cactus nudis_, Moc. et Sesce, fl. mex.
icon. ined. Flowers rose-coloured.

_Naked_ Mammillaria. Pl. 6 to 1½ foot.

† The following species are hardly known unless by name;

some of these names may, however, be referrible to those described
above.

1 _M. miliis_, Mill. dict. 2 _M. cénica_, Haw. suppl. 3 _M.
cespitosa_, Hort. berol. 4 _M. canascens_, Hort. berol. 5 _M.
angulalris_, Hort. berol. 6 _M. chrysanth&, Hort. berol. 7 _M.
aurita_, Hort. berol. 8 _M. fuscit&_, Hort. berol. 9 _M. atrat&,
Hort. berol.

‡ The following species were raised in the gardens in 1827
from seeds brought from Chili by Dr. Giles, but have not yet
been described. The species we have referred to this genus only
from their seedling state, without any knowledge of them when full
grown. The names are under the genus Cactus in Gillies’s

1 _M. spinosa_, Gill. 2 _M. quadrat&, Gill. 3 _M. caudat&,
Gill. 4 _M. cocincina_, Gill. 5 _M. solitaria_, Gill.

_Cult._ Mammillaria is a genus of small singular grotesque
succulent plants. A mixture of sand, loam, and peat, or loam
mixed with brick rubbish, is a good soil for them. The pots in
which the species are grown should be as small as the plants will
allow, and they should be well drained with sherds; they
require very little water. The pots should be placed on shelves
erected for the purpose in a stove, should there be no house for the
purpose of growing succulent plants, called a dry stove.
The plants are increased by offsets.

II. _MELOCACTUS_ (from _μέλος_, melon, a melon, and _κάκτος_,
cactus, a name applied to a spiny plant by Theophrastus;
the plants are in the form of a melon, and the angles are beset
Link et Otto, diss. 1827. p. 8. _D_. C. prod. 3. p. 460.— _Cactus,
Haw. syn. 172. exclusive of some species. _Cactus_, sect. B,
Link, enun. 2. p. 21.

_Lin. syst._ Icosidendria, Monogynia. Tube of calyx adhering
to the ovarium; lobes 5-6, petaloid, crowning the young fruit.
Petals 5-6, united into a long cylindrical tube with the sepals.
Stamens filiform, disposed in many series. Style filiform; stig-
mas 5, radiating. Berry smooth, crowned by the dry lobes of
the corolla and calyx. Seeds imbedded in the pulp. Cotyle-
dons small. Plumule large, nearly globose ( _D_. C. Organo-
graf. 14. f. 3.) Flabby globose simple roundish shrubs, with
deep furrows, alternating with vertical ribs, which are orna-
mented with confluent tubercels, each tubercle furnished with
a starry fascicle of prickles or spines. Spadix or flowering head
terminal, cylindrical, composed of mammillae, much crowed
between tomentose or setiferous tubercles. Flowers immersed in the
wool of the head under its apex.

1 _M. communis_ (Link et Otto, l. c. diss. p. 8. t. 11. _D_. C.
diss. t. 6.) plant ovate-roundish, deep green, with 11 or 15
ribs straight; spines strong, pale brown, unequal, 9 in each
fascicle: lower one the longest: middle one crept. — D. S.
Native of the West India Islands, in salt marshy
places near the sea; and probably on the main land of South
grass. t. 112. _Cactus Melocacte_, and _C_. coronat&., Lam. dict.
t. 1. p. 537.—Bradt. succ. t. 32. Ribs 12-18. Flowers tubular,
red. Fruit red, nearly like those of _Mammillaria_, but larger,
oblong, and deciduous, protruding from the wool on the head.
Snackbar. _oblongus_ (Link et Otto, l. c.) plant smaller; prickles
weaker, and more red. Stem 6 inches high, and 3½ thick.
_I. ar. _macrocystaphus_ (Link et Otto, l. c.) plant thicker, 14
inches high, and 9 inches broad.

1688. Shrub 1 foot.

2 _M_. _Lamarckii_; plant ovate, flatish at the base, with
14-20 angles at the top, which are rather oblique and bluntish
on the back; spines red, stiff, rather incurved, disposed in approximate fascicles, which are very woolly towards the tops of the angles; cap roundish, furnished with a few red sessile spines; flowers red. 

**Lamarck's Melon-thistle.** Pl. 1; foot. 

3. **M. macracanthus** (Link et Otto, diss. p. 9. t. 12.) plant roundish, light green, with 14 angles; ribs straight; spines in fascicles, very thick, whitish, but of a brownish red-colour at the apex; outer 12 radiating, central, 4 large and straight. 

**Lam.** D. S. Native of South America. Cactus Lamáreckii, Coll. hort. ripul. append. 3. t. 7. 

4. **M. pyramidalis** (Link et Otto, diss. t. 10. t. 25.) plant conical or pyramidal, with 17 angles; ribs rather oblique, crested; spines very long, in fascicles, of a brownish red colour; outer 14 radiating in 2 series, with 2 or 3 straight and very long. 

**Link.** D. S. Native of Curassova. Cactus pyramidalis, Link et Otto, obs. 1820. p. 1. Haw. rev. p. 69. Flowers unknown, but the spadix or woolly head is depressed at the top. 

**Long-spined** Melon-thistle. Clt. 1820. Shrub 1 foot. 

5. **M. placentaformis** (D. C. prod. 3. p. 460.) plant hemispherical, depressed, green, with 12 or 14 angles; ribs very blunt; prickles 8-12 in a fascicle, unequal, recurved, strong. 

**Link.** D. S. Native of Brazil. Cactus Melocactus, Besl. hort. eyest. 4. ord. f. 1. but not of Lin. C. placentaformis, Lehnn. ind. sem. hort. lamb. (1826). Melocactus Besleri, Link et Otto, diss. (1827), p. 11. t. 21. Lehman's name being older than Link's has been here adopted, as being more apt; but Link's figure and description are far better. Spadix or woolly head nearly globose, impressed in the vertex. Flowers reddish. Prickles blackish.

**Placenta-form Melon-thistle.** Shrub 1 foot. 

6. **M. Langsdorfi** (D. C. prod. 3. p. 461.) plant oblong, with 17 angles; spines slender, stiff, spreading; top of plant floriferous, very villous and very spiny. 

**Link.** D. S. Native of Brazil? Cactus Langsdorfi, Lehnn. in sem. hort. lamb. (1826). Flowers yellow. Stamens purple. The rest unknown. 

**Langsdorf's Melon-thistle.** Shrub 1 foot. 

† **Species not sufficiently known.**

7. **M. sellowii** (D. C. prod. 3. p. 461.) plant globose, depressed, glaucous, woolly and flat in the vertex, with 10 arched ribs; prickles 7 in each fascicle, recurved: the central 5 much the largest. 

**Link.** D. S. Native of Montevideo. Echinocactus Sellowii, Link et Otto, diss. p. 16. t. 22. Melocactus species secundum Salm-Dyck, who confirms that the plant is woolly at the top, and is analogous to **M. placentaformis.** Plant 2 inches high, and 4½ inches thick. Prickles 8-10 lines long, fuscosecent. Flowers unknown. 

**Selló's Melon-thistle.** Pl. 1; foot. 

8. **M. polyacanthus** (D. C. prod. 3. p. 461.) plant oval, glaucous, with a flat woolly apex, and with 21 blunt vertical ribs; prickles 8 in each fascicle: the upper 2 of these smaller than the others. 

**Link.** D. S. Native of Brazil in the province of Rio Grande. Echinocactus polyacanthus, Link et Otto, diss. p. 13. t. 16. f. 1. Stem 4 inches high, and 3 inches thick, attenuated at the base, with narrow funnels; prickles cuneous, Flowers unknown. 

**Many-spined Melon-thistle.** Shrub 1 foot. 

9. **M.? melocactoides** (D. C. prod. 3. p. 461.) plant globose, with 10 angles, having the tops of the angles beset with a series of woolly tubercles; prickles 7 or 8 in a fascicle, rather recurved, pale, but becoming gradually brownish towards the apex. 

D. S. Native of Brazil. Cactus melocactoides, Hoffis. verz. 2. (1826) 3. p. 24. Habit of **M. communis.** 

**Melocactoides-like Melon-thistle.** Pl. 1; foot. 

**Cult.** A grotesque and singular genus like the last, but larger of growth, and beset with stronger spines, without teats. The culture, propagation, and treatment of the species are the same as that recommended for the last genus. 

**III. ECHINOCACTUS** (from cactus, echinocactus, a name given by Theophrastus to the spiny plant; plants beset with spines like the hedgehog). 

**Link.** D. S. Native of Brazil. Cactus specie of Haw. 

**Lin. syst. Leucandra, Monagynia.** Sepals numerous, imbricate, adnate to the base of the ovary, united into a short tube at the base: outer ones in the form of an involucre: inner ones petal-formed. Stamens numerous. Style filiform, multifil at the apex. Berry scaly from the permanent remains of the sepals. Cotyledons wanting?—Simple, grotesque, fleshy, ovate or globose, ribbed, leafless shrubs, with the habit of **Melocactus;** ribs as if they were formed from confluent tubercles, bearing on their back fascicles of prickles. The woolly head or spadix, which is present in **Melocactus** is wanting in this genus. Flowers rising from the fascicles of spines at the tops of the ribs very like those of the genus **Cereus,** but the tube is almost wanting. 

1. **E. gibbosus** (D. C. prod. 3. p. 461.) plant ovate or nearly oblong, obtuse; ribs interrupted by tubercles; some of the tubercles rather tumescent at the apex, and tipped with fascicles of stiff straight needle-formed prickles; others in the outer series naked, elongated, and mammiform, and a little compressed. 

**Link.** D. S. Native of Jamaica. Cactus gibbous, Haw. syn. p. 173. bot. reg. 137. Plant nearly like that of **Mammillaria tuberculosa,** but not lacetaceous. Flowers 2, larger than any other of the genus, quite at the apex of the plant, which is depressed. The tube of the flower is greenish, and the sepals distal, with a white expanded limb: lobes obovate, rather mucronate, disposed in 4 series. Genitalis yellow. 

2. **E. subgibbosus** (Haw. in phil. mag. Oct. 1831. p. 418.) plant roundish-oblong, very spiny, with the spines interwoven; with 10 ribs about 1½ inches thick, and are, as well as the r compound, and acute; fascicles of spines distant. 

**Link.** D. S. Native near Valparaiso. Plant 5 inches high, and 3 inches broad, woolly at the base of the fascicles of spines. Spines straight, 12-15 in each fascicle: the lower ones of these are whitish or pale, bristle-formed, nearly half an inch long, horizontal: the 6 upper ones prickly-formed, much larger, nearly an inch long, bulbous, and yellowish at the base, and rufescent at the apex; the middle spine of the ultimate fascicles compared with the rest is straight. 

**Sub-gibbous Hedgehog-thistle.** Clt. 1830. Pl. 1; foot. 

**Noble Hedgehog-thistle.** Clt. 1796. Shrub 3 feet. 

4. **E. cornigerus** (D. C. diss. t. 7.) plant subglobose, very obtuse; ribs almost vertical, interrupted by tubercles, somewhat depressed: all prickly at the top; prickles unequal, straight, and needle-shaped: the lower one broad, thick, and a little recurved at the apex. 

**N.** D. S. Native of Mexico. 

---

*Vol. III.*

**Horn-bearing Hedgehog-thistle.** Ctr. 1825. Pl. ½ foot.

5. E. crispatus (D. C. diss. t. 8.) plant obvate, retuse at the apex, and rather umbilicate; ribs numerous, from 20 to 60, nearly vertical, undulately curved, and tubercular; prickles in fascicles, unequal, straightish. τ. D. S. Native of Mexico. Cactus crispatus, Moc. et Sessé, fl. mex. icon. ined. Flowers smaller than any other of the genus, at the top of the plant, purple; sepals densely imbricated along the tube, oblong-linear, acute, disposed in 2 series in the limb.

**Far. β. hérédus (D. C. mem. cact. in mem. mus. 17. p. 115.)** fascicled of spines approximate; prickles stronger, more erect and longer, of a greyish brown-colour.

**Cylindrical Hedgerow-thistle.** Pl. ¼ foot.

6. E. oryza (D. C. mem. cact. in mem. mus. vol. 17. p. 114.) plant nearly glabrous; with 3 deep compressed vertical ribs, ornamented with transverse rows of fleshy down, with 3 fascicles on each rib; prickles 7 in a fascicle, straight, yellow, and one central. τ. D. S. Native of Mexico. Coulter, no. 40. Plant 5 inches in diameter. Prickles 8-10 lines long.

**Ornamented Hedgehog-thistle.** Pl. ¼ foot.

7. E. tuberculatus (Link et Otto, diss. t. 26.) plant nearly globose, with 5 nearly vertical ribs, and with the recesses narrow; crests very obtuse, tubercled at the fascicles, of which there are 8 or 10 on each rib; areoles when young rather velutinous; prickles 12-13 in each fascicle, grey, with one central straight strong one, the rest radiating. τ. D. S. Native of Mexico. Coulter. Intervals on the ribs between the fascicles of spines 8-9 lines. Prickles an inch long.

**Far. β. spiralis (D. C. l. c.)** ribs twisted spirally to the right. τ. D. S. Native of Mexico. Coulter. Perhaps merely an older state of the species.

**Tubercled Hedgehog-thistle.** Pl. ½ foot.

8. E. ? ceresiformis (D. C. l. c. p. 115.) plant nearly cylindrical, green, with about 13 compressed ribs, with the recesses acute, and the crests blunt; prickles 7 radiating, and one central, in each fascicle, greyish, stiff, slender, with 3 fascicles on each rib. τ. D. S. Native of Mexico. Coulter. Perhaps a species of Cereus.

**Cereus-furred Hedgehog-thistle.** Pl. ¼ foot.

9. E. glaucascens (D. C. l. c.) plant nearly globose, depressed, glaucascens, with 11-13 vertical compressed obtuse ribs, with 6 fascicles on each rib; areoles oval-oblong, when young velutinous; prickles yellow, straight, with 6-7 radiating ones, and one central one in each fascicle. τ. D. S. Native of Mexico. Coulter. Flowers solitary on the top of each rib, rising in the front of a fascicle. Scales of calyx imbricated, smooth, oval, acuminate, with membranous ciliated margins. Plant 3 inches high, and 3 inches in diameter. Intervals between the fascicles on the ribs half an inch. Prickles an inch long.

**Glaucusacens Hedgehog-thistle.** Pl. ¼ foot.

10. E. coultori (Link et Otto) plant nearly globose, depressed, green, with 13-15 vertical ribs, with both the recesses and ribs acute; fascicles 3 on each rib; areoles oval, when young velutinous; prickles yellow, stiff, with 7-8 radiating ones, and one erect central one, which is nearly twice the length of the others, in each fascicle. τ. D. S. Native of Mexico. Coulter, no. 43. E. hystrich, D. C. l. c. but not of Haw. Plant 5-8 inches in diameter, and 3-4 inches high. Prickles an inch long, central ones 2 inches long. Intervals between the fascicles on the ribs 12-18 lines in length.

**Coulter's Hedgehog-thistle.** Pl. ½ foot.

11. E. ovata (D. C. diss. t. 9.) plant obovate-ovo-globose, depressed and umbilicate at the apex; ribs numerous, vertical; prickles in fascicles, unequal, divaricate, long; flower solitary at the top of the plant, surrounded by spines. τ. D. S. Native of Mexico. Cactus ovatulus, Moc. et Sessé, fl. mex. icon. ined.—Tepexencomitl, Horn. mex. p. 410, with a figure. Spines whitish, needle-shaped, diverging, intricate. Flower erect, purple, with the margins of the lobes of the limb white.

**Environment-flowered Hedgehog-thistle.** Pl. ½ foot.

12. E. tenuspinosus (Link et Otto, diss. p. 12. t. 19. f. 1.) plant nearly globose, umbilicate retuse at the apex; ribs 12, blunter; prickles in fascicles, slender, recurved, 3 or 4 of which are a little larger than the rest; flowers girdled by wool. τ. D. S. Native of Brazil, in the province of Rio Grande. Plant green, 2 or 3 inches in diameter. Sides of ribs rather impressed. Flowers beyond 2 inches long, yellow; sepals lanceolate, acute; petals dilated, obtuse, each macrorinated by a red bristle. Style 12-15 parted.

**Far. β. minor (Link et Otto, l. c. f. 2.)** plant smaller; spines longer and slenderer, and more bent.

**Selerche-spiced Hedgehog-thistle.** Pl. ¼ foot.

13. E. melacactiformis (D. C. diss. t. 10.) plant roundish-ovate, obtuse; ribs vertical, about 30 in number; prickles in fascicles, diverging, unequal; flowers numerous, in a kind of whorl beneath the apex of the plant. τ. D. S. Native of Mexico. Cactus multangularis, Moc. et Sessé, fl. mex. icon. ined. but not of Wild. Spines brownish. Flowers whitish. Sepals numerous, purplish on the outside, imbricated, and addressed to the tube; limb expanded; lobes oblong, acute, disposed in 2 or 3 series. Stigma long, 8-12, exserted above the stamens.

**Melon-thistle-shaped Hedgehog-thistle.** Pl. ¼ foot.

**Langsdorf's Hedgehog-thistle.** Shrub ½ foot.

† The flowers of the following species being unknown, some of them are probably referrible to the genus Melocactus.

15. E. terpbractanthus (Link et Otto, diss. p. 13. t. 14. f. 2.) plant globose, glaucascen, impressed on the top, not tubercled; ribs 15, acute; prickles 10 in each fascicle, spreading; the 4 central ones the largest. τ. D. S. Native of Brazil, in the province of Rio Grande. The plant is hardly an inch high, and hardly the same in thickness. Prickles canescent, hardly an inch long. Flowers unknown.

**Ash-coloured-spined Hedgehog-thistle.** Ctr. 1825. Pl. ½ to ¼ foot.

**Recurved-spined Hedgehog-thistle.** Ctr. 1796. Pl. 1 foot.

Var. β, purpureus (D. C. prod. 3. p. 462.) Melocactus purpureus, strict in spirem contortis, Plum. spec. 19. mag. miss. vol. 5. t. 8. Cactus nobilis. Lam. dict. 1. p. 537. Native of St. Domingo. The whole plant is purple, with white prickles. Perhaps a proper species, or a true species of Melocactus, ex Salm-Dyke in litt.

Salm-Dyke’s Hedgehog-thistle. Pl. ½ foot.

19 E. nystric (Haw. in phil. mag. Feb. 1839. p. 115.) plant roundish, usually with 12 angles; spines straight, an inch and a half long, fulvous, much longer than the wool from which they rise. ɔ. D. Native of the West Indies. Cactus hystrix, Haw. suppl. p. 73. Cereus hystrix, Sweet. Flowers unknown. Like E. Salmia’nus, but differs in the plant being more oblong, and in the spines being much fewer.

20 E. tuberculatus (Link et Otto, diss. p. 16. t. 26.) plant nearly globose, green, depressed at the top; ribs 8, bluntish; fascicles with 3 central straight prickles, and 7 spreading, rather recurved ray ones, which become gradually smaller from the centre. ɔ. D. Native of Mexico. Plant 4 inches high, and 3½ inches thick, with the furrows narrow. Central prickles of the fascicle an inch long, the ray ones gradually decreasing in length. Flowers unknown.

Tuberculated Hedgehog-thistle. Pl. ¾ to 3 foot.

21 E. clavatus (Link et Otto, diss. p. 17. t. 17.) plant oval-oblong, glaucenct, depressed at the apex; ribs 14-22, bluntish; prickles 10 in each fascicle, 3 central ones the largest, flattened, and elongated: middle one of the 3 erect; ray ones spreading much. ɔ. D. Native of Mexico. Plant 5 inches high, and 4 inches thick. Prickles canescent, crowded at the top, larger ones 2 inches long. Flowers unknown.

22 E. subl‘liferus (Link et Otto, diss. p. 16. t. 27.) plant subgloboso, green, not depressed at the apex; ribs 8-10, blunt, tubercled; central prickles large, erectish, recurved, and 4-5 spreading, and the 4-6 outer ones, divaricate, and slender, in each fascicle. ɔ. D. Native of Mexico. Plant 2½ inches high, and 2 inches thick, with the ribs evidently composed of conflated tubercles. Prickles hoary brown; the larger ones 2 inches long, and the smaller ones about 4 lines long. Flowers unknown.

Aurl-bearing Hedgehog-thistle. Pl. ½ to ¾ foot.

23 E. depressus (D. C. prod. 3. p. 463.) plant nearly globose, depressed at the apex; ribs vertical, about 20 in number, opaque, and somewhat tubercled; fascicles of prickles crowded; prickles rising from fascicles of white tomentum, stiff, very pale brown: central ones in each fascicle 3-4, and 10-12 ray ones: the lower one of these very strong. ɔ. D. Native of South America. Melocactus? depressus, Salm-Dyke in litt. Cactus depressus, Haw. syn. 1783.

24 E. orthanthus (Link et Otto, diss. p. 18. t. 18.) top of plant depressed; ribs 18, bluntish; prickles 7 in each fascicle: the central one of these strong, larger, and straight: the rest spreading. ɔ. D. Native of Monte Video. Plant 2½ inches in diameter, with narrow furrows. Prickles canescent; the larger ones 9 lines long, and the rest about 5 lines long. Flowers unknown.

Straight-spined Hedgehog-thistle. Pl. ½ to ¾ foot.

25 E. acrus (Link et Otto, diss. p. 15. t. 23.) plant subgloboso, glaucenct, not depressed at the apex; ribs 29, arched; prickles 7 in each fascicle, spreading, and recurved. ɔ. D. Native of Monte Video. Plant 3 inches high, and 2½ thick, with broad furrows. Sides of ribs not impressed. Prickles of a hoary fuscous colour, 4-6 lines long. Flowers unknown.

Arched-ribbed Hedgehog-thistle. Pl. ½ foot.

26 E. parvispinus (D. C. prod. 3. p. 463. Haw. in phil. mag. Feb. 1830. p. 114.) plant nearly globose, umbilicate at the apex; ribs 13, compressed; prickles small, white, fulvous at the apex, rising from white tomentum, 7-9 in each fascicle: the central one of these straight, and the ray ones 6-8 in number, and a little recurved. ɔ. D. Native of South America. Melocactus parvispinus, Haw. suppl. 73. Salm-Dyke in litt. Flowers unknown. Very like E. meaouacanthus, Link et Otto.

Small-spined Hedgehog-thistle. Pl. ½ foot.

27 E. intricatus (Link et Otto, diss. p. 19. t. 24.) plant oval, green, with a depressed tuberced top; ribs 20, bluntish; fascicles of prickles crowded, 18-20 in each fascicle: the 4 central ones of these larger and erect, the rest spreading, outermost ones divaricate. ɔ. D. Native of Monte Video. Plant 4 inches high, and 3½ thick. Sides of ribs depressed. Prickles of a hoary-fuscous colour: the larger ones 8 lines long. Flowers unknown.

Intricate Hedgehog-thistle. Pl. ½ foot.

28 E. meaouacanthus (Link et Otto, diss. p. 19. t. 15.) plant oblong, glaucenct, with the top depressed; ribs 14, arched; prickles 9 in each fascicle, short and straight, and one central. ɔ. D. Native of Jamaica. Plant 6½ inches high, and 4½ broad; ribs usually bent. Prickles yellowish, rising from short wool, 4 lines long. The form of the plant is elongated, and like that of a creeping Cereus. Flowers unknown.

Less-spined Hedgehog-thistle. Pl. ½ foot.

29 E. denua’tus (Link et Otto, pl. rar. hort. berol. t. 9.) plant subgloboso, green; with 6-8 bluntish ribs; spines 5-8 in each fascicle, all spreading; involucrum with few leaves. ɔ. D. Native of Brazil.

Naked Hedgehog-thistle. Pl.

30 E. tortusus (Link et Otto, pl. rar. hort. berol. t. 15.) plant nearly globose, depressed at the top, green, with 4 arched ribs; the 4-6 middle spines in each fascicle a little larger and thicker than the rest, which are numerous, but all are nearly equally spreading, and twisted. ɔ. D. Native of Brazil.

Twisted-spined Hedgehog-thistle. Pl.

31 E. erina’ceus (Haw. in phil. mag. Feb. 1830. p. 114.) plant globulos, usually with 14 angles; spines inclining, 9 lines long, numerous, somewhat recurvedly divaricate, fulvous, shorter than the wool from which they originate; fascicles of spines approximate. ɔ. D. Native of South America. Cactus erina’ceus, Haw. suppl. p. 74. Very like Melocactus polyacanthus, Link et Otto, in form, but differs from it in the number of the angles, and in the absence of the woolly flowering top; but the fascicles of spines are nearly similar.

† The two following species from their habit in a seedling state appear to belong to the present genus, but are not described; they are in the gardens of Edinburgh and Glasgow under the name of Cactus, and have been brought from Chili.

1 E. corrugata, Gill. mss. 2. E. foliata, Gill. mss. Cult. See Mammillaria, p. 160. for culture and propagation. Grotesque plants, with the habit of the last genus.

Lan. syst. Iconostralia, Monogr.ica. Seals very numerous, imbricated, adnate to the base of the ovary, united into an elongated tube; outer sepals the shortest, forming the calyx, milder in length and colored, innermost ones petal-formed. Stamens very numerous, united with the tube. Style filiform, multial at the apex. Berry arbores, tabular or scaly, either from the remains of the sepals, or from their eicacites when they have fallen off. Cotyledons wanting?—Fleshy grotesque shrubs, with a woody axis, and medulliferous inside; angles vertical, bearing fascicles of spines, regularly furrowed. Angles or wings either numerous or very few. Flowers large, rising from the fascicles of spines or indentures on the angles.

§ 1. Cerastri (an alteration from the generic name). Plants standing without support, never throwing out roots. Stems upright.

** Stems with many angles.

1. C. multangularis (Haw. suppl. 75.) stem erect, with 18-20 angles; angles very close, blunt; prickles setaceous, yellow, longer than the wood from which they rise. F. D. S. Native country and flowers unknown. Cactus multangularis, Willd. enum. suppl. 33. Perhaps the same as Cactus Kageneki, Gmel. ex Salm-Dyck in litt.

Many-angled Torch-thistle. Ch. 1815. Shrub 1 foot.

2. C. scopata (Salm-Dyck in litt. ex D. C. prod. 3. p. 464.) plant erect, stem with 50 vertical tubercled angles; fascicles of prickles crowded, rising from tufts of white tomentum; ray prickles setaceous, very numerous and white; central ones 3-4, dark-purple. F. D. S. Native of Brazil. Cactus scopata, Link, enum. 2. p. 21. Spreng, syst. 2. p. 494. Plant clothed with short, stiffish, setaceous prickles.

Broom Torch-thistle. Shrub 1 foot.

This is a very singular plant, covered all over with dense hair-like bristles; it is of an oblong shape, about 3 inches high, of a greyish-colour, bent, and hanging, like the grey head of an old man, hence the specific name.

4. C. lamactus (H. B. et Kunth, nov. gen. amer. 6. p. 68.) stems erect, branched, with many angles, and clothed with white wood; angles membranous, tubercled, and beset with stellate fascicles of prickles; central prickles 8-times longer than the rest. F. D. S. Native of Quito, near the rivers Arana and Guancabamba. Stem 10-15 feet high. Central prickles of each fascicle 1 or 1½ inch long. Flowers rising from lateral and longitudinal fissures of the stem, involved in wood. Fruit obovate, red, with a whitish green-coloured pulp.

5. C. micractus (D. C. membractus, D. C. membracti, in mem. mus. 17. p. 115.) plant dividing into many stems at the base, ovate-oblong, greenish, obtuse, with 13 vertical bluntish ribs, with the recesses broad, but hardly acute; fascicles of spines approximating, with tomentose areole; prickles 3 in each fascicle, short, setaceous, diverging. F. D. S. Native of Mexico. Coulter, no. 56. Perhaps a species of Echinocactus. Plant hardly an inch high and the same in thickness.

Small-spined Torch-thistle. Pl. 1 inch.

IV. Cereus.

6. C. polydorius (D. C. l. c.) plant quite simple, erect, green, cylindrical, with 15-18 vertical ribs, and with the furrows acute; crests rather repand; fascicles of prickles approximating, with the young areole convex and tomentose; prickles 8-9 in each fascicle, yellow, straight, diverging, but the central one is long and erect. F. D. S. Native of Mexico. Coulter, no. 15. Plant 30-40 feet in height, without any branch, according to Coulter.

Many-crested Torch-thistle. Shrub 30 to 40 feet.

7. C. Linki (Lehm. ind. sem. lort. hamb. 1827. p. 16.) plant oval, green, with 15 angles; ribs obtuse, bearing flowers at the top from the axis of the fascicles of spines; 3 central spines in each fascicle erectly spreading, and the 10 ray ones slenderer, much more spreading; stigmas 8. F. D. S. Native of Mexico. Calyx half an inch long, beset with greenish yellow scales, which are furnished with purple bristles and white cobwebs. Petals numerous, truncate at the apex, yellow, with purple bases. Styles yellow. Stigmas purple.

8. C. Le'cumii (Coll. hort. ripul. append. 5. t. 2. under Cactus) plant oval, tapering to the apex, with numerous blunt angles; fascicles of spines approximating, woolly at the base; spines white; ray ones spreading; central one long and straight. F. D. S. Native of South America.

Lecche's Cereus. Ch.? Shrub 1 foot.

** Stems with 6-12 angles.

9. C. hexagonus (Willd. enum. suppl. 32.) plant simple, erect, large, usually with 6 strong ribs; fascicles of spines middle-sized; prickles short, brown. F. D. S. Native of South America. Cactus hexagonus, Lin. spec. 1. p. 607. Andr. bot. rep. t. 913. Cactus Peruvianus, D. C. pl. grass. t. 58.—Brall. succ. 1. p. 1. t. 1. The plant is about 40 feet high, usually without any branches, varying with 5-6-7 angles. Flowers solitary, 6 inches long; having the sepals along the tube greenish and irregularly imbricated; limb a little expanded, reddish outside and white inside. Stamens greenish. Fruit dark purple, according to Plummer.

Var. b. abnormis (Willd. enum. suppl. 31.) stem simple, oblong, irregularly furrowed, and tubercled; tubercles oblong, compressed, unequal, bearing prickles at the apex, and rather woolly. F. D. S. Native of South America. C. Peruvianus b. monstrosus, D. C. cat. hort. monsp. diss. t. 11. Flowers twin, nearly as in C. hexagonus, but more expanded and larger, with the outer sepals reddish, but the inner ones are pure white and serrated; tube striated with green on the outside. Stigmas 9-13, greenish.

10. C. Ortus (Lehm. ind. sem. lort. hamb. 1827. p. 16.) plant oval, green, attenuated at the base, with 10 angles; ribs obtuse, bearing the flowers above from the fascicles of spines; 4 central spines in each fascicle, and 10-14 slender, spreading ray ones; stigmas 14. F. D. S. Native of Mexico. Calyx tubular; scales acute, greenish yellow, furnished with a fascicle of purple hairs, and white, cobwebbed wool. Petals numerous, closely serrated at the apex, rather diaphanous, yellow. Style yellow. Stigmas purple.

11. C. Peruvianus (Haw. syn. 171.) plant large, erect, with usually 8 angles or ribs; angles blunt, smooth, glaucous; spines whitish, rising from white tomentum, the lower one very small, and the central one very strong. F. D. S. Native of Peru and Curassao. Cactus Peruvianus, Lin. spec. 607. Willd. enum. suppl. 32. Cereus Echinocerus, Salm-Dyck, in cat. hort. Dyck. 1832. Cactus Coquinambus, Molin. chil. ed. gall. p. 140, ex
Bertol. virid. bon. 1824. p. 4.—Bradh. succ. t. 12.—Lob. icon. 2. p. 25.—Mor. oxon. sect. 17. t. 37. Like C. hexagónus, but differs in being clothed with glaucous bloom.

**Var. β, monstrósus** (Salim-Dyck, l. c.) ribs nearly obliterated; fascicles of prickles spirally confluent.

**Great-angled Torch-thistle**. Shrub large. 14 C. SEVERÁLIÓS (Haw. l. c.) plant 8-angled; bristles half an inch long; petals 5-times shorter than the tube; fruit rather conical, large, scaly, unarmored. ½. D. S. Native of St. Domingo.—Plum. amer. t. 195. f. 1. Large, bluntly angled. Bristles about 20 in each fascicle; fascicles remote. Petals narrow, lanceolate, serrulate, hardly an inch long, but the tube is ¾ inches long, and scaly. Very like *C. hexagónus*, but the spines are more numerous, longer, and slenderer.

**Scrubbed-petalled Torch-thistle**. Shrub large. 15 C. SOXOCTÓS (D. C. prod. 3. p. 404.) plant tall, erect, with 8 angles; angles blunt, compressed; spines stellate, nearly equal; petals emarginate at the apex. ½. D. S. Native of the Caribbe Islands.—Plum. ed. Birm. t. 191. exclusive of the synonyms. Plumier has himself made his plant the same as *C. Perúvius*, but by Linnaeus it has been referred to *C. hexágōnus*, but it differs from both these species, in the petals being bluntly emarginate at the apex, and nearly obovate. Limb of flower spreading. Style exserted; stigma 5-cleft. The name is derived from muque, mono, alone, and elxotoc, klono, a noise; but the application is not evident to us.

**Confused Torch-thistle**. Shrub 20 feet.

16 C. FIMBRÍATUS (Lam. dict. 1. p. 539. under *Cáctus*) plant tall, erect, bluntly 8-angled; prickles setaceous, white; flowers with a short tube; petals fringed. ½. D. S. Native of St. Domingo, in arid woods.—Plum. ed. Birm. t. 195. f. 1. Stem the thickness of a man's leg, and about 18-25 feet high. Flowers rose-coloured, campánulate, with few petals. Stamens very numerous; stigmas multiform. Fruit globose, red, size of an orange, beset with prickly tubercles; flesh red.

**Fringed-petalled Torch-thistle**. Shrub 18 to 25 feet.

17 C. HYSTRÍX (Salm-Dyck in litt. ex D. C. prod. 3. p. 404.) plant erect, green, shining, 9-angled; ribs rather compressed; prickles rising from grey tomentum, with 9 radiating ones, 2 small upper ones, and 3-4 strong, central ones, which are painted with white and brown. ½. D. S. Native of South America? Cáctus hístríx, Salm-Dyck. obs. bot. 1822. Old prickles grey, blackish at the apex. This is different from *Cáctus lec'tus* of H. B. et Kunth, and from C. hístríx, Haw.

**Porcine Torche-thistle**. Shrub.

18 C. R'æóx (Haw. in phil. mag. 1820. feb. p. 107.) plant oblong, nearly terete; with usually 8 ribs; spines divaricate, brown, dense. ½. D. S. Native of Brazil. Plant firm, green, thickly beset with horned spines, and of these there are usually 6 outer radiating ones, 4-5 middle ones, and 1 long central one in each fascicle.

**Fierce Torch-thistle**. Clt. 1827. Shrub 1 foot.

19 C. gáises (Haw. syn. 182.) plant erect, longish, usually 8-angled, deeply furrowed, branched at the base; prickles when old half an inch long, white, but tipped with black. ½. D. S. Native of South America. The rest unknown.

**Grey-petalled Torch-thistle**. Clt. 1809. Shrub 3 to 4 feet. 20 C. CRENNULÁTUS (Salm-Dyck, obs. bot. 1822.) plant erect, greyish-green, with 8-9 angles; ribs blunt, crenulated; prickles white, rising from grey tomentum, blackish at the apex, 9 in each fascicle, radiating and equal, and 1 long central one. ½. D. S. Native of South America. C. Royénii, Wildl. suppl. enum. p. 32. Stem rather woolly at the apex; wool grey, at length falling off.

**Var. β; plant rather slenderer than the species; and the prickles are shorter. Salm-Dyck, in litt.**

**Crenulated Torch-thistle**. Clt. 1728. Shrub 2 to 3 feet.

21 C. CINERA SCENES (D. C. mem. cact. in mem. mens. 17. p. 116.) plant simple, erect, greyish green; with 8 blunt tubercular ribs, and narrow recesses; areole while young convex and velvety; prickles 14 in each fascicle, white, setaceous, stiff, outer 10 radiating, central 4 erectly diverging, and longer than the ray ones. ½. D. S. Native of Mexico. Coulter, no. 23. Stem 6 inches high, and 2 inches in diameter. Outer prickles 6-9 lines long; central ones 12 lines long; in fascicles, which are 5-6 lines distant from each other.

**Var. β, crassior (D. C. l. c.) stem thicker; fascicles of spines more distant.**

**Var. γ, teniōris (D. C. l. c.) stems slenderer; ribs more approximate.** Very like *C. pentadíaphus*, but differs in being 5-angled, not 5-angled.

**Greysih Torch-thistle**. Clt. 1830. Shrub ¾ foot.

22 C. CALESCENS (D. C. l. c.) plant simple, or a little branched at the apex, erect, green, oblate, and rather unambiguously at the apex, with 7-8 vertical, obtuse ribs, and acute furrows; areole, while young, convex and tomentose, but at length becoming nearly glabrous; prickles 8-9 in each fascicle, brown, stiff, diverging; the central ones hardly to be distinguished from the outer ones. ½. D. S. Native of Mexico. Coulter. Very like *C. Peruviáns*. Fascicles of spines 6-9 lines distant from each other.

**Callcuescent Torch-thistle**. Shrub 8 to 10 feet.

23 C. MARGÍNÀTUS (D. C. l. c.) plant simple, or a little branched at the apex, erect, green, obtuse at the tip; with 7 vertical ribs, and acute recesses; crests obtuse, woolly their whole length from white tomentum, in consequence of the oval areole being confluent; prickles 7-9 in a fascicle, stiff, grey, short; with the central ones hardly to be distinguished from the ray ones. ½. D. S. Native of Mexico. Coulter, no. 13. Stem 2½ and 3 inches in diameter. Prickles 1⅔ lines long. A very distinct species.

**Margined Torch-thistle**. Shrub.

24 C. ALBÍSPÉNTE (Salm-Dyck, obs. bot. 1822.) plant erect, greyish green, with 9 or 10 angles; ribs obtuse, very prickly; prickles grey, tipped with yellow, rising from grey tomentum, 11 radiating ones and 1 central in each fascicle. ½. D. S. Native of South America. Very like *C. crenulátus*, but more slender and more woolly. Old plant only woolly at the apex, but the young plant all over; the wool grey. Salm-Dyck, in litt.

**White-petalled Torch-thistle**. Shrub 2 to 3 feet.

25 C. REGULÁTUS (Haw. suppl. p. 75.) plant erect, 9-angled, furrowed; spines fulvous, elongated, when young about equal in length to the wool. ½. D. S. Native of South America. Fascicles of spines much crowded.

**Rough Torch-thistle**. Clt. 1809. Shrub 10 feet.

26 C. VISTÈUS (Wildl. enum. suppl. p. 32. under *Cáctus*) plant erect, green, shining, 7-9-angled; ribs rather compressed repect; prickles brown, rising from brown tomentum; each fascicle composed of 8 radiating ones, a small superior one, and 3 central ones, which are much longer than the rest. ½. D. S. Native of South America. There is hardly any wool at the top of the stem; the rest unknown. Salm-Dyck, in litt.
27 C. HAWORTHII (Spreng. syst. 2. p. 495. under Cactus) plant erect, large, 5-angled, with profound furrows; spines numerous, usually an inch long, brown. b. D. S. Native of the West Indies. C. nobilis. Haw. syn. 179. This species is more formidable than the rest in the prickles being very large and numerous. The rest unknown. The Cactus nobilis, Lin. Haw. and Lam. are very different from each other, and constitute 3 distinct species.

Haworth's Torch-thistle. 1811. Shrub 3 to 4 feet.
28 C. AVREUS (Salm-Dyck. in litt. ex D. C. prod. 3. p. 465.) plant erect, green, 7-8-angled; ribs compressed, very prickly; prickles yellow, rising from straw-coloured tumour, with 8 radiating ones in each fascicle, and some central longer ones. b. D. S. Native country and flowers unknown. Differs from C. Haworthii, in the prickles being yellow, and in their fascicles being more closely crowded.

29 C. NIGER (Salm-Dyck. hort. dyck. cat. 1822.) plant erect, blackish, 7-angled; ribs rather compressed; prickles slender, fulvous, rising from white tumentum: with 7 radiating ones in each fascicle, the $\frac{3}{4}$ lowest of these longer than the rest, and 2 or 3 central ones, the lowest one very short. b. D. S. Native of South America. Cactus niger, Spreng. syst. 2. p. 495. Cereus niger. Haw. rev. 70. Said to be allied to C. repandus. Top rather woolly; wool grey.

30 C. FULVISPINOSUS (Haw. syn. 183.) plant erect, tall, usually 9-angled, simple or branched; prickles strong, yellowish, when full grown nearly an inch long. b. D. S. Native of South America. Cactus Royeni, Mill. dict. ed. 8.

31 C. FLAVISPINUS (Salm-Dyck. obs. bot. 1822.) plant erect, pale green, 8-10-angled; ribs rather compressed; prickles slender, yellowish, rising from white tumentum: with 8 radiating ones in each fascicle, the upper ones of these very small, and 3-4 central ones, the upper one of these erect and very long. b. D. S. Native of South America. Perhaps the same as C. flavispinus of Colla, hort. rip. p. 21. Stem hardly woolly at the apex; wool grey. There is a variety of this species with 6-angled stems and longer prickles. Salm-Dyck. in litt.

Yellow-spined Torch-thistle. Clt. 1796. Shrub 2 to 3 feet.
32 C. CHLOE'NIS (Colla, pl. rar. hort. ripul. app. 2. p. 342.) plant ovate, erect, 10-angled; angles blunt; prickles pale, pubescent, middle of one each fascicle the strongest; wool very short. b. D. S. Native of Chili. C. Coquimbanaus, Hort. but not of Moill. 279. D. C. pl. gras. t. 143. C. lanuginosus, Mill. dict. no. 7. Floral tube greenish. Calycine lobes red. Inner or corolline ones the longest, acuminate, and white. Stigmas 12. Fruit red, according to Herm.

33 C. LAGUNOSUS (Haw. syn. 182.) plant erect, bluntly 8-angled; spines shorter than the wool from which they issue. b. D. S. Native of the West Indies. Herm. lglg. bat. par. t. 115. without a flower. C. repandus, Mill. dict. ed. 8. Cactus laguninosus, Lin. spec. 667. The fruit, according to Herm., is red, not spiny.

36 C. REPANDUS (Haw. syn. 183. D. C. diss. t. 13.) plant long, erect, with 8-9 blunt angles; angles rather undulated; spines longer than the wool from which they issue; floral tube, and consequently the fruit, is unarmed: outer lobes of calyx narrow and much acuminate, almost exceeding the inner ones in length. b. D. S. Native of the Caribbean Islands. Cactus repandus, Lin. spec. 667. Ker. bot. reg. t. 336. Cereus gracilis, Mill. dict. ed. 8. no. 8. - Trew. direc. t. 14. Tube of flower green; inner calycine or coralline lobes white. Stigmas 8-10. Fruit yellow, white inside.

37 C. SUBREPANDUS (Haw. suppl, 78.) plant erect, with 8 angles; angles compressed, repand; prickles strong, of a pale colour; wool very short. b. D. S. Native of the West Indies. Very distinct from C. crenatus.

38 C. A. TURUS (Haw. in phill. mag. feb. 1830. p. 108.) plant erect, blunting 8-angled; angles short; fascicles of spines very black, as well as the short central wool. b. D. S. Native of Brazil. Very like C. repandus, but much more dwarf and simple, and very green; with about 12 spines in each fascicle. This is a singular plant, from its black spines and black bearded terminal brush.

39 C. POLYGOSUS (Lam. dict. 1. p. 539. under Cactus) plant erect, branched, with 11 blunt angles, woolly at the apex; prickles setaceous, grey; flowers short, with the limb hardly spreading. b. D. S. Native of St. Domingo.—Plum. ed. Burm. t. 196. Flowers white. Fruit reddish brown, tubercled; flesh reddish. Stem 10 feet high, and 6-7 inches in diameter. This species is allied to C. repandus, according to Lamarek, but Spreng. has joined it with C. grievus.

Many-angled Torch-thistle. Shrub 10 feet.
40 C. MAGNUS (Haw. in phil. mag. feb. 1830.) plant very strong, simple, with usually 12 deep furrows, and as many ridges; spines unequal, very stiff, dull. b. D. G. Native of St. Domingo. Spines about 12 in each fascicle; fascicles rather distant. Flowers large, white.

Large Torch-thistle. Clt. 1829. Shrub 3 to 4 feet.
41 C. DIVARICATUS (Lam. dict. 1. p. 540. under Cactus) plant erect, branched, very spiny, and bluntly 10-angled; branches spreading. b. D. S. Native of St. Domingo.—Plum. ed. Burm. t. 193. Flowers lateral, hardly known. Fruit globose, yellow, wartyed by large points, or unarumed; pulp white and sweet.

Dewarivce Torch-thistle. Shrub.
42 C. CHLOROCAPITUS (H. B. et Kunth, nov. gen. amer. 6. p. 68.) plant erect, branched; branches festigate, 10-12-angled; angles tubercled; tubercles beset with starry prickles; central prickle in each fascicle 4 times longer than the rest. b. D. S. Native of South America.

Green-fruited Torch-thistle. Shrub 10 feet.
43 C. LE'TUS (H. B. et Kunth, l. c.) plant erect, pale green, jointed; joints 7-angled; angles tubercled, each tubercle furnished with a fascicle of spines. b. D. S. Native of Quito, near Sondorillo. The rest unknown.

Fruitful Torch-thistle. Shrub.

** ** Stems with 3-4 or 5 angles, very rarely with 6 angles.

44 C. VIRNES (D. C. mem. caet. in mem. mus. 17. p. 116.) plant simple, erect, pale green, with 5 vertical, obtuse ribs; fascicles of spines remote, having the areola velvety when young;
prickles 8 in each fascicle, 4 of which are stiff, conical, and greyish, or blackish, 3 very short and diverging, and 1 large and horizontal. \( \gamma \). D. S. Native of Mexico. Coulter. Largest prickles in each fascicle 8-10 lines long, smaller ones hardly 2 lines long.

**Green Torch-thistle.** Shrub. 52 C. obelusus (Haw. rev. v. 70.) plant erect, pale green, triangular; ribs blunt; fascicles of prickles very remote; prickles tawny, rising from brown tomentum; with 4 radiating ones in each fascicle, and a central, elongated erect one. \( \gamma \). D. S. Native country and flowers unknown.

**Blunt-angled Torch-thistle.** Clt. 1820. Shrub 4 to 6 feet. 53 C. Jamaçaru (D. C. prod. \( \gamma \). 467.) plant erect; branches 3-4-angled; prickles in fascicles, straight; flowers cylindrical, with an erect limb; genitils inclosed. \( \beta \). D. S. Native of Brazil. Jamaçaru, Pison, hist. nat. bras. p. 100. F. 1. Trunk triangular, beset with spines. Flowers white, scentless. Fruit red, size of a goose’s egg. Perhaps Jamaçaru quarta species. Maregr. hist. nat. bras. p. 127. \( \gamma \). 3. is the same or a distinct species.

**Jamaçaru Torch-thistle.** Shrub. 54 C. valérus (Haw. in phil. mag. sept. 1831. p. 418.) plant tetragonal, firm, glaucous at the apex, with the sides nearly flat, or rather convex at first, with the angles very blunt and spiny in the middle. \( \beta \). D. S. Native of South America. Spines brownish.

**Strong Torch-thistle.** Shrub.

§ 2. Serpentini (from serp, to creep); stems creeping and rooting. D. C. prod. 3. p. 467. Stems jointed, prostrate, rooting or twining.

* Stems with many angles.

55 C. serpens (Lag. anal. sec. nat. 1801. p. 261.) plant creeping, flexuous, and somewhat climbing, with 11-12 very blunt angles; bristles in fascicles, much longer than the wool from which they issue, but which at length falls off; floral tube very bristly at the base. \( \gamma \). D. S. Native of South America. Wildld. cunn. suppl. 31. Link, et Otto, abbild. t. 91. D. C. diss. t. 12. Flowers large, beautiful; lobes blunted; outer ones greenish; middle ones purplish; inner ones white. Stigmas 7. This plant appears to hold a kind of middle station between the erect and creeping species of the genus, and rarely throws out roots from its stems. Bristles 7-8 lines long, purplish, also crowded at the base of the floral tube.

**Serpentine Torch-thistle.** Clt. ? Shrub 3 to 4 feet. 56 C. tunica (Lehm. ind. sem. hort. lamb. 1827. p. 16.) plant erectish, articulate branching; joints attenuated at the base, tubercular; tubercles impressed at the apex, woolly and bearing spines; spines coated by a somewhat diaphanous, moveable membrane. \( \beta \). D. S. Native of Brazil. Joints terete when young, 1½ inch long, furnished with fleshy, subulate leaves, which become at length deciduous.

**Coctel-spired Torch-thistle.** Clt. ? Shrub ½ to 1 foot. 57 C. ambiguest (Bompl. nat. t. 36. under Cactus) plant erect, with 9-12 blunt angles; bristles spinescent, longer than the wool from which they issue; floral tube bearing bristles at the base. \( \beta \). D. S. Native country unknown. Flowers very like those of C. serpens, of which it is probably only a variety, differing only in the stem being more erect, and in the bristles being shorter.

**Ambiguous Torch-thistle.** Shrub 2 to 3 feet. 58 C. flagelliforms (Mill. dict. ed. 8. no. 12. Haw. syn. 158.) stems prostrate, with about 10 angles; tubercles crowded, bearing bristles; style rather shorter than the petals. \( \gamma \). D. S. Native of South America, and is now to be found in the Arabian deserts, but has been probably introduced there. Cactus flagelliformis, Lin. spec. 688. Curt. bot. mag. t. 17. D. C. pl. grass. 127. This species is very common in gardens, and has trailing stems, unless supported, which are therefore easily trained to any kind of trellising. The flowers are so beautiful, and are produced in such profusion, that the plant is worth being conveyed.
into the house whilst in flower, to adorn any of the rooms; they are red or pink.

59 C. exserta (H. C. mem. cact. in mem. mus. 17, p. 117.) plant creeping, a little, cylindrical, with 7-8 very blunt, rather repand ribs; areole velvety, but convex in the adult state; prickles 12-18 in each fascicle, stiffish, yellow, radiating, having the 2 or 3 central ones erectish. \(\hat{\epsilon}\). D. S. Native of Mexico. Coulter, no. 32. Habit of *C. flagelliformis*, but 3 times slenderer.

Slender Torch-thistle or Creeping Cereus. Clt. 1830. Fl. pr.

60 C. Humboldttii (H. B. et Kunth, nov. gen. amer. 6, p. 66. under *Cactus*) stems procumbent, with 10 or 12 ribs, glabrous; angles tubercled; tubercles bearing stiff bristles; style much exceeding the corolla. \(\hat{\epsilon}\). D. S. Native about Quito, in fields between Quito and San Felipe. Said to be very like *C. flagelliformis*. Flowers red.

Humboldt's Torch-thistle or Creeping Cereus. Shrub pr.

61 C. rossoinii (H. B. et Kunth, l. c.) stems procumbent, simple, usually with 20 angles; angles bearing fascicles of bristles; style length of petals, 8-eleft at the apex. \(\hat{\epsilon}\). D. S. Native of Quito, in dry places near Nabo. According to the authors, this plant is sufficiently distinct from the foregoing. Flowers white.

Twenty-angled Torch-thistle. Shrub proc.

62 C. sehirum (H. B. et Kunth, l. c.) stem erect, with 1) angles; angles bearing fascicles of prickles; stamens and style about equal in length, but exceeding the corolla a little; stigma 8-parted. \(\hat{\epsilon}\). D. S. Native of Quito, in sandy places, near Riobamba, at the foot of Mt Chimbaborzo, where it is called Pitahaya by the natives. According to the authors this species is sufficiently distinct from *C. Humboldttii*. Flowers rose-coloured. Fruit red.

Hedge Torch-thistle. Shrub 6 ft.

63 C. Cardifinis (H. B. et Kunth, l. c.) stems in fascicles, elongated, creeping, branched, somewhat tetragonal; angles tubercled; each tubercle bearing a fascicle of stellate bristles. \(\hat{\epsilon}\). D. S. Native of New Andalusia, near Caripe, growing on rotten wood. Very like *C. flagelliformis* in habit, but both the flowers and fruit are unknown, and therefore the place which it should occupy in this genus is doubtful.

Caripe Torch-thistle. Shrub creeping.

** Stems with 5 or 6 angles.

64 C. grandiflorus (Mill. dict. ed. 8, no. 11. Haw. syn. 181.) stems rooting, diffuse, climbing, 5-6-angled; bristles 5-8 in each fascicle, hardly longer than the down from which they proceed. \(\hat{\epsilon}\). D. S. Native of the West India Islands, and in many parts of the main land of South America. *Cactus grandiflorus*, Lin. spec. p. 668. D. C. pl. grass. t. 52. Andr. bot. rep. t. 508.—Mill. fig. t. 90.—Trew. chrest. t. 31, 32.—Volk. hscp. 1. t. 234. This species, when of sufficient strength, will produce many exceeding large, beautiful, sweet-scented flowers, like those of most of the species of very short duration, hardly continuing 6 hours full blown, nor do the flowers ever open again when once closed. They begin to open between 7 and 8 o'clock, in the evening, are fully blown by 11 o'clock, and by 3 or 4 o'clock in the morning they fade, and hang down quite decayed; but during their short continuance there is hardly any flower of greater beauty, or that makes a more magnificent appearance; for the calyx of the flower, when open, is near a foot in diameter, the inside of which being of a splendid yellow colour, appears like the rays of a bright star, the outside is of a dark brown; the petals being of a pure white add to the lustre; the vast number of recurved stamens in the centre of the flower, make a fine appearance: add to all this, the fine scent, whichperfumes the air to a considerable distance; there is scarcely any plant whose flowers, when placed in the hot-house so much as this, especially as it may be trained against the wall, where it will not take up any room. The flowers make a most magnificent appearance by candle-light, sometimes there may be 6 or 8 flowers open upon one plant at the same time; and there will be a succession of them for several nights together, provided the plant is large and healthy.

65 C. spinulosus (D. C. mem. cact. in mem. mus. 17. p. 117.) plant a little branched, creeping, and climbing somewhat, nearly terete, with 5-6 hardly exerted, acutish ribs, and with broad, bluntish furrows; areole when young, velvety; prickles 8 in each fascicle, very short, stiff, when young yellowish, but afterwards becoming brownish, the lateral ones radiating. \(\hat{\epsilon}\). D. S. Native of Mexico. Coulter, no. 27. Habit of the stems like those of *C. grawillei*, but the prickles are very different.

Spinulose Torch-thistle. Shrub cl.

67 C. radicans (D. C. prod. 3. p. 468.) plant prostrate, jointed, pale green, with 5-5 angles; prickles stiff, slender, rufous, naked at the base, with 6-9 radiating ones in each fascicle, and 1 central one, which is rather elongated. \(\hat{\epsilon}\). D. S. Native of South America. *Cactus réptans*, Salm-Dyck. in litt. not Wild. It differs from *C. pentagonus* in the stems being prostrate and rooting, not erect.

Rooting Torch-thistle. Shrub creeping.

68 C. numillis (D. C. prod. 3. p. 468.) plant jointed, divaricate, rooting, green, with 4 or 5 angles; ribs much compressed and repand; fascicles of prickly crowded prickles about equal in length to the whiteomentum from which they arise; 8-10 radiating white bristle-formed ones in each fascicle and 3 stiffish straw-coloured, central ones. \(\hat{\epsilon}\). D. S. Native country and flowers unknown. *C. gricalis*, Salm-Dyck. in litt. but not of Haw. Plant humble, with the joints a little elongated and divaricating, deeply furrowed.

Humble Torch-thistle. Shrub.

69 C. armistródis (Haw. rev. 77.) plant creeping, green, with 5 angles; prickles bristle-formed, white, stellately expanded, shorter than the rufous wool from which they arise. \(\hat{\epsilon}\). D. S. Native of St. Domingo. The rest unknown.

** Stems with 3-4 angles.

70 C. quadrangulairis (Haw. syn. p. 181.) plant creeping, 3-4-angled; angles hardly channelled; spines 5-7 in each fascicle, hardly stellate. \(\hat{\epsilon}\). D. S. Native of the West Indies.—Plun. ed. Burm. t. 199. f. 1. Flowers white, opening at night, beautiful, and sweet-scented.

71 C. triternis (Salm-Dyck. in litt. ex D. C. prod. 3. p. 468.) plant jointed, erectish, rooting, green, 3-4-angled; ribs much compressed, rather repand; fascicles of spines crowded, with 8 radiating ones in each fascicle, and 3 stiffish central ones. \(\hat{\epsilon}\). D. S. Native country unknown. It differs from *C. gricalis*,
to which it is nearly allied, in the stems being for the most part 3-angled, rarely 4-angled, and never 5-angled, in being more erect, and in the joints being longer and broader, as if they were winged, and also in the prickles being longer.

**Three-winged Torch-thistle.** Clt. 72. 72 C. speciosissimus (Desf. mem. mus. 3. p. 190. t. 9. under Cactus) plant erect, 3-angled; spikes subulate, straight, rising from white tomentum; limb of flower expanded; genitils declinate. 7 C. D. S. Native of Mexico. Cactus speciosiss. Cav. hort. madr. Wildd. enunt. suppl. p. 31. Colla, hort. rip. t. 10. but not of Bonpl. Cactus speciosissimus, Ker. bot. reg. 486. herb. amat. t. 391. Flowers large, of a beautiful scarlet colour, somewhat violaceous inside. Genitils white. This is a most splendid plant when in flower, and is now very common in the gardens.

**Var. f. bifrons** (Haw. suppl. p. 76.) plant dwarfer, more decumbent, and throwing out more roots.

**Var. f. major** (D. C. prod. 8. p. 468.) Native of St. Helena.

74 C. undatus (Haw. in phil. mag. nov. 1829. p. 109.) plant large, climbing, triangularly furrowed; joints large, rather lobately crenated, sometimes like a chain. 7 C. D. S. Native of China. Very like C. triangularis, but much larger; and the branches are greener and more radicant. Fascicles of spines small.

**Waved Torch-thistle.** Clt. 1828. Shrub cl.

75 C. sectiger (Haw. in phil. mag. nov. 1829. p. 108.) plant erectish; branches few, quadrangular; fascicles containing about 20 spines each, 3 or 4 of which are linear, radiating, and nearly equal in length. 7 C. D. S. Native of Brazil. The habit of the plant is referrible to Stappèa aterius, but taller and the angles more concave; wool at base of spines short.

**Bristle-bearing Torch-thistle.** Clt. 1828. Shrub.

76 C. triangularis (Haw. syn. 181.) plant jointed, erectish, rooting, green, triangular; spines reCOMP, with the fascicles of prickles remote; prickles rising from fuscous tomentum, ray ones seactaceous and deciduous, central 3-4, stiff, short, and fulvous. 7 C. D. S. Native of South America. C. prismáticoicus, Desf. hort. par. Prickles dirty yellow, 2-3 lines long, rising from short tomentum. Stem 5-6 feet high, branched. Flowers unknown.

**Triquetrous-stemmed Torch-thistle.** Clt. 1794. Shrub 5 to 6 feet.

77 C. tenenfusus (Haw. in phil. mag. feb. 1827. p. 125.) plant weak, branched, somewhat articulated, climbing and rooting; branches very slender and triangular; bristles very slender, bent, wool-formed. 7 C. D. S. Native country unknown, but probably in some part of South America. Bristles in crowded interwoven fascicles along the angles of the stems, which they hide. Perhaps the same as C. Myosinus.

**Slender-spined Torch-thistle.** Clt. 1826. Shrub 1 foot.

78 C. trigonus (Haw. syn. 181.) plant creeping, triquetrous; angles hardly channelled; prickles 5-7 in a fascicle, stellate. 7 C. D. S. Native of the West India Islands. Cactus triqueter

**IV. CEREUS.**

β, Haw. misc. nat. 199.—Plum. ed. Burm. t. 200. f. 2. Cactus triangularis foliosus, Jacq. amer. 152. ex Lam. dict. 1. p. 541. Flowers white (ex Plum.) and the fruit of a violaceous scarlet colour; but the fruit, according to Jacquin, is of a shining scarlet colour; there are therefore probably two species confused under this name.

**Trigonial-stemmed Torch-thistle.** Clt. 1809. Shrub cl.

79 C. prismáticoicus (Salm-Dyck. in litt. but not of Wildl. ex D. C. prod. 3. p. 469.) plant articulated, erectish, rooting, green, triangular; ribs expanded; spines of prickles crowded; prickles nearly equal, fulvous, rising from fuscous tomentum, 7 radiating ones and 2 or 3 central ones in each fascicle. 7 C. D. S. Native country unknown. Plant slenderer and more humble than C. trigonum; prickles smaller and more numerous; and the fascicles are more crowded.

**Prismatic Torch-thistle.** Clt. 1818. Shrub cl.

80 C. coecileus (Salm-Dyck. in litt. ex D. C. prod. 3. p. 469.) plant with long joints, rooting, deep green, triangular; ribs compressed, repand; prickles rising from fulvous tomentum; radiating ones few, pilose, white, and 4 rather recurved, stiff, fulvous, central ones in each fascicle. 7 C. D. S. Native of Brazil, among rocks on the mountains. Flowers said to be numerous, large, and scarlet.

**Scarlet-flowered Torch-thistle.** Clt. ? Shrub cl.

81 C. extensus (Salm-Dyck. in litt. ex D. C. l. c.) plant with long joints, rooting, green, triangular; ribs much compressed, repandly crenated, furnished with an ovate acutus scale, and numerous white hairs in the crenatures. 7 C. D. S. Native of Brazil. This is a very singular plant, with the sides of the joints 2 inches broad, and 4-toothed at the angles, and for the most part margined with red; teeth as in Stappèa, furnished each with a marcescent scale or leaf. Flowers small, solitary, when dried permanent, yellow; petals 6-8, acute. Style filiform, 8-scept at the apex. Fruit unknown.

**Extended Torch-thistle.** Clt. ? Shrub 1 to 2 feet.

82 C. squamulosus (Salm-Dyck. in litt. ex D. C. l. c.) plant erect, jointed, rooting a little, green, triangular; ribs much compressed, repand, furnished with an ovate acutus scale, and numerous white hairs in the crenatures. 7 C. D. S. Native of Brazil. This is a very singular plant, with the sides of the joints 2 inches broad, and 4-toothed at the angles, and for the most part margined with red; teeth as in Stappèa, furnished each with a marcescent scale or leaf. Flowers small, solitary, when dried permanent, yellow; petals 6-8, acute. Style filiform, 8-scept at the apex. Fruit unknown.

**Scaly Torch-thistle.** Clt. ? Shrub 1 to 2 feet.

83 C. setacatus (Salm-Dyck. in litt. ex D. C. l. c.) plant jointed, erect, rooting a little, deep green, triangular; ribs rather compressed, somewhat repand; hairs rising from white tomentum, with 7-9 radiating ones in each fascicle, and in the middle of each fascicle is a central soft prickle. 7 C. D. S. Native of Brazil.

**Bristly Torch-thistle.** Clt. ? Shrub 1 to 2 feet.

84 C. mounshus (Salm-Dyck. in litt. ex D. C. l. c.) plant rather articulated, erect, rooting a little, slender, margined with red, 3-4-angled; ribs crenulated, furnished with pencil-like fascicles of white hairs at the crenatures. 7 C. D. S. Native of Brazil. Sides of stem hardly 3 lines broad. Pili long, erect, especially on the young branches. The rest unknown.

**Mouse-tail Torch-thistle.** Shrub.

85 C. tenenfusus (D. C. prod. 3. p. 469.) plant low, climbing, acutely trigonal, with some roots issuing from the sides; hairs in fascicles along the angles, elongated, soft and adpressed; flowers sessile, usually with 5 sepals and 5 petals. 7 C. D. S. Native of Brazil. Cactus tenuiss, Sott. ined. Flowers small, rose-coloured, hardly open, rising from among the fascicles of hairs; tube very short.

**Slender Torch-thistle.** Clt. ? Shrub cl.
§ 3. Opuntiaceae (plants having the habit of Opúntia). D. C. prod. 3. p. 470. Stems composed of globose joints, horrific from diverging prickles. Flowers tubular. Style much exerted, multifid at the apex. Perhaps a proper genus, intermediate between Cereus and Opúntia?

Necklace-formed Torch-thistle. Shrub procumbent.

87 C. sephexes (H. B. et Kunth, nov. gen. amer. 6. p. 68. under Cactus) plant creeping, branched, rather angular; areoles 6-angled, prickly at the apex; flowers tubular. H. D. S. Native of Quito, on dry hills on the banks of the river Guanacamba, near Sondorillo. Flowers flesh-coloured; petals 8-12, aente; stigmas 5, approximate. Perhaps a species of Opúntia.

Creeping Torch-thistle. Shrub ex. 88 C. nausus (H. B. et Kunth, l. c. under Cactus) plant creeping and jointed; joints terete, rather compressed, areolate, prickly, a little branched. H. D. S. Native of Quito, near Sondorillo, on the banks of the Guanacamba. The rest unknown.

Dwarf Torch-thistle. Shrub proc. 2 to 3 inches.

99 C. graecilis (Haw. in phil. mag. feb. 1827. p. 136.) plant erectish, nearly terete; old spines solitary, straight, an inch long, but at first twin or more, white. H. D. S. Native of South America. Plant with the habit of Euphorbia hústrix, but less spiny and the spines shorter. It appears to be more nearly allied to C. nausus than to any other species.

Weak Torch-thistle. Clt.? Shrub.

† The following species are in the gardens, but nothing is known of them but the names.

1 C. rosácus, Hort. berol. 2 C. Déppii, Hort. berol. 3 C. inerustátius, Hort. berol. 4 C. exsérven, Hort. berol. 5 C. affínis, Hort. berol. 6 C. protésidórum, Hort. par. 7 C. Col-villi, Sweet. 8 C. ovátus, Gil. (under Cactus). 9 C. pólymórphus, Gil. (under Cactus).

Cult. The same kind of soil recommended for Mammillária, p. 160. will answer the species of this genus; and they are easily propagated by cuttings, which if left to lie a few days after being separated from the mother plant, strike root readily. In order to have several species on one tree, insert them in a plant of Pereskía.

Linn. syst. Ieocandria, Monogynia. Tube of corolla very long, middle-sized, or very short, furnished with remote, unarmed scales, rising from the crenatures of the branches, among small innocuous spines. Limb of corolla fugacious, deeply multifid, and as if it were polypetalous, rosaceous or more or less of a ringent form. Branched, slender, hardly climbing substrubs, natives of South America, growing among rocks or on the trunks of old trees; branches much compressed, 2-edged, thin but fleshy, lobately crenated, green, smooth; with a slender, woody, central axis. Flowers solitary, usually large and showy, white, rose-coloured, or scarlet, rarely sweet-scented. The branches towards the roots are rather angular. The rest as in Cereus, of which perhaps it is merely a section.

Sect. I. Nocturna (from nocturnus, nightly, or in the night; in reference to the time at which the flowers expand). Haw. in phil. mag. aug. 1829. p. 107. Corollas fugacious, sweet-scented, white, expanding alone at night; tube very long.

1 E. phyllánthus (Haw. syn. 197.) corolla small, much shorter than the tube, which is nearly a foot in length; stigmas 10. H. D. S. Native of South America, in Brazil, Guiana, Surinam, Guadaloupe, &c. Cactus phyllanthus, Lin. spec. 670. D. C. pl. grass. t. 145. Opúntia phyllanthus, Mill. dict. no. 9. Cereus phyllanthus, D. C. prod. 3. p. 499.—Dill. et clin. t. 64. f. 74. Flowers white, 9-12 inches long, expanding at night, sweet-scented.

2 E. Hookeri (Haw. l. c.) corolla middle-sized, much shorter than the tube, which is about half a foot long; stigmas usually 13. H. D. S. Native of South America. Flowers white, sweet-scented. Cactus phyllanthus, Hook. bot. mag. 2692. Flowers white, sweet-scented.

Hooker's Epiphyllum. Fl. June, July. Clt.? Sh. 2 feet.

Sect. II. Duírna (from Diurnus, belonging to the day-time; in allusion to the time of the blossoms expanding). Haw. in phil. mag. aug. 1829. Corollas scentless, open day and night; tube middle-sized or very short.

4 E. Vandesii (Hortul.) branches flat or triquetrous, with no spines in the notches, except when young, when there are a few small ones at the base; branches rather convex. H. D. S. A hybrid raised in the garden of the Count de Vandes at Bayswater, from the seed of E. phyllántoides, impregnated by the pollen of Cereus speciosissimus. The flowers are large, and of a deep red colour, and, upon the whole, it may be considered the most splendid of the genus.

5 E. Jenkínsé (Hortul.) branches round or triquetrous at the base, but always flat at the apex, with the notches more prominent and spiny than in any other species of the genus; the branches are likewise more convex and firm. H. D. S. A hybrid, raised from the seeds of Cereus speciosissimus, impregnated by the pollen of Epiphyllum speciosum. Cactus Jenkínsé, Hortul. The flowers of this hybrid are large, and of a deep scarlet-colour, and are said even to outvie in splendour those of E. Vandesii. There are several other hybrids now in various gardens, raised from the same parents as the present plant, which may prove even superior in splendour to any of the genus, but they have not yet flowered.

6 E. oxyptálum (Haw. l. c.) tube of flower length of the accumulated lobes; flowers sessile; fruit nervved longitudinally.
1. D. S. Native of Mexico

Cereus oxypetalus, D. C. prod. 3. p. 470. Flowers 4 inches long, reddish brown on the outside, and white inside. Berry red, oblong, ribbed, attenuated at both ends. Branches like those of E. phyllanthoides.

Sharp-petalled Epiphyllum. Shrub 2 to 3 feet.

8. E. akermanii (Haw. in phil. mag. Aug. 1829. p. 108.) corolla large, rather ringent, assurgent before expansion, and acute at the apex, nearly 4 times longer than the tube; stigmata 7. D. S. Native of Mexico, from whence it was brought by a Mr. Akerman. Cactus Akermanii, Hortul. Flowers large, scarlet. Petals keeled, a little recurved at the apex. Branches flat, thin, seldom with any spines in the notches except when young.

Cult. The species of Epiphyllum are extremely showy when in flower. Their culture and propagation are the same as that recommended for the last genus. They are known at first from all the other genera of this order by their flat elongated branches.

Lin. syst. icosandria, Monogyma. Sepals numerous, leaf-form, adnate to the ovaryum: upper ones flat and short: inner ones petal-formed, obovate, rosaceous, expanded: without any tube above the ovaryum. Stamens numerous, shorter than the petals. Style cylindrical, constricted at the base; stigmata many, thick, erect. Berry ovate, umbilicate at the apex, tubercled, and usually bearing spines. Embryo rather spiral, nearly terete. Cotyledons semi-terete (ex Geertm. fruct. 2. t. 138.), after germination becoming foliaceous, flat, and thickish. (see Dill. elth. f. 381.) Plumule small.—Shrubs, with the trunk at length becoming terete, but having the young branches very rarely cylindrical, but usually more or less compressed, and jointed: joints ovate or oblong, bearing fascicles of spines or bristles, which are disposed in a quincuncial or spiral order. Leaves nearly the form of those of some species of Stelum, but fall off very soon, one under each fascicle of spines or bristles on the branches when young. Flowers rising from the fascicles of spines or bristles, or from the edges of the joints, either yellow or reddish. Stamens rather irritable to the touch.

Sect. I. Cylindraceae (from cylindraceus, like a roller; in allusion to the cylindrical branches). D. C. prod. 3. p. 471. Stems cylindrical, neither jointed, nor furrowed, but bearing areolate convex tubercles, and fascicles of prickles. The species of this section are not sufficiently known, or probably they would have constituted an intermediate genus between Cereus and Opuntia.

1 O. rosea (D. C. diss. t. 15.) plant erect, rose-coloured; stems and branches tubercular; tuberules oblong, depressed, disposed in spiral series, bearing each at the apex a caducous leaf, and a fascicle of straight white prickles; flowers nearly round, usually by fours at the tops of the branches. D. S. Native of Mexico. Cactus subquadriflorus, Moz. et Ses. Pl. Mex. icon. ind. This is an anomalous species, as from the stems it agrees with Cereus tuberculatus, and from the rotate flowers it agrees with Opuntia. Flowers flesh-coloured. Fruit white. Leaves terete, acute, soon falling off.

Rose-coloured Indian-fig. Shrub 2 to 3 feet.

Cylindrical-branched Indian-fig. Cilt. 1793. Sh. 2 to 3 feet.

3 O. inermicata (D. C. prod. 3. p. 471.) plant erect, terete, not furrowed, but superficially ribbed, and rather lobe-formed, somewhat inerimbrately tesselated in various ways. D. S. Native country and flowers unknown. Cereus inermicatus, Haw. rev. 70. Allied to O. cylindrica, but more robust according to Haworth, but according to the Prince de Salm-Dyck it is slenderer.

Inericate-tesselated Indian-fig. Cilt. 1820. Shrub 2 to 3 feet.

4 O. statele (D. C. mem. cact. in mem. mus. 17. p. 117.) plant branched, irregularly tufted, deep green; joints ovate or oblong; areole small, tomentose in the axils of the tuberules; prickles 5-6 in a fascicle, stiff, straw-coloured, setaceous, when old the epidermis or coat separates from them. D. S. Native of Mexico. Coulter, no. 38. Stem hardly an inch high. Habit almost of Staphelis cespitosa, but which is without prickles.

Stapella-like Indian-fig. Cilt. 1830. Shrub 1 to 2 inches.

5 O. exuvia (D. C. l. c. p. 118.) plant branched, erect, nearly terete; branches furnished with compressed tuberules, and irregular crests, so as to make them nearly pentagonal; areole orbicular, velvety at the axils of the tuberules; prickles 5-6 in a fascicle, stiff, straight, when old the epidermis separates from them. D. S. Native of Mexico. Coulter, no. 18. Cactus tunicatus, Hort. berol. ex Salm-Dyck. Trunk a foot high, and 18 inches thick.

Far. P. angustior (D. C. l. c.) trunk slenderer; prickles fewer; areoles narrower. Coulter, no. 17.

Far. r. spinosior (D. C. l. c.) stem dwarf; prickles longer and more numerous, and more spine-like.

Striped Indian-fig. Cilt. 1830. Shrub 1 foot.

6 O. decripiens (D. C. l. c.) plant erect, branched, green; branches cylindrical, attenuated at the base; tuberules few, spirally disposed; areole small; prickles of two forms, the lower one large and spreadingly deflexed; the rest, 3-4 in number, bristle-formed and radiating. D. S. Native of Mexico. Coulter, no. 26. Leaves small, ovate-oblong, deciduous. Large prickles an inch long, where the epidermis separates from it. The rest 1-2 lines long. Compare it with O. cylindrica.

15 O. CURASSAICA (Mill. Dict. no. 7; Haw. syn. 190.) plant erect; joints brittle, cylindrically ventricose, compressed, very much divaricated, deep green; prickles 1-4 in each fascicle, whitish. ½. D. S. Native of Curassoa. Bradl. succ. t. 4. Cactus Curassavicus, Lin. spec. 670. Flowers yellow, an inch and a half in diameter. Stigmas 3-5.

Var. β. longa (Haw. rev. p. 71.) branches more firm, and twice the length of those of the species. ½. D. S. Native of Brazil. Perhaps a proper species. There are several other varieties mentioned by Haworth, but they appear to have sprung more from the state of the plants, and the manner of culture.

16 O. fra'elis (Nutt. gen. amer. 1. p. 296. under Cactus) joints short, oblong, nearly terete, fragile, doubly spinose; fruit dry and prickly. ½. H. Native of North America, in sterile places about the river Missouri. Flowers small, yellow, solitary on the tops of the branches. Truly distinct from all the rest, and will perhaps form a distinct section along with two other unpublished species, which are now growing in the garden of the Prince de Salm-Dyck.

Brittle Indian-fig. Clt. 1814. Shrub ½ to 1 foot.

17 O. pusilla (Salm-Dyck, obs. bot. 1822. et in litt. 1827.) plant prostrate, divaricate, of a dirty-green colour; joints cylindric, cucumber-formed; fascicles of prickles crowded; prickles setaceous, white, rising from white tomentum, 1 or 2 in each fascicle are more elongated than the rest. ½. D. S. Native of South America. Joints rather attenuated at the apex.

Small Indian-fig. Clt. 1817. Shrub prostrate.

Sect. III. Grandispinosæ (from grandis, great, and spinosus, full of spines; in reference to the prickles being large and numerous). Haw. syn. 195. Joints compressed, ovate or obovate. Prickles variable, the smaller ones setaceous, and the larger ones much longer and stronger.

18 O. Missouríensis (D. C. prod. 3. p. 472.) joints broad, nearly orbicular, very prickly; prickles of 2 forms, larger ones radiating and permanent; flowers numerous; fruit dry and prickly. ½. H. Native of North America, in arid places about the Missouri, plentiful. Cactus ñerox, Nutt. gen. amer. 1. p. 296. but not of Wild. O. polycántica, Haw. rev. p. 82. Larger than O. vulgarís. Flowers pale yellow or sulphur-coloured. Stigmas 8-10, greenish. Prickles white.

Missouri Indian-fig. Fl. June, July. Clt. 1814. Sh. 1 ft. 19 O. ñerox (Haw. suppl. p. 82.) joints oblong, elongated; prickles strong and setaceous, numerous, whitish, in fascicles, longer than the wool from which they issue, one of which in each fascicle is longer than the rest. ½. D. S. Native of South America. Cactus ñerox, Wildl. enum. suppl. p. 35. but not of Nutt. The rest unknown.

Fierce Indian-fig. Clt. 1817. Shrub 2 to 3 feet.

Perhaps Cactus humilis, Lag. nov. spec. is different from this. The plant often occurs in the gardens under the name of O. Tuna.

Horrid Indian-fig. Fl. July. Clt. 1795. Shrub 1 to 3 feet. 22 O. Dilleanii (Haw. suppl. p. 79.) plant erect; joints roundish-ovate, undulated, glaucous; prickles strong, divaricated, yellow, but the bush-like branches by which they are surrounded are much shorter. 2. D. S. Native of South America. —Dill. eth. f. 382. Cactus Dilleanii, Ker, bot. reg. 253. Flowers large, pale yellow. Ovarium shorter than the corolla, furnished at the summit by fascicles of bristles.

Dillenius's Indian-fig. Fl. Oct. Clt. 1810. Sh. 3 to 5 feet. 23 O. Tuna (Mill. dict. no. 3. Haw. l.c.) plant erect; joints broadly ovate-oblung; prickles subulate, long, yellow; wool at the base of the spines short. 2. D. S. Native of South America. Cactus Bonplandii, H. B. et Kuch, nov. gener. amer. 6. p. 69.—Dill. eth. 296. t. 295. f. 386. Flowers of an orange-colour, or iron grey-colour, or dirty red. Stigmas 8-10-cleft. This kind of Indian-fig makes strong fences. When the Island of St. Christopher was to be divided between the English and the French, three rows of the Tuna were planted by common consent between the boundary lines. Sloane. Sir James Smith, in his paper upon the irritability of vegetables, informs us that the long and slender stamens of the flower are very irritable; and that if a quill or feather is thrust through them, in the space of 2 or 3 seconds they begin to lie down gently on one side, and in a short time become recumbent at the bottom of the flower. According to Humboldt and Bonpland the fine kind of cochineal is nourished by this plant.

Tuna Indian-fig. Fl. July, Aug. Clt. 1731. Sh. 3 to 6 ft. 24 O. Polyanthia (Haw. syn. p. 190.) plant erect; joints oblong and ovate; prickles very different in form, yellow, larger ones setaceous, erectly spreading; flowers numerous at the tops of the branches. 2. D. S. Native of South America. Cactus Polyanthia, D. C. pl. grass. no. 138. with a figure. Cactus polyanthys, Sims, bot. mag. t. 2691. Flowers yellow. Style full, not fistular as in the other species. Stigmas 6.

One-spined Indian-fig. Clt. 1816. Shrub 6 to 8 feet. 26 O. Elatio'n (Mill. dict. no. 4. Haw. syn. 187.) plant erect; joints broadly oblong-ovate; prickles subulate, very long, blackish, with the wool from which they rise nearly obsolete. 2. D. S. Native of South America. Cactus Tuna 6, Willd. spec. 2. p. 94.—Dill. eth. t. 294. f. 376. Flowers yellow, varying to purple. Stigma 5-cleft. Adult stem nearly terete ex juv.

Blackish Indian-fig. Fl. Aug. Clt. 1795. Sh. 2 to 3 feet. 28 O. Maxima (Mill. dict. ed. 8. no. 5.) plant erect; joints ovate-oblung, very thick; spines unequal. 2. D. S. Native of South America. Perhaps the same as O. Angichea.

Greatest Indian-fig. Shrub 6 to 8 feet. 29 O. Triaca'mtha (Willd. enum. suppl. under Cactus,) joints ovate-oblung; prickles whitish, usually 3 together, strong, longer than the wool from which they issue. 2. D. S. Native of South America. Very nearly allied to O. polyanthia ex Salm-Dyck in litt. but the joints are a little larger, and the prickles are white. Flowers unknown.

Three-spined Indian-fig. Shrub 2 to 3 feet.

Sect. IV. Parvispinosa (from parvus, small, and spinosa, full of spines: in reference to the spines being small, equal, and numerous). D. C. prod. 3. p. 175. Prickles uniform, hair-like, short or nearly wanting.

30 O. Decembera (Haw. rev. 71.) joints ovate-oblung; prickles deciduous, length of the wool from which they issue. 2. D. S. Native of South America. Cactus decumans, Willd. enum. suppl. 34. O. maxim'a, Mill. dict. ed. 2. no. 5. Cactus elongatus, Willd. enum. suppl. 34. There are varieties of this plant with either ovate or lanceolate-oblung joints, almost unarmed or furnished with some short white prickles. Flowers yellow. The cochineal bug thrives almost as well on this species as on the next.

Huge Indian-fig. Clt. 1768. Shrub 5 to 10 feet. 31 O. Cochinillifera (Mill. dict. ed. 8. no. 6. Haw. syn. 192.) plant erect; joints obovate, nearly unarmed; petals crimson; stamens and style exserted. 2. D. S. Native of South America. Cactus cochinillifera, Lin. sp. 670. Hook, in bot. mag. 2741. and 2742.—Dill. eth. t. 297. f. 382. Joints while young oblong, aracelate, at length obovate-oblung. Flowers blood-coloured ex Dill. eth., small, spreading a little. Spines slender, blackish. The ripe fruit is said to check fluxes by its mild restringency. Flowers red. Perhaps Nopal de Castille Thierr-Menonville, voy. Guax. 2. p. 278. is the same as this plant.

Of the particular species of Opuntia which nourishes the cochineal insect much doubt has existed. There is some reason to believe that the Opuntia cochinillifera, Haw. Cactus, Lin. is not the plant which produces the best Mexican cochineal. Tillot, on the authority of well informed travellers, states that the cochineal Cactus has no spines, and a fruit imbued with deep red pulp. Clavigero, however, says, "In Misteca, where I was for five years, I always saw the insect upon prickly Nopals. M. de Raynal imagines that the colour of the cochineal is to be ascribed to the red fig on which it lives; but that author has been misinformed, for neither does the cochineal feed upon the fruit, but only upon the green part of the plant; nor does that species of Nopal bear red, but white figs. Clavigero adds, "it may be reared upon the species with red fruit, but that is not the proper plant of the cochineal." M. Thierry de Menonville, who procured the cochineal insect, and the Opuntia on which it feeds from Guaxaca in Mexico, and transported them to St. Domingo, and who unquestionably had the best means of determining the kinds of Cacti cultivated for the insect, describes particularly 3 sorts on which it may be reared, and cultivated to advantage. The first is the Cactier Nop'al, upon which alone the cochineal is reared in Mexico, both the fine and the common sorts, although there are throughout the country many other kinds of Opuntia. The two following, therefore, it is presumed are employed in St. Domingo. 2. The Cactier splendide, which may be used to equal advantage with the former; and 3. The Cactier de Campeche. Of these the first, as far as can be determined by description, is the Cactus Tuna of Lin. which is the Opuntia Tuna of Mill. The second appears to be very similar to the former, but larger in its joints, and very glaucous. The third is without doubt the Cactus cochinillifera, Lin. and which he says of it from his own experience, that it may be usefully employed for rearing the Coccinile sylvestre, and may even support a small quantity of the fine kind. Humboldt also, although
he allows that it is the plant upon which the cochineal has often been sent to Europe, asserts that our Opuntia cochiliifera is not the individual of the Mexican Nopaleries, which he makes a new species under the name of O. Bonplandii, and he quotes under it a mark of doubt the Cactus Tuna of Lin. At Rio Janeiro, when that place was visited by the Chinese embassy under Lord Macartney, there were considerable plantations of Cactus Tuna, now Opuntia Tuna, for rearing the cochineal, which had sometime previously been introduced to Brazil. In St. Vincent the Rev. L. Guilding has a considerable nursery of the Opuntia cochiliifera inhabited by thousands of the true cochineal; and he is in expectation of sending to the Society of Arts a large quantity of the dried insects. From all that has been said we think it may be inferred with safety that in Mexico and Brazil the Opuntia Tuna or Bonplandii is the favourite food of the cochineal; and that in the West Indian Islands, where O. Tuna is perhaps less frequent, the O. cochiliifera is employed by the natives, and answers the purpose sufficiently well.

Like all the species of Opuntia, the plants propagate readily by having the joints stuck into the ground, and the plants love dry and barren spots. If cultivated for the purpose of rearing the cochineal, it must be defended, at least in the rainy Island of St. Vincent, from storms and winds, by sheds placed to windward.

The cochineal insect, which feeds upon the kinds of Opuntia just mentioned, is too well known to need a particular description here; as are also its valuable properties in producing the dye which bears its name, and carmine. It is the Coccus cacti of Linnaeus, a small insect of the order Hymenopreta, having a general appearance not very dissimilar to that of the mealy-bug of our gardens, and equally covered with a white powder substance. The male is winged. It is originally a native of Mexico, and was cultivated for its precious dye long before the conquest of that country; and these plantations, called Nopaleries, are most extensive in the Mistsca and Oaxaca; the latter district alone has exported, according to Humboldt, upon the average 32,000 arobas annually, estimated at 2,400,000 piastres, above 500,000l. sterling.

In S. loue's Jamaica, vol. i. t. 9, a representation of a Mexican Nopalerie is given from a drawing made at Guayaaca, by an Indian. In these small plantations or enclosures they cultivated either the fine sort (Grana fina of the Spaniards), or the common kind (Grana sylvestre), which differ by the first having a finer quality and more powdery covering; whilst the latter, less valuable in its produce, has a cottony covering; but whether these two insects be specifically distinct has not yet been determined. The placing of the females, when big with young, is called sowing. The proprietor of a Nopalerie buys in April or May the branches of joints of the Tunas de Castilla (Opuntia Tuna), which are sold in the market of Oaxaca at about 3 francs a hundred, loaded with young cochineals (semlia). These are kept in cellars for 20 days, when they are exposed to the air, suspended under a shed. So rapid then is the growth of the insect, that by August or September the females are big with young, and ready for sowing, which is done in small nests, made of the fibrous parts of the foliage of a Tiliacastria called Paxtie. In four months from the time of sowing the harvest commences. The insects are brushed off with a sparrow's or deer's tail by women, who sit during this operation, for whole hours at one Nopal plant; so that it was not for the extreme cheapness of labour in that country, Humboldt says, that the rearing of the cochineal would prove an unprofitable employment. After being gathered, the insects are killed by boiling water, or by exposing them in heaps to the sun, or by means of the vapour baths of the Mexicans (tenaselli), when dry and of commerce. From the latter method, the powdery substance is preserved, which increases the value of the insects in commerce. Dr. Bancroft has estimated the annual consumption of cochineal in Great Britain only at about 750 bags or 150,000 lbs., worth 275,000l. "A vast amount," as the authors of the introduction to Entomology observe, "for so small a creature, and well calculated to show us the absurdity of despising any animals, on account of their minuteness." According to the same writers, the only kind of cochineal that has been conveyed to the East Indies is the sylvestre or wild cochineal from Brazil, and the Court of Directors of the East India Company have offered a reward of 6,000l. to any person who should introduce the more valuable sort. The insects were introduced to the royal gardens at Kew in 1814 from Martinico, by M. Castelneau d'Auros, late superintendent of the botanic garden on that island. In 1820, the fine cochineal was introduced to the Apothecaries' botanic garden at Chelsea by W. Priness of Calcutta, from some of the Nopaleries of Mexico.

32 O. ficus-indica (Haw. syn. p. 191.) joints ovate-oblong, obtuse at both ends; prickles setaceous, length of the wool from which they rise. f. D. S. Native of South America. Cactus Ficus Indica, Lin. spec. 670. Wild. enum. suppl. 34. Joints a foot long. Prickles all setaceous, and very short. Flowers sulphur-coloured. Fruit large, edible, deep purple. This is the most common kind of Indian-figs in Jamaica, and upon the fruit of it a wild kind of cochineal feeds. The plant is to be found in many parts of Asia, but has perhaps been transplanted thither.

Common Indian-fig. Fl. June, July. Ct. 1731. Shrub 2 to 3 feet.

33 O. pseudotuna (Salm-Dyck, obs. bot. 1822. et in litt. 1827.) plant erect, branched, light green; joints obovate, compressed, large, thick; fascicles of prickles distant; prickles yellow, setaceous, collected into brush-like heaps; lower one of each heap strong, and subulate. f. D. S. Native of South America. Allied to O. Ficus-Indica, but more shining. This species occurs often in gardens under the name of O. Tuna.

False-Tuna. Shrub 2 to 3 feet.

35 O. lanceolata (Haw. syn. 192.) plant erectis; joints lanceolate; spines uniform, very short. f. D. S. Native of South America. Cactus lanceolatus, Haw. misc. p. 188. Leaves larger in this species than any of its allies, generally they are more than 3 lines long. Flowers 4 inches in diameter, of a shining yellow-colour. Stigmas 5, sulphur-coloured. Lanceolate-lobed Indian-fig. Fl. July. Ct. 1796. Shrub 2 to 3 feet.

36 O. tuberculata (Willd. enumm. suppl. p. 34. under Cáctus,) joints ovate-oblong, attenuated at both ends; tubercles spinose; prickles setaceous, about equal in length to the wool from which they rise. f. D. S. Native of tropical America. Haw. rev. p. 80. The rest unknown.

Warted Indian-fig. Ct. 1818. Shrub 1 to 2 feet.

37 O. inermis (D. C. prod. 3. p. 473.) plant strictly erect; joints fleshy, ovate-elliptic; spines uniform, very short, hairiform, very numerous. f. D. S. Native of South America. Cactus Opuntia, D. C. pl. grass. no. 138. with a figure. Cactus strictius, Haw. misc. 188. but not of Willd. O. stricta, Haw. syn. 191. Flowers yellow on both sides, spreading.

Amyclea Indian-fg. Shrubs 2 to 4 feet. 39 O. REBE'CA (Salm-Dyck in litt. 1827. ex D. C. prod. 3. p. 474.) plant erect; joints elongated, compressed, reddish green, somewhat tuberculately aruncate, unarm'd; leaves small, reddish, at the base of the white tomentum.  b. D. Native of Brazil. This plant is very showy when young, being of a reddish-colour, and the stem flat and elongated, nearly as in Opuntia, but absolutely without spines.

Reddish Indian-fg. Shrubs 1 to 2 feet. 40 O. CRASSA (Haw. suppl. p. 81.) plant erect; joints ovate or oblong, very thick, full of a fleshy substance; fascicles of bristles minute, unarmed, yellowish.  b. D. Native of Mexico.

Hernandezii's Indian-fg. Clt. 1827. Shrubs 1 foot.

Per. bras. p. 100. f. 2. Flowers yellow.

† The following species are only known by name, but having been described.

1 O. leucantha, Hort. berol. 2 O. alata, Hort. berol. 3 O. myriacantha, Hort. berol. 4 O. subinermis, Link. 5 O. sulpharica, Gill. (under Cactus). 6 O. siccva, Gill. (under Cactus).

Cult. The species of Indian-fg are of very easy culture: the soil recommended for Mammillaria will suit them; and in order to propagate them, the branches should be separated at the joints, and allowed to lie a few days to dry after being so separated, and when stuck into the earth they will soon strike root.

Lin. syn. Leosistrum, Monosynia. Sepals numerous, adnate to the ovarium, and often remaining on the fruit, leaf-formed. Corolla rotate, nearly as in Opuntia. Stamens numerous, much shorter than the petals. Style filiform; stigmas collected, in a spiral manner. Berry globose or ovate. Seeds imbedded in the pulp.—Shrubs or trees. Branches terminate. Prickles solitary at the axis of the leaves, and in fascicles on the stem. Leaves distinct, flat, larger than those of any other genus in the present order. Flowers somewhat panicked, solitary, terminating the branches, or rather lateral.—Pereskia, Thierry Mennov. voy. guax. 2. p. 275. is probably a species of Opuntia.

1 P. aculeata (Mill. dict. Haw. syn. 198.) leaves elliptic; prickles solitary, in the axis of the leaves, but becoming at length in fascicles on the stems; flowers rather panicked; fruit globose, bearing the foliaceous sepals.  b. D. Native of the Western Indies, where it is called American or Barbadoes Gooseberry by the inhabitants, and by the Dutch Blood-apple. Plumm. gen. t. 26.—Dill. hort. clt. t. 227. f. 294. Cactus Pereskia, Lin. spec. 671. Prickles half an inch long. Buds rather woolly. Flowers white. Fruit yellowish, edible.

2 P. longispina (Haw. syn. 178.) leaves elliptic; prickles twin, an inch and a half long, very woolly.  b. D. Native of South America. P. aculeata b, longispina, D. C. prod. 3. p. 474.

Long-spined Barbadoes-gooseberry. Shrubs 6 to 6 feet. 3 P. BLEO (H. b. et Kunt. nov. gen. amer. 6. p. 69.) leaves oblong, acuminate; prickles axillary, 5-6 in a fascicle; flowers 2-4 together at the tops of the branches, each on a short peduncle; petals obovate, retuse.  b. D. Native of New Granada, on the banks of the river Magdalen, near Badilla, where it is called Bleo by the inhabitants. Lindl. bot. reg. 1173. Flowers pale red. Stamens also red, but white at the base. Stigma 5-7-cleft.

4 P. OBSCURA (H. b. et Kunt, l. p. 70.) leaves oblong, acute at both ends; spines 1-3 together, subulate, in the woolly axis of the leaves; flowers 2-3 together, axillary, pedunculate, rising above the spines.  b. D. Native of South America, in the province of Jaen de Baracamaros, on the banks of the Amazon. Flowers small, red. Stigma 3-4-cleft.

Horrid Barbadoes-goosberry. Shrubs or tree.

5 P. portulacefolia (Haw. syn. 199. in a note) leaves obovate-cuneate; prickles solitary, under the leaves, but at length coming in fascicles on the stem; flowers solitary; petals emarginate; fruit globose, retuse, naked.  b. D. Native of the West Indies.—Pluml. ed. Burnt. 197. f. 1. Cactus portulacéfalus, Lin. spec. 671. Lin. hort. jaim. 2. p. 255. About the size of an apple-tree. Prickles blackish, Flowers terminal, purple; petals roundish. Fruit umbilicate, greenish, with white flesh, and numerous black seeds.

Purslane-leaved Barbadoes-goosberry. Clt. 1820. Tree 20 to 30 feet.

6 P. ZINNIFLORÁ (D. C. dict. t. 17.) leaves ovate, acute, undulated; prickles axillary, twin; but at length somewhat fasciculate on the stem, about the cicatrices occasioned by the falling of the leaves; flowers solitary, terminal; petals obcordate; ovarium bearing the sepals.  b. D. Native of Mexico. Cactus zinnifloras, Moc. et Sesse. fl. mex. icon. ined. Flowers of a deep reddish-violet colour, greenish on the
outside, about an inch in diameter. Very like the preceding species.

_Zinnia-flowered_ Barbados-goosberry. Tree 10 feet. 
7 P. _lychnidiflora_ (D. C. diss. t. 18.) leaves ovate, acute; petals white, in axils of the leaves, but in flessicles on the stems; flowers solitary, terminal; petals cuneate, fringed at the apex; ovary bearing the sepals. _L. S_. Native of Mexico. Cactus fimbriatus, Moc. et Sesse, fl. mex. icon. ined. Flowers of a coppery pea colour, about 2 inches in diameter, similar to those of _Lychnis coronatus_.

_Lychnis-flowered_ Barbados-goosberry. Shrub. 
8 P. _opuntiiflora_ (D. C. diss. t. 15.) leaves oblong, mucronate, usually 2 together; petals white, solitary, very long, but perhaps disposed in flessicles on the stem; flowers usually terminal, or nearly so, solitary; petals white, ovate, ovary bearing flesicules of hairs. _L. S_. Native of Mexico. Cactus opuntiiflorus, Moc. et Sesse, fl. mex. icon. ined. Flowers of a dirty scarlet colour, an inch in diameter; petals disposed in 2 series.

_Indian-fig-flowered_ Barbados-goosberry. Shrub. 
9 P. _rotundiflora_ (D. C. diss. t. 20.) leaves roundish, mucronate; petals white, solitary, but perhaps disposed in flessicles on the stem; flowers solitary, lateral; petals broad, roundish, mucronate; ovary bearing the sepals; fruit oblong, 2 round, full of cacticules. _L. S_. Native of Brazil. Cactus rotundiflorus, Moc. et Sesse, fl. mex. icon. ined. Flowers yellow, variegated a little with scarlet, 3 1/2 inches in diameter. Berry red, oblong.

_Round-leaved_ Barbados-goosberry. Shrub. 

_Great-leaved_ Barbados-goosberry. Cilt. 1818. Sh. 6 feet. 
_Cult._ The species of this genus are very different in habit from the rest of the genera of the present order, from the branches being woolly and furnished with proper leaves; but the flowers resemble the other genera of the order. They are of easy culture, growing freely in any light earth, and cuttings of them are readily rooted in mould or sand, under a band- glass, in heat. A large plant of any of the species has a very grotesque and ornamental appearance, when several species of _Cereus_ and _Epiphyllum_ has been grafted or inserted on it.

** Tribe II. **

** RHIOPSALEÆ.** (this tribe only contains the genus _Rhipsalis_.) D. C. prod. 3, p. 475. Ovula, and therefore the seeds are fixed to the central axis of the berry.

**Linn. syst._** _Iovandria, Monogynia._ Tube of calyx adhering to the ovarium, smooth; limb superior, 3-6-parted, short; teeth acuminate, membranous. Petals 6, oblong, spreading, inserted in the calyx. Stamens 12-18, fixed to the base of the petals. _Style_ filiform, crowned by 5-6 stigmata. Berry pellicled, roundish, crowned by the marcescent calyx. Seeds imbedded in the pulp, without albumen; radicle of the embryo thick; cotyledons 2, short, obtuse.—Small shrubs, growing upon trees in the West Indies, usually pendulous, branched, leafless, and terete, naked or bearing rather falcate small bristles; flesicules of bristles, when present, disposed in a quincuncial spiral order. Flowers lateral, sessile, small, white. Berries pellucid and white, nearly like that of _Viscum_ or _Missilicote._

1 R. _Cassyttha_ (Gaertn. l. c. Haw. l. c.) plant pendulous; branches verticillate, naked, glabrous; calyx 6-parted; petals white, petaloid, fringed at the apex; ovary bearing the sepals. _L. S_. Native of the Mauritius, on the rock called Lapoquc. Cactus pendulus, Sieb. fl. macr. 2, no. 259. Perhaps this plant has been introduced to the Mauritius from the Brazils, as all the other species of this genus are natives of America. _Flowers white._ Berries white.

3 _Rhipsaloides_; plant pendulous; branches verticillate, naked, glabrous; calyx 3-lobe; petals broad at the base, and acuminate at the apex; petals 6. _L. S._ Native of Mexico. Flowers white. Berries white, about the size of red currants. _Cactus rhipsaloides_, Moc. et Sesse, fl. mex. icon. ined. _R. Cassyttha γ_, _Mociniana_, D. C. prod. 3, p. 476. _Cilt. 21._

_Cassyttha-like_ Rhipsalis. Shrub 1 foot.

_Dichotomous_ Rhipsalis. Shrub 1 foot.

6 _R. fasciculata_ (Haw. suppl. p. 83.) pendulous; branches terete, in flesicules; flesicules of hairs disposed in a spiral quincuncial order along the younger branches. _L. S._ Native of the West Indies Islands. _Christy_, in bot. mag. 3073. _R. parasitica_, Haw. syn. p. 187. _Cactus parasiticus_, Lam. dict. 1, p. 541. D. C. pl. grass. t. 59. _Cactus fasciculatus_, Willd. enum. suppl. p. 32. _Flowers greenish-white, few, and confined to the main branches._ Berry similar to _R. Cassyttha._

7 _R. salicornioides_ (Haw. suppl. p. 83.) plant erect, branched, prolific at the joints; joints short, oblate, terete, and angular, with flesicules of very minute hairs, floriferous at the apex; flowers solitary. _L. S._ Native of South America. _Otto et Link._ abbl. t. 49. Petals 7-10, acute, yellow, longer than the stamens and style.

8 _R. mesemeryxanthoides_ (Haw. rev. p. 71.) plant glomerately branched; branches erect, terete, straight, bearing joints;
joints lateral, crowded, terete, attenuated at both ends, clumped, bearing the flowers in the middle; fascicles of capillaceous bristles white or pale, but when old and faded black; flowers solitary.

R. D. S. Native of South America. Christy, in bot. mag. 3878. C. salicornoides β, Haw. suppl. p. 88. Joints at the sides of the branches numerous, crowded, and nearly erect. Flowers solitary, rising from the middle, not from the tops of the joints, white. Fruit a white berry, smaller than those of R. CassiaTha.

Fig-marigold-like Rhipsalis. Fl. Ju. Jul. Clt. 1817. Sd. ⅔ f. 9 R. parasitica (D. C. prod. 3. p. 476.) plant pendulous, branched, glabrous; branches striated, or undulate repand. R. D. S. Native of the West India Islands.—Plum. ed. Burm. t. 197. f. 2. Flowers like those of R. dichotoma. This species is hardly known, but distinct from the others in the stem being repand in an undulating manner.

Parasitic Rhipsalis. Shrub 1 foot.

10 R.? Micro' yeti (H. B. et Kunth, nov. gen. amer. 6. p. 65, under Cactus) plant glabrous, pendulous, branched; branches with 3-4 angles, or compressedly 2-edged; flowers rising from the angles. R. D. S. Native of Quito, in groves, near Oleros. Flowers white, minute.

Small-flowered Rhipsalis. Shrub ⅔ foot.

Cult. This is a genus of singular plants, but without much beauty. Being parasitic, on trees, they grow best in vegetable mould, mixed with a little brick rubbish; and they are easily increased by cuttings.

Calyx superior (f. 32. d. f. 33. b.); limb 4-5-parted (f. 33. b. f. 32. a.), regular, coloured. Petals 5, inserted in the throat of the calyx (f. 33. c.), and alternating with its segments, equal. Stamens 4-5 (f. 33. c.), very rarely 6, very short, inserted alternately with the petals, equal; filaments conical or cylindrical, distinct; anthers 2-3-celled, opening lengthwise on the inside; but in the varieties of R. rubrum they burst laterally and transversely. Ovarium 1-celled, with 2 opposite parietal placenta; ovula numerous. Style one, (d. f. 32. c. f. 33. e.) 3 or 4-cleft. Fruit succulent (f. 32. e.), nearly globose, umbilicate at the apex from the permanent calyx (f. 32. d.), 1-celled, many-seeded. Seeds arillate, suspended by a long filiform podsperm; outer integument gelatinous or juicy, and membranous: under one a very thin membrane, adhering closely to the albumen; bluntest at the extremity opposite the hynum. Albumen horny, conforming to the seed, white. Embryo minute, placed at the sharpest end of the seed, excentric, with a blunt radicle, which is placed next the hilum.—Unarmed or spinous shrubs. Leaves alternate, lobed or cut, plated while in the bud. There is one bracteae at the base of each pedicel, which is cut more or less, and two much smaller ones called bracteoles under each ovary. Flowers greenish, white, yellow or red, very rarely unisexual.

This order was formerly confounded with Cacteae: notwithstanding the dissimilarity of their appearance they are most closely related; the principal differences between the two orders are, that in Cacteae the stamens are indefinite, the seeds without albumen, and the calyx and corolla indistinguishable; while in Grossularia the stamens are definite, the seeds albuminous, and the calyx and corolla distinct. There are spines in both orders, and some of the Cacteae have distinct leaves.

The properties of the gooseberry and currant are those of the generality of the order, except that in other species a mawkish or extremely acid taste is substituted for the refreshing and agreeable flavour of the former. Some are emetic. The black currant, which is tonic and stimulant, has fragrant glands upon its leaves and flowers; these reservoirs are also found upon some other species. Male acid exists in currants and gooseberries. Turner, 634.

I. RIBES (the name of an acid plant mentioned by the Arabian physicians, which has been discovered to be the Ribes Ribes). Lin. gen. 281. Berlandier, mem. soc. phys. gen. 3. pt. 2. p. 43. t. 1-3. and D. C. prod. 3. p. 477.—Grossularia, Tourne., Gartn.

LIN. syst. Pentándria, Monogynia. Character the same as the order.

SECT. 1. GROSSULARIA (a dim. of grossus, thick; meaning a gooseberry bush; the species contained in this section all bear gooseberries). Ach. Rich. l. c. Berlandier, l. c. t. 1. Stems usually prickly (f. 32.). Peduncles 1-2-3-flowered. Calyx more or less campanulate (f. 32. a.). Leaves plicate.

* Flowers greenish.

1 R. oxyacantho'ides (Lin. spec. 291.) plant prickly and bristly, naked; spines 1 or 3, joined at the base; leaves cordate, 5-lobed, serrated, often pubescent beneath, and on the petioles; peduncles very short, usually 2-flowered; tube of calyx glabrous, hairy inside, with a spreading limb, which is longer than the obovate petals; gers and pedicels naked. 2. H. Native of North America throughout Canada, and as far as the Saskatchewan, and of Newfoundland. Berlandier, l. c. t. 1. f. 1. The shrub varies much in the aculei and spines, in their number and colour, and in the more or less dense ramifications, and pubescence. Mr. Drummond says, the fruit of this species is much like the common gooseberry, and is equally agreeable, either of a red or green colour.

Hawthorn-like Gooseberry. Fl. May, June. Sh. 3 to 4 ft.

2 R. se 'theta (Lin. ill. bot. reg. t. 1237. Hook, fl. bor. amer. 1. p. 293.) branches beset with dense bristles; prickles unequal, subulate; leaves roundish, cordate at the base, pubescent, 5-3-lobed, deeply crenated; peduncles 2-flowered, rather bracteate; calyx tubularly campanulate, with the segments linear, obtuse, and spreading, twice the length of the petals, which are entire; berries hispid. 3. H. Native of North America, on the banks of the Saskatchewan.

3 R. triflorum (Willd. hort. berol. t. 61.) prickles wanting; spines usually solitary; leaves cordate, 3-lobed, serrated, glabrous; peduncles elongated, 2-3-flowered; tube of calyx narrow, cylindrical, glabrous, with a spreading limb, which afterwards becomes reflexed; stamens exserted; ovarium naked. 3. H. Native of North America, in mountainous situations to the west of the Rocky Mountains; and of Pennsylvania. Berlandier, l. c. t. 1. f. 4. R. stamineum, Horn. hort. lafni. p. 237. Berry reddish, glabrous. The species seems to be easily distinguished from R. Cynosbati by the constantly smooth fruit, very narrow flowers, and exserted stamens.

A n.
Three-flowered Gooseberry. Fl. April, May. Chl. 1812. Sh. 3 to 4 feet.

4. R. Cyno'sbari (Lin. spec. 292.) stem unarmed, rarely prickly; spines usually two; leaves cordate, 5-lobed, serrated, more or less pubescent underneath, and on the petals; peduncles elongated, 2-3-flowered; pedicels divaricate; tube of calyx ovate-cylindrical; limb spreading, with the segments exceeding the petals, which are obovate; stamens hardly exserted; ovary broadly. 3. H. Native of Canada (Michx.). Japan (Thunb.). Bernoull. l.c. t. 1. f. 5. Jacq. vind. 2. t. 133. Berries briskly or prickly. It hardly differs from R. divaricatum, except in the broader tube of the corolla, and the shorter stamens.

7. branches prickly; peduncles shorter; flowers pubescent, purplish; fruit prickly. 3. H. Native about Lake Huron.

Dog-branched Gooseberry. Fl. Apr. Chl. 1759. Sh. 3 to 4 ft. 5. R. divaricatum (Dougl. in bot. reg. 539.) branches divaricate, bristly, at length naked; spines 1-3 together, axillary, deflexed, large; leaves roundish, 3-lobed, deeply toothed, nerved, glabrous; peduncles 3-flowered, drooping; calyx funnel-shaped; with the segments at length spreading, and twice the length of the tube; style and stamens exserted; berries glabrous. 3. H. Native of the north-west coast of America, a common bush on the banks of streams near Indian villages. This species comes nearest to R. triflorum. Berries black, smooth, and spherical, pleasant to the taste. Petals white.

Divaricatum Gooseberry. Fl. April. Chl. 1826. Sh. 5 to 7 ft. 6. R. irreg. (Dougl. in Hort. trans. 7. p. 516. Hook. fl. bor. amer. 1. p. 231.) prickles axillary, tern; leaves cordate, somewhat 5-lobed, toothed, ciliated, pilose on both surfaces, nerved; peduncles 3-flowered, beset with glandular pili; calyx campanulate; segments linear, about equal in length to the tube; berries glabrous. 3. H. Native of the north-west coast of America, on moist mountain rooks near springs and streams, on the Blue Mountains, and on the banks of the Spokane river. Berries spherical, half an inch in diameter, smooth, juicy, and well-flavoured. Apparently closely allied to R. triflorum.

Well-watered Gooseberry. Shrub 3 to 4 feet.

7. R. saxatile (Hook. fl. bor. amer. 1. p. 231.) stem unarmed, rarely prickly; spines wanting, solitary or twin; leaves cordate, 5-lobed, serrated, smoothish; peduncles very short, deflexed, 1-2-flowered; calyx glabrous, with a campanulate tube; segments spreading, but at length reflexed, twice the length of the corolla, and about equal in length to the stamens; ovary naked. 3. H. Native of the north-west coast of America, common on the undulating grounds of the interior among stones; and about Lake Huron, and on the banks of the Sacramento; also near Boston. R. saxitile, Dougl. misc. R. triflorum, Bigel. fl. boist. ed. 2. p. 90. Fruit resembling a common gooseberry.

Stone Gooseberry. Shrub 3 to 4 feet.

8. R. nitre'lli (Michx. fl. bor. amer. 1. p. 479.) spinules nearly axillary; branches beset with a few short bristly hairs; leaves small, semi-trifid; lobes few-toothed; peduncles 1-flowered; berry glabrous, red. 3. H. Native of North America, in Canada, in stony places by the river Signey; and on the mountains of Virginia.

9. R. lacust'ri (Poir. encyl. suppl. 2. p. 856. Pursh. fl. amer. sept. 1. p. 161.) stem very prickly; spines many-parted, slender; leaves cordate, deeply 3-5-lobed, cut; racemes 3-5-flowered, loose; calyx rotate; germs and pedicels hispid, and glaucular. 3. H. Native throughout Canada to Fort Franklin and Bear Lake, near the Arctic circle; mouth of the Columbia; mountains of the Columbia, and of North California; also of Virginia, &c. R. oxyacanthoides, Michx. fl. bor. amer. 1. p. 111. R. echinatum, Dougl. misc. This has the flowers of the currant, and the prickly stems of the gooseberry. The fruit is about the size of black currants, in pendulous racemes, purplish black, shining, clothed with hairs, unpleasant to the taste.

Lake Gooseberry. Fl. April, May. Chl. 1812. Sh. 4 to 5 ft.

10. R. rotundifolia (Michx. fl. bor. amer. 1. p. 110.) spinules nearly axillary, solitary; leaves nearly orbicular, clothed with very minute down, a little lobed; lobes roundish, obtuse; peduncles 1-flowered; limb of calyx tubular. 3. H. Native on the high mountains of Carolina. Berries glabrous.

Round-leaved Gooseberry. Shrub 3 to 4 feet.

11. R. gracile (Michx. fl. bor. amer. 1. p. 111.) spinules nearly axillary, very short, solitary; leaves on slender petioles, lobed; lobes acute, cut; peduncles capillary, erect, usually 2-flowered; calyx glabrous, tubularly campanulate. 3. H. Native of North America, on the mountains of Tennessee; and in mountain meadows from New York to Virginia. Berry glabrous, purple or blue, with a very pleasant taste. Leaves pubescent.

Slender Gooseberry. Fl. April, May. Chl. 1812. Shrub 3 to 4 feet.

12. R. caucaca'm (Adams, in reliq. Willd. ex Rom. et Schultes, cast. 5. p. 507.) prickles stipular, tern; peduncles 1-flowered, erect; leaves 5-lobed, deeply toothed. 3. H. Native of Caucasian. Perhaps only a variety of R. Uva-crispa.

13. R. microphyllum (H. B. et Kunth, nov. gen. amer. 6. p. 62.) prickles usually solitary; leaves nearly reniform, small; peduncles very short, 2-flowered; calyx campanulate; segments oblong, obtuse; petals sparsely obovate, retuse at the apex. 3. H. Native of Mexico, in mountainous places near El Guada, between Guchi and the city of Mexico, at the elevation of 4200 feet. Ovarian rather turbinate. Flowers red.

Small-leaved Gooseberry. Shrub 4 to 6 feet.

14. R. cuneifolium (Rouz et Pav. fl. per. 3. p. 233. f. unc.) unarméd; leaves cuneiform, cut, trifid; peduncles not half the length of the leaves; peduncles solitary, axillary, 2-3-flowered, length of the petals; bracteas 2, at the base of each flower. 3. G. Native of Peru; on the Andes. Berry pale red. Habit of R. Uva-crispa. Perhaps belonging to a separate section.

Wedge-leaved Gooseberry. Shrub 3 to 4 feet.

15. R. cucullatum (Hook. et Arn. in bot. misc. 3. p. 250.) unarmed; branches glabrous; leaves glabrous, somewhat 5-lobed, roundish-reniform, cuneulate at the base, and cuneated: the lobes lying over each other, acutely and deeply lobed; petals a little shorter than the leaves; racemes hardly puberulous, axillary, short, few-flowered; flowers nearly sessile, hardly exceeding the bracteas, which are roundish. 3. G. Native of the Cordillera of Chili. Nearly allied to R. cuneifolium, but apparently quite distinct.

Hooded-leaved Gooseberry. Shrub 4 to 5 feet.

16. R. aculeare (Smith in Rees' cyclo.) very prickly; prickles stipular, 3-8-parted; leaves rather pubescent, nearly orbicular, 3-5-lobed; lobes bluish, deeply serrated; peduncles usually 1-flowered, bracteolate in the middle; calyx campanulate, smoothish; berries bractless, and are, as well as the styles, quite glabrous. 3. H. Native of Siberia, in stony rocky mountainous places. Led. fl. vos. alt. ill. t. 230. R. Uva-crispa, Sievers in Pall. nord. beitr. 7. p. 274. Pall. fl. ros. 2. p. 37. Stem erect or procumbent. Petals white. Berries glabrous, yellowish or purplish, sweet, with a grateful taste.
Acicular-spined Gooseberry. Shrub.

17. R. grossularia (Lin. spec. p. 331) prickle 2 or 3 under each bud; branches otherwise smooth, and spreading or erect; pedicels 1-2-flowered; leaves 3-5-lobed, rather villous; bracteas close together; calyx campanulate, with reflexed segments, which are shorter than the tube; petals rounded at the apex, glabrous, but barded in the throat; style always beset with long down.

h. II. Native of Europe and Nipaul, in woods and hedges; plentiful in some parts of Britain, in hedges, thickets, and waste ground, as the woods and hedges about Darlington; apparently wild in Hamilton wood, Scotland.

Var. 3. Uva-crispa (Smith, engl. fl. p. 333) plant beset with spines all over; leaves small, rather villous; berries smaller, glabrous.

Var. γ. spinosissimum (Berl. ms.) plant spinny all over; prickle scattered, reflexed. Native of Europe in stony places.

Var. 3. subebrum (Berl. ms.) plant nearly glabrous; bark smooth, brown; prickles axillary; flowers and leaves small. Native about Geneva. Perhaps a variety of R. reclinatum.

Var. ι. macrocarpon (D. C. prod. 3. p. 478) stigmas often longer than the petals; flowers and berries large.

Var. θ. brevicaule (Berl. ms.) berries clothed with 2-4-5 straight coloured, nearly opposite, bracteas and bristles, emululating sepalas, which fall off before the berry arrives at maturity.

The gooseberry is called Grossile à moqeur, in French; Uva-spono in Italian; Stackelbeerastrich, in German; in Scotland it is called Grosser; in Piedmont, where the gooseberry is found wild, and where the Italian botanists state the berries to be eatable, but astringent and neglected, it is called Griselle. Some derive our own gooseberry from gorzeberry, from the resemblance of the bush to gorze; others, as Professor Martyn, from its being used as sauce with young or green geese. Gerarde says it is called feaberry (fleberry) in Cheshire; and it has the same name in Lancashire and Yorkshire. In Norfolk this term is shortened to scables, or, as they pronounce it, fapes. Carberry is another British name for this fruit.

The gooseberry is a low, branching, prickly shrub, bearing pendulous, hairy, or smooth berries, of various colours; it is a native of several parts of Europe, and abounds in the Vallais, in copsewoods, where it produces a small, green, hairy, high-flavoured fruit. In England it is naturalized in various places, as on old walls, ruins, and in the woods and hedges about Darlington. It is cultivated in greater perfection in Lancashire than in any other part of Britain; and next to Lancashire the climate and treatment of the Lothians seem to suit this fruit. In Spain and Italy the fruit is scarcely known. In France it is neglected and little esteemed. In some parts of Germany and Holland the moderate temperature and humidity of the climate seem to suit the fruit; but in no country is its size and beauty to be compared with that produced in Lancashire, or from the Lancashire varieties, cultivated with care, in the more temperate and humid districts of Britain. Neill observes, that when foreigners witness our Lancashire gooseberries, they are ready to consider them as forming quite a different kind of fruit. Happily this wholesome and useful fruit, to be found in almost every cottage-garden in Britain; and it ought to be considered a part of every gardener's duty to encourage the introduction of its most useful varieties in their humble enclosures. In Lancashire, and some parts of the adjoining counties, almost every cottage, who has a garden, cultivates the gooseberry, with a view to prizes, given at what are called Gooseberry-prize Meetings, of which there is annually published an account, with the names and weight of the successful sorts, in what is called the Manchester Gooseberry Book. The prizes vary from 1l. to 3l. or 10l. The second, third, to the sixth and tenth degree of merit, receiving often proportionate prizes. These are meetings held in spring, to "make up," as the term is, the sorts, the persons, and the conditions of exhibition; and in August to weigh and taste the fruit, and determine the prizes.

Use.—The fruit was formerly in little esteem; but it has received so much improvement, that it is now considered very valuable for tarts, pies, sauces, and creams, before being ripe, and when at maturity, it forms a rich dessert fruit for three months; and is preserved in sugar for the same purpose, and in water for the kitchen. Unripe gooseberries can be preserved in bottles of water against winter; the bottles are filled with berries, close corked, and well sealed: they are then placed in a cool cellar till wanted. By plugging the bottles, after being corked, into boiling water, for a few minutes (heating them gradually to prevent cracking), the berries are said to keep better.

—Neill.

Varieties.—The gooseberry is mentioned by Turner, in 1573. Parkinson enumerates 8 varieties; the small, great, and long common, 3 reds, 1 blue, and 1 green. Ray mentions only the pearl gooseberry, but Rea has the blue, several sorts of yellow, the white Holland, and the green. Miller only says, there are several varieties obtained from seed, most of them named from the persons who raised them; but as there are frequently new ones obtained, it is needless to enumerate them. The present list of the London nurserymen contains from 80 to 100 names, but those of some of the Lancashire growers exceeds 300. Forsyth, in 1800, mentions 10 sorts as common; and adds a list of 43 new sorts, grown at Manchester. The following may be considered established varieties, and such as merit cultivation.

List of gooseberries.—Those marked with a star may be considered the best; the rest only second rate.

1. Fruit green.

§ 1. Branches spreading or pendulous.

* Berries smooth, green.

1 Berkeley's green champagne. Fruit roundish, middle-sized.
2 Perrin's cr. green. Fruit large, oblong.
3 Fame. Fruit large, oblate. Branches pendulous.
5 Glory of Kingston. Fruit roundish, middle-sized.
6 Allen's glory of Ratcliffe. Fruit oblong, middle-sized.*
7 Horsfield's green gage. Fruit large, roundish.
8 Green globe. Fruit round, middle-sized.
9 Nixon's green myrtle. Fruit large, oblong. Branches pendulous.
10 Berry's greenhouse. Fruit large, oblong. Branches pendulous.
11 Massy's heart of oak. Fruit large, oblong. Branches pendulous.*
12 Grundy's high sheriff of Lancashire. Fruit obovate, middle-sized. Branches pendulous.
16 Northern hero. Fruit large, obovate. Branches pendulous.
17 Reformer. Fruit large, oblong. Branches pendulous.*
19 Large smooth green. Fruit large, obovate.*
20 Green Walnut, Belmont's, smooth green, nonpareil. Fruit middle-sized, obovate.*

* Berries green, hairy, or downy.
21 Colonel Axson's. Fruit large, oblong, hairy. Branches pendulous.
22 Holt's beauty. Fruit large, oblong, hairy. Branches pendulous.
23 Early green hairy, early green, green Gascoigne. Fruit small, round.*
26 Green globe. Fruit small, round, hairy. Branches pendulous.*
27 Green scolding. Fruit small, oblong, hairy. Branches pendulous.*
29 Lovely Anne. Fruit large, oval, downy. Branches pendulous.
30 Gregory's perfection. Fruit large, roundish, downy, late. Branches pendulous.*
31 Prophet's profit. Fruit large, oblong, downy. Branches pendulous.*
33 Ryder's triumph. Fruit small, obovate, hairy. Branches pendulous.
34 Moore's trouble. Fruit large, roundish-oblong, hairy. Branches pendulous.*
35 Unicorn. Fruit large, oval, downy. Branches pendulous.*

§ 2. Branches erect.

* Fruit green, smooth.
36 Pitmaston green-gage. Fruit small, obovate.*
37 Briggs's independent. Fruit large, obovate.
38 Merry fast. Fruit middle-sized, obovate.
39 Midsummer. Fruit small, roundish.
40 Royal George. Fruit middle-sized, oval.

** Fruit green, hairy, or downy.
41 Monck's Charles Fox. Fruit small, ovate, hairy.
42 Green oak. Fruit large, roundish, hairy.
43 Greensmith. Fruit middle-sized, roundish, hairy.
44 Heburn's prodigy. Fruit middle-sized, roundish, hairy.*
45 Colter's jelly angler, Lay's jelly angler, Collins's jelly angler. Fruit large, oblong, downy.*
46 Mills's Langley green. Fruit large, roundish, hairy.
47 Late green. Fruit small, obovate, downy.
48 Parkinson's laurel, green laurel, green willow. Fruit large, obovate, pale green, nearly white.*
49 Hopley's Lord Crew. Fruit large, oblong, hairy.*
50 Megaronette. Fruit small, roundish, hairy.
51 Lovat's Moses. Fruit large, obovate, hairy.
52 Green Rumbollion. Fruit small, round, hairy. Branches pendulous.
53 Small green. Fruit small, globular, downy.
54 Small hairy green. Fruit small, round, hairy.
55 Bratherston's Wistaston hero. Fruit large, oblong.

II. Fruit yellow.

§ 1. Branches spreading or pendulous.

* Fruit yellow, smooth.
1 Amber, amber yellow, smooth amber. Fruit small, roundish.
2 Diggles's Donny Roger. Fruit large, obovate.
3 Copper's Banker's Hill. Fruit large, roundish.
4 Hopley's Cheshire cheese. Fruit large, oblong.
5 Forbes's golden chain. Fruit large, oblong. Branches pendulous.
6 Bamford's golden Purse. Fruit large, obovate. Branches pendulous.
7 Beamont's smiling beauty. Fruit large, oblong. Branches pendulous.*
8 Beardell's smuggler. Fruit large, roundish, oblong. Branches pendulous.*
10 Mather's victory. Fruit large, obovate. Branches pendulous.
11 Forester's Lord Combermere. Fruit large, obovate.
12 Saunter's Napoleon. Fruit large, obovate.
13 Costerdale's Champion Goliath. Fruit large, oblong, smooth, golden yellow. Branches pendulous.
14 Large yellow. Fruit obovate, middle-sized, golden yellow, smooth. Branches pendulous.
16 Long yellow. Fruit large, oblong, golden yellow.

** Fruit yellow, hairy, or downy.
17 Capper's bottom Sawyer. Fruit large, obovate, downy.
18 Lister's Britannia. Fruit large, obovate, downy.
19 Hopley's globe. Fruit large, round, hairy. Branches pendulous.
22 Jackson's golden orange. Fruit large, oblong. Branches pendulous.
23 Bratherston's golden sovereign. Fruit large, roundish, hairy.
24 Hill's golden gourd. Fruit large, oblong, hairy. Branches pendulous.
28 Sparklet. Fruit small, obovate, downy.
29 Hollow's Trafford. Fruit large, oblong, hairy. Branches pendulous.
31 Weedham's delight. Fruit large, oblong, hairy.

§ 2. Branches erect.

* Fruit yellow, smooth.
32 Yellow ball. Fruit middle-sized, roundish.*
33 Blithfield. Fruit small, round, late.
34 Clegg's Tim Bobbin. Fruit middle-sized, oblong.
35 Old dark yellow. Fruit small, roundish.
36 White walnut. Fruit middle-sized, obovate, whitish yellow.
** Fruit yellow, hairy, or downy.

181

37 Hebberd's yellow aston. Fruit small, roundish, hairy.*
38 Yellow champagne. Fruit small, roundish, hairy.*
39 Catlow's conquering hero. Fruit large, oblong, coarse, hairy.
40 Heap's conquering girl. Fruit large, oblong, hairy.
41 Golden drop. Golden lemon.
42 Pot's golden fleeces. Fruit large, oval, hairy.
43 Sulphur. Fruit small, roundish, hairy.*
45 Foster's husbandman. Fruit large, oblate, downy.
46 Heywood's invincible. Fruit large, roundish-oblong, downy.
47 Hardcastle's jolly gunner, royal gunner. Fruit large, oblong, hairy.
48 Prophet's regulator. Fruit large, roundish, hairy.
49 Rumhullion. Yellow globe, round yellow. Fruit small, roundish, downy.
50 Smooth yellow. Fruit small, roundish, downy.*
51 Williamson's yellow hornet. Fruit small, ovate, downy.
52 Yellowsmith. Fruit small, roundish-oblong, hairy.*
53 Kelk's yellow. Fruit middle-sized, oblong, downy.

III. Fruit white, or greenish white.

§ 1. Branches erect.

* Fruit smooth, white.
1 Cranshaw's ambush. Fruit large, oblate, white.
2 White Damson. Fruit small, roundish.*
3 Honey white. Fruit middle-sized, roundish-oblong.
4 Hosam's smiling yellow. Fruit large, roundish-oblong.
5 Cook's white eagle. Fruit large, oblate.
6 Lovat's Queen Caroline. Fruit middle-sized, oblate.

** Fruit greenish white, hairy, or downy.

7 Large early white. Fruit large, oblate, downy.*
8 Sampson's Queen Anne. Fruit large, oval, downy.
9 Peers's Queen Charlotte. Fruit middle-sized, oblong, hairy.*
10 Morris's Queen Mary. Fruit middle-sized, ovate, downy.
11 Trumian. Fruit large, oblate, hairy.

** Fruit white, hairy, or downy.

12 Danny landlady, noble landlady. Fruit large, oblong.
13 Hopkyn's lady of the manor. Fruit large, roundish-oblong, hairy.
14 White lion. Fruit large, oblate, hairy.
15 Stringer's maid of the mill. Fruit middle-sized, oblate, downy.
16 Marchioness of Downshire. Fruit middle-sized, oblong, hairy.
17 Early rough white. Fruit large, oval, hairy.
18 Saunders's royal rock getter, Andrews's royal rock getter. Fruit large, oblate, downy.
19 White royal. Fruit small, round, hairy.
20 Compton's Sheba Queen. Fruit large, oblate, downy.*
21 Wellington's glory. Fruit large, roundish-oblong, downy.*
22 Moore's white bear. Fruit large, oblate, hairy.*
23 Nixon's white heart. Fruit middle-sized, heart-shaped, hairy.
24 White lily. Fruit middle-sized, oblate, downy.
26 Taylor's bright Venus. Fruit middle-sized, oblate, hairy.*
27 White champagne. Fruit small, roundish-oblong, hairy.*

28 Saunders's Cheshire lass. Fruit large, oblong, downy.
29 Hedgehog. Fruit middle-sized, roundish, hairy.*

§ 2. Branches spreading or pendulous.

* Fruit smooth, white.
30 Crystal. Fruit small, roundish.*
31 White fig. Fruit small, ovate.
32 Parkinson's first rate. Fruit large, oval.
34 Great Britain. Fruit large, oblong, greenish white.
35 White rasp. Fruit small, round.
36 Brundrett's white rock. Fruit large, oblate, Branches pendulous.
37 Diggles's wanton. Fruit middle-sized, roundish, greenish white.
38 Denny's Victoria. Fruit large, oblate, greenish white.

** Fruit greenish white, smooth.
40 Great Britain. Fruit large, oblong. Branches pendulous.
41 Denny's Vittoria. Fruit large, oblate, Branches pendulous.

*** Fruit white, hairy, or downy.

42 Copper's bony lass. Fruit large, oblong, hairy.
43 White crystal. Fruit small, roundish, hairy or downy.*
44 Early white. Fruit middle-sized, roundish, hairy.*
45 Grundy's fowler. Fruit middle-sized, oblate, downy.
46 Large white. Fruit roundish-oblong, oval, downy.
47 Smith's radical. Fruit large, roundish-oblong, hairy. Branches pendulous.
48 Irish white raspberry. Fruit small, round, hairy.
49 Cleworth's white box. Fruit large, oblate, downy. Branches pendulous.*

**** Fruit greenish white, hairy or downy.

50 Counsellor Bringham. Fruit large, oblong, downy.
51 Bratherton's generosity. Fruit large, roundish-oblong, hairy.
52 Princess royal. Fruit large, oblate, hairy. Branches pendulous.*
54 Taylor's speedwell. Fruit large, oblong, hairy. Branches pendulous.

IV. Fruit red.

§ 1. Branches spreading or pendulous.

* Fruit hairy or downy.
1 Alexander. Fruit large, oblate, hairy.
2 Hamlet's beauty of England. Fruit large, oblong, hairy.
3 Warwick's black bullfinch. Fruit middle-sized, dark red, downy.
4 Shipley's black prince. Fruit middle-sized, roundish, downy, deep red.
5 Boardman's British crown. Fruit large, roundish, hairy.
6 Williams's conqueror. Fruit large, oblate, hairy.
7 Mealing's crown bob. Fruit large, oblong, hairy.*
8 Worthington's defiance. Fruit large, oblate, hairy. Branches pendulous.
10 Early black. Fruit middle-sized, oblong, dark red. Branches pendulous.
12 Berry's former's glory. Fruit large, obvate, downy. Branches pendulous. *
13 Smith's favourite. Fruit middle-sized, roundish-oblong, hairy.
15 Knight's Marquis of Stafford. Fruit large, roundish-oblong, hairy. *
16 Wright's matchless. Fruit middle-sized, oblong, dark red, hairy. Miss Bold, pigeon's egg. Fruit middle-sized, roundish, downy, dark red, early. *
17 Branthorpe's over-all. Fruit large, oblong, hairy. Branches pendulous. Branches pendulous. *
19 Red Mogul. Fruit small, roundish, hairy. *
20 Red rose. Fruit large, oblong, downy. Branches pendulous. *
22 Rough red, little red hairy, old Scotch red, thick skinned red. Fruit small, round, hairy. *
23 Small dark rough red, small rough red. Fruit small, round, hairy. *
24 Royal oak. Fruit middle-sized, roundish, hairy. *
25 Small red. Fruit small, round, hairy. *
26 Copper's top sawyer. Fruit large, roundish, hairy, pale red. Branches pendulous. *
27 Denny's triumphant. Fruit large, obvate, hairy. Branches pendulous. *
28 Lomax's victory. Fruit large, roundish, hairy. Branches pendulous. *
29 Red nutnut, Murrey, Eckerley's double bearing, Ashton red. Fruit middle-sized, obvate, downy, early. Warrington red, Aston, volunteer. Fruit large, roundish-oblong, hairy. Branches pendulous. This is one of the best, and hangs late. *
30 Knight's warrior. Fruit large, ovate, downy, pale red. Branches pendulous. *
31 Wilmot's late superb. Branches large, roundish-oblong, hairy. ** Fruit smooth, red. *
33 River's emperor Napoleon. Fruit large, obvate. Branches pendulous.
35 Red Turkey, smooth red. Fruit small, obvate. *
38 Farron's roaring lion, great chance. Fruit very large, oblong. Branches pendulous. 
39 Saint John. Fruit middle-sized, obvate. *
40 Rider's scented lemon. Fruit large, obvate. *
41 Great Smolensko. Fruit large, obvate. Branches pendulous. 
42 Chadwick's sportsman. Fruit large, obvate, dark red. Bratherton’s whisper-in. Fruit large, oblong, dark red. Branches pendulous. *
43 Wilnott's early red. Fruit large, roundish-oblong, dark red. Branches pendulous. *

§ 2. Branches erect.

* Fruit smooth, red. ** Fruit red, hairy or downy.

62 Small red globe, smooth Scotch. Fruit small, roundish. ** Fruit red, hairy or downy. *

63 Brandreth's atlas, Brundit's atlas. Fruit large, oblong, hairy. *

64 Barton's red. Fruit middle-sized, roundish, hairy. 
65 Red Champagne, red Turkey, countess of Errol, Ironmonger of many. Fruit small, roundish-oblong, hairy. A fruit of unqualified richness. *

70 Daline's black. Fruit middle-sized, oblong, dark red. A bad bearer. 
71 Large red globe. Fruit large, roundish, hairy. 
72 Barton's hairy red. Fruit small, roundish, hairy. A good bearer. 
73 Bratherton's huntsman, Speechley's rough red. Fruit large, roundish, hairy. A good bearer. 
74 Irish plum. Fruit middle-sized, roundish, hairy. 
75 Hopley's jubilee. Fruit large, roundish, hairy, dark red. 
76 Allcock's king. Fruit large, roundish, hairy, dark red. 
77 Lad Hartshorne's Lancashire. Fruit large, roundish, hairy, dark red. A good bearer. 
78 Little John. Fruit small, oblong, hairy, dark red. 
79 Beaumont's red. Fruit middle-sized, roundish, hairy. *
81 Rob Roy. Fruit middle-sized, obvate, hairy. 
82 Scarlet transparent. Fruit small, roundish, hairy. A bad bearer. 
83 Scotch best jam, dumpling. Fruit small, hairy, roundish. *
84 Denny's Shakespeare. Fruit large, roundish, hairy. 
85 Mellor's Sir Francis Burdett. Fruit large, obvate, pale red. 
86 Thompson's Tantarara. Fruit middle-sized, obvate, downy. *

87 Speechley's Yarkey hero. Fruit large, obvate, hairy. *
Selection of sorts.—"It must be admitted," Neill observes, "that although large gooseberries make a fine appearance on the table, they are often deficient in flavour when compared with some of smaller size. Many of them have very thick strong skins, and are not eatable unless thoroughly ripened. Some of the large sorts, however, are of very good quality, such as the red Champagne and the green walnut, &c. For culinary use in the month of May, Wilmot's early red is larger and better than most others, the skin not being tough, and the whole berry melting to a fine consistence." Forsyth very judiciously recommends cultivating the early and late sorts, in order to prolong the season of this fruit. But the best way of selecting sorts for any particular purpose is from the list given above, where those that are of particular excellence are marked by an asterisk.

Propagation.—The gooseberry may be propagated by all the modes applicable to trees or shrubs, even by pieces of the roots; but the mode by cuttings is usually adopted for continuing varieties, and that by seeds for procuring them.

By seeds.—The scientific mode of propagating one variety with another has, we believe, not been applied to this fruit. In general the seed of some choice variety, thoroughly ripe, is taken and sown in autumn or early in spring, in beds or pots of rich light mellow earth; when the plants are a year old, they are planted out in nursery rows, to be cultivated and trained there a year or two; in general they will bear the third year. By preparing for the best of these seedlings a very rich soil, and by watering, shading, and thinning the fruit, the largest sorts have been obtained. Not content with watering at the roots and over the top, the Lancashire connoisseur, when he is growing for exhibition, places a small saucer of water immediately under each gooseberry, only 3 or 4 of which he leaves on the tree. This is technically called suckling. He also pinches off a great part of the young wood, so as to throw all the strength he can into the fruit.

By cuttings.—Miller says, the best season for planting gooseberry cuttings is in autumn, just before their leaves begin to fall. The cuttings should be taken from bearing shoots, rather than from those that issue from the main stem. Cut them to such a length as the strength and ripeness of the wood will bear, and cut off all the buds, excepting three, or at most four at top, and train the plants with a single stem of 9 inches or a foot high, from the top of which the branches should radiate upwards at an angle of 45°, or better if 45°. Haynes advises taking off cuttings in July; when the fruit is on the bush, in order to make sure of the sorts. He says, by immediate planting, watering, and shading, as good plants are produced as from ripe wooded cuttings. Treat. of the gooseberry, &c. p. 29.

Soil and site.—Any good garden soil, on a dry bottom, and well manured, will suit the gooseberry. That which is soft and moist produces the largest fruit. The situation should not be under the drip of trees, over much shaded or confined, otherwise the fruit will be small, ill flavoured, and the plants apt to mildew. Forsyth says, gooseberries should be dunged every year, or at least have a good coat of dung once in two years. Haynes recommends a mixture of peat and loam well manured, and a shaded situation. The last he proposes to effect by planting among his quarters of gooseberries, rows of Jerusalem artichokes in the direction of east and west.

Final planting.—"The season for planting gooseberries is any time during open weather, from October till March. When trees are procured from the public nurseries, choose such as are in some advanced state, about 3 years' growth, with pretty full heads, for immediate plentiful bearers. Let the general supply be in standard bushes, and plant principally in the kitchen garden, in single rows along the boundary edges of the main quarters or outward borders, from 6 to 8 feet apart, or some may be planted in cross rows, to subdivide extensive quarters. When the object is to raise large quantities of fruit, plantations are made in continued parallel rows, 8 or 10 feet asunder, by 6 feet in the row. It would be eligible to plant a few choice sorts against south and other sunny walls or paling, for earlier and larger fruit; and on north walls to ripen late in succession." Abercrombie. Forsyth says, "The market gardeners about London plant them in rows, from 8 to 10 feet apart from row to row, and 6 feet from plant to plant in the rows. In small gardens I would recommend planting them in quarters by themselves, at the distance of 6 feet between the rows, and 4 feet from plant to plant; or you may plant them round the edges of the quarters about 8 feet from the path; you will then have the ground clear for cropping, and a man, by setting one foot on the border, can gather the gooseberries without injuring the crop." Neill says, "In some places gooseberry bushes on the sides of the borders, are trained to a single tall stem, which is tied to a stake; this, though 6 or 8 feet high, occasions scarcely any shade on the border, and it does not occupy much room, nor exclude air; while, at the same time, the stem becomes close hung with berries, and makes a pleasant appearance in that state." Edib. encycl. art. hort. § 161. Maher observes (Hort. trans. 2, p. 146.) "that as the crop of ripe fruit is often injured by having the largest and earliest berries prematurely gathered, whilst green, for tarts, a sufficient number of trees of such varieties as are earliest should be planted in a separate quarter of the garden, and devoted exclusively to the use of the kitchen, for tarts and scones."

Mode of bearing.—"The gooseberry produces its fruit not only on the shoots of last summer, and on shoots 2 or 3 years old, but also on spurs or snags arising from the older branches along the sides; but the former afford the largest fruit. The shoots retained for bearers should therefore be left at full length or nearly so." Abercrombie.

Pruning.—"The bushes will require a regular pruning twice in the year.

Summer pruning.—"Where any bushes are crowded with cross and water shoots of the same year, shading the fruit from the sun, and preventing the access of air, thin the heart of the plant and other tufted parts moderately, pinching off or cutting out close what spray is removed; but do not touch the summer shoots in general. Maher says, it will greatly contribute to the production of the fruit, if the very small berries are taken away, with a pair of scissors about the middle or end of May; and these small berries will be found quite as good for sauce or gooseberry cream as the larger."

Winter pruning.—"You may proceed to the winter pruning any time from November until the end of February, or until the buds are so swelled, that further delay would endanger their being rubbed off in the operation. Cut out the cross-shoots and water-shoots of the preceding summer, and the superfluous among crowded branches. Prune long ramblers and low stragglers to some well placed lateral or eye; or if any under straggler spring very low, cut it away. Of last year's shoots retain a sufficiency of the best well-placed laterals and terminals in vacant parts, to form succession bearers, and to supply the places of unfruitful and decayed old-wood, which, as you proceed, should be removed. Mostly retain a leading shoot at the end of the principal branch, leaving it either naturally terminal, or, where the branch would thus be too extended, pruning in some competent lateral within bounds. The superfluous young laterals on the good main branches, instead of being taken off clean, may be cut into little stubs of one or two eyes; which will send out fruit-buds and spurs. Of the supply reserved for new bearers, a small number will probably require shortening, where too extended, or curved incommmodiously; leave these from 8 to
12 inches in length, according to strength and situation; those of moderate extent and regular growth will require very little shortening, and many none at all. Observe, too close cutting or general shortening, occasions a great superfluity of wood in summer; for the multiplied laterals thus forced from the eyes of the shortened branches, increase to a thicket, so as to retard the growth, and prevent the full ripening of the fruit; on which account it is an important part of pruning to keep the middle of the head open and clear, and to let the occasional shortening of the shoot be sparing and moderate. Between the bearing branches keep a regular distance of at least 6 inches at the extremities, which will render them fertile bearers of good fruit.

Some persons, not pruning the gooseberry bush on right principles, are apt to leave the shoots excessively close and tufted, while they shorten the whole promiscuously; others sometimes clip them with garden shears to close round heads; in consequence of being pruned in these methods, the bushes shoot crowdely, full of young wood in summer, from which the fruit is always very small, and does not ripen freely with full flavour." Forsyth says, "Many of the Lancashire sorts are apt to grow horizontally, and the branches frequently trail on the ground, which renders them liable to be broken by high winds, especially when they are loaded with berries. In such instances I would recommend pruning in February, or March, to be put round them, to which the branches may be tied to support them, and prevent their being broken by the wind." S. Jeeves has tried training gooseberries on an arched trellis in the manner of a berceau or arbour-walk. For this purpose he plants in rows, 51 feet apart, and the plants 3 feet distant in the row. He chooses the strongest growing kinds, and trains 4 branches at 9 inches distance from each plant, till they meet at the top. The advantages of this plan are beauty of appearance, fruit not splashed by rain, easily gathered, and the ground more readily cultivated.

Insects and diseases, &c.—The caterpillars of saw-flies (Tenthredinidae, Lecid.), of butterflies (Papila, Lin.), and of moths (Phalena, Lin.), are well known as serious enemies to gooseberries. The larvae of the Tenthredinidae have from 16 to 20 feet, a round head, when touched they will roll themselves together. They feed on the leaves of the gooseberry, apple, and most fruit trees, as well as on roses, and other shrubs and plants. When full grown they make, sometimes in the earth, and sometimes between the leaves of the plants on which they feed, a net-work case, which, when complete, is strong and gummy, and in that change to the pupa incomplete, which for the most part remains during the winter in the earth. The perfect fly emerges early in the ensuing spring; its serrated sting is used by the female in the manner of a saw, to make incisions in the twigs or strans of plants, where it deposits its eggs. The Caledonian Horticultural Society having requested information respecting the best method of preventing or destroying the caterpillar on gooseberries, received various communications on the subject, and the following are extracts from such as they deemed fit for publication.

J. Gibb describes the large black, the green, and the white caterpillar, with his methods of destroying them:—

"During the winter months the large black kind may be observed lying in clusters on the under parts, and in the crevices of the bushes; and even at this season (Feb.) I find them in that state. In the course of 8 or 10 days, however, if the weather be favourable, they will creep up in the day time, feed on the buds, and return to their nest during the night. Whenever leaves appear upon the bushes they feed upon them till they arrive at maturity, which is generally in the month of June; after which they creep down upon the under sides of the branches, where they lodge till the crust or shell is formed over them. In July they become moths, and lay their eggs on the under side of the leaves and bark. The produce of these eggs, coming into life during the month of September, feed on the leaves so long as they are green, and afterwards gather together in clusters on the under side of the branches, and in the crevices of the bark, where they remain all the winter, as already said. Winter is the most proper time for attacking this sort with success, as their destruction is most effectually accomplished by the simple operation of pouring a quantity of boiling-hot water upon them from a watering-pan, while no injury is thereby done to the bushes.

"The green sort are at present (February) in the shelly state, lying about an inch under ground. In April they come out small flies, and immediately lay their eggs on the veins and under sides of the leaves. These eggs produce young caterpillars in May, which feed on the leaves till June or July, when they cast a blackish kind of skin, and afterwards crawl down from the bushes into the earth, where a crust or shell grows over them, and in that state they continue till the following April. The only method which I have hitherto found effectual for destroying these is, 1st, to dig the ground around the bushes very deep during the winter season, by which means the greater part of them are destroyed, or buried too deep ever to penetrate to the surface. 2ndly, when the flies make their appearance, to pick off all the leaves on which any eggs are observable; this is a tedious operation, but may be done by children. If any of the enemy should escape both these operations, they will be discernible as soon as they come into life, by their eating holes through the leaves, and may then easily be destroyed, without the least injury to the bushes or fruit.

"The white kind, otherwise called borers, are not so numerous as the other kinds, though very destructive; they bore the berry, and cause it to drop off; they preserve themselves during the winter season in the chrysalis state, about an inch under ground, and become flies nearly at the same time with the last mentioned kind; they lay their eggs on the blossoms, and these eggs produce young caterpillars in May, which feed on the berries till they are full grown, and then creep down into the earth, where they remain for the winter in the shelly state." Caled. mem. vol. 1.

Macmurray, in autumn, pours a little cow urine around the stem of each bush, as much as suffices merely to moisten the ground. The bushes which were treated in this manner remained free of caterpillars for two years; while those that were neglected or intentionally passed over, in the same compartment, were totally destroyed by the depredations of the insects. A layer of sea-weed laid on in autumn, and dug in in the spring had the same effect for one year. Caled. mem. vol. 1. p. 95.

R. Elliot says, "take 6 pounds of black currant leaves, and as many of elder leaves, and boil them in 12 gallons of soft water; then take 14 pounds of hot lime, and put it in 12 gallons of water; mix them altogether; then wash the infested bushes with the hand engine; after that is done, take a little hot lime, and lay it at the root of each bush that has been washed, which completes the operation. By these means you completely destroy the caterpillars, without hurting the foliage. A dull day is to be preferred to any other for washing. When the foliage is all off the bushes, wash them over with the hand engine to clean them of decayed leaves; for this purpose any sort of water will do; then stir up the surface of the earth all round the roots of the bushes, and lay a little hot lime about them to destroy the eggs. This I have never found to fail of success since the first trial, 6 years ago. The above mentioned proportion of leaves, lime, and water, will serve for 2 acres of ground or more, covered with bushes or trees in the ordinary manner, and will cost very little money indeed. The same proportion is
to be observed in making a wash for the rest of the trees or bushes.

J. Machray procured some tobacco and soft or black soap, and boiled a quarter of a pound of tobacco with the one pound of soft soap in about 18 scotch pints of water; and kept stirring the liquid while boiling with a whisk, in order to dissolve the soap; this liquor, when milk-warm, or so cool as not to hurt the foliage, he applied to the bushes with a hand-squirt, in the evening, and in the morning found all the ground under the bushes covered with dead caterpillars. This practice he continued for six years, always when he saw any symptoms of the approach of caterpillars.

J. Tweedie, in the course of any of the winter months, pares all the earth from under the bushes to the depth of about 3 inches, into a flat ridge betwixt the rows; and on the first dry day following, either treads, beats, or rolls these ridges, and trenches the whole down 1 ½ or 2 spades deep, observing to tread the foul earth into the bottom of the trench.

Forestry's method is as follows: "Take some sifted quick-lime, and lay it under the bushes, but do not at first let any of it touch the branches or leaves; then shake each bush suddenly and smartly, and the caterpillars will fall into the lime; if the bush be not shaken suddenly, the caterpillars, on being a little disturbed, will take so firm a hold as not easily to be shaken off. After this is done, sift some of the lime over the bushes; this will drive down those which may have lodged on the branches. The caterpillars ought to be swept up next day, and the bushes well washed with clear lime-water mixed with urine; this will destroy any caterpillars that may still remain, and also the aphides, if there are any on the bushes."

Of all the methods of destroying caterpillars mentioned above, Gibb's appears to us the only plan on which any reliance can be placed.

Taking the crop.—"From gooseberries being useful for different purposes, both in a green and in a mature state, and from the compass of time afforded by early and late sorts, they are in season in great request 4 or 5 months in summer, from April till September. The early sorts on south walls come in for gathering in small green berries for tarts, &c. in April or early in May, and attain maturity in June. From common standard bushes an abundant supply is yielded in May and June of gooseberries in a green state; and in proportion as part is reserved to ripen, a succession, in full size and maturity, is obtained in June, July, and August. Some late kinds, either planted in shady situations, or shielded with mats from the sun in their ripening state, continue good on the bush till September."

Prolonging the crop.—In addition to planting late sorts in shady situations, the bushes, whether standards or trained, may be natted over when the fruit is ripe, and in this way some of the reds, as the Warrington, and the thick-skinned yellow sorts, as the Mogul, will keep on the trees till Christmas.

Forcing.—The gooseberry may be forced in pots or boxes placed in pits, or in the peach-house or vinery. The plants in pots or boxes, are placed in pits, or in the peach-house in January, and has ripe fruit in the end of April, which is sent to table growing on the bush.

* Flowers red.

18 R. speciosum (Pursh. fl. amer. sept. 2, append. 731.) shrub, bristly and prickly; spines tripartite; leaves roundish-ovate, 3-5-lobed, obtuse; peduncles few-flowered; bracteas broadly ovate; calyx cylindrical, 4-parted, with erect glandular segments; germens and pedicels beset with glandular bristles. H. Native of North California and Monterey, and Mexico. Sweet, fl. gard. second ser. t. 149. Lindl, bot. reg. vol. 18, with a figure. R. vol. III.
Flowers greenish or greenish-yellow.

23 R. alpinum (Linn. spec. 291.) leaves 3-5-lobed, obtuse, shining beneath, pilose above; racemes erect, rather crowded; bracteas lanceolate, ventricose, bearing a few glads, usually longer than the flowers; petals minute, almost abortive; anthers more or less nearly sessile; styles joined. H. Native of Europe and Siberia, on the Alps; in Britain, in woods, in and north of England; near Bradford, Yorkshire; near Ripon and in Durham; also of Scotland, but rare. Smith, engl. bot. 704. Fl. d. t. 698. Fl. exce. 1. t. 47. Flowers greenish-yellow. Berries red, elliptic, mucilaginous and insipid.

Var. a, stérile (Wallr. sched. p. 108.) flowers flat, destitute of the germ, fugacious; racemes dense, many-flowered; anthers nearly sessile, bearing pollen, acute. R. dioicium, Muench. meth. p. 583.

Var. β, bacciferum (Wallr. l. c.) flowers somewhat hypocreteriform; racemes few-flowered; anthers distinctly pedicellate, but imperfect; style hardly seminibid; germ large. Cultivated in gardens.

Var. γ, piumulum (Lindl. in hort. trans. 7. p. 244.) in every respect the same as the species, but not one-third the size, never exceeding 3 feet.

Alpine Currant. Fl. April, May. Britain. Shrub 3 to 6 ft.

24 R. kerriscom (Pursh, fl. amer. sept. 1. p. 163.) all parts of the shrub are full of resinous glands; leaves 3-5-lobed, roundish; racemes erect; calyx flatish; petals bluntly rhomboid; bracteas linear, longer than the pedicels. H. Native of North America, on the mountains. Sims, bot. mag. 1583. Berl. l. c. t. 2. f. 10. Flowers greenish yellow. Berry hairy, red? Perhaps the flowers are dioecious. Very like R. alpinum.

Resinous Currant. Fl. April, May. Clt. 1800. Sh. 3 to 5 ft.

25 R. Ciliatum (Weitl. miss. ex Reem. et Schultes, syst. 5. p. 500.) plant beset with glands; leaves 5-lobed, deeply corollate, doubly crenate-serrate, ciliated, glabrous above, but hairy on the nerves and veins beneath; lobes acute; petioles beset with glandular hairs; racemes solitary. H. Native of Mexico, on the burning moun Mount Jorollos, at the elevation of 1500 feet. R. Jorollese, H. B. et Kunth, nov. gen. amer. 6. p. 61. Nearly allied to R. macrobotrys.

Ciliated Currant. Shrub 3 to 4 feet.

26 R. macrobotrys (Ruiz et Pav. fl. per. 3. p. 12. t. 202. f. a.) leaves cordate, lobed, deeply serrated; petioles ciliated at the base; racemes very long, pendulous, hairy; bracteas linear-subulate, pilose, nearly the length of the pedicels; calyxes reflexed; petals small, red. H. Native of Peru, on the Andes, in groves. Berl. l. c. t. 2. f. 17. Berries greenish, hairy.

Long-racemed Currant. Shrub 4 to 5 feet.

27 R. Albidifolium (Ruiz et Pav. fl. per. 3. p. 12. t. 132. f. 6.) leaves rather cordate, deeply serrated; racemes twice the length of the leaves, pendulous; bracteas spatulate, ciliated, length of pedicels; petals roundish, pubescent; anthers nearly sessile. H. Native of Peru, in groves about Munna. Berl. l. c. t. 2. f. 18. Berries globose, rather hairy. Allied to R. macrobotrys.

White-leaved Currant. Shrub 4 to 5 feet.

28 R. Bracteatum (Doug. miss. ex Hook. fl. bor. amer. 1. p. 232.) leaves on long petioles, cordate, deeply 3-5-lobed; lobes acuminate, cut, doubly serrated, hispid above, but full of resinous dots beneath; racemes often terminal, at length exuding the spatulate bracts; calyx rotate, glabrous; petals minute, roundish; germinces and berries full of resinous dots. H. Native of the north-west coast of America, at the confluence of the Columbia with the ocean. This is a very remarkable and elegant shrub, with leaves nearly as large as, and resembling, those of the Sycamore; these, as well as the fructified racemes, have a very strong resemblance to R. macrobotrys; but the flowers are widely different. Flowers purplish-yellow. Berries about the size of those of R. rubrum.

Bracteate Currant. Shrub 3 to 5 feet.

29 R. hirtum (Humb. et Bonpl. in Willd. herb. ex Reem. et Schultes, syst. 5. p. 501.) leaves ovate, rather cordate, 3-lobed, reticulate beneath from hairy nerves and veins, and pale, but blackish green above; flowers deeply serrated, middle one the largest; petals pilose, glanduliferous, and somewhat tomentose; racemes reflexed; bracteas dentately ciliated; petals roundish-obovate; styles fimbriate. H. G. Native of South America, in cold places on Mount Antisana, at the elevation of 300 feet. Berl. l. c. t. 2. f. 13. R. frigidum, H. B. et Kunth, nov. gen. amer. 6. p. 62. Flowers flesh-coloured. Berries hispid.

Hairy Currant. Shrub 4 to 5 feet.

30 R. fraerians (Pall. nov. act. pet. 5. p. 377. t. 9.) leaves glabrous, on long petioles, 3-5-lobed, greener above than below; racemes erect, stylif; flowers campanulate, white, sweet-scented; bracteas deciduous; petals lanceolate, acute, spreading. H. Native of Siberia, on the higher mountains. Berries red, of a very sweet taste. From the under surface of the leaves, exudes a very fragrant little yellow drop, a very fragrant balsamic resin, having a strong smell of the black currant.

Fragrant Currant. Shrub 1 to 2 feet.

31 R. procerus (Pall. fl. Ross. 2. p. 35. t, 65.) leaves bluntly lobed; lobes serrated: lateral ones a little cut; racemes erect; peduncles long, sessile; segments of the limb of the flower pubescent, acute, of a vivid purplish colour; anthers hardly rising from the calyx. H. Native of Siberia, in moist shady places. Flowers flatish. Berries very grateful to the taste, rafuse when ripe. Ait. hort. kw. 2. p. 41. R. polycarpum, Gmel. syst. veg. p. 419.

32 R. prostratum (Lerit. str. l. p. 3. t. 2.) leaves deeply corollate, 5-7-lobed, glabrous; lobes acute, cut, doubly serrated, naked on both surfaces; racemes erect, loose, slender; bracteas small, obtuse, much shorter than the pedicels, which are beset with glandular bristles; calyx rotate; germinces and berries beset with glandular bristles. H. Native of Newfoundland; throughout Canada; and in woods on the Rocky Mountains. Berl. l. c. t. 2. f. 12. R. glandulosum, Ait. hort. kw. ed. 1. p. 279. R. rigens, Bigel. fl. bost. ed. 2. p. 9. R. glandulosum, Richards, in Frankl. 1st. journ. ed. 2. append. p. 7. R. laxiflorum, Richards, in Frankl. 1st. journ. ed. 2. append. p. 7. Berries large, reddish. This is a very distinct species.

33 R. trifolium (Mich. fl. bor. amer. 1. p. 110.) leaves smoothish, moderately lobed; racemes loosely many-flowered, pubescent; flowers small; calyxes segments rather trifid; berries hairy, red. H. Native of North America, near Quebec, and at Hudson’s Bay. Lobes of leaves acutish. Racemes weak, nearly like those of R. rubrum, but the flowers smaller. Petals purplish, spatulate, rounded at the apex. Perhaps this is the same as R. prostratum.

34 R. Takahe (D. Don, prod. fl. nep. p. 208.) leaves corollate, 3-lobed, acuminate, doubly serrated, pubescent on both surfaces, as well as on the branches. H. Native of Nipal, in Sirinagar. Leaves as large as those of the Sycamore. Flowers unknown. The bush is called Takare by the Nipaluse.

Takahre Currant. Shrub.
35 *R. multiflorum* (Kit. in Rom. et Schultes, syst. 5. p. 493. but not of H. B. et Kunkl) leaves 5-lobed, cordate, tomentose beneath; racemes very long, pendulous, drooping; bracteas shorter than the flowers; pedioles length of leaves; petals wedge-shaped; styles bident, and sometimes distinctly trifid.  

36 *H. petaloides* (Robb. in Lin. trans. 3. p. 249. t. 21.) leaves roundish-cordate, 3-5-lobed, covered with soft pili above, and tomentum beneath; racemes erect; flowers more or less pedicellate; bracteas obtuse, tomentose, much shorter than the pedicels; sepals roundish-cuneate; petals oblong; styles bident.  

37 *H. pedicela* var. rotundifolia (Robb. in Lin. trans. 3. p. 249. t. 21.) leaves 3-5-lobed, covered with soft pili above, and tomentum beneath; racemes erect; flowers more or less pedicellate; bracteas obtuse, tomentose, much shorter than the pedicels; sepals roundish-cuneate; petals oblong; styles bident.  

38 *H. petaloides* var. rotundifolia (Robb. in Lin. trans. 3. p. 249. t. 21.) leaves 3-5-lobed, rather cordate, deeply serrated, on long petioles, pilose above; racemes erect, crowded, rather pubescent; bracteas shorter than the pedicels; sepals obtuse; petals obcordate.  

39 *H. petaloides* var. rotundifolia (Robb. in Lin. trans. 3. p. 249. t. 21.) leaves 3-5-lobed, rather cordate, deeply serrated, on long petioles, pilose above; racemes erect, crowded, rather pubescent; bracteas shorter than the pedicels; sepals obtuse; petals obcordate.  

40 *H. petaloides* var. rotundifolia (Robb. in Lin. trans. 3. p. 249. t. 21.) leaves 3-5-lobed, rather cordate, deeply serrated, on long petioles, pilose above; racemes erect, crowded, rather pubescent; bracteas shorter than the pedicels; sepals obtuse; petals obcordate.  

41 *H. petaloides* var. rotundifolia (Robb. in Lin. trans. 3. p. 249. t. 21.) leaves 3-5-lobed, rather cordate, deeply serrated, on long petioles, pilose above; racemes erect, crowded, rather pubescent; bracteas shorter than the pedicels; sepals obtuse; petals obcordate.  

42 *H. petaloides* var. rotundifolia (Robb. in Lin. trans. 3. p. 249. t. 21.) leaves 3-5-lobed, rather cordate, deeply serrated, on long petioles, pilose above; racemes erect, crowded, rather pubescent; bracteas shorter than the pedicels; sepals obtuse; petals obcordate.  

43 *R. multiflorum* (Meyer, in acad. Moroz. vol. 7.) unarmed; hairs glabrous, at length deciduous; adult leaves cordate, 5-lobed, pubescent beneath; racemes somewhat spicate, terminal, drooping; calyx tubular, pubescent, exceeding the bracteas; petals nearly orbicular.  

44 *H. petaloides* var. rotundifolia (Robb. in Lin. trans. 3. p. 249. t. 21.) leaves 3-5-lobed, rather cordate, deeply serrated, on long petioles, pilose above; racemes erect, crowded, rather pubescent; bracteas shorter than the pedicels; sepals obtuse; petals obcordate.  

45 *H. petaloides* var. rotundifolia (Robb. in Lin. trans. 3. p. 249. t. 21.) leaves 3-5-lobed, rather cordate, deeply serrated, on long petioles, pilose above; racemes erect, crowded, rather pubescent; bracteas shorter than the pedicels; sepals obtuse; petals obcordate.

Grossularië. 

Var. \( \alpha \), angustior (D. C. fl. fr. 4. p. 406.) leaves and berries smaller; lobes of leaves short.

Var. \( \beta \), hortâce (D. C. l. e.) leaves larger, sometimes variegated; berries sweeter and larger than in var. \( \alpha \). Cultivated in gardens. R. rubrum, Lois. nov. dict. 3.

Var. \( \gamma \), càrcenum (Berl. mss. ex D. C. prod. 3. p. 69.) leaves rather tomentose beneath; sepals red; cells of anthers distant; berries pale red. R. rubrum domesticum \( \beta \), bacés càrneis, Wallr. sched. p. 106.

Var. \( \epsilon \), variegâtum (D. C. prod. 3. p. 69.) berries variegated. Wallr. l. e.

The red currant is called Grosselle ordinaire à grappes, or d'outre mer, in French; Johannisbeere, in German; and Uvetta, in Italian. It is a low shrub, with smooth branches, downy leaves, yellowish green flowers, disposed in pendulous racemes, which appear in May, and the fruit ripens in June and July. The berries of this shrub, in its wild state, are red; but cultivation has produced white and pale red berries. Professor Martyn observes, that "the currant does not seem to have been known to the ancient Greeks and Romans, as the southern nations of Europe have not even an appropriate name to it at this day. The old French name, grosselles d'outre mer, and the Dutch, besk_ins weerzeer, proclaim their having been strangers imported. Our English name of currant is evidently from the similitude of the fruit to that of the Cornith grape, the small grape of Zante, or the common grocers' Corinths or currants. The red currant has been long cultivated in Britain, and very much improved in the size of the bunch and berry."

Use.—The fruit is acceptable at the dessert, being of an agreeable acid taste. It is much used for jellies, jams, and wines. Forsyth says it is the most useful of all the small fruit, either for the table and kitchen, or for preserving, making wine, &c., and continues longer in succession than any other. According to Withering, the juice forms an agreeable acid to punch; and Professor Martyn says it was a common beverage in Paris in 1763. Its medicinal qualities are similar to those of other sub-acerb fruits, allaying thirst, lessening an increased secretion of the bile, and correcting a putrid and scorbatic state of the fluids.

Varieties.—There are as follow:

* Red currants.

1. Common red, grosseliers rouge à petit fruit, grosseliers ordinaire à fruit rouge.

2. Red Dutch, large red Dutch, New red Dutch, large red, large bunched red, Morgan's red, red grape, grosseliers rouge à gros fruit. This is the best of the red currants for all purposes.

3. Knight's large red.

4. Knight's sweet red currant.

5. Knight's early currant.

6. Champagne, grosseliers à fruit couleur de chair.

7. Striped-leaved currant, and variegated-leaved currant.

8. Large pale red Dutch.

* * White currants.

1. Common white currant, grosseliers à fruit blanc.

2. White Dutch currant, new white Dutch, Morgan's white, white crystal, leghorn, pearl white. This is one of the very best of the white currants.

3. Pearl white, blanc perle.

4. Speary's white.

Propagation and nursery culture.—The same as in the gooseberry. With a view to obtaining new improved varieties from seed, Mr. Knight procured cuttings, in the year 1810, of the finest varieties of the red and white currants, which he planted in pots of very rich mould, and placed under a south wall, to which the trees were subsequently trained. At the end of 3 years, within which period the pots had been as often changed, the trees were first suffered to produce blossoms. These were, with the exception of a very small number, removed from the white currant bushes, as soon as their buds showed; and the shoots which remained were deprived of their stamens while immature, and subsequently fertilized by the pollen of the red variety. The seeds thus obtained were sown in pots, as soon as the fruit had become perfectly mature, and were subjected early in the following spring to the artificial heat of a forcing-house; by which means, and by proper subsequent attention, the plants grew more than a foot in height the first season. At 2 years old, in the year 1816, several of the plants, and in 1817, the greater part of them, produced fruit of great variety of character and merits; but of about 200 varieties, only 3 red and 2 white appeared to possess greater merits than their parents.

Soil and site.—All the sorts are very hardy, will grow freely and bear plentifully almost any where, alike in open or shady situations, by which the fruit may be the more useful; but they are not hardy enough for the northern counties in winter. The exposure must be rather rather south than north, and slight, and protected from the wind. A light soil, with a prod. of straw, and abundance of manure is very suitable to the currant. The currants are preserved for the table, either by forcing,toa forcing-house; by which means, and by proper subsequent attention, the plants grew more than a foot in height the first season. At 2 years old, in the year 1816, several of the plants, and in 1817, the greater part of them, produced fruit of great variety of character and merits; but of about 200 varieties, only 3 red and 2 white appeared to possess greater merits than their parents.

Pruning.—The chief part of the future culture is seasonal pruning. After the plants are furnished with full heads, they produce many superfluous and disorderly shoots every summer, crowding the general bearers, so as to require retrenchment and regulation, both in the young growth of the year and older wood. The season for the capital pruning is winter; but a preparatory part is performed in summer, to thin the superfluous shoots of the year where too crowded, excluding the sun and air from the fruit. First as to standards:—

Summer pruning.—In May or June cut out close the most irregular shoots, rising in the centre of the bush with all the cross and water shoots, to admit more freely the essential influence of the air and sun, and promote the growth of the fruit and improve its flavour. Also twist off all root suckers as they appear.

Winter pruning.—This extends both to the old and young wood; the time for it is when the plant is at rest. Of the shoots of the preceding summer, cut out the cross-places and the otherwise irregular, with those which are not wanted for vacancies; but superfluous good lateral shoots are to be cut down to short stubs or artificial spurs, about half an inch long, so as to leave an eye or two, in order that they may send out fruit-shoots and spurs. With regard to the old bearers, take away those which are nacked, or getting unfruitful, or of which the fruit is declining in size; reduce any of excessive length, pruning in to some well-placed lateral young shoot, to preserve the head within some regular compass; cut out also any decayed or cankered parts; retain a competency of the finest best-placed new shoots above and below vacant parts, to come in for successional bearers, or to supply the places of defective old wood; and preserve a leading shoot to the principal branches, where within orderly limits, shortening such terminal shoots as are of greatest length to 10, 12, or 15 inches, according to their strength and the situation of the branches, and leaving those of small extent mostly entire. Take care of the small lateral fruit-spurs, and occasionally select short lateral shoots of 1, 2, or 3 inches, for bearing fruit; or similar small shoots may be cut to short snags of an inch or two long, also for fruiting. Thin out spurs of the old branches where very thick. As the old fruit branches decline bearing, or decay, cut them away, taking care to provide young ones in succession; and thus keep the bushes always furnished with full-bearing branches, and advancing young bearers, in a regular open expansion, 6, 8, or 10 inches asunder at the extremities, circumscripting the general head within the height of 3 or 4 feet, possibly 5 at most.

“Currants of the finest quality,” Mr. Neill observes, “are raised by Macdonald, at Dalkeith House. A good deal depends upon the way in which he manages the bushes, especially during the ripening of the fruit. He prunes the bushes at the usual season of mid-winter, shortening the last year’s shoots down to an inch or an inch and a half. Next summer the plants show plenty of fruit, and at the same time throw out plenty of strong shoots. As soon as the berries begin to colour, he cuts off the summer shoots to within 5 or 6 inches before the fruit. This is commonly done with the garden shears, with which a man may go over half an acre of bushes in a day. Sun and air thus get more free access, and more of the vigour of the plant is directed to the fruit; the berries are found not only to be of higher flavour, but larger than usual.”—Neill, Cal. mem. vol. II.

To wall-bushes, espaliers, and fan-standards, without support, the same course of summer and winter pruning is applicable, with the obvious variations required by their figure. In training wall-trees, 2 branches are led in an horizontal direction along the bottom of the wall or trellis, perhaps half a foot from the surface of the earth, and the growths from these of all upright shoots, which will admit of being arranged at the distance of 5 or 6 inches from each other, is encouraged. Fan standards are sometimes trained in a manner nearly similar, and sometimes with the branches radiating from the crown of the stem.

Insects, &c.—The red currant is occasionally attacked by the catterpillar, and very frequently by the aphis ribes, Lin, which changes the colour of the leaves to red, pits and puckers them, and causes the fruit to be shrivelled and flavourless. Forsyth says, “As currants are very liable to be devoured by earwigs, which take shelter under their leaves and branches, bundles of bean-stalks should be hung up some time before the bushes are covered with mats or nets. If proper attention be not paid to this, the fruit will generally suffer very much from these insects. After the bushes are covered, take the mats off once in 3 or 4 days, and kill the earwigs that have got into the bean-stalks, which it will be necessary still to keep hung up. As there is a sweetness in the inside of bean-stalks which attracts the earwigs, they very regularly take shelter in them from rain.”

Taking the crop and preserving.—The ripening fruit comes in for small gatherings in June, advances to maturity in July, and continues in perfection till the end of August; or if trees in a full exposure are timely defended from birds and the full sun, with garden mats, or protected with nets where they grow against walls, the fruit may be continued good till September or October. Gather in a dry state, as in rainy weather they lose their flavour.

Forcing.—To obtain early currants by forcing, let some good bearing trees, in pots, be placed early in January or February, in any common forcing department; they will produce ripe fruit in April or May.

51 R. campanulatum (Humb. et Bonpl. in Willd. herb. ex Rom. et Schultes. 2. p. 500.) leaves somewhat 5-lobed, doubly crenated, cordate, hairy beneath; lobes obtuse; petioles ciliated with glandular hairs; racemes pendulous; calyx campylia; petals oblong-spatulate; styles bifid. η. H. Native of Mexico, near Moran, at the height of 3000 feet. R. affine, H. B. et Kunth, nov. gen. et spec. amer. 6. p. 60. Flowers white. Hardly distinct from the following species.

Campanula-calyced Currant. Shrub 4 to 6 feet.

52 R. kunthii (Berl. miss. ex D. C. prod. 3. p. 482.) leaves somewhat 5-lobed, doubly serrated, rather cordate at the base, pubescent; racemes solitary or numerous, crowded, erect; calyx campylia; petals spatulate, reflexed; stamens 5-6, hardly shorter than the petals; styles 3-4-cleft; stigma capitulate. η. H. Native of Mexico, along with the preceding. R. multi-florum, H. B. et Kunth, l. c. but not of Kit.

Kunth's Currant. Shrub 4 to 6 feet.

53 R. triste (Pall. nov. act. petro. 10. p. 378.) leaves 5-lobed; branches simple, twiggy, bearing leaves and racemes of flowers at the apex; racemes pendulous, both when in flower and in fruit; corollas flattish, reddish on the outside, and yellowish inside; petals revolute. η. H. Native of Siberia, on the Mongol Mountains. Berries small, black, insipid. Root creeping.

54 R. glacialae (Wall. cat. no. 6833.) branches smooth; leaves glabrous above, but with a few scattered briskly hairs beneath, corotate at the base, 3-5-lobed at the apex; lobes acute, serrated; petioles long, serrated at the base; racemes droop-
GROSSULARIE. I. RIBES.

Bieberstein’s Currant. Shrub 4 to 6 feet.

57. R. Hudsoni (Richards in Frankl. first. journ. ed. 2. append. p. 6.) branches erect; leaves 3-lobed, quite glabrous above, full of resinous dots beneath, and are, as well as the petals, villous; germens dotted; berries glabrous, glabrous, black; racemes erect, pubescent; bracteas short; segments of the calyx, which is campanulate, spreading. \( \pi \). H. Native of North America, from Hudson’s Bay to the Rocky Mountains, in the west, and as far north as lat. 57°. Flowers small; petals white. The fruit, and peculiar odour of the plant, are that of R. nigrum.

Var. \( \beta \); racemes longer; calyx smoothish. \( \pi \). H. Native of the north-west coast of America, on the mountains of the Columbia, about the Kettle Falls. R. petiolare, Doug. in hort. trans. 7. p. 514.

Hudson’s Bay Currant. Shrub 3 to 4 feet.

58. R. floridum (Lher. stip. 1. p. 4.) leaves full of resinous glands, 3 or 5-lobed, cordate, doubly-serrate; racemes pendulous, pubescent; bracteas linear, longer than the pedicles; calyx tubularly campanulate, glabrous: with the segments obtuse, and at length reflexed; germens and black berries oval-globose, glabrous. \( \pi \). H. Native throughout Canada; and of Pennsylvania. Berl. l. c. t. 2. f. 22. R. nigrum \( \beta \), Lin. spec. 291. R. Pennsylvanicum, Lam. dict. 3. p. 49. R. recurvatum, Michx. fl. bor. amer. 1. p. 109. according to Torrey.—Ribesium nigrum, &c. Dill. chb. 2. t. 244. f. 315. This is in many respects allied to R. nigrum, but its more copious, denser flowers, and especially the long bracteas, and more tubular calyx, will always distinguish it; the solitary pedicle too at the base of the flowers is wanting in this species. Petals oblong, rather crose at the apex.

Flowering Currant. Fl. April, May. Clt. 1729. Sh. 4 to 6 ft.

59. R. impunctatum (Lindl. in bott. reg. 1471.) leaves reddish, deeply 3-5-lobed, and deeply toothed, truncate at the base, glandular on both surfaces; pedicels pubescent; peduncles 3-5-flowered, pendulous; flowers aggregate; calyx tubular, glandular, with the segments recurved. \( \pi \). H. Native of North America. Calyx greenish white, with the tube 4 lines long. Leaves smilling like those of R. floridum. The species was received from Mr. Floy of New York, under the name of intoxicating currant, but without any account of its quality. The berries probably possess some narcotic quality.

60. R. cercum (Doug. in hort. trans. 7. p. 512. bot. reg. 1265.) leaves small, cordate, lobed, serrate, clothed with glandular pubescence, glabrous, glaucous, full of white glands above; racemes pendulous, rather capitate; bracteas ovate, adpressed to the germs, which are glabrous; flowers nearly sessile, cylindrical, rather angular; calyce segments small, reflexed. \( \pi \). H. Native of North-west America, on the banks of the Columbia, and its southern tributary streams, from the Great Falls to the Rocky Mountains, in gravelly or sandy soil. In the small foliage, and few-flowered racemes, this species resembles the gooseberry tribe, but without any thorns. The flowers are rather large and white, with a slight tinge of green, rather downy. White waxy dots like scales cover the upper surface of the leaf, whence the specific name.

61. **R. viscosissimum** (Pursh. fl. amer. sept. 1. p. 153.) leaves cordate, obtuse, 3-5-lobed, deeply crenated, viscid from glandular pubescence; glands on both surfaces; racemes erect, corymbose; bracteas linear-obovate, rather shorter than the pedicels, which are clothed with glandular hairs; calyx tubularly campanulate, with erectly spreading obusate segments; germen and fruit ovate-oblong, clothed with viscid hairs. *H.* Native of North America, on the Rocky Mountains, and in dry plains in partially shaded places towards the sources of the Columbia; also on the summits of the hills near the Spokan and Kettle Falls, at an elevation of 8000 feet above the sea. Hook. fl. bor. amer. 1. p. 234. t. 74. Berries oblong-ovate, black. Flowers large, pale yellowish green. This is a very fine and remarkable species.

---

62. **R. atropurpureum** (Meyer in Led. fl. ross. alt. ill. t. 231. fl. alt. 1. p. 268.) stem erect; leaves pubescent, nearly orbicular, cordate, 3-5-lobed; lobes acute, serrated; racemes drooping; pedicels exceeding the bracteas; calyces campanulate, eiliated; berries glabrous, bractless. *H.* Native of Altaiu, on mountains and subalpine places at the river Ursal, also at the river Tscharysch. Berries dark purple, size of those of the common currant.

*Var. a*; flowers deep purple; leaves rather pubescent beneath, but smooth and glabrous above, as well as the branches. *Var. b*; leaves rather pubescent beneath, but hispid from bristles above, as well as the petioles and stems. Near the river Volkshi, Ulegumen.

*Var. γ*; flowers paler; leaves pubescent above, but most so below; branches smooth.

63. **R. sanguineum** (Pursh. fl. amer. sept. 1. p. 164.) leaves cordate, somewhat 5-lobed, serrated, veiny, smoothish above, but clothed with villous tomentum beneath; racemes drooping, pubescent, twice the length of the leaves; calyx tubularly campanulate, with oblong obtuse spreading segments, exceeding the petals, which are red, and quite entire; bracteas obovate-spatulate; berries turbinate, hairy. *H.* Native of the north-west coast of America, in abundance from lat. 38° to 52°, usually growing in rocky situations by the sides of streams. Doug. in hort. trans. 7. t. 12. bot. reg. 1349. Sweet, fl. gard. n. s. t. 199. R. malva-cum, Smith in Rees’ cyc. This is perhaps the most ornamental species of the genus, bearing a profusion of large racemes of deep rose-coloured flowers, and is therefore well adapted for ornamenting shrubberies and pleasure grounds. The berries are brownish black and bitter, completely destitute of the pulpy substance common to most of the species of the tribe.

---

**FIG. 33.**

64. **R. aureum** (Pursh. fl. amer. sept. 1. p. 161.) quite glabrous; leaves 3-lobed; lobes divaricate, with a few deep teeth, shorter than the petals, which are ciliated at the base; calyx tubular, longer than the pedicels: tube slender: segments oblong, obtuse; petals linear, much shorter than the calyceine segments; bracteas linear, length of the pedicels; style entire; berries glabrous. *H.* Native of North-west America, in light gravelly soils, from the Great Falls of the Columbia River to the mountains, and on the southern branches. Berl. l. c. t. 2. f. 23. Flowers golden yellow. Fruit yellow, seldom black, and of an exquisite flavour.

*Var. a. preëcox* (Lindl. in hort. trans. 7. p. 242.) flowers earlier; leaves eiliated at the base, pubescent beneath; lobes deeply serrated; berries copious, earlier, turbinate; racemes bracteate. *H.* Native of North America.

*Var. γ. scorpiïnun* (Lindl. l. c.) flowers late; leaves of various forms, smoothish beneath; lobes deeply serrated; berries few, late, round; racemes naked. *H.* Native of North America.

65. **R. tenueflorum** (Lindl. in hort. trans. 7. p. 242. bot. reg. 1374.) unarmed, quite glabrous; leaves roundish, 3-lobed, mealy; lobes bluntly toothed at the apex; racemes pendulous, many-flowered; calyx tubular, glabrous, longer than the pedicels, coloured; petals quite entire, linear, one-half shorter than the segments of the calyx, which are oblong and obtuse; bracteas linear, length of the pedicels; berries glabrous. *H.* Native of North America, common on the rocky tracts of the Columbia, near the head waters of the Missouri. *R. aureum*, Colla, hort. rip. append. 3. t. 1. f. A. *R. flavum*, Berl. in D. C. prod. 3. p. 483. *R. Missourienis*, Hort. In habit this species is more erect than *R. aureum*, and has the young wood very thinly clothed with leaves; its whole appearance is also paler during the early part of the season. The flowers are not more than half the size of those of *R. aureum*, and have entire, not notched petals. The fruit is the size of a red currant, of an agreeable flavour, but possessing little acidity.

*Var. a. fructo-nigrum*; berries changing from yellow to red, and finally acquiring a deep blackish purple-colour.

*Var. β. fructo-bœlo*; fruit yellow, always retaining the same colour.

*Yellow-flowered Currant.* Fl. April, May. Clt. 1812. Shrub to 8 feet.

*Cult.* All the species of *Ribes* grow well in any kind of soil, and all root freely from cuttings planted in autumn, or early in spring. Those species, natives of Chili, Peru, Mexico, and other parts of South America, require shelter in severe weather. Some of the species are well adapted for ornamenting shrubberies and pleasure grounds. But the most ornamental and
most worthy of cultivation are \textit{R. speciosum}, \textit{R. Menziei}, \textit{R. sanguineum}, \textit{R. atropurpureum}, and \textit{R. aureum}.

Calyx superior, 5-toothed (f. 34. b. f. 35. a.). Corolla of 5 petals (f. 34. c. f. 35. b.), alternating with the calycine segments, from within which they rise, forming by their cohesion a tube (f. 34. c.), but finally separating from each other (f. 35. b.), imbricate in activation. Stamens arising from the calyx (f. 35. b.), alternating with the petals (f. 35. b.); anthers bursting lengthwise. Disk conical, epigynous (f. 34. c.), plaited, surrounding the base of the style (f. 34. c.). Ovarium inferior (f. 34. a.), 2-celled, with 2 large polynymous placentas (f. 34. f.) in the axis. Style simple (f. 34. d.). Stigma 2-lobed. Fruit capsular, 2-celled, crowned by the style and calyx (f. 34. a. b. c. d.), which are permanent, splitting by the separation of the cells at their base. Seeds numerous, minute, with a transparent membraneous integument. Embryo minute, in the apex of an oily albumen, having the radicle pointing to the extremity opposite the hilum.—Shrubs or trees. Leaves alternate, exstipulate, simple, full of resinous glands. Flowers axillary, conspicuous, white, rarely reddish.

This order is distinguished from \textit{Grossulariaceae} by the cohering petals, and by the radicle being at the extremity of the seed, opposite the hynum; the albumen is also oily, not horny, and the placentas are not parietal; from \textit{Philadelphaceae} they are known by their glandular leaves and minute embryo; from \textit{Vacciniaceae}, by the final separation of the petals, and by the anthers.

**Synopsis of the genera.**

1 \textit{Escallonia}. Limb of calyx 5-toothed or 5-lobed (f. 34. b.). Stigma peltate, 2-lobed (f. 34. d.). Capsule baccate (f. 34. f.), somewhat 2-celled, opening by pores at the base. Seeds sericulate.

3 \textit{Forsturna}. Limb of calyx 5-parted. Style finally divisible into 2 parts; stigma 2-lobed. Capsule 2-celled, dehiscing between the parts of the style.

4 \textit{Anacperus}. Calyx 6-lobed (f. 35. a.). Petals and stamens 6 (f. 35. b.). Stigma bifid (f. 35. c.). Capsule 1-celled, 2-valved (f. 35. d.). Seeds compressed, furnished with a wing at the top.

5 \textit{Itea}. Calyx 5-cleft. Stigma capitiate. Style finally divisible into 2 parts. Capsule compressed, 2-celled, separable into 2 parts.

\textbf{Lin. syst. \textit{Pentandra}, Monogynia.} Tube of calyx semi-globose, adnate to the ovarium (f. 34. a.); limb 5-toothed or 5-lobed (f. 34. b.). Petals 5, arising from the calyx. Stamens 5; anthers ovate-oblong. Style filiform, permanent. Stigma peltate (f. 34. d.), somewhat 2-lobed by a furrow. Capsule baccate (f. 34. f.), crowned by the calycine lobes and the style (f. 34. b. c. d.), somewhat 2-celled, dehiscing irregularly by pores at the base; deisipment incomplete at the top, and therefore placentiferous. Seeds very numerous, sericulate.—Trees and shrubs, natives of South America, especially Chili, usually full of resinous glands. Leaves scattered, serrated, or entire. Flowers terminal, bracteate, variously disposed, white or red. In many of the species the genus is present a conical perispermic urceolus, girding the base of the style; for this reason the species of the genus may hereafter be formed into sections.

* Pedicels solitary, 1-flowered.

1 \textit{E. serrata} (Smith, icon. med. 2. p. 31.) shrub glabrous, erectish; leaves obovate, obtuse, serrated, veinless beneath (except the middle nerve); flowers terminal, solitary; petals oblong, tongue-shaped. \textit{G. F.} Native of the Strains of Magellan, at Terra del Fuego. Rœm. et Schultes, syst. 1. p. 326. Stereoxylon serratum, Poir. dict. 7. p. 435. Flowers white.

\textit{Serrate}ed Escallonia. Shrub 3 to 6 feet.

2 \textit{E. myrtilloides} (Lin. fil. suppl. p. 156.) shrub glabrous; branches spreading much; leaves obovate-oblong, acute, crenately serrated, veiny; flowers terminal, solitary; petals spatulate. \textit{G. F.} Native of New Granada, every where on the Andes, in cold places. Smith, icon. med. 2. t. 30. H. B. et Kunth, nov. gen. amer. 3. p. 294. Stereoxylon pâtes, Ruiz. et Pav. fl. per. 3. t. 294. f. 6. but the leaves and flowers are larger.

\textit{Myrtle-like} Escallonia. Shrub 6 to 10 feet.

3 \textit{E. alpina} (Poep. pl. excis. no. 820.) branches glabrous; leaves obovate, narrowed into short petioles, serrated at the apex, densely clothed with fine down beneath, and with scattered down above; flowers axillary, solitary, on short pedicels; tube of calyx puberulous, with subulate teeth; petals oblong-tongue-shaped. \textit{G. F.} Native of Chili, on the higher mountains. Flowers white.

\textit{Alpine} Escallonia. Shrub 3 to 4 feet.

4 \textit{E. tortuosa} (H. B. et Kunth, nov. gen. amer. 3. p. 295.) shrub glabrous; branches spreading, twisted; leaves obovate, acute, reticulately veined, glandularly erenated, rather shining; flowers nearly terminal, solitary; lobes of calyx quite entire. \textit{G. F.} Native in very rough mountainous places, on the Andes about Quito. Flowers white. Allied to \textit{E. myrtilloides} and \textit{E. corymbosa}. Fruit almost the size of that of \textit{Vaccinium myrtillus}.

\textbf{Twisted} Escallonia. Shrub 3 to 6 feet.

5 \textit{E. berberifolia} (H. B. et Kunth, nov. gen. amer. 3. p. 296.) shrub glabrous; branches spreading; leaves obovate, bluntesti, crenulately denticulated, reticulately veined; flowers terminal, solitary; lobes of calyx quite entire; petals rather spatulate. \textit{G. F.} Native on the Andes, about Quito. Flowers white. Perhaps only a variety of \textit{E. tortuosa}, according to the authors.

\textbf{Barberry-leaved} Escallonia. Shrub 3 to 4 feet.

6 \textit{E. corymbosa} (Pers. ench. 1. p. 234.) shrub glabrous; branches erectish; leaves obovate, acute, serrulately; flowers terminal, solitary; lobes of calyx denticulated; petals oblong. \textit{G. F.} Native of Peru, in cold humid places, on high hills, where it is called \textit{Siaba} by the natives. Stereoxylon corymbosum, Ruiz. et Pav. fl. per. 3. p. 14. t. 234. f. a. Peduncles
straight, bearing 1 leaf each, just under the calyx. Petals white, spreading reflexed. Stigma peltate.

 Corymbose-flowered Escallonia. Shrub 6 to 10 feet.

 E. variegata (Pers. ench. 1. p. 233.) shrub glabrous; branches erect; leaves obovate, acute, serrulate, veinless; peduncles nearly terminal, 1-flowered; lobes of calyx denticulated; petals obovate. \( \text{F.} \) Native of South America, on mountains, and in humid woods in the province of Rere, near Nacimento. Stereòxylon virgatum, Ruiz et Pav. fl. per. 3. p. 14. t. 235. f. 6. Stem much branched; branches cinctures, grey, rather spinose. Flowers white.

 Twiggly Escallonia. Shrub 5 to 10 feet.

 8 E. punctata (D. C. prod. 4. p. 3.) shrub smoothish; branches erectish; leaves obovate obtuse, or lanceolate acuminate, serrated, full of resinous dots beneath; pedicels 1-flowered, arising from the axis of the upper leaves, each bearing 2 linear bracteoles; lobes of calyx long, denticulated. \( \text{F.} \) Native of South America. Allied to E. variegata, but differs in the leaves being dotted beneath, to E. rubra, but the flowers are on axillary, solitary, 1-flowered pedicels. In this and in E. rubra the urceolus is conical and pervious at the apex, 10-angled, and 10-toothed, girding the style at the base.

 Dotted-leaved Escallonia. Shrub 5 to 8 feet.

 9 E. floridiana (Poepp. exliss. no. 843. ex D. C. prod. 3. p. 666.) shrub glabrous; leaves linear-lanceolate, acuminate at both ends, with a few serratures, crowded; flowers on short pedicels, arising from the axis of the upper leaves, solitary, collected into an ovate raceme; limb of calyx 3-cleft, with obtuse recesses and acute lobes; petals obovate, on short claws. \( \text{F.} \) Native of Chili, probably on the mountains. Leaves 8-9 lines long, and \( \frac{1}{2} \) line broad. Petals with obscure veins, which are pinnately disposed.

 Florid Escallonia. Shrub 4 to 6 feet.

 * * * Flowers disposed in terminal racemes or panicules.

 10 E. rubra (Pers. ench. 2. p. 233.) shrub smoothish; branches erect, when young clothed with glandular villi; leaves obovate-oblong, acuminate, serrated, full of resinous dots beneath; peduncles 2-flowered, bracteate; lobes of calyx denticulate; petals spatulate. \( \text{F.} \) Native of Chili, on the mountains at Colocolo, in the fissures of rocks, and about Valparaiso. Hook. bot. mag. 2890. Stereoxylon rubrum, Ruiz et Pav. fl. per. 3. t. 236. f. b. Petals red, conniving, but spreading a little at the apex. (f. 34. c.)

 Var. a, glabrescens (Hook. et Arn. in bot. misc. 3. p. 252.) branches glandular, hardly pubescent; leaves glabrous; flowers red. \( \text{F.} \) Native of Chili, near La Guardia, on the Andes of Chili, and about Valparaiso.

 Var. \( \beta \), albiflora (Hook. et Arn. l. c.) flowers white. \( \text{F.} \) E. glabrescens, Lodd. bot. cab. t. 1291. Native of Chili; and the province of Maule.

 Var. \( \gamma \), pubescens (Hook. et Arn. l. c.) branches hardly glandular, but clothed with villous pubescence; leaves pubescent on both surfaces, but more so beneath; flowers red. \( \text{F.} \) Native of the Andes of Chili. The leaves of all the varieties are spotted beneath with resinous dots.

 11 E. Peppigiana (D. C. prod. 4. p. 3.) shrub smoothish; leaves pubescent, rather clanny; leaves oval, acute, tapering into the petiole, serrated, full of resinous dots beneath, rather clanny above; pedicels 1-flowered, disposed in a few-flowered, terminal raceme; calyx glabrous, with the tube drawn out beyond the ovaryium; teeth subulate; petals erect, oblong. \( \text{F.} \) Native of Chili. E. rubra, Poepp. exliss. no. 81. Flowers red. Like E. rubra, but differs in the peduncles being 1-flowered, in the teeth of the calyx being subulate, in the urceolus not being prominent, and in the style being equal in length to the petals. There is a long-leaved variety of this, or a species, which was collected on the mountains in Chili, where it is called by the natives Ripa.

 Peppig's Escallonia. Shrub 4 to 6 feet.

 12 E. Macra'atha (Hook. et Arn. in bot. misc. 3. p. 251.) branches pubescent, glandular; leaves ovate-obtuse, blunthish, acuminate at the base, glabrous, full of resinous dots beneath, bluntly crenate-serrate; lower peduncles simple, axillary: upper ones racemose; bracteoles wanting, or very minute; calycine teeth subulate. \( \text{F.} \) Native of Chili. Petals convivine. The flowers are larger and the leaves broader than in E. rubra.

 Large-flowered Escallonia. Shrub.

 13 E. myriotoea (Bert. in litt. ex D. C. prod. 4. p. 666.) shrub glabrous; leaves lanceolate, serrated, attenuated at the base; racemes terminal, nearly simple, hardly longer than the leaves; limb of calyx campanulate, 5-cleft; lobes subulate, reflexed; petals obovate, on long claws. \( \text{F.} \) Native of Chili, at the river Cachapual near Rancagua, where it is commonly called Luma. The calyx agrees with that of E. recurvata, but differs in the whole plant being smooth, and in many other points.

 Myrtle-like Escallonia. Shrub 3 to 6 feet.

 14 E. illinajtta (Presl, in relg. Henk. 2. p. 49. t. 59.) quite glabrous; branches spreading, annointed with resin; leaves petiolate, obovate or oblong, obtuse, crenulate, attenuated at the base, beset with glandular dots above, and clanny; panicle terminal, many-flowered, leafy; calycine segments acuminate, quite entire; petals on long claws; capsule turbinate, 5-nerved; style furnished with a 10-toothed, 10-angled, pervious, cylindrical urceolus at the base, as in most of the species. \( \text{F.} \) Native of the Cordillera of Chili.

 Var. a; leaves beset with shining resinous dots on both surfaces especially beneath. \( \text{F.} \) Native of Chili, in El Arroyo de los Lances, Valle del Rio Tinguiririca, where it is called by the natives Luma.

 Var. \( \beta \); leaves bearing minute glands beneath. \( \text{F.} \) Native of Chili, in La Siente Vieja, and La Cuesta de Cha cabuco, and La Laguna near Valparaiso, where it is called by the natives Araca or Arayin. This variety is perhaps a distinct species; the glands beneath sometimes pass into a kind of pubescence.

 Anointed Escallonia. Shrub 3 to 6 feet.

 15 E. arguta (Presl, relg. Henk. 2. p. 48. t. 58.) quite glabrous; branches erect; leaves obovate or oblong-lanceolate, mucronate, sharply serrated, attenuated into the petiole, discobered beneath; panicle terminal, many flowered; rachis pubescent with calyx, obtusely acute, quite entire; petals spatulate, on long claws; capsule turbinate, 10-nerved. \( \text{F.} \) Native of Chili, at San Gabriel, La Guardia, and La Cuesta del Ingaa; Andes of Chili, and Valle del Rio Claro. Luma is its vernacular name. E. microcarpa, Gill. ms. E. reflexa, Gill. ms. E. myriotoea, Gill. ms. hardly of Bertero. The raceme is very compact, and the flowers nearly sessile. Perhaps afterwards it may prove a mere state of M. rubra.

 C c
ESCALLONIÆ.

Sharp-serrate-leaved Escallonia. Shrub 3 to 6 feet.
16 E. resinosa (Pers. ex. Hook. & Arn. in bot. misc. p. 253.) shrub glabrous; branches erect; leaves lanceolate, tapering into the petiole at the base, serrated, full of resinous dots beneath; leaves many-flowered, terminal; teeth of calyx short, quite entire; petals spatulate. †. F. Native of Brazil. E. resinosa var. dodo-nivifolia, Cham. in Linn. Soc. Reg. 1. p. 555. Very like E. resinosa. Style hardly longer than the fruit. Flowers white. Var. β. spirifolia (D. C. prodr. l. e.) leaves obovate, obtuse, tapering into the petiole at the base. †. S. Native of Brazil. E. resinosa spirifolia, Cham. in litt.

Selio's Escallonia. Tree 10 to 20 feet.
19 E. Callcottii (Hook. & Arn. in bot. misc. 3. p. 252.) branches smooth, glabrous; leaves ovate, oblong, oval or roundish, acute at both ends, petiolate, glabrous, glabrescent, with sharp adpressed serratures; flowers panicled; petals erect, on long claws; teeth of calyx subulate. †. F. Native of Juan Fernandez, where it was collected by Mrs. Callcott, late Mrs. Maria Graham. The lower peduncles of the raceme are branched, thus forming a panicle. The toothed urceolus at the base of the style is not so conspicuous in this as in other species of the genus.

Callcott's Escallonia. Shrub.
20 E. Monteviδμες (D. C. l. e. p. 4.) shrub glabrous; branches erect; leaves oblong, cuneated at the base, acutish, finely serrated, full of resinous dots beneath; panicle terminal, many-flowered, crowded, intermixed with foliaceous bracteas; lobes of calyx acute, rather denticulated; petals obovate-oblong. †. F. Native of Brazil, in many places, but especially on the sandy banks and shores of the Uruguayan. E. floribunda var. β. Monteviδμες, Schlecht. in Linn. Soc. Reg. 1467. E. bibida, Link et Otto, abbild. t. 25. Flowers white, very like those of the lathorn. Style permanent, double the length of the fruit after flowering.

21 E. floribunda (H. B. et Kunth, nov. gen. am. 3. p. 297.) shrub glabrous; branches covered with clammy resin; leaves oblong, obtuse, finely crenulated or quite entire, membranous; coriaceous terminal, rather panicked, much branched, leafy; teeth of calyx acute; petals obovate-spatulate. †. F. Native of New Granada, on the Andes. Style length of the stamens. Leaves when young clammy and shining above. Flowers white. This species is said to come near F. cuneifolia.

Brande-flowered Escallonia. Tree 10 to 20 feet.
22 E. Caracasana (H. B. et Kunth, nov. gen. am. 3. p. 297.) shrub glabrous; branchlets scattered, somewhat trigonal; leaves oblong, acute, cuneated at the base, petiolate, finely crenulated, membranous; petiole terminal, many-flowered, leafy; teeth of calyx acute; petals obovately spatulate. †. G. Native of South America, in temperate places near Caracas. Flowers white. Style shorter than the stamens. Very like E. floribunda.

Caracas Escallonia. Tree 12 to 20 feet.
23 E. spectabilis (Hort. monac. ex D. C. prod. 4. p. 4.) branchlets pubescent; leaves oblong or elliptic, somewhat cuneated at the base, obtuse at the apex, serrated, glabrous; panicle short, thyrsoid; bracteoles and lobes of calyx acute, somewhat serrated by black glands; petals obovate-spatulate. †. F. Native country unknown. Flowers red. Style length of the stamens. E. glandulosa, Lodd. bot. cab. 1291.

24 E. paniculata (Roxm. et Schultes, syst. 5. p. 328.) shrub glabrous; branches angular, rather clamy; leaves lanceolate-oblong, obsolescetly serrated; peduncles racemose; petals of calyx very short; petals obvate. †. F. Native of Peru, in the groves of Pillao. Stereoxylon paniculatum, Ruiz et Pav. fl. per. 3. p. 16. t. 238. f. 5. Flowers white. Style very short. Calyx nearly entire.

Panicled-flowered Escallonia. Shrub 5 to 8 feet.
25 E. angustifolia (Presl, in reliq. Henk. 2. p. 47.) glabrous; branches spreading; leaves glandular; flowers long, linear-lanceolate, obtuse, dotted with glands, and glandularly serrulated, narrowed at the base; panicle terminal, many-flowered; segments of the calyx entire; style exceeding the capsule. †. F. Native of Peru. Style naked at the base, not furnished with an urceolus, as in those formerly named Stereoxylon.

Narrow-leaved Escallonia. Shrub.
26 E. multiflora (Presl, in Henk. reliq. 2. p. 48. t. 57.) glabrous; branches spreading; leaves glandular and glutinous; leaves nearly sessile, obovate, mucronate, glandularly serrulated, pale beneath, and glandularly ciliated at the base; pedicles terminal, many-flowered; teeth of calyx obtuse, quite entire; petals obvate; style equal in length to the ovariun, which is pubescent. †. F. Native of Chili and Peru. Style naked at the base, as in most species.

Many-flowered Escallonia. Shrub.
27 E. leave′scens (Presl, in reliq. Henk. 2. p. 48.) quite glabrous; branches erect; leaves obvate, recurvedly acuminate, glandularly serrulated, and pinnately veined, attenuated at the base; flowers terminal and axillary, sessile; teeth of calyx acuminate, glandular; capsule tubinate, 10-nerved. †. F. Native of the Cordillera of Chili. Style furnished with a urceolus at the base.

Yellowish Escallonia. Shrub.
28 E. cuneifolia (Roxm. et Schultes, syst. 5. p. 328.) branches spreading; leaves oblong-wedge-shaped, serrulated, nearly sessile, whitish beneath; petals terminal, rather corymbose, hairy; teeth of calyx small; petals obvate, obsolescently crenulated. †. F. Native of Peru, in woods on the Andes, at Chacna. Stereoxylon cuneifolium, Ruiz et Pav. fl. per. 3. p. 16. t. 238. f. 5.

Wedge-leaved Escallonia. Shrub 5 to 8 feet.
29 E. d′icolor (Vent. choix. t. 54.) branchlets rather pubescent; leaves cuneiformly lanceolate, somewhat crenulated, or quite entire, of a different colour beneath, having the middle nerve hairy; petals terminal, many-flowered; calyx puberulous; petals obvate. †. F. Native of New Granada, on the Andes. Stereoxylon discolor, Poir. dict. 5. p. 246. E. Tubis-Latus ex Humb. tabl. nat. 1. p. 113. Kunth, nov. gen. am. 3. p. 299. Flowers white. Style length of the petals, shorter than in any other species, rather conical at the base, striated.
ESCALLONEÆ. 1. ESCALLONIA. II. QUINTINIA. III. FORGESIA. IV. ANOPTERUS.

**Discoloured-leaved Escallonia.** Ch. 1820. Shrub 6 to 8 ft.

30 E. revoluto (Pers. ench. 1. p. 235.) shrub hairy in every part; branches erect, rather clamy, smooth; leaves oblong, cuneate, obtuse, on short petioles; racemes terminal, cymose, much shorter than the fruit.

Reedulate-leaved Escallonia. Tree 10 to 20 feet.

31 E. fulvulex (Pers. ench. 1. p. 235.) shrub hairy in every part; branches rather erect, somewhat lignified; leaves elliptical, obtuse, on short petioles, serrated, rather clamy above when young; racemes terminal, spike-formed, erect; teeth of calyx spreading; petals obvate.

**Powdered Escallonia.** Shrub 6 to 10 feet.

32 E. berteroi (D. C. prod. 4. p. 666.) shrub glabrous, clamy, short hairs from resin; leaves elliptical, petiolate, serrated, shining above; racemes spike-like, terminal, simple, twice the length of the leaves; calyxes shining and clamy, 5-cleft; petals elliptic-oblong, sessile. F. Native of Chili, on the banks of rivers near Santiago, Valparaiso, and Quillota.

33 E. chilophylla (Cham. et Schlecht. in Linn.1. p. 542.) shrub glabrous, branches rather angular; leaves obovate-cuneate, mucronate, quite entire, of a greyish white colour; racemes terminal, clothed with powdery down; bractlets about equal in length to the peduncles; petals obvate-spatulate. F. Native of Brazil. Flowers white.

Green-leaved Escallonia. Shrub.

34 E. pendula (Pers. ench. 1. p. 235.) branches erectly spreading; rather clamy when young; leaves oblong-lanceolate, acute, finely crenulated, hairy beneath, but especially on the nerves; racemes terminal, spike-formed, pendulous; calyx hairy, with the teeth acute; petals linear-spatulate. F. Native of Peru, in groves; and on the Andes about Loxa, near Guayaquil.

**Pendulous-racemed Escallonia.** Tree 10 to 14 feet.

35 E. hirta (Willd. in Rüm. et Schultes, syst. 3. p. 329.) leaves obovate-oblong, almost quite entire, glabrous; panicle terminal; peduncles hairy. F. Native of South America, where it is said to have been gathered by Humboldt and Bonpland, but it is not mentioned in the nov. gen. amer.

**Hairy Escallonia.** Shrub.

**Cult.** All the species of Escallonia are very fine ever-green shrubs; they grow best in a mixture of peat, sand, and loam; and cuttings strike readily in mould or sand under a hand glass.

Most of the species will probably be found sufficiently hardy to stand in the open air in our climate, provided they are planted in a warm sheltered situation, particularly against a south wall or hot-house; and in winter they may be protected by throwing a mat over them.

**Lin. syst. Pentandria, Monogynia.** Tube of calyx adhering to the ovary, marked by 10 nerves; limb 5-toothed, permanent. Petals 5, obvate. Stamens 5. Style columnar, filiform; stigma peltately capitate, 4-5-lobed. Capsule crowned by the style and calytic teeth, 3-celled, with the disseminations hardly complete; cells many-seeded. Seeds small, ovate, compressed. Shrub smooth. Leaves alternate, petiolate, oval, acuminate at the apex, attenuated at the base, quite entire, coriaceous. Panicles terminal, composed of spreading racemose branches. Pedicels spreading, shorter than the fruit.

1 Q. Sieberi (Alph. D. C. 1. c.) F. Native of New Holland.—Sieb. pl. exsic. nov. holl. no. 261.

**Sieber's Quintinia.** Shrub.

**Cult.** See Escallonia above for culture and propagation.

III. FORGESIA (in honour of M. Desforges, Governor of the Isle of Bourbon, when Commerson investigated the vegetation of that country). Comm. in Juss. gen. p. 164. D. C. prod. 4. p. 5.—Deforgia, Lam. ill. t. 125.

**Lin. syst. Pentandria, Monogynia.** Tube of calyx turbinate, adnate to the ovary; limb 5-parted: lobes lanceolate. Petals 1, inserted in the calyx, linear-lanceolate, approximate at the very base, hardly longer than the calyx, somewhat valvate in animation. Stamens 5, erect; anthers ovate. Style filiform, finally separable into 2 parts; stigma 2-lobed. Capsule half adnate, crowned by the erect separated style, 2-celled, many-seeded, opening between the styles. —Tree small, quite glabrous. Leaves alternate, coriaceous, lanceolate, attenuated at both ends, on short petioles, serrated. Racemes terminal, few-flowered, bracteate at the base of the pedicels.

**Cult.** For culture and propagation see Escallonia above.

IV. ANOPTERUS (from ano, ano, upwards, and πετερον, a wing; in reference to the seeds, which are winged at the apex). Labill. nov. holl. 1. p. 86. t. 112. R. Br. in Frankl. narr. journ. 756. vern. schrift. 1. p. 545.

**Lin. syst. Hexandria, Digynia.** Tube of calyx turbinate (f. 35. a.), adnate to the ovary at the base; lobes 6, short, acute, permanent. Petals 6 (f. 35. b.), alternating with the calyxine lobes, and inserted in the calyx. Stamens 6 (f. 35. b.), inserted with the petals, shorter, and alternating with them. Style short; stigma bifid (f. 35. c.). Capsule oblong, 1-celled, 2-valved (f. 35. d.); valves opening from the apex to the base, with the placentas at the margins (f. 35. c.). Seed ovate, compressed, furnished with a wing at the top.—Tree, quite glabrous. Leaves alternate, rarely nearly opposite, ovate-oblong, attenuated at both ends, nearly sessile, coriaceous, crumulously toothed. Racemes simple, terminal. Flowers sometimes 7-cleft.

1 A. glandulosa (Labill. 1. c.) F. Native of Van Diemen's Land. Flowers white. (f. 35.)

---

**FIG. 35.**
ESCALLONE. E.  V. ITEA. CUNONIAEE.

LIN. SYST. PENTANDRIA, MONOCAEIA. Calyx regular, permanent, campyliate, 5-cleft, with the recesses obtuse, and the teeth subulate. Petals 5, lanceolate-linear, inserted in the upper part of the tube of the calyx, and alternating with its lobes, valvate in aestivation. Stamens 5, alternating with the petals, and shorter than them; anthers oblong, rather bifid at the base, 2-celled, bursting lengthwise. Ovarium oblong, free. Style 1, but at length separating into 2 parts: stigma capitulate, usually divisible in the furrow. Carpels 2, joined into a 2-celled compressed bispiculate capsule, which separate at length from each other from the base to the apex. Seeds numerous, disposed in 2 rows along the inflexed margins of the carpels. — Shrubs, with alternate simple exstipulate leaves. Flowers racemose, as in Weiglandia, but pentandrous, and as it were single styled. The character of the genus is alone taken from I. Virginica. 

1 I. Virginica (Lin. spec. 289.) leaves lanceolate, acutely toothed; racemes simple, terminal. H. Native of North America, from Pennsylvania to Carolina. Lam. ill. 1. t. 147. f. 1. Lher. strirp. 1. p. 138. Lois. in Duham. abr. ed. 2. vol. 6. t. 9. Sims, bot. mag. 2409. — Trew. chfrt. t. 98. When this shrub is in vigour it is entirely covered with racemes of white flowers in July and August, and then makes a fine appearance. 

Virginia itea. Fl. June, Aug. Clt. 1744. Sh. 6 to 7 feet.

† Asiatic shrubs related to Itea, and referred to the genus by the authors, but will probably constitute 2 or 4 different genera when the parts of fruits and the flower are properly examined. 

* Leaves alternate.

2 1. ? Umella (Roxb. fl. ind. 2. p. 419.) leaves alternate, broadly lanceolate, entire, smooth; panicles axillary and terminal, composed of simple umbels, on long peduncles. H. S. Native of the Malay Islands. Capsule 1-celled, 2-valved, with 2 partial placentas on each side. Flowers white. 

Umella-flowered Itea. Shrub 6 to 8 feet.

3 1. ? Macrophylla (Wall. in Roxb. fl. ind. 2. p. 419.) leaves alternate, elliptic-ovate, acuminate, callously serrated; racemes axillary, fasciculate, erect, equal in length to leaves. H. G. Native of the East Indies, on the Khasse mountains bordering on the province of Silhet. Flowers yellow, fragrant, when young conical, and valvate in aestivation. Ovarium half adhering to the calyx, 2-celled. Style columnar. 

Long-leaved Itea. Tree 20 feet.

** Leaves opposite.

4 1. ? Fragrans (Wall. in Roxb. fl. ind. 2. p. 420.) leaves opposite, cuneate-lanceolate, entire; racemes terminal; flowers in sessile fascicles, tetrandrous, and pentandrous. H. G. Native of the East Indies, in the Island of Singapore. Flowers yellow, fragrant. Calyx cup-shaped, 4-5-toothed. Petals 4-5, linear, valvate in aestivation, longer than the stamens. Ovarium adnate to the calyx, 2-celled. Style columnar. This species, with the preceding, will perhaps form a new genus nearly allied to Escallonie.

Fragrant-flowered Itea. Shrub 5 to 6 feet. 

5 I. ? Rosmarinus (Roxb. et Schultes, syst. 5. p. 408.) leaves opposite, liliform, glabrous, hardish; peduncles axillary, 1-flowered. H. F. Native of the north of Cochim-china, in sandy places, and in China about Macao. Cedrela Rosmarinus, Lour. coff. p. 166. Calyx somewhat campylate, 5-toothed, with the base permanent, and the teeth deciduous. Petals 5, obtuse. Stamens 5, equal in length to the petals. Style 1. Capsule 3-celled, 3-valved, debiseful at the apex, many-seeded. Leaves odoriferous, from containing a quantity of essential cephalic oil. This plant hardly belongs to the order. 

Rosmary-like Itea. Shrub 5 to 6 feet.

Cult. Itea Virginica is a very pretty hardy shrub, well adapted for decorating the front of a shrubbery. It is increased by layers put down in the autumn. The rest of the species should be grown in pots, in order that they may be protected by a frame in winter, or to be grown against a south wall, where they may be easily preserved from the frost by masts; a light soil is best suited for them, and they may be either increased by layers put down in the autumn, or by cuttings.

Calyx of many divisions (f. 36. a. f. 37. a. f. 38. a. f. 39. a.), valvate in aestivation. Petals equal in number to the divisions of the calyx (f. 36. b. f. 38. b. f. 39. c.), and alternating with them, imbricate in aestivation, sometimes wanting. Stamens inserted in a perigynous disk, definite (f. 37. b.), rarely indefinite; anthers peltate, 2-celled (f. 38. c. f. 39. d.); bursting lengthwise by a double fissure. Ovarium 2-celled: ovula usually indefinite; styles 2 (f. 36. e. f. 37. d. f. 38. e. f. 39. b.); rarely connate: stigmas 2, simple, obtuse, pruinose. Capsule composed of 2 conflated follicles, which are applied to each other, rarely confluent, 2-celled, 2-valved; for the most part furnished with 2 beaks, and many-seeded; disseminations double, from the inflexed edges of the valves. Placenta central, composed of fascicles of umbilical vessels. Seeds pendulous, sometimes winged; testa crustaceous or membraneous. Albinum copious, fleshy. Embryo slender, straight, with the radicle turned towards the umbilicus, usually rather long. — Trees or shrubs, for the most part natives of the southern hemisphere. Leaves usually opposite, but sometimes verticillate, simple or compound. Stipulas interpetiolar, rarely wanting. Flowers usually disposed in spicate racemes or panicles.

The Cunoniacceæ were first proposed by Dr. R. Brown as a separate family from Saxifragaceæ, to which they had been referred by Jussieu, and to which they are intimately related, being chiefly distinguished by habit alone. M. Kunth considers them merely as a section of Saxifragaceæ, but it appears preferable to regard them as a distinct family; for the advantages arising from dividing extensive families and genera are, that the individuals composing these become better understood, and their characters more accurately investigated. The Saxifragaceae are almost exclusively confined to the northern, as Cunoniaceæ are to the southern hemisphere. Some pass beyond these limits, but their number is very small. Both families agree in having entire
and divided petals, and a superior and inferior ovarium. In the
series of natural affinities the Philadelphaceae clearly follow the
Cunoniaceae, with which they correspond in habit; and in Bau-
era and Belangiera the stamens are indefinite, and the seeds of
Caldesia have a striking analogy to those of Philadelphus.
The styles both in Saxifragaceae and Cunoniaceae are often 3,
and in Cornia of the Flora Peruviana that number is always
constant.

A species of Weinmannia is used in Peru for tanning leather,
and its astringent bark is employed to adulterate the Peruvian
bark. The Indian Weinmannias appear to possess similar
astringent qualities.

**Synopsis of the genera.**

**Tribe I.**

**Cunoniaceæ.** *Stamens definite. Ovarium distinct.*
1 Weinmannia. Calyx 4-parted, permanent (f. 36. a.).
Petals 4 (f. 36. b.). Stamens 8. Hypogynous disk urceolate
(f. 36. d.). Styles 2. Capsule opening at the apex of the dis-
sepalum; cells many seeded. Seeds reniform, hairy. Leaves
simple or compound, with 3-5 leaflets.
Stamens 8. Hypogynous disk flat, entire. Styles 2. Capsule
opening in the manner of Weinmannia; cells many-seeded.
Seeds smooth. Leaves simple.
3 Caldesia. Calyx membranous, 4-parted, deciduous.
Styles 2. Capsule opening in the manner of Weinmannia; cells
5-10-seeded. Seeds fusiform; with the testa membranous, and
larger than the nucleus. Leaves simple.
4 Platylophus. Calyx 4-cleft, sometimes 5-cleft, perma-
nent. Petals 4, rarely 5, trifid. Stamens 8 or 10. Hypogyn-
ous disk urceolate, entire. Styles 2. Capsule membranous,
2-celled at the base, and ending in a flat bifid wing at the apex;
cells 1-seeded. Seeds large, arched. Leaves compound, with 3
leaflets.
5 Cunonia. Calyx 5-cleft; segments deciduous. Petals 5.
opening like that of Weinmannia; cells many seeded. Seeds
oblong, compressed, smooth, winged on one side. Leaves im-
pari-pinnate.
6 Arnoelia. Calyx 4-parted. Petals 4. Stamens 8. Hy-
Carpels 2, connate at the base, solitary from abortion, beaked
by the styles, opening on the inside, 1-seeded. Leaves im-
pari-pinnate.
7 Pterophylla. Calyx 4-cleft, deciduous. Petals 4. Sta-
mens 8. Styles 2, very short. Ovarium 2-celled. Capsule un-
known. Leaves impari-pinnate.
8 Calycosmis. Calyx 5-parted, permanent. Petals 5.
Stamens 10. Hypogynous disk small. Styles 2, setaceous. Cap-
sule globose, 2-celled, opening at the apex; cells many seeded.
Seeds minute, smooth. Leaves simple.
9 Callicoma. Calyx 4-parted, rarely 5-parted (f. 37. a.),
permanent. Petals wanting. Stamens 8, rarely 10 (f. 37. b.).

**Tribe II.**

**Codieæ.** *Stamens definite. Ovarium inferior.*
12 Codia. Limb of calyx 4-5-parted, permanent.
Petals 4-5. Stamens 8-10. Styles pubescent. Capsule closed at
the apex, usually 1-seeded from abortion. Seeds roundish, smooth.
Leaves simple.

**Tribe III.**

**Baueræ.** *Stamens indefinite. Ovarium free.*
13 Belangera. Calyx deeply 6-parted; segments deci-
Capsule superior, 2-celled, 2-heaked, opening at the dis-
sepalum; cells many-seeded. Seeds compressed, winged at the apex.
Leaves compound, with 3-5 leaflets.
14 Baurà. Calyx 6-10 parted (f. 39. a.). Petals 6-10
(f. 39. c.). Styles 2 (f. 39. b.), glabrous. Capsule superior,
2-celled, 2-valved at the apex, opening by a transverse chink;
cells few-seeded. Seeds scabrous from resinous dots. Leaves
in whorls.

**Tribe IV.**

**Symphyogyneæ.** *Stamens definite. Ovarium free. Styles
connate.*
15 Geissos. Calyx 4-parted, deciduous. Petals wanting.
Stamens 8. Style 1; stigma 2. Capsule compressed, 2-celled, 2-
valved; cells many seeded. Seeds compressed, winged.
Leaves compound, with 5 leaflets.

**Tribe I.**

**Cunoniæ.** (plants agreeing with Cunonia in having de-
finite stamens). Stamens definite. Ovarium distinct from the
calyx.

I. **Weinmannia.** (in honour of John William Weinmann,
apothecary at Ratisbon, author of Phytothoza Iconographica,
308. H. B. et Kunth, 6. p. 42. D. Don, in edinb. phil. April,
Lin. syst. Octandria, Digynia. Calyx permanent, 4-parted
(f. 36. a.). Petals 4 (f. 36. d.). Stamens 8. Disk hypogyn-
ous, urceolate (f. 36. d.). Capsule opening at the dissepiments
from the apex; cells many seeded. Seeds roundish-reniform.
—Trees, natives of South America and the Mauritius. Leaves
compound or simple; petioles articulated. Stipulas undivided,
caducous.
Flowers hermaphrodite, racemose, usually white; pedicels in fascicles.

* Leaves simple.

1. **W. ovata** (Cav. icon. 6. p. 45. t. 566.) leaves elliptic-oblong, bluntish, crenated, glabrous on both surfaces, as well as the branches, acute at the base. p. S. Native of Peru, at the town of San Buenaventura. Leaves 2-3 inches long, and an inch or an inch and a half broad. Racemes 3 inches long, loose. Hypogynous disk with 5 glands (f. 36. d.).

*Ovate-leaved Weinmannia.* Fl. May, June. Clt 1824. Tree. 12 to 20 feet.

2. **W. Kunthiana** (D. Don in edinb. phil. journ. April, 1830.) leaves elliptic, crenated, cunctated at the base, membranous, glabrous; racemes elongated; fascicles many flowered. p. S. Native of New Granada, near Santa Fe de Bogota. W. ovata, H. B. et Kunth, 6. p. 52. exclusive of the synonyme of Cav. Leaves with the nerves and veins beneath, rather pilose, 3-4 inches long, and an inch or a half or 2 inches broad. Racemes a span long; fascicles 3-10-flowered.

*Kunth's Weinmannia.* Tree 10 to 15 feet.

*Balbis's Weinmannia.* Tree or shrub.

4. **W. laurina** (H. B. et Kunth, l. c. 6. p. 51.) leaves oblong, acute, crenated, glabrous, attenuated at the base; fascicles of racemes many flowered. p. S. Native of South America. Leaves 3 inches long or more, puberulous on the veins beneath. Racemes 2 inches long.

*Laurin-leaved Weinmannia.* Tree.

5. **W. Macrophylla** (H. B. et Kunth, l. c. p. 52. t. 521.) leaves nearly sessile, ovate, acuminate, serrated, glabrous on both surfaces, as well as on the branches, rounded at the base; fascicles of racemes many flowered. p. S. Native of Quito, in the Andes of Quito, between Loxa and Nabon. Leaves 2-3 inches long, and 2-3 inches broad, shining above, Racemes rather loose. Capsule terete, oblong, glabrous.

*Long-leaved Weinmannia.* Tree or shrub.

6. **W. latifolia** (Presl, in Huenke, reliq. 2. p. 51.) leaves ovate-elliptic, obtuse, acute at the base, crenately serrated, coriaceous, quite glabrous above, hairy beneath; racemes longer than the leaves; stipular oblong, obtuse, silky outside; areoles entire. F. G. Native of Peru, in mountain woods.

*Broad-leaved Weinmannia.* Tree.

7. **W. elliptica** (H. B. et Kunth, l. c. p. 50.) leaves petiolate, elliptic, obtuse, crenated, glabrous on both surfaces, acute at the base; racemes loose. p. S. Native of Quito, near Loxa. Leaves an inch or an inch and a half long, coriaceous. Racemes 1½ or 2 inches long. Capsule ovate, glabrous. Flowers purplish.

8. **W. ovatis** (Ruiz et Pav. fl. per. 4. t. 333. f. a. ined.) leaves petiolate, oval, crenated, quite glabrous on both surfaces, as well as the branches, shining, acute at the base; fascicles of racemes many flowered. p. S. Native of Peru, on the Andes, in groves at Pillao. Leaves coriaceous, 2 or 3 inches long. Racemes loose, a hand long. Capsule ovate, quite smooth.

*Ovate-leaved Weinmannia.* Tree.

9. **W. crassifolia** (Ruiz et Pav. fl. per. 4. t. 331. f. a. ined.) leaves nearly sessile, oval, coarsely crenated, rather pilose as well as the branches, rounded at the base; fascicles of racemes many flowered. p. S. Native of Peru. Leaves 2 inches long, coriaceous, thick, pilose on the rib and veins beneath. Racemes 2-3 inches long. Capsule ovate-oblong, smooth.

*Thick-leaved Weinmannia.* Tree.

10. **W. subcordata** (Moricand, herb. ex D. C. prod. 3. p. 8.) leaves oval, obtuse, somewhat cordate at the base, dentately crenated, coriaceous, glabrous, shining above; racemes when in flower exceeding the leaves a little. p. S. Native of Peru. Flowers on very short pedicels. Leaves 24-30 lines long, and 16-18 lines broad.

*Subcordate-leaved Weinmannia.* Tree.

* **Leaves simple and ternate.

11. **W. heterophylla** (H. B. et Kunth, nov. gen. amer. 6. p. 52. t. 522.) leaves simple and ternate, ovate-oblong, acutely and coarsely serrated, rather pilose beneath; fascicles of racemes many flowered. p. S. Native of New Granada, near Santa Fe de Bogota. Leaves for the most part simple, glabrous above, pilose beneath, particularly at the ribs, 3-5 inches long, and 1½ or 2 inches broad. Petioles half an inch long. Racemes loose, 4 inches long. Capsule ovate, smooth.

*Variable-leaved Weinmannia.* Tree.

12. **W. cordata** (D. Don in edinb. phil. journ. April, 1830.) leaves nearly sessile, cordate-ovate, bluntish, coarsely serrated, rather pilose beneath, and on the branches; fascicles of racemes many flowered. p. S. Native of Peru. W. heterophylla, Ruiz et Pav. fl. per. 4. t. 331. f. b. Leaves simple or ternate, 2 inches long. Racemes loose, 3 inches long.

*Cordate-leaved Weinmannia.* Tree.

13. **W. auriculata** (D. Don, in edinb. phil. journ. April, 1830.) leaves elliptic, with revolute, serrated margins, rounded at the base, hairy beneath and on the branches; fascicles of racemes crowded. p. S. Native of Peru, in groves at Pillao. W. ovata, Ruiz et Pav. fl. per. 4. t. 333. f. b. ined. W. dryasifolia, D. C. prod. 4. p. 9. Leaves shining and glabrous above, but densely clothed with fuscous hairs beneath, an inch or an inch and a half long, 1-obed at the base, and sometimes trifoliate. Racemes dense, spicate, 2-3 inches long. Capsule roundish-ovate, and are as well as the styles rather hairy.

*Auriculate-leaved Weinmannia.* Tree.

14. **W. Australis** (Cunning, in Field's new south wales, p. 533.) leaves trifoliate; leaflets ovate-lanceolate, deeply and equally serrated, sessile; flowers terminal. p. G. Native of New Holland, on moist shady rocks, at Springwood.

*Southern Weinmannia.* Shrub.

*** **Leaves ternate and quinata.

15. **W. pentaphylla** (Ruiz et Pav. fl. per. 4. t. 330. f. a.) leaves ternate and quinata; leaflets 3-5, ovate-lanceolate, acute, serrated, glabrous on both surfaces; racemes loose. p. S. Native of Peru. Branchlets pubescent. Leaflets coriaceous, shining above, 2-3 inches long; lateral ones unequal-sided at the base. Racemes loose, a hand long; pedicels longish. Capsule ovate, smooth. Styles sometimes 3, when this is the case the capsule is 3-celled.

*Fieue-leaved Weinmannia.* Tree.

16. **W. cresata** (Presl, in reliq. Huenke. 2. p. 51.) leaves of the branch with 2 pairs of leaflets and an odd one, those of the branchlets ternate; leaflets oblong, obtuse, broadly crenated, quite glabrous, coriaceous, terminal one oblong-lanceolate, attenuated at the base; wings of the rachis and petiole semi-obovate; racemes longer than the leaves, and are as well as the branchlets pubescent; flowers glomerate; segments of the calyx
Native.; urceolus, crenated. 7. G. Native of Peru, in mountain woods.

**Cavanillesia**. Tree.

17 W. Mauritian (D. Don, in edinb. phil. journ. April 1830.) leaves ternate and quinate; leaflets 3-5, obovate, or elliptic, obtuse, crenated, smoothish; racemes loose. 7. S. Native of the Mauritius, where it is called *La Lou*. W. trifoliata, Lam. dict. 7. p. 579. ill. t. 313. f. 2. exclusive of the synonyme. *Smith*, in Rees' cyclo. exclusive of the synonymes of Lin. Thunb. and Willd. W. Madagascariensis, D. C. prod. 4. p. 9. Leaflets coriaceous, pubescent beneath, 1/2 or 1 inch long. Racemes loose, 2 inches long; fascicles few-flowered.

**Mauritian Weimannia**. Tree.

18 W. Maringa (Moricand, mss. ex D. C. prod. 4. p. 10.) leaves with 3-5 leaflets; leaflets ovato-lanceolate, acute, serrated, attenuated at both ends: extreme one the largest; petiole marginal; capsule glabrous. 7. S. Native of Peru. Branchlets villous, by thorns at the tops of the branches. Racemes exceeding the leaves. Leaflets 2-3 inches long, and 8-14 lines broad.

**Marginate-petioled Weimannia**. Tree.

19 W. Microphylla (H. B. et Kunth, nov. gen. amer. 6. p. 54. t. 523.) leaves ternate and quinate; leaflets 3-5, obovate, crenated, glabrous; racemes very short, somewhat corymbose. 7. S. Native of Quito, near Loja. Leaves with sometimes only 2 leaflets; leaflets small, cuneate-ovoblate, crenated, quite glabrous, shining, 3 lines long. Capsule ovate, glabrous.

**Small-leaved Weimannia**. Shrub.

---

**Glabrous Weimannia**. Fl. May, June. Cl. 1815. Sh. 6 ft.

20 W. glabra (Lin. fil. suppl. p. 228.) leaves with many pairs of leaflets; leaflets oblong or obovate, crenated, rather pilose beneath; rachis with rhomboid joints; racemes loose. 7. S. Native of the Islands of Santa Cruz and Martinique; and of Mexico, near San Salvador and Chiquiqueria. Willd. spec. 2. p. 436. exclusive of the synonyme of Lam. W. pininata, Lam. spec. l. 515. exclusive of the synonyme of Browne, jam. Flowers numerous, white.

**Hair-seeded Weimannia**. Shrub.

21 W. hirta (Swartz, prod. p. 65. fl. ind. occid. 2. p. 691.) leaves with 3 pairs of leaflets; leaflets elliptic, serrated, hairy beneath as well as the branches; joints of rachis cuneated. 7. S. Native of Jamaica, St. Domingo, and Brazil. Windmanna fruticosa, &c. Browne, journ. p. 212. Leaflets hairy, at length smoothish above, coriaceous. Racemes loose, very copious, 2 inches long.

**Ilong Weimannia**. Fl. May, July. Cl. 1829. Tr. 10 to 20 ft.

22 W. nitida (D. Don, in edinb. phil. journ. April, 1830.) leaves with usually 3 pairs of leaflets; leaflets oblong, obtuse, coriaceous, toothed towards the apex, hairy on the middle nerve beneath: terminal leaflet oblong-lanceolate, acute at both ends; wings of racis semi-ovoblate; racemes spicate, longer than the leaves, and are as well as the branchlets and petals very hairy; joints of rachis cuneate; fascicles smoothish; urceolus entire. 7. G. Native of Peru, on the mountains.

**Glabrous-flowered Weimannia**. Tree.

23 W. tinctoria (Smith, in Rees' cyclo.) leaves with many pairs of leaflets; leaflets oblong, serrated, smoothish; joints of rachis spicate; fascicles of racemes many-flowered. 7. S. Native of the Island of Bourbon. W. glabra, Lam. dict. 7. p. 578. ill. t. 313. f. 1. W. macrostachya, D. C. prod. 4. p. 10. The tree is called *Tan rouge* by the inhabitants of Bourbon, where it is used for dying red.

**Dyers' Weimannia**. Tree.

24 W. folagoides (H. B. et Kunth, nov. gen. amer. 6. p. 54. t. 524.) leaves with many pairs of leaflets; leaflets obovate or elliptic, crenated, glabrous on both surfaces, shining above; joints of rachis obcordate. 7. S. Native of Peru, at Pillao, and at Loja. Branchlets with annular chinks, pubescent. Leaflets from 5-15, coriaceous, pilose on the joints beneath, 3 lines long. Racemes 2 inches long; fascicles many-flowered. Capsule ovate-oblong, glabrous.

**Togara-like Weimannia**. Tree.

25 W. parvifolia (Ruiz, mss. ex D. Don, in edinb. phil. journ. April, 1830.) leaves with many pairs of leaflets; leaflets oblong, serrated, pilose beneath; joints of rachis oboblate; racemes short. 7. S. Native of Peru, at Pillao, and in New Granada. W. microphylla, Ruiz et Pav. fl. per. 4. t. 334. f. a. Branchlets densely pilose. Leaflets from 9-15, contiguous, naked and opaque above; 3-5 lines long. Racemes dense, cylindrical, hardly an inch long; fascicles many-flowered, crowded. Capsule roundish, ovate, glabrous.

**Small-leaved Weimannia**. Tree.

26 W. reticulata (Ruiz et Pav. fl. per. 4. t. 332.) leaves with many pairs of leaflets; leaflets elliptic, crenated, clothed with rusty tormentum beneath; joints of rachis obovate-oblong; fascicles of racemes crowded. 7. S. Native of Peru, at Pillao and Aconay. W. pubescens, Ruiz, mss. Branchlets densely clothed with rusty tormentum, usually with annular chinks. Leaflets 9-17, pilose above and shining, reticulately veined, half an inch long. Racemes dense, cylindrical, 2 or 3 inches long; fascicles many-flowered, very pilose. Styles rather pilose at the base. Capsule ovate, smooth.

**Reticulated-leaved Weimannia**. Tree.

27 W. leptocalyx (Presl, in reliq. Henck. 2. p. 52.) leaves with 3-5 pairs of leaflets; leaflets oblong, obtuse, toothed, coriaceous, hairy on the nerves, racemes, and petioles: terminal one oblong-lanceolate, acuminate at both ends; wings of petiole and rachis semi-ovoblate; flowers on long pedicels; segments of the calyx ciliated; urceolus angular and crenated. 7. G. Native of Peru, on the mountains.

**Lentiscal-leaved Weimannia**. Tree.

30 W. tomentosa (Lin. fil. suppl. p. 277.) leaves with many pairs of leaflets; leaflets oval, with revolute margins, quite entire, clothed with hoary tormentum beneath; spikes cylindrical, much crowded. 7. S. Native of New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 55. t. 525. Leaflets size of those of box leaves, 9-15, approximate, very blunt, convex and pubescent above; at length green. Joints of rachis obovate, with revolute margins. Spikes cylindrical, obtuse, an inch long; fascicles many-flowered, much crowded; peduncles short, densely clothed with tormentum.

**Tomentose Weimannia**. Tree.

31 W. cinerea (Ruiz et Pav. fl. per. 4. t. 332. f. b.) leaves with usually 3 pairs of leaflets; leaflets elliptic, serrated, reticulated, smoothish; joints of rachis cuneate-oblong; racemes
leaves with 6-7 whorls of leaflets, leaflets small, ovate, coarsely
lobed, acute to acuminate at the base, pointed to acuminate at the
apex, margin entire, base cuneate, petioles long, leaflets usually
4-5 mm long, 3-4 mm wide, ovate to elliptic, with dark green
margins and white, waxy midribs, leaves alternate, petioles long.

segments linear, acute, sometimes uniseminate. Stamens 8 or 10.
Disk hypogynous, urceolate, entire; cells of ovarium biolulate.
Styles very short. Capsule membranous, reticulately, flattened
into a bifid wing at the apex, ventricose at the base, 2-celled; cells 1-seeded. Seed large, arched, with a smooth coriaceous
testa.—An elegant tree, native of the Cape of Good Hope.
Leaves petiolate, ternate; leaflets sessile, lanceolate, acuminate,
sharply serrated, coriaceous, glabrous, reticulately with many
veins. Flowers terminal, panicked.
1 P. trifoliata (D. Don, l. c.) G. Native of the Cape
of Good Hope, where the tree is called white ash by the
Thunb. prod. p. 77, exclusive of the synonyme of Lamark.
Cult. For culture and propagation see Weinmannia, below.

V. CUNONIA (dedicated by Linnaeus to John Christian
Cuno, of Amsterdam, who described his own garden in verse in
April.—Ostfeldyka, Burm. afr. 239. t. 96.
Lin. syst. Decandria, Digitiana. Calyx 5-cleft; segments
deciduous. Petals 5, entire. Stamens 10. Disk hypogynous,
small. Capsule opening from the base at the dissepiments;
cells many seeded. Seeds oblong, compressed, smooth, winged,
with a rather loose membranous testa. Cotyledons somewhat
folaceous.—Smooth trees, with imparti-pinnae leaves, serrated
coriaceous leaflets, large caducous interpetiolar stipulas, and
with the flowers disposed in axillary racemes or panicles.
1 C. Capeensis (Lin. spec. p. 569.) shrubby; leaflets 5-7,
lanceolate, coriaceous, serrated; racemes spicate, opposite; pe-
dicels numerous, in fascicles. G. Native of the Cape of
Good Hope. Lam. ill. t. 371. Lodde. bot. cab. t. 836. Flowers
white.
2 C. pinnata (Blum. bijdr. p. 867.) shrubby; leaves somewhat
ternately pinnae; leaflets ovate-oblong, acuminate, ob-
liquely suberect at the base, doubly serrated; panicles axil-
ary, clothed with rusty tomentum. G. Native of Java, in
woods on the higher mountains.
Indian Cunonia. Shrub 6 to 8 feet.
3 C. Ceylonica (Blum. l. c.) arboreous; leaflets ovate-oblong,
acuminate, serrated; lateral ones oblique at the base; panicles
corymbosous, axillary. G. Native of the Ceylons, on the
beaches.
Celebes Cunonia. Tree 20 to 30 feet.
Cult. See Callicoma for culture and propagation.

VI. ARNO'DIA (named in memory of Joseph Arnold, M.D.
who accompanied Sir Stamford Raffles to the East Indies,
where he collected many plants; and the discoverer of the
gigantic flower Rafflesia Arnoldi in the Island of Sumatra). Blum.
Stamens 8, interposed by glands. Ovarium didymous, biolulate.
Styles 2, incurved; stigma simple. Carpels 2, connate at the
base, solitary from abortion, beaked by the styles, 1-
seeded, opening lengthwise on the inside.—Indian shrubs, with
opposite branches and leaves. Leaves imparti-pinnae, glabrous.
Stipulas interpetiolar, orbicular, deciduous. Racemes axillary
and terminal, twin or tern.
1 A. Pinna'ata (Blum. 1. c.) leaves with 4-5 pairs of lanceo-
late, bluntly serrated coriaceous leaflets; stipulas deciduous;
racemes usually twin. G. Native of Java, in mountain
woods, where it is called Kiringit. Spir'a pinnata, Blume, cat.
hort. buit. p. 76.

Pinnate-leaved Arnoldia. Shrub.
2 A. heterophylla (Blum. l. c.) lower leaves with two pairs
of leaflets, and an odd one: upper ones ternate or simple; leaf-
lets lanceolate, distantly serrulately; racemes twin or tern.
G. Native of Java, in mountain woods in the province of
Bantam.
Variable-leaved Arnoldia. Shrub.
Cult. For culture and propagation see Weinmannia, p. 200.

VII. PTEROPHYLLA (from πτερόν, pteron, a wing, and
φύλλον, phyllon, a leaf; so called in reference to the large folia-
ces stipulatus). D. Don, in edinb. phil. journ. April, 1830.
Lin. syst. Octandria, Digitiana. Calyx 4-cleft, deciduous.
2-celled. Capsule?—A tree, native of the Moluccas. Leaves
imparti-pinnae; leaflets lanceolate, bluntly acuminate, crenated,
glabrous, glaucous beneath, oblique at the base, 3 inches long;
the odd or terminal one on a longer petiole than the others.
Stipulas large, foliaaceous, reflexorium, quite entire, deciduous.
Flowers minute, polygalaceous, in spicate racemes. Racemes erect,
terminal, aggregate, rather panicked, a hand long. Ovarium
densely clothed with wool.
1 G. fra'xinae (D. Don, l. c.) G. Native of the Island
of Honimao, one of the Moluccas. Weinmannia fra'xinae.
Smith, herb.
Ash-like Pterophylla. Tree.
Cult. See Weinmannia, p. 200. for culture and propagation.

VIII. CALYCOMIS (from καλός, kalos, beautiful, and κοῦς,
konu, hair; in allusion to the tufts of flowers). R. Br. in gen.
rem. p. 17. D. Don in edinb. phil. journ April, 1830.
Lin. syst. Decandria, Digitiana. Calyx 5-parted, permanent.
Petals 5. Stamens 10. Disk hypogynous, very small. Styles
tacteous. Capsule globose, 2-celled, opening at the apex;
cells many seeded. Seeds minute, smooth.—An Australian,
crest, evergreen, branched shrub. Leaves simple, nearly sessile,
2- to 3-inch, oblong, obtuse, or nearly cuneate, coriaceous,
glabrous, glaucous beneath. Stipulas pleaeaceous, per-
manent. Flowers small, white, cymose, in whorls, pedicellate.
Capsule membranous, gaping at the apex nearly as in Heuchera.
1 C. verticillata (D. Don, l. c.) G. Native of New
Holland, among the mountains on moist rocks.
Whorl-flowered Calymcomis. Shrub.
Cult. For culture and propagation see Callicoma.

IX. CALLICOMA (from καλός, kalos, beautiful, and κοῦς,
konu, hair; appearance of tufted heads of flowers). Andr. bot.
rep. t. 566.
Lin. syst. Octo-Decandria, Digitiana. Calyx 4-parted, rarely
5-parted (f. 37 a.), permanent. Petals wanting. Stamens 8,
rarely 10 (f. 37 b.). Disk hypogynous, small. Ovarium dist-
tinct; cells many-ovulate. Styles 2, setaceous (f. 37 d.). Cap-
sule inclosed in the calyx, which is permanent, dehiscent at the
dissoments; cells ventricose, 1-2-seeded from abortion. Seeds
ovate, scabrous from minute papilhae on every side, like those of
Streptocarpa; with a crasptaceous testa.—Trees, natives of Au-
stralia. Leaves simple, petiolate, serrated; petioles jointless.
Stipulas membranous, bidentate, caducous. Flowers capitulate;
heads terminating the tops of the branches, pedunculate, glo-
bose.
1 C. serratifolia (Andr. l. c.) leaves lanceolate, acumi-
nated, hoary beneath, attenuated at the base. G. Native of New
Holland, where the tree is called black wattle by the
English colonists. Deaum, herb. amat. t. 299. Sim, bot. mag.
D d

Vol. III.

CUNONACE.E. V. CUNONIA. VI. ARNO'DIA. VII. PTEROPHYLLA. VIII. CALYCOMIS. IX. CALICOMA. 201
Flowers yellow. The twigs are used for making baskets in New Holland. Perhaps the flowers are dioecious. (f. 37.)

**Fig. 37.**

2. C. ferruginea (D. Don, in edinb. phil. journ. April, 1830.) leaves oblong-acute, cuneate at the base, clothed with rusty tomentum beneath, and on the branchlets. G. Native of New Holland, on the banks of rivers.

*Rusty Callicoma.* Shrub.

Cult. A genus of very pretty shrubs; they will thrive well in a mixture of loam and peat; and ripened cuttings root readily in sand under a hand-glass.

**X. CERATOPETALUM** (from *xeropétalos*; keratos, a horn, and *πτερον* petalon, a petal; the petals are jagged so as to resemble a stag’s horn). Smith, nov. holl. 1. p. 9. t. 3.

Lin. syst. Decandria, Digynia. Calyx with a 5-parted permanent limb (f. 38. a). Petals 5 (f. 38. b.), linear, multifid, stiff, permanent, or wanting. Stamens 10; anthers cordate, terminated by a beak-formed process (f. 38. c). Ovarium half inferior, 2-celled, few-ovulate. Capsule 1-seeded from abortion, dehiscing at the apex. Seed round, with a thick crustaceous testa.—Trees, natives of New Holland, with ternate or simple serrated glabrous leaves, standing on petioles, which are jointed at the apex. Stipulas undivided, rather foliaceous, caduceous. Flowers terminal, panicked.

* Leaves ternate; flowers with petals.

1. C. gumiferum (Smith, nov. holl. t. 3.) G. Native of New Holland, where it is called red gum-tree by the English colonists. (f. 38.)

Gum-bearing Ceratopetalum. Ckt. 1826. Tree 50 feet.

* Leaves simple; flowers apetalous.

2. C. apektalum (D. Don, in edinb. phil. journ. April, 1830.) leaves lanceolate. G. Native of New Holland. Ceratopetalum monopetolatum, Caley, mss. Perhaps the flowers are sometimes furnished with one petal only.

Apetalous Ceratopetalum. Tree.

Cult. For culture and propagation see *Callicoma* above.

**XI. SCHIZOMERIA** (from *σξιζομερής*; schizo, to cut, and *μέρος* meros, a part; in reference to the cut petals). D. Don, in edinb. phil. journ. April, 1830.

Cult. For culture and propagation see *Callicoma* above.

**Tribe II.**

**CODIEÆ.** Stamens definite. Ovarium inferior.

XII. CODIA (from *κόδια*, kódia, a little ball, in reference to the flowers, which grow in little round heads). Forst. gen. p. 29, t. 50. Labill. sert. calad. p. 45. t. 46.

Lin. syst. Octo-decandria, Digynia. Calyx permanent, with a 4-5-parted limb. Petals 4-5. Stamens 8-10. Ovarium 2-celled? adhering to the tube of the calyx. Styles densely pubescent. Capsule closed at the apex, usually 1-seeded from abortion. Seed roundish, smooth, with a bony testa; albumen very sparing; cotyledons rather foliaceous; radicle very short.—A shrub, with simple, elliptic, obtuse, quite entire, glabrous, coriaceous leaves; jointless petioles; caduceous stipulas; and small, white, capitate flowers. Heads of flowers globose, pedunculate, axillary. Ovarium densely woolly. Stigmas simple, obtuse.

1. C. montana (Forst. gen. l. c. icon. med. t. 35. Labill. sert. l. c.) G. Native of New Caledonia. Flowers yellow? *Mountain Codiae.* Shrub 6 to 8 feet?

Cult. For culture and propagation see *Callicoma* above.

**Tribe III.**

**BAUERÆÆ.** (plants agreeing with Bauera in having indefinite stamens). Stamens indefinite. Ovarium distinct.

XIII. BELANGERA (in honour of — Belanger, Director of the Royal Garden at Pondicherry, who has travelled in many parts of Perâ and India, where he collected a copious herbarium). Cambess. in St. Hil. fl. bras. 2. p. 203.—Polystémon, D. Don, in edinb. phil. journ. April, 1830.

Lin. syst. Icosandria, Digynia. Calyx deeply 6-parted; segments reflexed, deciduous, valvate in aestivation. Petals wanting. Stamens indefinite, disposed in many series; filaments subulate, glabrous; anthers 2-celled, bursting lengthwise. Disk girding the base of the ovarium. Ovarium 2-celled; cells many-ovulate; ovula flattened, fixed to the middle of the dispersion in 2 rows. Capsule superior, 2-celled, 2-valved, 2-beaked; valves at length bifid; cells many-seeded. Seeds compressed, ending in a wing at the apex.—Small, Brazilian trees, with opposite branches, and opposite stalked leaves. Leaves with 3 or 5 leaflets. Stipulas interpetiolar, foliaceous, deciduous. Flowers racemose; racemes simple, axillary. Ovarium densely tomentose. Capsule coriaceous. Stamens erect in the bud.

1. B. glabra (Cambess, in St. Hil. fl. bras. 2. p. 204. t. 115.) leaves trifoliate; leaflets oblong, narrow at the base, serrated, glabrous; capsule smooth; G. Native of Brazil, on Serra Negra, in the province of Minas Geraes. *Glabrous Belangera.* Tree.

2. B. cunelata (Cambess. l. c. p. 204.) leaves trifoliate; leaflets oblong-cuneate, sharply serrated, puberulous beneath; capsule clothed with hairyomentum; hairs russeted. G. Native of Brazil, in the province of Minas Geraes.
CUNONIACEÆ. XIII. BELANGERA. XIV. BAUERA. XV. GESISSS. GALACINÆ. 203

Native and oblong, to the inner stigmas outer petals. Stamens flowers B. 11G.) S. and bot. ann.

Habit of Vcinmdnnia, D. Bauera. of Brazil, is like

Native of Holland. Bauera. of Brazil, in that part of

Native of Holland. Flowers 8-10-petalled, bursting

Calys 4-5-parted, permanent. Petals 4-5, hypogynous, caduous, alternating with the calycine segments; stamens 8-10-16, hypogynous, joined into a tube, which is toothed at the apex, or distinct; filaments or alternate teeth antheriferous. Ovarium composed of 3 or 4 follicles, which are joined, therefore 3-4-celled; ovula indefinite; stigma composed of 3-4 joined ones, undivided or 4-lobed. Capsule 3-4-celled, 3-4-valved; valves bearing the dissepiments in the middle. Central placenta none. Seeds numerous, minute, scabiform, inserted in the inner angle of the cells; outer testa loose, membranous, cellular; inner one very thin, closely adhering to the allamen. Albumen copious, fleshy. Embryo erect, terete, with short cotyledons, and a long cylindrical centripetal radicle.—Perennial American herbs. Leaves radical, simple, lyrate, pinnatifid or serrated; the teeth tipped each by a gland. Flowers terminal, copious, disposed in spicate racemes; pedicels 1-flowered, propped each by a permanent bracteole.

This order differs from Saxifragacae by the presence of sterile stamens, alternating with the fertile ones; in the absence of a central placenta; and in the frequent quaternary arrangement, in the parts of the calyx and corolla.

Synopsis of the genera.

1 GALAX. Calys 4-5-parted. Petals 5. Stamens joined into a tube, which is 10-toothed: the alternate teeth antheriferous; anthers 1-celled. Stigma entire. Capsule 3-celled.

2 FRANÇOÈ. Calys 4-parted. Petals 4. Stamens distinct, p d 2
16, 8 of which are fertile; anthers 2-celled. Stigma 4-lobed. Capsule tetragonal, 4-celled.

I. GALAX (from gala, gala, milk; in reference to the whiteness of the flowers). Lin. gen. 276. Juss. gen. 420.—Blandfordia, Andr. bot. rep. t. 343.—Viticella, Mitch. gen. 24. Lin. syst. Pentandria, Monogyne. Calyx 5-parted. Petals 5. Stamens joined into a tube, which is 10-toothed at the apex: the alternate teeth bearing anthers; anthers 1-celled: cell transverse. Ovary villous. Capsule 3-celled, destitute of any central column. Seeds mucronate at both ends, as in Actisopia of De Candolle.—A small herbaceous plant; with radical rosette stiff crenated leaves; and naked scapes (f. 40 c.), bearing a loose, spicate raceme of small white flowers at the apex.

GALACE. I. Galax. II. Francoa. III. Tetilla. SAXIFRAGACEE.

Lin. syst. Octandria, Tetragyne. Calyx 4-parted. Petals 4, spatulate, with their nerves pannate and branched towards the apex. Stamens 16, only 8 of which are antheriferous, these are subulate or setaceous, and tapering at the apex; the 8 sterile ones are flattened, obtuse, shorter and broader; anthers cordate, 2-celled, 2-lobed at the base: cells confluent at the apex. Ovary bluntly 4-sided, 4-celled, with 4 furrows, which are opposite the dissipemts. Style very short, or wanting; stigma 4-lobed: lobes dilated, obtuse, and pruinose. Capsule tetragonal, having the angles drawn out a little at the apex into 4 tubercles, 4-celled, 4-valved; cells prominent, dehiscent by a longitudinal suture, many-seeded; dissipements formed from a double lamina. Seeds ovate-oblong, fuscosecent, smooth, mucil. —Perennial herbs, natives of Chili, beset with simple, deciduous hairs. Leaves lyrate, nearly like those of the turnip, reticulately veined; lobes roundish, toothed: terminal one large, cordate, obtuse, sinuate toothed, teeth terminated each by a gland. Flowers red, terminal, copious, in spicate racemes, which are disposed in a panicle; pedicels 1-flowered.

1 F. appendiculata (Cav. in ann. sc. nat. matr. 4. p. 273. Icon. 4. p. 76. t. 596.) stenless; leaves petiolate; racemes loose, second; calyx segments lanceolate, acute; lobes of stigma cuneate, emarginate. 2. F. Native of the island of San Carlos de Chile. D. Don, in Sweet, fl. gard. new ser. t. 151.—Herb hairy. Leaves petiolate, lyrate. Scape nearly simple. Petals pale red, marked each by a deeper spot in the middle. Fertile filaments 3 times longer than the sterile ones.

3 F. Ramosa (D. Don, in edinb. phil. journ. Oct. 1826.) plant caulescent; leaves petiolate; racemes spicate, erect; calyx segments lanceolate, obtuse, nerveless; lobes of stigma cuneate. 2 F. Native of Chili, near Santiago. Herb erect, branched, hairy. Stem furnished with small, petiolate, simple, deeply-toothed leaves. Radical leaves not seen, but they are probably lyrate. Flowers smaller and more numerous than in the rest of the species, neither are they secund, but disposed on every side of the racemes, erect; petals obvolute, obtuse. Fertile filaments 4 times longer than the flattened, obtuse, sterile ones. Style distinct, but very short; stigma 4-lobed; lobes cuneated, emarginate, or 2-lobed, thick, with revolute margins.

Obs.—The Pankectinctoria of Molina belongs to a very distinct genus from Francoa.

Cult. The species of Francoa are beautiful plants when in flower, and deserve a place in every garden. A mixture of peat and sand is the best soil for them; they should be grown in pots, well drained with sherds, to prevent their rotting. The protection of a frame is sufficient for them in winter; or they may be planted out in the open ground, in a warm sheltered situation, where they will probably survive the winter by a little protection. They are only to be increased by seeds.

Lin. syst. Octandria, Digynia. Calyx 4-parted; lobes ovate, equal. Petals 4, the 2 superior ones roundish-ovate, large; the 2 inferior ones small, oblong. Stamens 8. Ovary ovate, clothed with glandular pubescence. Styles 2, very short, smoothish, slender. Capsule 2-celled, dehiscing at the apex at the dissipements, many-seeded. —A smoothish slender herb. Radical leaves on long petioles, orbicular, profusely cordate, with the recess closed, palmately 3-nerved, sinuate toothed; recesses broad, obtuse, mucronulate. Scape erect, naked, simple. Racemes elongated; pedicels short, 1-flowered, longer than the bracteas; larger petals cream-coloured, red at the base, smaller ones red.

1 T. Hydrocotylefolla (D. C. 1. c.). 2 F. Native of Chili, at Concon, in the mountains of Leone, where it is called Tetilla by the natives.

Hydrocotyle-leaved Tetilla. Pl. 1 to 2 feet.

Cult. This is a curious and beautiful plant. Its culture and propagation are the same as that recommended for the species of the genus Francoa.

Calyx either superior or inferior, of 4 or 5 sepals (f. 42. a. f. 43. a.), which cohere more or less at their base. Petals 5 (f. 42. b. f. 45. d.) or wanting, inserted between the lobes of the calyx. Stamens 5-10, inserted either into the calyx or beneath the ovary; therefore they are either perigynous or hypogynous; anthers 2-celled, bursting lengthwise. Disk either hypogynous or perigynous, sometimes obsolete, sometimes annular and notched, rarely consisting of 5 scales. Ovary inferior, or nearly superior, usually consisting of 2 or 5 carpels (f. 42. d. f. 46. e. f. 48. e.) or follicles, cohering more or less on the inner side, but distinct at the apex; sometimes 2-celled, with a central placenta; sometimes 1-celled, with parietal placentas, rarely 4-5-celled. Styles none; stigmas sessile on the tips of the lobes of the ovary (f. 42. e. f. 52. e.). Fruit generally a membranous 1-2-celled capsule, with 2 bracteas, rarely a 4-5-celled 4-5-valved capsule, and sometimes a 4-celled berry. Seeds numerous, very minute, usually with long hexagonal reticulations on the side of a transparent testa. Embryo terebra, in the axis of a fleshy albumen, with the radicle next the huylum.—Shrubs or herbs, variable in habit. Leaves simple, either divided or entire, alternate, without stipulas. Flower-stems simple, often naked.

The plants of this order agree in some respects with the herbaceous part of Rosaceae, with which they agree in habit, and from which they differ in their polyserpous partially concrete carpella, albuminous seeds, and want of stipulas. From Cunoniiaceae they are divided by their habit, and by the want of stipulas. To Caryophyllaceae their habit allies them; but they differ in the insertion of their stamens, the situation of the embryo, and otherwise. Grossulariaceae agree very much in the structure of the flowers, but differ from them in the capsular fruit, usually 2-celled ovum, in the seeds being without aril, furnished with a short podosperm, not gelatinous on the outside, and in the more fleshy albumen and habit. From Grossulariaceae they differ in the fewer carpella, which are joined together, and usually with the calyx; and in having no glands on the inner side of the carpella. From Umbelliferae they are easily distinguished in the carpella or cells of the ovary being disheiscent and many seeded, not indehiscent and single seeded, in the form of the petals, in the absence of petals, and in habit. From Fibarneae, to which the tribe Hydrangeae comes very near, in the fruit being capsular, not baccate, and in the styles being exserted, not wanting, &c. From Vacciniaceae, Campanulaceae, Ericaceae, Gentianaceae, in the corolla being polypetalous, not gamopetalous. The genus Drummundia has the stamens equal in number to the petals, and opposite them; thus indicating some analogy to the monopetalous Primulaceae.

According to De Candolle the whole order is more or less astringent. The root of Heuchera Americana is a powerful astringent, whence it is called in North America alum-root, Barton, 2. p. 162. Otherwise they possess no known properties; for the old idea of their being lithotritic appears to have been derived from their name, rather than their virtues.

Synopsis of the genera.

Tribe I.

§ 1. Stamen twice the number of the petals or sepals.

1 Saxifraga. Calyx 5-parted (f. 41. a. f. 42. a.). Petals 5 (f. 41. b. f. 42. b. f. 46. c.), on short claws, entire. Stamens 10 (f. 42. c. f. 46. d.), Capsule adnate to the calyx or free, composed of 2 carpella (f. 42. d.), which are usually joined even to the style, many seeded (f. 42. f.).

2 Erogyria. Calyx 5-cleft. Petals 5, hardly unguiculate. Stamens 20, monadelphous at the base. Ovaries 4-6, free, connected together by dense wool. Carpels distinct, 4-6, free from the calyx, many seeded.

3 Leptarrhëna. Calyx 5-parted (f. 47. a.). Petals 5 (f. 47. b.), entire, on short claws. Stamens 10; anthers (f. 47. c.), 1-celled, 2-valved. Capsule composed of 2 carpels (f. 47. e.), which are joined at the base, many seeded.

4 Chrysospermiurn. Tube of calyx adhering to the ovary; limb 4-5-lobed. Petals wanting. Stamens 8-10. Styles 2, Capsule 2-valved and 2-beaked, at length 1-celled and many seeded.

6 Telëllia. Free part of the calyx inflated, 5-toothed (f. 49. b.), the adhering part conical. Petals 5 (f. 49. c.), jagged. Stamens 10 (f. 49. a.). Styles 2-3, distinct. Capsule (f. 49. f.), 1-celled, 2-valved at the apex.

§ 2. Stamens equal in number to the petals, or fewer, and alternating with them.

**Tribe II.**

**Hydrangeæ.** (plants agreeing with *Hydrangea* in being shrubby). *D. C. prod.* 4. p. 13.

17 Cianitis. Limb of calyx 5-toothed. Petals 5, rather fleshy. Stamens 10. Styles 3-5; stigmas obtuse. Berry crowned by the teeth of the calyx, somewhat 3-5-celled, many seeded.

19 Broussaisia. Calyx 5-parted, hemispherical, free from the ovarium. Petals 5, oblong, acuminate, with the acumen reflexed as in umbelliferous plants. Stamens 10, hypogynous. Ovarium roundish, crowned by the short style and truncate stigma, 5-celled; cells many seeded.

**Tribe I.**

§ 1. Stamens twice the number of the petals and sepals.

**LIN. SYST. Deciduæ, Digiïa.** Calyx 5-cleft (f. 41. a. f. 42. a. f. 16. a.). Petals 5 (f. 42. b. f. 36. c.), entire, unguiculat. Stamens 10 (f. 42. c. f. 16. d.); anthers 2-celled. Styles 2 (f. 42. c.) permanent. Capsule (f. 42. d.) 2-celled, 2-valved, 2-beaked, opening within the beak by an orbicular hole, many seeded. Seeds minute, smooth.

1 S. crassifólia (*Lin. spec.* 573.) leaves oval or obovate, very blunt, glabrous, serrulat; petals elliptic-oblong. 2. H. Native of Siberia, on the Alps. *Curt. bot. mag.* 196. *Gmel.* fig. 4. p. 166. t. 56. Megásæa crassifólia, Hw. ennum. sax. p. 6. Flowers large, red. The root is stiptic or astringent when chewed.

**Var. b.** Hworrhitha (Ser. in *D. C. prod.* 4. p. 86.) leaves somewhat orbicularly cordate, flat, hardly crenated. 2. H. Native of Siberia. Megásæa médin, Hw. ennum. sax. 7.

**Var. b. minor** (Wall. mas.) leaves much smaller; flowers more loose, and distant.

Petals white or pale red, furnished at the base with red and yellow spots. 

Far. γ, crenata (Haw. l. c.) hairy; leaves reniform, round, bluntly crenated. Υ. II. Robertsonia crenata, Haw. l. c. S. crenata, Loud. hort. brit. p. 53.

Far. χ, polita (Haw. l. c.) hairy; leaves reniform, roundish, sharply toothed, with the surface naked and smooth. Υ. II. Native on the mountains of Ireland. Robertsonia polita, Haw. l. c. S. polita, Loud. hort. brit. p. 176.

Genus Saxifraga. Fl. May, July. Ireland, Pl. 1 foot.

Far. β; leaves roundish, cordate, glabrous on both surfaces.

Far. χ, sphyroideæ (Haw. enum. sax. p. 54.) leaves broadly oval, somewhat cordate, bluntly crenated, with the surface naked. Υ. II. Native of the Pyrenees. Robertsonia sphyroideæ, Haw. syn. 322. S. sphyroideæ, Loud. hort. brit. 176.

Haery Saxifrage. Fl. May, June. Ireland. Pl. ½ to 1 ft.

6 S. umbrosa (Lin. spec. p. 574.) leaves obovate, retuse, cartilaginously crenated, quite glabrous, crowded and spreading in the adult state; petals short, compressedly dilated; pedicels few-flowered. Υ. II. Native of the Pyrenées and Ireland, in the clefts of rocks and on the mountains. In several parts of Ireland; plentiful on a mountain called the Mangeston, county of Kerry; on the mountains of Sligo; on Crough Patrick, near the Lake of Killarney, in great abundance; in Thorp Arch woods, near Wetherby, Yorkshire; betwixt Arncliffe and Horton, in Craven. Mill. fig. 141. f. 2. Lapeyr. pyr. sax. p. 44. t. 22. Smith, engl. bot. 635. Sternb. sax. p. 14. Robertsonia phyllobosa, Frév. et Léon. Sax. sax. p. 55. S. spatulæris, Bro. fl. his. 2. p. 172. Petals oval, of a reddish white colour, full of scarlet and yellow dots, with 3 conspicuous branched nerves. The plant is very variable in habit.

8 S. pacificès (Sternb. rev. sax. suppl. 1. p. 6. t. 4. f. 2.) root tufted; leaves roundish or ovate-roundish, toothed, cuneated at the base, running down the petiole, which is short; petals ovate, unguiculate, longer than the calyx. Υ. II. Native of Siberia and Kamtschatka. Petals spotted.

Few-flowered Saxifrage. Pl. ¼ foot.

9 S. speciætæ (D. Don, in Lin. trans. 13. p. 355.) leaves on long petioles, orbicularly cordate, sharply serrated, veiny, pilose; petals dilated at the base; raceme elongated, spike-formed; calyce segments very short. Υ. II. Native of Sledge Island, on the west coast of America. S. génum, Pursh, fl. amer. sept. 1. p. 511. but not of Lin. Plant tufted. Petals elliptic-oblong, dotted, 3-nerved, with the nerves branched.

Spike-flowered Saxifrage. Pl. 1 foot.

Nelson's Saxifrage. Pl. ½ to 1 foot.

11 S. arctæa (D. Don, in Lin. trans. 13. p. 356.) leaves roundish-reniform, deeply serrated, glabrous; petals filiform; scape slender, smooth; calyce segments oblong, acute. Υ. II. Native of the western coast of America. Flowers white, size of those of S. stellaris.

Sharp-cut-leaved Saxifrage. Pl. ¼ foot.

Far. β, élata (D. Don, in Lin. trans. 13. p. 357.) scapes numerous, a foot high. Υ. II. Native of Siberia.

Far. γ, angulifolia (D. Don, l. c.) leaves narrower and longer, with few teeth at the apex. Υ. II. Native of Siberia. Far. ß, Schleicheri (D. Don, l. c.) leaves obovate, repandely crenated; scapes humble, flexuous. Υ. II. Native of Switzerland, on the Alps. S. stellaris, Schleich. in litt.

Far. æ, Bellardii (D. Don, l. c.) plant stemless; leaves roundish, repand; flowers sessile. Υ. II. Native of the Alps of Piedmont. S. Bellardii, Allion. pedem. no. 1536. f. 1.
SAXIFRAGE. 1. Saxifraga.

Var. 2, dissimilis; leaves with deep broad teeth. 2. H. Native of Scotland, on the western Highlands. S. dissimilis, G. Don, in Loid, hort. brit. p. 176.

Var. η, uniflorum (D. C. fl. fr. 4. p. 370. var. α.) plant very minute; scape 1-flowered. 2. H. Native of Switzerland, on the Alps. S. stellarius, piuma, Gaudin, fl. helv. 3. p. 106.

13 S. rotundifolia (R. Br. in Parry's 1st voy. app. p. 275.) radical leaves cuneated, a little toothed; scape divided; branches 1 flower at the apex, covered below by a fascicle of small leaves; calyx inferior, obovate; segments of the petals-cordate- lanceolate. 2. H. Native of Lapland, Melville Island, and other Arctic islands. S. stellarius, Lin. fl. lapp. ed Smith, p. 144. t. 2. f. 3. S. stellarius, comosa, Wild. spec. 2. p. 641.

Leafy Saxifrage. Pl. 1/2 foot.

15 S. melaleuca (Fisch. in Sternb. rev. sax. suppl. 3. t. 3.) leaves roundish ovate, acerish, somewhat dentilicate, tapering into the petiole, glabrous; scape few-flowered, also glabrous; flowers disposed in a somewhat panicle-corymb; calyx segments ovate, acute; petals unguiculate. 2. H. Native of Altaia, on the Alps at the river Tschlysychm, and at Lake Teletskoe Ozero. S. elongata, Gläbra, Sternb. rev. sax. p. 9. Petals obovate, pale sulphur coloured, suffused with violet on the outside; filaments of a pale violet colour. Leaves greenish yellow; upper part of plant of a deep violet colour.

Black and white Saxifrage. Pl. 1/2 to 3/4 foot.

16 S. strigosa (Wall. cat. no. 448.) lower leaves sessile, somewhat rosetulate, oblong-lanceolate, few-toothed, mucronate at the apex, clothed with strigose hairs; calyces lanceolate-linear, acute, entire, much smaller than the lower ones; stem simple, few-flowered, and is as well as the pedicels beset with numerous capitular hairs; sepals lanceolate, acute; petals 3-nerved, obtuse; styles very short; stigmas thickish. 2. H. Native of Nipan, on the Emoli mountains at Gosainthom, and at Kannou. Leaves almost the same and form of those of Arabis alpina. Filaments flat.

Strigose Saxifrage. Pl. 1/2 foot.

17 S. sarmentosa (Linn. fl. suppl. p. 210.) stolons or runners creeping; leaves orbicular-linear, labiate, crenated, pilose, red beneath; petals unguiculate, the 2 outer ones large and flaccid. 2. F. Native of China and Japan, in moist places on mountains, among stones. Schrchr. mon. pion. 16. t. 2. f. 3. Curt. bot. mag. 92. S. stolonifera, Jacq. icon. rar. 1. t. 80. Ligularia sarmentosa, Duval, pl. sec. p. 11. ex Haw. num. sax. p. 50. Diptera sarmentosa, Borkh. in Rem. mag. 1. p. 29. S. ligulata, Murr. comm. 1781. p. 26. t. 1. S. Chinensis, Lour. coch. p. 281. Petals white: 3 inner ones cordate; of these the 3 lateral ones are marked by a yellow spot at the base; and the central one by 2 scarlet spots at the base: but the 2 outer petals are large, flaccid, and 3-nerved.

Var. β, cuscuteformis (Ser. in D. C. prod. 4. p. 43.) plant much smaller; stem usually 3-flowered; leaves ovate-rounded, coarsely and simply toothed; flowers less irregular; petals more acute. 2. F. Native of China. S. cuscuteformis, Lodd, bot. cab. t. 186. Ligularia minor, Haw. num. sax. p. 151. The stolons or runners resemble dodder very much.

Var. β; leaves hairy.

Naked-leaved Saxifrage. Fl. May, Ju. Clt. 2. Pl. 1/2 to 1 ft.

Sect. III. LEIOGYNE (from lēios, leios, smooth; and γυμεν, γυνη, a female; in reference to the stigmas being beardless). D. Don, in Lin. trans. 13. p. 344. Calyx deeply 3-leafed (f. 41. a.). Petals (f. 41. b.) sessile in most of the species. Staminates inserted in the throat of the calyx (f. 41. c.); filaments subulate. Styles straight; stigmas orbicular, flatish, beardless. Capsule free from the calyx (f. 41. d.). Seeds roundish. —Humble herbs, rarely subshrubs. Roots fibrous, but in many of the species they are granular. Stems flexuous, usually many-flowered and many-leaved. Leaves in all reniform and lobed. Flowers white or yellow.

21 S. hybrida (Sternb. sax. p. 17. t. 8. f. 3.) radical leaves petiolate, roundish-cuneated, created; calyces one minute, entire; stem panicled. 2. H. Native of the Pyrenees. Very like S. rotundifolia, but differs in the smaller stature and slenderer habit; in the leaves being acute at the base, not cordate, and in the calyces being minute, entire, and nearly sessile.

Hybrid Saxifrage. Pl. 1 foot.

22 S. diversifolia (Wall. cat. no. 452.) leaves thickish, more or less pilose, of many forms; lower ones cordate, petiolate; calyces one petiolate, or sessile and stem-clasping, entire, of a different form; sepals broad, reticulately veined, marked above by small depressed dots; flowers in panicle-corymb; bractens and calyxes more or less ciliated with short, capitulate

**Var. a. lanceolata** (Ser. in D. C. prod. 4. p. 44.) leaves lanceolate; lower ones not seen; but the middle ones are attenuated at the base, and acutish; calyxie lobes oblong, beset with glandular hairs. 2. F. S. diversiflora, Wall.  

**Var. b. parnasifolia** (Ser. 1. c.) radical leaves cordate, obtuse, on long petioles: calyxie lobes acute, stem-clasping, obtuse; calyxie lobes oblong, beset with glandular pub. 2. F. S. parnasifolia, Wall. cat. no. 451.  

**Var. c. Moerocretia** (Ser. 1. c.) lower leaves elliptic; calyxie ones stem-clasping, ovate-oblong, numerous; flowers larger; calyxie lobes more eiliated with glands. 2. F. S. Moerocretia, Wall. cat. no. 453.  

**Diverse-leaved Saxifrage.** Pl. 1 foot.  

23 S. Farvulosa ( Riv. stirp. rar. fasc. 4. p. 1. t. 3.) stem branched at the base, or simple; leaves reniform, 5-lobed: superior oones 3-lobed: uppermost ones entire, lanceolate; peduncle spreading, opposite the leaves; petals oblate, longer than the calyx. 2. F. Native of Sicily, in the mountains, on mossy rocks.—Cup. panph. 3. t. 36. Flowers white, almost like those of *Stellaria media.* Styles very short, diverging; stigmas spathulate, papillate. Capsule bladdery, slender.  

**Var. a. ramosa** (Ser. in D. C. prod. 4. p. 44.) stem branched at the base, few-flowered; lower leaves 5-lobed, crenated: superior ones 3-lobed. 2. F. Native among rocks, on Mount Maronis, near the monastery of St. Martin in Decalis. Bernardi, l. c. t. 3.  

**Var. b. Boccioni** (Ser. 1. c.) stem purple, erect, 2-flowered: lower leaves 3-lobed, or lanceolate, entire. 2. F. Native on the mountains, about Palermo. (ex Guss. Bocc. cent. 2. p. 4. t. 45. f. 2.)  

**Small-flowered Saxifrage.** Pl. ½ foot.  

24 S. Cymbalaria (Linn. spec. 579.) lower leaves reniform, on long petioles, very bluntly 5-lobed: upper ones 3-lobed or undivided; calyxie segments oblong, obtuse; petals ovate, acute, with branched nerves. 2. H. Native of the Levant, on Parnassus and other Greek mountains. Smith, fl. gracc. 378. S. hederaee, Bieb. fl. taur. 1. p. 317. exclusive of the synonyms. Lobaria cymbalaria, Haw. enum. sax. p. 18. —Duxb. cent. 2. p. 40. t. 45. f. 2.—Val. Itin. ed. gall. t. 305. Flowers small, golden yellow. Stems numerous, leafy, slender, flaccid, creeping at the base.  

**Cymbalaria-like Saxifrage.** Pl. cr.  

25 S. Hederaee (Linn. spec. 579.) lower leaves acutely 5-lobed: upper ones ovate, entire; calyxie segments ovate, acute; petals roundish, unguiculate. 2. H. Native of Canidia and Cyprus, among humid shaded rocks. Smith, fl. gracc. t. 379. Lobaria hederaee, Haw. enum. sax. 18. Plant small; stems numerous, filiform. Flowers small, white.  

26 S. Orientalis (Jacq. obs. 2. p. 9. t. 34.) radical leaves roundish: calyxie ones cuncated, acutely and coarsely toothed; calyxie segments ovate, acute; petals ovate, with simple nerves. 2. H. Native of the Levant; and of Caucasus, on the higher mountains of Turkey near springs and on the banks of rivulets. S. reticulata, Sternb. sax. p. 21. t. 18. S. paradoxa, Sternb. l. c. p. 22. t. 14.? Lobaria orientalis, paradoxa, and reticulata, Haw. enum. sax. pp. 18. and 20. Stems erectish, branched, decumbent at the base. Petals golden yellow, size of those of *S. hederaee.*  

**Oriental Saxifrage.** Pl. dec.  

27 S. Rutes (Presl, del. prag. p. 140.) radical leaves petiolate, distinctly crenated, coriace at the base, somewhat 5-lobed: cauline ones sessile: lower ones 3-lobed, middle lobe the longest; uppermost leaves lanceolate, entire; sepals ovate; petals lanceolate, 3-nerved, twice the length of the calyx. 2. H. Native of Sicily, on rocks and among stones, about Giuliana. Plant 2-3 inches high, beset with short glandular hairs. Flowers white.  

**Russo's Saxifrage.** Pl. ½ foot.  

28 S. Jamesii (Torrey, in ann. lyc. New York 2. p. 204.) plant beset with glandular pubescence; lower leaves on long petioles, reniform, crenately lobed; upper leaves tapering into the petiole, cuneate, nearly sessile; lobes of calyx triangularly ovate, acute; petals spatulate, acute, on long claws; racemes seced; bracteae lanceolate; pedicels of calyces glandular. 2. H. Native of North America, among the Rocky Mountains. Hook. fl. bor. amer. 1. p. 247. t. 74. Flowers about the size and colour of those of *S. oppositifolium* (fig. 41).  

**James's Saxifrage.** Pl. ½ foot.  

29 S. Richardsoni (Hook. fl. bor. amer. 1. p. 247.) stem glandular, leafy, pubescent above; leaves on long petioles, orbicularly cordate, crenately lobed, veiny, with the margins and veins glandular beneath; glands pedicellate; racemes rather compound; bracteae lanceolate, and are as well as the pedicels glandular; petals obvate-elliptic, on short claws, very acute, nerved, about twice the length of the calyce segments, which are acuminate; at base, 2. H. Native of the Arctic Sea shore, between the Mackenzie and Coppermine rivers; and of Kotzebue's Sound. S. Nelsoniana, Hook. et Arn. in bot. Beech. p. 134. t. 29. but not of D. Don. This and the preceding are very elegant plants.  

**Richardson's Saxifrage.** Pl. ½ foot.  

30 S. Nudicaulis (D. Don, in Linn. trans. 13. p. 366.) leaves reniform, palmate, glabrous: lobes ovate, mucraten; stem erect, naked, terete; flowers panicked; lobes of calyx triangularly ovate, acute; petals obvate, a little longer than the calyx. 2. H. Native of the north-west coast of America, Behring's Straits; very gracile. Sternb. rev. sax. suppl. p. 7. t. 5. f. 1? Flowers panicked, white, size of those of *S. rivularia.*  

**Naked-stemmed Saxifrage.** Pl. ½ foot.  

31 S. Helvetica (Hook. fl. bor. amer. 1. p. 252. t. 78. β.) plant rather pubescent; radical leaves on long petioles, reniformly cordate, membranous, veiny, many-lobed: lobes short, somewhat tridentate: teeth acute, mucate; sepa naked; flowers panicked, usually abortive; some of the filaments clavate, and others petal-formed; ovarium free; calyces reflexed; branches of panicle sometimes bearing bulws below. 2. H. Native of North America, common on moist rocks of the Columbia, from its source to its confluence with the sea. The leaves resemble those of *S. rotundifolia,* but they are furnished with a long, membranous, sheathing base, and altogether radical.  

**Variable-flowered Saxifrage.** Pl. ½ foot.  

32 S. Granulata (Linn. spec. p. 576.) plant hairy; radical leaves reniform, crenately lobed: calyxie ones petiolate; calyxie segments lanceolate, obtuse; petals spatulate; root granular. 2. H. Native of the north and middle of Europe, in dry fields and the borders of woods; plentiful in some parts of Britain. Fl. dan. t. 514. Lam. ill. t. 273. f. 1. Smith, engl. bot. t. 500. Stem leafy, many-flowered; pedicela elongated, Ee
1-flowered, and are as well as the calyxes clothed with clammy down. Flowers snow-white; nerves of petals branched.

Var. \( \beta \), plena; flowers double. Common in gardens.

Var. \( \gamma \), multicaulis (Lapeyr. fl. pyr. t. 27.) stems numerous, short; lower leaves lobed, broadly crenated; upper ones obovate, acuminate, entire, rarely 1-2-toothed; peduncles many-flowered. 2. H. Native of the Pyrenees. S. granulata \( \gamma \), ramosissima, Ser. in D.C. prod. 4. p. 36.

Var. \( \varepsilon \), Cerasina (Ser. in Duby, bot. gall. I. p. 211.) plant very small; stem 1-4-flowered; leaves small, crenately lobed; flowers hardly smaller than those of the species. 2. H. Native of Corsica. S. rivularis, Phl. exsic.

Var. \( \alpha \), penduliflora (Ser. in Duby, bot. gall. I. p. 211.) leaves reniform, broadly crenated; flowers somewhat umbellate, pendulous; peduncles 1-flowered, weak. 2. H. Native of Auvergne. S. penduliflora, Bast. in journ. bot. 1814. p. 17. and D. C. fl. ser. 5. p. 519.

Var. \( \eta \), sessiliflora (Ser. in D.C. prod. 4. p. 36.) stems quite simple; leaves reniform; crenated; flowers sessile, subcapitate. 2. H. In dry places.

Var. \( \zeta \), bulbiliferis (Ser. exsic.) stem more or less branched; flowers numerous, sessile, abortive, transformed into little bulbs, which rise from the axils of the leaves. 2. H. Native of Sicily. S. granulata geminifera, Ham. exn. sax. p. 23.

33 S. GONTHOPHYLLA (Wall. cat. no. 454.) leaves reniform, bluntly lobed, rather pubescent; stem few-flowered, many-flowered, and as well as the pedicels and calyxes clothed with glandular pubescence; petals obvate, unguiculate; stigmas diverging, capitate. 2. H. Native of Nipaul, in Kamaon. Roots woody, fibrous. Flowers white. Pedicels 1-flowered. Very like S. granulata.

Tooth-leaved Saxifrage. Pl. 1/2 to 2 ft.

34 S. BULBIFERA (Lin. spec. 577.) radical leaves reniform, petiolate, crenated: cauleine ones sessile, deeply lobed: calyce segments trinervously ovate, acute; stem branched, many-flowered. 2. H. Native of the south of Europe, as in Spain, in stony meadows and shady places; also of Switzerland, on dry hills. Sternb. sax. p. 15. t. 12. f. 1.—Mor. hist. 3. p. 474. sect. 12. t. 9. f. 24.—Column. ceph. l. p. 318. t. 317. S. vivipara, Vest. in flora. 1820. p. 405. Flowers white, smaller than those of S. granulata. Peduncles elongated, 1-flowered, clothed with gluttonous down as well as the calyxes. Stem beset with viscid hairs. Leaves pilose.

Var. \( \beta \), Veronesefoia (Sternb. rev. sax. 16. t. 12. f. 1. and in Sturm, deutschl. fl. 55., with a figure). 2. H. Haw. exn. sax. 23. S. veronesefoia, Bertol. amm. p. 361. There is also a variety of this with a 1-flowered stem, under the name of S. bulbifera acutea, Haw. exn. sax. p. 247.

55 S. CERNA (Lin. spec. 577.) leaves glabrous, petiolate; radical ones reniform, deeply lobed: cauleine ones palmate; calyce segments ovate, obtuse; petals spathulate, emarginate; stem quite simple, generally 1-flowered. 2. H. Native of Lapland, Pyrenees, Switzerland, and Scotland, about alpine rills on the loftiest mountains. In North America, on the arctic shore and islands, and in Kotzebue's Sound; also of Siberia, on alpine rocks, at the rivers Ursal and Tschuha. In Scotland, on Ben Lawers and on Craigallachie. Fl. dan. t. 22. Gunn. fl. norw. no. 528. t. 9. f. 2. Sternb. sax. p. 19. t. 12. f. 2. Lobaria cernea, Haw. exn. sax. p. 20.—Lin. fl. lap. p. 172. t. 27. f. 4. Bulbs scaly; scales fleshy, rising from the base of the petioles of the primordial leaves. Stem simple, 1-flowered, leafy, with small aggregate bulbs rising from the upper leaves. Flowers solitary, large, campion-like, drooping, white; nerves of petals branched. The species from the Rocky Mountains of North America are more leafy, especially on the stem amongst the bulbs, which are very numerous.

Var. \( \beta \), ramosa (Ser. in D.C. prod. 4. p. 36.) stem a little branched, few-flowered; flowers nearly all transformed into bulbs. 2. H. Native of the Alps of Lapland and Norway.

Var. \( \gamma \), Ledebourii; stem branched; branches elongated, 1-flowered; leaves crenated: lobes acute. 2. H. Native of Altaia, on alpine rocks, at the rivers Tschuha and Ursal.

Var. \( \varepsilon \), multiforma (Hook. et Arn. in Beech. voy. pt. bot.) plant branched; each branch bearing a large flower, and no bulbs. 2. H. Native of Kotzebue's Sound. Perhaps S. Stephaniana, Sternb. sax. suppl. p. 8. t. 6. f. 2. may be correctly referred to this variety.

36 S. STEPHANICA (Lin. spec. 577.) root granular; leaves hairy, petiolate: radical ones reniform, palmitately lobed: cauleine ones digitate; pedicels elongated, remote, capillary; petals obvate, with simple nerves; stem much branched, bilobed. 2. H. Native of Siberia, Altaia, and the Alps of Caucasus, among rather humid shaded rocks, or among stones; also of Labrador and Newfoundland. Sternb. sax. p. 25. t. 25. f. 1.—Gmel. moll. 4. p. 162. no. 74. S. granulata \( \beta \), Steven de sax. caue. in mus. mont. no. 3. S. grandis; Sternb. sax. t. 19. 4. f. 2. S. cyanobalbaria, Bleich. fl. tur. 3. p. 292. no. 750. Lobaria Siberica, Haw. exn. sax. 21. Lobes of calyx ovate-linear. Petals white. Stem beset with viscid hairs.

37 S. BRACETA (D. Don, in Lin. trans. 13. p. 367.) radical leaves as well as cauleine leaves on long petioles, reniform; and deeply lobed; flowers in crowded corymbs, bracteate; stem leafy, flexuose, branched, ascending, clothed with viscid villi. 2. H. Native of Eastern Siberia. Flowers white, like those of S. cernea, but a little larger; calyce segments broadly ovate, obtuse. Petals obvate, a little longer than the calyce segments.

Briquetted-flowered Saxifrage. Pl. 1/2 foot.

38 S. RIVULARIS (Lin. spec. 577.) stem weak, quite simple; leaves reniform, on long petioles, glabrous; flowers usually by threes, sessile, bracteate. 2. H. Native of the higher Alps of Europe, as in Lapland, Norway, as well as of Siberia. It is also found in North America, as in Labrador, Arctic Sea shore and Islands, Kotzebue's Sound, and in elevated places among the Rocky Mountains. In Scotland about Alpine rivulets, and in wet fissures of rocks, as on Ben Nevis, near the lake in the ascent; also on Ben Lawers, and at Loch Rannoch. Lin. fl. hopp. no. 174. t. 2. f. 7. Fl. dan. t. 118. Smith, engl. bot. 2275. Sternb. sax. p. 19. t. 12. f. 3. Plant annual. Stem weak, ascending, few-flowered, furnished with viscid hairs above. Leaves 5-6-lobbed; lobes obtuse. Flowers small, white, bracteate. Calyce segments ovate, very blunt, obtuse, conning. Petals oval, obtuse, triple nerved.

39 S. HYPERBOREA (R. Br. in Parry's first voy. append. p. 274.) stem woolly, 2-flowered; leaves glabrous: radical ones palmate, on long petioles; petals 1-nerved. 2. H. Native of Ireland, and Arctic America. S. rivularis \( \beta \), Hook. fl. bor. amer. 1. p. 246. Flowers white. Perhaps only a variety of S. rivularis.

Northern Saxifrage. Pl. 2 inches.

40 S. XUTANS (D. Don, in Lin. trans. 13. p. 268.) stem rather pubescent, decumbent at the base, jointed in the middle, and furnished with one leaf at the joint; raceme drooping, few-flowered: radical leaves on long petioles, reniform, deeply and coarsely toothed, with a few scattered stiff hairs on both sur-
faces: cauline one petiole; petioles hairy. 2. H. Native of the west coast of North America, in the Island of Unalaska. Flowers white, size of those of S. bulbifera; calycine segments lanceolate, acute; petals obovate, with branched flexuous nerves. Pedicels and calyces beset with crowded glandular hairs.

**Nodding-flowered Saxifrage.** Pl. ½ foot.

41 S. ranunculifolia (Hook, fl. bor. amer. 1. p. 246. t. 82.) plant clothed with glandular pubescence, slender: lower leaves on very long petioles, reniform, 3-parted: segments broadly cuneate, deeply lobed; cauli leaves few; flowers corymbose, pentandrous; petals obovate, twice the length of the calyx; calyx beset with glandular hairs: segments acute. 2. H. Native of North America; common on the high grounds around the Kettle Falls of the Columbia, and on the Rocky Mountains. Flowers white, size of those of S. stellaris. Petals obovate, unguiculate.

**Cren-foot-leaved Saxifrage.** Pl. ¾ foot.

42 S. ovata (Steph. in Sternb. sax. suppl. p. 8. t. 3. f. 1.) root tufted: radicles capillary; radical leaves palmately 5-lobed, petiolate: cauline ones linear, entire; petals obovate-oblong, much longer than the 5-cleft calyx. 2. H. Native of Siberia, and probably of Kotzebue's Sound. Stem weak, 2-flowered. Flowers white.

**Slender Saxifrage.** Pl. ¼ foot.

43 S. laevigata (Elwin, Sax. suppl. 1. p. 8. t. 6. f. 2.) plant with many stems; radical leaves on long petioles, reniform, 5-7-lobed, crenated, reticulately veined lengthwise, glabrous; stems and pedicels ornamented with long intricate hairs; flowers few, somewhat capitate, involucred by 3-4 crenately lobed bracteas; lobes of calyx ovate, obtuse, shorter than the petals; petals 5-nerved towards the middle. 2. H. Native of the Island of St. Lawrence in Behring's Straits. S. Chamissosii, Sternb. med. but not S. Chamissosii, Sternb. Flowers white.

**St. Lawrence Saxifrage.** Pl. ½ foot.

44 S. stephaniana (Stern. suppl. sax. 1. p. 8. t. 6. f. 2.) plant tufted; stem usually 4-flowered, pilose: radical, as well as the cauline leaves, petiolate, and palmately many-lobed, pilose; bracteas nearly linear; sepals linear, obtuse; petals obovate, many nerved. 2. H. Native of Siberia, Steph. S. palmata, Steph. in litt. ex Sternb. l. c. Flowers white.

**Stephens Saxifrage.** Pl. ½ foot.

45 S. altiflora (Haw. enum. sax. p. 24.) leaves deeply and palmately 5-parted: segments profoundly 5-5-cleft: pedicels subracemose, divaricate. 2. H. Native country unknown. S. adscendens, Haw. exclusive of the synonyms. Very nearly allied to S. granulata, but truly distinct, and differs in the fissures of the leaves, and in the more decumbent stems. Flowers white.

**Deep-cleft-leaved Saxifrage.** Fl. May, June. Pl. ½ foot.

46 S. hirculus (Linn. spec. 576.) leaves lanceolate, obtuse, not ciliolate; calycine segments lanceolate, obtuse, usually ciliolate; petals obovate, many nerved; styles almost wanting; stigmas spatulate, when young delicately, afterwards divaricate. 2. H. Native of Sweden, Switzerland, Lapland, Siberia, Caucasus, Germany, and in England, in boggy places. It is also found in North America, from the Saskatchewan to the Arctic sea shore and Islands, where it seems most abundant; Behring's Straits, Cape of Good Hope, Kotzebue's Sound, &c. In England, in a turfy morass about the centre of Knauford moor, Cheshire; and on Cotherestone Fell, near the junction of the Black Heath with the river Balder, Yorkshire. Fl. dan. t. 500. Smith, engl. bot. 1009. S. flava, Lam. fl. fr. 3. p. 529. S. propinqua, R. Br. in Ross' voy. ed. 2. vol. 2. p. 192. Hirculus ranunculoides, Haw. enum. sax. p. 60.—Gmel. sib. 4. p. 165. t. 65. f. 3. Plant pale green, with numerous procumbent stolons. Stem from 4 inches to 1 foot high. Peduncles long, 1-flowered, covered with clammy fuscous villi. Flowers large, showy golden yellow; sepals obtuse.

**Var. b. flava; stem a foot high, many flowered; peduncles very villous.** 2. H. Native of Eastern Siberia.

**Var. tripliata (Serr. in D. C. prod. 4. p. 45.) segments of calyx acute; styles rather elongated.**—Hall. hist. no. 972. t. 11.

**Var. c. Altaiace; stem usually 1-flowered, pubescent; pedicels clothed with rufous villi.** 2. H. Native of Altai, in humid subalpine places at the rivers Ursul and Tschaja. S. Hirculus, Ledeb. fl. alt. 2. p. 121.

47 S. myosotifolia (D. Don, in Linn. trans. 13. p. 373.) plant tufted, without any stolons or flagellae; leaves ovate, acute, mucil, bristly; pedicels elongated, and are as well as the calyces beset with glandular pili; stem nearly naked, usually 3-flowered; calycine segments broadly ovate, acute; petals roundish, unguiculate, 5-nerved. 2. H. Native of Siberia. Surculy very short, erect, crowded. Stem 2-3-flowered, beset with stiff hairs. Leaves ciliated with hairs on the margins, and on both surfaces. Flowers cream-coloured; filaments compressed, yellowish. Styles short, thick.

**Mouse-car-leaved Saxifrage.** Pl. 2 inches.

48 S. flagellaris (Sternb. sax. p. 25. t. 6.) stolons or flagellae fliform; stems erect, simple, 1-5-flowered, and are as well as the calyces clothed with glandular pubescence; radical leaves as well as lower cauline ones obovately spatulate; superior ones rather villous; petals permanent, longer than the capsule, which is semi-superior. 2. H. Native of the Alps of Caucasus; and of north-west America, at Cape Newham, in Melville Island, Baillf's Bay, Behring's Straits, Arctic Islands, summits of the Rocky Mountains, Kotzebue's Sound, &c. Hook. fl. bor. amer. 1. p. 253. t. 77. S. setigera, Pursh. fl. amer. sept. 1. p. 312. S. aspera, Biebr. fl. taur. 1. p. 314. exclusive of the synonyms. Hirculus flagellaris, Haw. enum. sax. p. 41. Stem leafy, 1-5-flowered. Radical leaves crowded, all ciliated on the margins, with ciliate spindles: calyx and pedicels clothed with glutinous down. Flowers yellow, size of those of S. Hirculus (f. 42.).

**Var. b ; stem 1-flowered; ovary adhering to the calyx at e & c 2.**
SAXIFRAGACEAE.

53 S. brochialis (Lin. spec. 572.) suffrutescent; leaves crowded, linear-subulate, triquetrous, mucronate, ciliated with stiff spinules; calyce segments ovate; petals oblong; stems few-leaved and many flowered. 2. H. Native of Siberia; north-west coast of America, Behring's Straits, Kotzebue's Sound, height of land at the portage of the Columbia river, on the west side of the Rocky Mountains. Ciliaria bronchialis, Hav. rev. sax. 43.—Gmel. sib. 4. p. 164. t. 65. f. 2. Surculi numerous, erect, branched. Panicle terminal, few or many flowered. Flowers small, cream-coloured; petals obovate-oblong, 3-nerved, with numerous minute copper-coloured dots; anthers copper-coloured. This is very nearly allied to S. tricuspidata, but differs in the want of the lateral points to the leaves.

Var. β, Levadinsis (D. Don, in Lin. trans. 13. p. 377.) surculi shorter; leaves longer, spreading; panicle larger, spreading, fastigate. 2. H. Native of Siberia, at the river Lena.

54 S. tenella (Wulf. in Jacc. coll. 3. p. 144. t. 17.) plant tufted; leaves crowded, linear-subulate, flat, pungent, ciliated; stems slender, few-leaved, few-flowered; calyces linear-lanceolate; petals obovate. 2. H. Native of Carinthia, on the Alps. S. nitida, Wulf. in Jacc. coll. 3. t. 10. f. 4. Surculi numerous. Stems numerous, erect. Leaves imbricated, keeled below, glabrous. Peduncles three, long, capillary, 1-flowered, beet with glandular hairs, as well as the calyxes. Flowers white, spotless; anthers yellow.

55 S. silicatus (Wall. cat. no. 445.) stems filiform, much branched, beet with capitate hairs; branches filiform, 1-flowered; leaves linear, sessile, full of pellucid dots, nerveless, ciliated by capitate bristles; sepals lanceolate-oblong, bluish; petals obovate, obtuse, 3-nerved; styles much elongated; stigmas thickish, arched. 2. F. Native of Nipal. Branches dense. Flowers golden yellow. Perhaps distinct from S. brachypoda.

Thread-stemmed Saxifrage. Pl. 1/2 foot.

56 S. kruschiana (Fisch. in litt. ex D. C. prod. 4. p. 46.) plant tufted; leaves dense, imbricate, ovate, ciliated, nerveless; flowers by threes; sepals lanceolate, obtuse; petals elliptic, much less than the style, with minute nerves; capsule somewhat hemispherical; styles arching. 2. H. Native of Siberia, near Ijiga, where it was found by Krush, according to Fischer. This species is very distinct from S. aspera, in the leaves being oval, not linear-ovate, in being nerveless, not 3-nerved, and in the petals being feathered, &c. S. glandulosa, Wild. herb. ex Stev. in litt. 1821.

Krush's Saxifrage. Pl. 1/2 foot.

57 S. stelleraiana (Merk ex Fisch. in litt. ex D. C. prod. 4. p. 46.) plant tufted; leaves of the surculi or sterile branches small, numerous, oblong, ciliated and mucronate, hardly petiolate; ciliate ones distant: uppermost ones acute, not ciliated; stems branched, 5-7-flowered; flowers distinct; pedicels and calyxes glabrous; calyx lobes oblong, acute; petals oblong, 3-nerved, exceeding the calyx; ovary conical; styles hardly diverging, length of the petals. 2. H. Native of Eastern Siberia.

Steller's Saxifrage. Pl. 1/2 foot.

58 S. multiforma (L. decb. dec. pl. in men. acad. des. scient. peteb. 5. p. 532. no. 18. fl. ross. alt. ill. t. 335.) leaves lanceolate-linear, scattered, cuspidate, remotely and setaciously ciliated, and covered with cobwebbed villi; coryns terminal, many flowered; calyce segments ovate, obtuse; petals elliptic, bluish, 1-nerved, more than thrice the length of the calyx; stamina exceeding the corolla. 2. H. Native of Altai. It differs from S. aspera and S. bronchialis, and all the nearly
allied species, in the many flowered corymbs, in the surfaces of the leaves and margins, &c.

Many-flowered Saxifrage. Pl. ¼ foot.

59 S. Aspera (Lin. spec. 575.) leaves flat, lanceolate-linear, scattered, pungent, remotely ciliated with spines, glabrous; stem branched, few-flowered; calyces segments ovate, cuspidate; peduncles broadly elliptic, rounded at the apex, 5-7-nerved, twice the length of the calyx, and a little longer than the stamens. ¼. H. Native of Switzerland and the Pyrenees; also of Siberia. Jacq. austral. appendix 31. Sternb. sax. 29. t. 3. f. 1.—Scheuch. t. 2. p. 13. t. 19. f. 3.—Ges. fass. 22. t. 6. f. 27. S.aspera var. elongata, Gaudin, fl. helv. 3. p. 108. S. intermedia, Heg. fl. helv. 5. p. 285. Ciliaria aspera, Haw. enum. sax. p. 52.—Moris. hist. 3. p. 479. sect. 2. t. 7. f. 35. Plant grey; surculi elongated, decumbent, villous. Stems branched, reddish, brittle, hispid from short hairs. Peduncles longish, stiff, 1-flowered, furnished with glabelliform hairs, as well as on the calyces. Nerves of peduncels branched. Flowers large, cream-coloured.

61 S. cherlerioides (D. Don, in Lin. trans. 13. p. 383.) tufts of leaves on the tops of the surculi globose; leaves densely imbricated, spatulate, mucronate, ciliated; calyces segments semi-ovate, obtuse; petals obvate, 3-nerved; stems filiform, many-flowered. ¼. H. Native of Kamtschatka. S. bryoides, Pall. mss. Plant tufted. Stems ascending, 4-5-flowered, with a few small adpressed leaves. Flowers corystose, cream-coloured, much smaller than those of S. bryoides. Pedicels 1-flowered, furnished with a few scattered glands, as well as the calyces.

Cherleria-like Saxifrage. Pl. ¼ foot.

62 S. eriopeta (D. Don, in Lin. trans. 13. p. 380.) plant tufted, and hispid; stems filiform; leaves ovate, mucronate, bristly, with one tooth on each side; flower terminal, nearly sessile; calyces bristly, petals nearly orbiculate, triple-nerved: nerves simple, straight. ¼. H. Native of Napaul, on the Alps. Flowers yellow, on short pedicels, drooping in the bud. Styles incurved at the apex.

Rather-hispid Saxifrage. Pl. ¼ foot.

63 S. evolvuloides (Wall. cat. no. 447.) stems very simple, 1-flowered, ornamented by long capitulate spreading hairs; leaves ovate-lanceolate, acute, furnished with 1 or 2 teeth, nerveless, sessile, covered with striate pilis; sepals ovate, mucronate by a bristle, and bearing strigose hairs; petals roundish-ovoblate, opaque, hardly longer than the calyx. ¼. F. Native of Napaul, at Gosangthan and Kamaon. Perhaps distinct from S. hispidula. Leaves small, superior ones broadest. Pedicels filiform, nearly twice the length of the flowers. Flowers yellow.

Evolvuloides-like Saxifrage. Pl. ½ foot.

64 S. Levis (Bieb. fl. taur. 1. p. 314. suppl. 291. but not of Haw.) stems decline, few-flowered; calyces leaves oblong, acutish, crowded, naked, unarmed, glaucenceous; flowers terminal, sessile; petals obovate-oblong, longer than the calyx. ¼. H. Native of the Alps of Caucasus. Flowers yellow. Very nearly allied to S. aizoides, but differs in the flowers being smaller and sessile.

Smooth Saxifrage. Pl. ¼ to ½ foot.

65 S. spinulosa (Adams, in mem. soc. mosc. 5. ex Spreng. neue, entd. 3. p. 225.) stems nearly naked, many flowered; leaves imbricate, undivided, erect, linear-lanceolate, flat, ciliated, spinis. ¼. H. Native country unknown.

Spinulose Saxifrage. Pl. ¼ foot.

66 S. Chamissoi (Stern. rev. sax. suppl. 1. p. 13. t. 10. f. 1.) plant tufted; stem generally 4-flowered; lower leaves cuneated, cuspisiply tripped, ciliated; calyces leaves linear-lanceolate, quite entire; sepals small, obtuse; petals oblong, minute, hardly longer than the sepals. ¼. H. Native of the Island of Unalaschka; and the subalpine regions of Mount Hood. S. tricuspidata β. Hook. fl. bor. americ. 1. p. 254. Flowers minute, white. 

Chamisson's Saxifrage. Pl. ¼ to ½ foot.

67 S. tricuspidata (Retz. prot. fl. scand. ed. 2. no. 527.) stems straight, thick; lower leaves dense, coriaceous, cuneiform, tricuspidate, with the margins finely ciliated; flowers somewhat corystose; peduncles short and stiff; calyces segments ovate; petals oblong or lanceolate, 3 times longer than the calyx; capsule conical, ending in diverging styles; stigmas subcapitate. ¼. H. Native of Greeneland, and of North America; from Lake Winepeg in lat. 50° to the Arctic sea and islands; and from Hudson's Bay to the Rocky Mountains; Kotzebue's Sound, Newfoundland, &c. Rotb. in act. hafn. 10. p. 446. t. 6. Pl. dan. t. 976. Leptacta tricuspidata, Haw. enum. sax. p. 40. Plant densely tufted, glabrous; surculi very short. Stems ascending, many flowered. Superior leaves undivided. Pedicels elongated, glabellular, as well as the calyces. Flowers yellow, size of those of S. Hirculus. Pedals spotted, triple-nerved; nerves simple.

68 S. junipéra (Bieb. fl. taur. 1. p. 314. suppl. 291.) stems suffruticosus, proliferus; leaves crowded at intervals, subulate, triquetrous, stiff, pungent; flowers disposed in spikes; petals obovate, triple-nerved. ¼. H. Native of the Alps of Caucasus, at the foot of the Kaischaur Alps frequent, and nearly throughout the whole of Caucasus. Sternb. sax. p. 31. t. 10. Chondrosea juniperina, Haw. enum. sax. p. 15. Stems numerous, crowded with leaves, proliferously branched at the apex. Leaves flatish on the keel beneath, biaulate above, furnished with an acicular spine at the apex, and finely serrated at the base. Spike 6-10-flowered; pedicles short, beset with clammy down. Bractes linear, obtuse, ciliated with glands. Flowers yellow, size of those of S. aspera.

Var. a, Steveniinthis (Ser. in D. C. prod. 4. p. 23.) flowers disposed into a capitate corymb, emulating that of Lýchnis alpina, Sternb. sax. p. 31. t. 10. a middle figure.

Juniper-like Saxifrage. Pl. ¼ to ½ foot.

Sect. V. Porphyro’s (from porphuros, porphyros, purple; colour of flowers). Tacche, hort. canal. fass. f. 1. D. C. prod. 4. p. 17.—Antiphrilla species. Haw. enum. sax. p. 43.—Calliphyllum, Gaudin, fl. helv. 3. p. 94. Calyx 3-cleft, with a long, erect, permanent tube (f. 43. a), joined to the ovarium or free from it. Pedals sessile, perigynous. Stamens perigynous (f. 43. b. c); filaments flat, gradually attenuated. Stigmas
spreading, flat, spatulate, bearded with short down (f. 43. c.). Capsule covered by the calyx. Seeds angular, smooth or wrinkled.—Tufted evergreen herbs, with small opposite coriaceous or thick, permanent leaves. Flowers red or violaceous.

Elegant little plants.

69. S. oppositifolia (Lin. spec. 575.) stems 1-flowered; leaves imbricated, ovate or obovate, flat, obtuse, ciliate; segments of the calyx broadly ovate, obtuse; petals obovate, 5-nerved; genitils shorter than the corolla. 2. H. Native of Lapland, Switzerland, Spitzbergen, Pyrenees, Scotland, and England, on alpine rocks and precipices; also of North America, as in Newfoundland and Labrador; Antecosti, in the Bay of St. Lawrence; Rocky Mountains, near the highest summits, between lat. 52° and 56°; Arctic sea shore and islands; Bay of Eschheoltz, &c. In England on the west side of Ingleborough Hill, Yorkshire; on Snowdon plentifully; and on Ben Lomond and other Scottish mountains. Lin. fl. lapp. p. 179. t. 2. f. 1. Fl. dan. t. 34. All. pedem. 1532. t. 21. f. 3. Lapey. pyr. sax. p. 36. t. 16. Smith, engl. bot. t. 9. Hohenwart in Reiner. itin. i. p. 133. t. 3. S. coriacea, Pers. ench. 1. p. 488. Antiphylla coriacea, Haw. exann. sax. p. 49. Plant forming a broad flat tuft; sessile short, procumbent, reddish. Leaves usually perforated at the apex by 1 or 2 pores. Flowers large, of a beautiful lilac colour.

Jar, β, distant (Ser. in D. C. prod. 4. p. 18.) leaves of the sterile branches loose and distant. 2. H. Native of the Alps of Switzerland and the Pyrenees.

Two-flowered Saxifrage. Fl. April, June. Clt. 1826. Pl. 1 to 2 inches.

72. S. Escscholtzii (Sternb. rev. sax. suppl. p. 9. t. 10. f. 2.) plant small, densely tufted; leaves closely imbricated, ob-

Cotyledon or Pyramidal Saxifrage. Fl. May, July. Clt. 1596. Pl. 1 to 2 feet.

74. S. Lingulata (Bell in act. taur. 5. p. 226.) leaves linear-lanceolate, channelled, tubercularly crenated; calyx densely beset with glands: with semi-ovate obtuse segments; petals oblong-acute. 2. H. Native of the tops of the Alps of Switzerland; and the Pyrenees, on the Alps by the sea side, and other alpine places about Montrecel. C. Cotyledon, Mill. dict. no. 2. S. longifolia, Lapey. pyr. sax. p. 36. t. 11. Chondrosea longifolia, Haw. exann. sax. p. 11. Plant tufted. Stem erect, flexuous, branched in a pyramidal form, leafy, beset with glandular hairs. Leaves glaucous, ciliate at the base, recurved at the apex. Panicle nodding. Peduncles many flowered, and are, as well as the calyces, beset with rusty glandular down. Flowers flat, white, with numerous rose-coloured dots; petals conspicuously triple-nerved.

Jar, β, media (Sternb. sax. p. 1. t. 1. a. and in Sturm, deutsch fl. 53. f. a.) leaves shorter; stem panicked above; panicles erect, pyramidal. 2. H. Native of the Alps of Carinthia. Chondrosea intermédia, Haw. exann. sax. p. 11.—Hort. eyst. ord. 5. pl. 10. f. 1.—Pluk. phyt. t. 229. f. 1. Perhaps a distinct species.

Var. £, subminna; flabelliform; stem simple. Lapeyr. l. c. 2. H. Native on the tops of the Pyrenees.

Var. \( \beta \), retusa (D. Don, in Liu. trans. 15. p. 293.) one-half smaller than the species; leaves shorter and lower. 2 H. Native of the Pyrenees. S. Aizoon \( \beta \) minor brevitilia, Sternb. 401. l. c. t. 3. f. \( \beta \). S. rosulatis, Schlach. cat. 1824. p. 64. Chondrosea Aizoon \( \gamma \) parviflora and C. rosulatis, Haw. enum. sax. 12. Chondrosea Aizoon minor, Haw. l. c. p. 11. S. rosulata, Ehrh. pl. sel. no. 51. There is another variety of this with still smaller leaves, in Sternb. l. c. t. 56. f. 2. S. Aizoon minima, Ser. anz. 1828. p. 73. S. Aizoon \( \epsilon \) rufescens, Gaudin, fl. helv. 5. p. 88.

Var. \( \gamma \), recta (Ser. in D. C. prod. 4. p. 19.) stems erect, many flowered; peduncles elongated, 3–4-flowered. 2 H. Native of the Alps of Switzerland and the Pyrenees. S. recta, Lapeyr. fl. pyrr. p. 35. t. 15. D. C. fl. fr. 4. p. 661. \( \beta \). S. Aizoon \( \gamma \), Gaudin. Petals without any dots. Gaudin, fl. 5. p. 88.

Var. \( \delta \), nigræcta (Ser. in D. C. l. c.) tufts of leaves glabrose; raceme simple, few-flowered, somewhat cylindrical; petals rose-coloured, dotted with purple. 2 H. Native of Italy.—Sedum Barcel. icon. 1310. ex Tenore. S. nigricula, Tenore, append. prod. fl. neap. p. 19. S. Aizoon and S. recta, Tenore, fl. neap. prod. p. 25. There is a variety of this with a sessile corimb of flowers in the tufts of leaves; peduncles and calyx are quite glabrous, and the stem 1-flowered.

77 S. Intacta (Moric, fl. ven. 1. p. 431.) plants quite glabrous; stem angular; leaves of the tufts oblong-spathulate, ciliate at the base, with crassulous margins; cauline leaves oblong, somewhat denticulate, acute; panicle branched, many-flowered; petals ovate, oblate, much longer than the calyx; styles straight, ascending. 2 H. Native of Virgin Mount, near Naples. S. Aizoon, Guss, in litt. S. pyramidalis, Tenore, fl. neap. prod. 1. p. 25. Petals yellow, as seen in a dried state. Flowers very like those of S. Cotyledon, and the leaves like those of S. Aizoon.

Southern Saxifrage. Pl. 1 foot.

78 S. cartilaginae (Willd. ill. ex Sternb. sax. p. 6. t. 3. c.) leaves of the tufts and stems lanceolate, acute, cartilaginously serrated; flowers panicked, somewhat corymbose; lobes of calyx ovate, about equal in length to the campanulate tube; calyx and peduncles beset with glandular pili; petals ovate, contiguous at the base, spotless; styles diverging. 2 H. Native of Caucasus. S. Cotyledon, Bieb. fl. taur. 1. p. 313. 3. p. 290. Chondrosea carilaginosa, Haw. enum. sax. 12. Flowers cream-coloured, dotted. Perhaps only a variety of S. Aizoon.

Cartilaginous-edged Saxifrage. Pl. 1 foot.

79 S. Marginata (Sternb. rev. sax. suppl. 1. p. 1. t. 1. f. 1.) radical leaves lingulate, ciliate at the base, having pitted dots within the edge; flowers somewhat corymbose; petals ovate, twice the size of the calyx. 2 H. Native of Naples. S. Cotyledon, Tenore, cat. hort. neap. append. alter. p. 86. and S. Aizoon, longifolia, and recta, Tenore, fl. neap. prod. p. 25. ex Moretti, tent. sax. p. 35.

Marginate-leaved Saxifrage. Pl. 1 foot.

80 S. floribunda (Moretti, tent. sax. p. 9.) radical leaves tufted, lanceolate, mucronate, ciliate: cauline ones linear; stem fistular, bearing flowers from the base to the apex; flowers disposed in a racemose thysse, white, or cream-coloured. 2 H. Native on the mountains about Nice.

Bundle-flowered Saxifrage. Pl. 1 foot.

Var. \( \beta \), macroptila (Ser. in D. C. prod. 4. p. 20.) petals ovate-oblong, spotted. 2 H. Native of Switzerland. Hall. hist. no. 979. t. 16. f. 2.

§ 2. Leaves lingulately-spatulate, apiculated, with quite entire cartilaginous margins.

radical ones rosulate, glabrous; cauline leaves cuneate, clothed with glandular hairs. Pedicels 1-flowered, and are as well as the calyxes clothed with viscid hairs. Petals obovate, dark purple. Genitals inclosed in the calyx.

Middle Saxifrage. Pl. $\frac{3}{4}$ to $\frac{3}{4}$ foot.

La Peyrrouse’s Saxifrage. Pl. $\frac{3}{4}$ to $\frac{3}{4}$ foot.

84 S. arcticoides (Lapéry. pyr. sax. p. 28. t. 13.) leaves aggregate, linear-lingulate, upright, mucronulate, keeled, glau- cous, with cartilaginous margins; stem clad with clammy tomentum; petals linear-spatulate, crenulated at the apex. 2. H. Native of the Pyrenees, on calcareous rocks. Chondrösæ arcticoides, Haw. enum. sax. p. 14. Plant densely tufted. Leaves imbricate, ciliately toothed at the base, with a few perforated dots near the margin. Flowers by threes, g‘den yellow. Pe- dicels and calyces clothed with clanny down. Calyceine segments ovate, acute. Very like the two preceding species, but the plant is much smaller.

§ 3. Leaves triquetrous, obtuse.

85 S. diapensioïdes (Bellardi, in act. acad. taur. 5. p. 237.) stems, peduncles, and calyces glandular; leaves linear, erect, keeled, aggregate, imbricated, crenately glaucous; stem many-leaved, few-flowered; calyceine segments elliptic-oblung. 2. H. Native of the Alps of Piedmont and Switzerland. Lapéry. append. fl. pedem. p. 21. t. 3. Sternb. sax. p. 35. t. 9. Chondròsa diapensioïdes, Haw. enum. sax. p. 13. S. ceásia β, Lam. dict. l. p. 676. Plant densely tufted. Leaves with cartilaginous margins, ciliated at the base, and with 1 or 2 perforated dots at the apex, which is obtuse. Flowers 3 or 5, cam- panulate, white, disposed in a terminal head. Petals narrow at the base, with an orbicular, 5-nerved limb.

86 S. squarrosa (Sieb. in fl. 1821. p. 99. and fl. austr. excis. no. 133.) stem pubescent below, usually 3-flowered; leaves linear-elliptic, rather retuse, stiff, squarrosely imbricated, permanent, when young poddry; branches diffuse, flaccid; ped- uncles and stems glabrous. 2. H. Native of the Alps of Tyrol. Flowers white, larger than those of S. ceásia. Lobes of calyx broader than in S. ceásia and S. diapensioïdes. Squarrosa-leaved Saxifrage. Pl. $\frac{3}{4}$ fl.

87 S. ramulosa (Wall. cat. no. 446.) plant densely tufted; stems 1-flowered, very short; leaves of the barren stems or surculi acute and flabellate at the apex, lined with rugose dots; the upper surface of the leaves have a regular marginal, double line of dots; margins of leaves thin and cartilaginous; lobes of calyx acute; styles nearly parallel, longer than the calyx; stigmas thickish, capitate. 2. F. Native of Nepa, at Bhundrınath. Very nearly allied to C. ceásia, but perfectly distinct.

Branched Saxifrage. Pl. 1 inch.

Tar. (a) patens (Ser. in D. C. prod. 4. p. 22.) leaves loosely rosetulate, not recurved at the apex, with a few crenate spots; stems short, usually 2-flowered. 2. H. Native of Vaillaïs, on Mount Fouly. S. patens, Gaudin. in Meissner, anz. 1818. p. 65. fl. helv. 3. p. 92, but not of Sternb. rev. sax. suppl. 1. t. 1. f. 2. Chondrösæ patens, Haw. enum. sax. p. 14. There is a variety of this without any stem and with 1 sessile flower in the middle of the leaves, which is a native of Upper Styria, and is described by Vest, in flora. 1820. no. 26. p. 397.

Grey Saxifrage. Fl. May, June. Clt. 1752. Pl. $\frac{3}{4}$ to $\frac{3}{4}$ fl.

89 S. rocheliana (Sternb. suppl. sax. 2. ex Host. fl. austr. 1. p. 501.) flowers corymbose; sepals ovate; petals lanceolate-ovate, twice the length of the calyx; lower leaves lingulate, glabrous, ciliated at the base, disposed in tufts; cauline ones clothed with clammy villi, pale green. 2. H. Native of Austria, in the fissures of rocks. Leaves white at the edges, and with distinct impressed dots. Flowers white. Perhaps a variety of S. ceásia or S. valdénia.

Rochel’s Saxifrage. Pl. $\frac{3}{4}$ to $\frac{3}{4}$ foot.

90 S. valdénia (D. C. fl. fr. 5. p. 517.) peduncles and calyces very clammy, and beset with glandular hairs; leaves of the surculi and stems flat at the base, but more or less triquetrous at the apex, with the upper surface marked with dots, which are disposed without order. 2. H. Native of the Alps of Lyons, on the hill called Lacroix, near Abries and Pignerol; and on Mount Cenis. S. rutpérstris, Thomas, exsic. S. ceásia, var. Wild. spec. 2. p. 642. in a note. S. ceásia γ, Moretti. tent. sax. p. 12. Flowers white, corymbose; peduncles short. Leaves dense, short. Leaves dense, short.

Tar. (a) laxifólia (Ser. in D. C. prod. 4. p. 22.) leaves loose, elongated; flowers very numerous, loose, disposed in panicked corymbs. 2. H. Native of Portugal and Italy. S. laxifólia, var. ex alpinus Italicus, Linn. mant. p. 581. but not of his spec. S. ceásia β, major, D. Don, in Linn. trans. 13. p. 403. S. com- pàcta, Sternb. suppl. 1. p. 9. t. 1. f. 3. under the name of S. patens.

Lyons Saxifrage, Fl. May, June. Clt. 1825. Pl. $\frac{1}{2}$ foot.

91 S. serpellehólia (Pursh, fl. amer. sept. 1. p. 310.) surculi creeping; leaves rosulate, imbricately reflexed, oblong, obtuse, tapering into the petiole, coriaceous, quite glabrous; stem filiform, few-leaved, best with glandular pubescence, 1- to 2-flowered; calyceine segments obtuse, not adhering to the ovum; petals broadly obovate, somewhat 3-nerved. 2. H. Native of the north-west coast of America, at Cape Newhan, Behring’s Straits, and Unalaska. S. Fischèr., Ser. in D. C. prod. 4. p. 22. S. Eschelholtzii, Cham. in litt. S. planifólia, Cham. in herb. Hook. S. diapensioïdes, Fisch. in litt. but not of Bellardi. Plant green, tufted. Flowers large for the plant, apparently yellow, solitary, on slender, few-leaved, glandular stalks. Calyx wholly inferior.

Wild-thyme-leaved Saxifrage. Pl. $\frac{1}{3}$ foot.

§ 4. Leaves triquetrous, mucronately pungent.

92 S. nitida (Schreb. in litt. ex Sternb. rev. sax. p. 32. t. 10.}
b. f. 4.) stems nearly naked, few-flowered; leaves densely imbricated, lanceolate, spinosely mucronate, and ciliate, shining beneath; flowers usually by threes, panicled; calyx pilose; with ovate lobes, which end in a little spine each; petals obtuse, hardly longer than the calyx. 2. H. Native country unknown. Chondrosea nitida, Haw. enum. sax. p. 16. Very nearly allied to S. tentella. Flowers yellowish.

93. S. Tene'lla (Wulf. in Jacq. coll. 3. p. 144. t. 17.) leaves crowded, linear-subulate, flat, pungent, ciliate; stems slender, few-leaved, many-flowered; calycine segments linear-lanceolate; petals obovate. 2. H. Native of the Alps of Carinthia, Carniola, and of the Carpathian mountains; also about Prague. Chondrosea tentella, Haw. enum. sax. p. 15. Plant tufted; surculi decumbent. Leaves crowded, imbricate, deep green, keeled beneath. Flowers panicked, white. Calyx beset with glandular hairs.

Sand-wort-like Saxifrage. Pl. 1/4 foot.

95. S. Berseriana (Lin. spec. 572.) stem beset with glandular hairs; leaves aggregate, subulate, pungent, smooth, glaucous; stems usually 1-flowered; segments of the calyx ovate; petals roundish, with curled edges, and branched nerves. 2. H. Native of the Alps of Carinthia and Carniola; and in Upper Italy, on the mountains. Wulf. in Jacq. misc. 1. p. 153. t. 17. f. 3. Sternb. sax. p. 33. t. 10. f. 1-2. and in Sturm, deutschl. fäse. 33. no. 10. f. a. b. c. d. —Segner, pl. rar. 3. p. 291. t. 5. f. 2. Chondrosea Berseriana, Haw. enum. sax. p. 15. Plant densely tufted. Surculi short, erect. Leaves rosulate, tricorifrons. Flowers large, beautiful, milk-coloured, lined with branched, yellowish, flexuous nerves.

Var. β, subfíffera (Sternb. l. c. t. 10. β.) stems usually 2-flowered.

Vandelli's Saxifrage. Pl. 1/4 foot.

obate, rather membranous, nerved, deeply crenate-toothed, tapering into the broad petiole; ovate naked; flowers in panicked corymbs; calyces segments crenate, obtuse; petals oblong, oblate, more than twice the length of the calyx. 2. H. Native of Canada, and to the mountains of the Columbia, and from Fort Vancouver to the Kettle Falls. S. Virginica, Torrey, fl. unit. stat. p. 444. Flowers small, white, forming an imperfect corymb or thyrse. This species differs from S. Virginica in the disposition of the flowers.

Spring Saxifrage. Fl. May, June. Ch. 7. Pl. 3 foot.

102 S. Reflexa (Hook, fl. bor. amer. 1. p. 249. t. 85.) plant clothed with woody down; leaves ovate, rather coriaceous, opaque, deeply serrated, tapering into the petiole; scape naked; panicle quite glabrous, compact, corymbose; petals obtuse, bi-maculate; calyx reflexed. 2. H. Native of North America, on the shores of the Arctic Sea, between the Mackenzie and Coppermine rivers. Together with the harsh and rigid foliage of S. nivalis, the present species has a panicle more resembling that of S. verrucosa; but the petals have two orange spots, similar to those of S. leucanthemifolia. The pubescence gives a whitish or hoary appearance to the whole plant, the panicle exception; but as the pubescence is very variable in all the species of the present section, it cannot be depended upon. (f. 43.)

Reflexed-calyxed Saxifrage. Pl. 3 foot.

103 S. Integrifolia (Hook. fl. bor. amer. 1. p. 249. t. 86.) the whole plant clothed with pinnate pubescence; leaves radical, ovate, rather membranous, very blunt, quite entire, or minutely crenated, reticulately veined; scape elongated, naked, panicked, at the apex; panicle loose, broad or contracted, bracteate; petals obvate, twice the length of the calyx, which is at first spreading, but at length reflexed; stamens short; styles diverging. 2. H. Native of the north-west coast of America, near the mouth of the Columbia. The leaves are short, in proportion to the height of the plant.

Entire-lobed Saxifrage. Pl. ½ to 1 foot.

104 S. nivalis (Linn. spec. p. 573.) leaves ovate or obvate, coriaceous, unduly crenated, tapering into the broad petiole; scape naked, simple; flowers in crowded heads; calyces segments erect, obtuse; petals obvate, permanent, hardly one half longer than the calyx. 2. H. Native of Scotland, north of England, Lapland, on the loftiest mountains; in North America, on the Arctic Sea-shore and islands, abundant; Labrador, Canada, Spitzbergen, and the Rocky Mountains. In Britain, upon Snowdon, and on the summits of several hills about Snowdon; on Ben Lawers, Clova, and other Highland mountains of Scotland; and near the top of Ben Lomond. Lightly fl. scot. with a figure. Smith, engl. bot. t. 410. Sternb. in Sturm, deutsch. fl. with a figure. S. congesta, Haw. Dermasea nivalis, Haw. syn. sax. p. 9.—Lin. succ. p. 176. t. 2. f. 5. 6.—Ray. angl. 3. p. 354. t. 16. f. 1.—Oed. fl. dan. t. 25. Leaves glabrous above, villous beneath. Scape clothed with viscid hairs. Flowers disposed in crowded bracteate heads; bracteas ciliate. Pedicels and calyces clothed with viscid down. Petals white, but becoming reddish as they fade, triple-nerved; nerves simple. The American specimens of this plant are very variable in habit, and in many instances so closely approach the varieties of some of the preceding species, as hardly to be distinguished. It is therefore most easily to be recognised by its stiff and rigid habit, by the broad permanent petals, which remaining amongst the deep purple capsules form a singular contrast with them.

105 S. Longiscapa (D. Don, in Lin. trans. 13. p. 388.) leaves ovate, serrated, on long petioles; thyrse of flowers ovate; segments of the calyx ovate, acute; petals ovate, hardly longer than the calyx. 2. H. Native of Siberia. Leaves hairy. Scape filiform, beset with glandular hairs. Pedicels and calyces downy. Flowers white. This plant scarcely differs from S. nivalis var. γ, tenus.

Long-scaled Saxifrage. Pl. ¼ foot.

106 S. Palla (Waller. cat. no. 450.) plant quite glabrous; leaves lanceolate, obtuse, obscurely crenated, petiolate; bracteas linear; flowers few, disposed in a loose panicle; pedicels filiform, longer than the fruit; petals ovate, longer than the calyx; calyces lobes lanceolate, length of tube, each terminated by a sessile gland; filaments clavate? capsule rather bladderly, nerved, marked by minute elevated dots; stigma sessile, thickish. 2. F. Native of Nipal, at Gosasingth, Emodi, and Kamaon.

Pale Saxifrage. Pl. ¾ foot.

107 S. Dahurica (Willd. spec. 3. p. 465.) plant quite glabrous; leaves cuneiform, on long petioles, attenuated at the base, coarsely and deeply serrated at the apex; flowers in loose panicles; calyces segments ovate, acute; petals elliptic, acute. 2. H. Native of Dahuria, on the tops of the Alps, near the limits of perpetual snow. In North America, at Behring's Straits; alpine rivulets of the Rocky Mountains, Kotzebue's.

Leaves said to be pubescent; the scape beset with glandular hairs, and the pedicels and calyces clothed with clanny downy. Petals white, marked with 2 yellow spots at the base. The broadly cuneate, or rather flabelliform leaves are very remarkable.

Dakurian Saxifrage. Pl. ¼ foot.

Sect. VIII. Saxifraga-veR-E (this section contains what are considered the true species of the genus.) D. Don, in Lin. trans. 13. p. 315.—Daetyloides, Tausch, hor. canai. fasa. 1. D. C. prod. 4. p. 23.—Muscariaria and Saxifraga, Haw. enum. sax. p. 22-29.—Triplinervium, Gaudin, fl. helv. 3. p. 116. Calyx 5-cleft (f. 46. a.), erect, permanent, with the tube adhering to and involving the ovary (f. 46. b.). Petals sessile, perigonous (f. 46. c.). Stamens perigonous (f. 46. d.); filaments flat, gradually attenuated. Stigmas spreading (f. 46. e.), flat, spatulate, bearded with short down. Capsule covered by the calyx (f. 46. b.), and closely adhering to it. Seeds obovate.—Perennial rarely annual, humble, densely tufted herbs, for the most part bearing surculi. Leaves alternate, variously parted, rarely simple, usually green; with the margins neither cartilaginous nor doted. Stems leafy, few, or many-flowered. Flowers white or yellow, rarely red.

§ 1. Perennial. Surculi numeros. Leaves undivided, rarely trichotomous at the apex.

108 S. Farnasifolia (D. Don, in Lin. trans. 13. p. 405.) stem erect, leafy, 3-4-flowered; leaves cordate, stem-clasping,
glabrous; calyceine segments ovate, mucronate; petals obvate, 5-nerved. 2. F. Native of Nipaul, on the Alps. Habitat of plant referable to Parannis palustris. Stems numerous. Leaves ciliolate with glandular hairs. Pedicels 1-flowered, and as well as the calyces glandular. Flowers milk-coloured. This is evidently only a small specimen of S. diecrosifolia var. β, parnasifolia, p. 209.

Parannis-leafed Saxifrage. Pl. ½ foot.

Var. β, tridentata (Gaun. syn. sax. in Meisner, an. 1818. p. 67. fl. helv. 3. p. 115.) leaves cuneiform, more or less, 3-5-toothed. 2. H. Native of the Alps, but rare. Sternb. rev. sax. t. 11. a. f. 4. and in Sturm, deutschfl. p. 33. no. 15. S. androsacea trifida, Hall. comm. sax. p. 55. S. Pyrennea, Seop. fl. curr. no. 498. t. 16. S. androsacea triflora, Sternb. rev. sax. suppl. p. 11. t. 7. f. 5. S. tridens, Jan. in litt.

Spatulate-leaved Saxifrage. Pl. ¾ foot.

112 S. tenëra (Sut. fl. helv. 1. p. 245.) surculi short, very leafy; leaves linear-oblong, obtuse, and are as well as the stems best with glandular hairs; calyceine segments oblong-ovate; petals obvate, retuse, exceeding the calyx. 2. H. Native of the Alps of Switzerland, Piedmont, Pyrenees; and on Mount Cenis. Sternb. sax. p. 28. t. 9. f. 4. S. planifolia, Lapeyr. fl. pyr. sax. p. 31. Sternb. sax. p. 28. t. 7. f. 3. S. mucroideae. All fl. pedem. no. 1528. t. 61. f. 2. exclusive of the synonyms. S. planifolia citrina, Gaun. syn. in Meisner, an. 1818. p. 66. fl. helv. 5. p. 113. a. β. Plant densely tufted. Stems 1-3-flowered. Flowers cremn-coloured, twice the size of those of S. sedoides. Easily distinguished from S. sedoides in the stems and leaves being densely beset with glandular hairs, and in the petals being obvate, retuse, and twice the length of the calyx.

Var. β, trifida (Gaun. in Meisner, an. 66. fl. helv. 3. p. 114.) some of the leaves trifid. 2. H. Native of Valtellins, in the valley called Bagnes.

113 S. depressa (Sternb. rev. sax. 42. t. 11. a. f. 5.) stem roughish, few-flowered, furnished with 2 leaves, one of which is a little stem-clasping: leaves spatulate, entire, and cuneately tridentate at the apex, running into the petiole at the base, rather searish beneath; petals hardly exceeding the calyx, which is campanulate; calyceine lobes triangular, broad. 2. H. Native of Italy, on Mount Alto. Haw. comm. sax. p. 31. It differs from S. androsacea, to which it is nearly allied, in the leaves running into the petiole at the base, and in the lower surface of the leaves being roughish from short stiffish hairs, not pilose. Perhaps the same as S. androsacea β, tridentata.

114 S. Mečkin (Fisch. in Sternb. rev. sax. 1. p. 1. f. 3.) stems tufted, usually 3-flowered; calyceine segments ovate; petals obvate-rounded, longer than the calyx; capsule rather bladdery; styles parallel; radial leaves rosalate, ovate or spatulate, entire, ciliolate, glabrous; cauline ones smaller, few. 2. H. Native of Siberia, in humid plains on Mount Jabloni. Habit nearly of S. androsacea, but differs in the capsule being bladdery, much longer than the calyx. Flowers white.

Merk's Saxifrage. Pl. ¼ foot.

115 S. crocea (Gaun. syn. sax. in Meisner, an. 1818. p. 70. fl. helv. 3. p. 130.) stems tufted, 3-5-flowered, covered with short pubescence; terminal pedicle sessile; lateral ones very long; leaves linear-oblong, obtuse, or tridentate; calyceine segments oblong-rounded, bluntish, clothed with clanny pubescence, longer than the tube; petals elliptic, bluish, hardly equal in length to the calyx. 2. H. Native of Savoy, in the southern Alps. Muscaria crocea, Haw. comm. sax. p. 38. Flowers copper-coloured.

Copper-coloured-flowered Saxifrage. Pl. ¾ foot.

117 S. geranoides (Lin. spec. 578.) leaves reniform, 3-5-lobed, pubescent, on long petioles: segments cuneated, deeply toothed; panicle coaractate, many-flowered; calyceine segments linear-lanceolate, obtuse, reflexed; peduncles oblong, flat. 2. H. Native of the Pyrenees. Lapeyr. pyr. sax. p. 66. t. 45. S. paniculata, Schleich. cat. 1821. S. quinqueflora, Lam. fl. fr. 3.
SAXIFRAGACEÆ. I. SAXIFRAGA.

*Var. β. obtusiflora* (Ser. in D. C. prod. 4, p. 30.) plant hardly pilose; lobes and lobules of leaves hardly toothed; flowers subumbellate; bracteas linear. 2. H. Native of Switzerland. S. geranioides, Schlech. cat. 1822. p. 62.

*Pedatifid-leaved Saxifrage.* Fl. May, June. Scotland. Pl. ½ to 1 foot. 121 S. viscosa (Haw. in misc. nat. 164. enum. sax. p. 26.) stems hairy; radical leaves pedatifid; of the surculi, which are erect, 5-5-cleft; cauline ones trifid and lanceolate, 3-nerved. 2. H. Native country unknown. Allied to S. geranioides and *S. pedatifida,* but much smaller and more clammy. Flowers white.

*Clammy Saxifrage.* Fl. May, June. Pl. ½ to 3 foot. 122 S. ceratophylla (Dryander, in hort. kew. 3. p. 70.) surculi woody; leaves 2-3-parted, petiolate, stiff, glabrous; segments subulate, with hairy mucrones; stems clammy; calyx brownish, glabrous; with ovate segments, which are furnished each with a recurved mucrone at the apex; petals oblong. 2. H. Native of Spain. Sims. bot. mag. 1815. S. trifurcata, Schrad. hort. goetz. fasc. 1. p. 13, t. 7. S. petraeae, Pavon. herb. Plant densely tufted, quite glabrous. Stems reddish at the base, covered with viscid juice. Petioles naked, channelled above. Flowers snow white, disposed in a loose branched panicle. Pedicels and calyces covered with clammy juice.

*Blunt-cleft-leaved Saxifrage.* Pl. ½ foot. 124 S. ajugiformia (Lin. amoen. acad. 4. p. 271.) surculi procumbent; leaves 5-parted: segments lanceolate, mucronate; bases slender; calyces segments ovate, mucronate; petals flat, oblong. 2. H. Native of Provence, on the mountains, and of the Pyrenees. Lapeyr. pyr. sax. p. 66. t. 31. Sternb. sax. p. 46. Plant green, furnished with a few viscid hairs, which are more dense on the petioles: densely tufted at the time of flowering, but growing in a loose manner afterwards. Surculi long, reddish, as well as the base of the stems. Leaves glabrous, but ciliated: cauline ones undivided, lanceolate. Flowers large, campanulate, white. Calyx base with glandular hairs. Petals triple-nerved: nerves simple.

*Capitate-flowered Saxifrage.* Fl. May, June. Pl. ½ foot. 127 S. pentadactylis (Lapeyr. fl. pyr. sax. p. 64. t. 40.) surculi short, erect; leaves long on petioles, glabrous, 5-parted:
segments linear, obtuse, ribbed beneath; calycine segments lanceolate, acute; petals obovate, with branched nerves. \( \text{fl.} \). Native of the Pyreness. Herb glabrous, pale green, densely tufted. Stems branched, terete, glabrous, flexuous. Petioles long, compressed, glabrous. Flowers white, disposed in loose panicles.

\( \text{fl.} \), corymbosa (Ser. in D. C. prod. 4. p. 30.) flowers numerous, in dense corymb; peduncles more rigid and shorter.

\( \text{var.} \), capitellata (Ser. 1. c.) flowers somewhat capitate; peduncles very short.

**Five-fingered-leaved Saxifrage.** Fl. May, June. Chit. 1815. Pl. 4 to \( \frac{1}{4} \) foot.

128 S. LATIFOLIA (D. Don, in Lin. trans. 13. p. 420.) succulii erect, short; radical and cauline leaves broadly cuneate, glabrous; 3-5-lobed; lobes broadly ovate; calyx glabrous, with ovate-lanceolate mucronulate segments; petals spatulate, with simple nerves. \( \text{fl.} \). Native of Spain. S. ascendscens, Pavon, herb. Plant quite glabrous, pale green, tufted. Stems many leaved, many flowered. Lower cauline leaves like the radical ones, but more profusely lobed: lobes lanceolate; upper cauline leaves undivided. Peduncles elongated, 2-flowered. Flowers white.

**Broad-cleft-leaved Saxifrage.** Pl. 1/4 foot.

**Deceiving Saxifrage.** Fl. May, June. Wales. Pl. \( \frac{1}{4} \) foot.

130 S. hiçta (Dunn, cant. ed. 5. p. 107.) plant very villous; radical leaves 5-cleft: succulii ones trifid: segments ovate-lanceolate, acute; calycine segments triangularly ovate, acute; petals obovate. \( \text{fl.} \). Native of Ireland, among alpine rocks, western highlands of Scotland, and Wales; as on the Galty mountains, Tipperary; in the west part of Scotland; near Twil du in Cwfl Idwell, also on the walls of Dolwyddelan castle, between Capel Cory and Llandew, North Wales. Smith, engl. bot. 2291. Plant canescent, densely tufted before flowering, but afterwards loose, with the succulii decumbent and flexuous. Stems many leaved, few-flowered, clothed with villous hairs. Petioles dilated. Lower cauline leaves 3-parted, with linear segments: upper ones undivided. Flowers white, smaller than those of S. decipiens. Pedicels and calyces clothed with glandular hairs. Petals triple-nerved: nerves simple.

**Hairy Saxifrage.** Fl. May, June. Ireland. Pl. \( \frac{1}{2} \) to \( \frac{1}{4} \) foot.

131 S. platipe⁠tal⁠tale (Smith, in Lin. trans. 10. p. 391.) plant villous; succulii elongated, prostrate; leaves 5-5-parted: segments linear, acute, and awned; calycine segments ovate, mucronate; petals orbicular. \( \text{fl.} \). Native of the Alps of Scotland and Wales; as upon Snowdon in Wales; and the Clow mountains in Angus-shire, Scotland. Smith, engl. bot. 2276. S. recúra, Schleich. chit. 1821. S. hypnoides rhodopétála, Haw. enum. sax. p. 32. Plant densely tufted before flowering, but afterwards loose. Stems leafy, many flowered. Upper cauline leaves undivided. Flowers rather large, milk-coloured. Peduncles and calyces clothed with glandular down. Petals red at the apex when in the bud, triple-nerved: lateral nerves incurved, a little branched, middle one straight and simple.

**Broad-petalled Saxifrage.** Fl. June. Britain. Pl. \( \frac{3}{4} \) foot.

**Incurved-leaved Saxifrage.** Fl. May, June. Ireland. Pl. \( \frac{1}{4} \) foot.

**Naked Saxifrage.** Fl. May, June. Scotland. Pl. \( \frac{1}{4} \) foot.

**Sternberg's Saxifrage.** Fl. May, June. Pl. \( \frac{1}{4} \) foot.

**Neat Saxifrage.** Fl. May, June. Chit. 1818. Pl. \( \frac{1}{4} \) foot.

136 S. tridentáta (D. Don, in Lin. trans. 13. p. 429.) plant glabrous; radical leaves 5-cleft, succulii ones on long petioles, acutely tridentate; calycine segments triangularly ovate, mucronate; petals spatulate. \( \text{fl.} \). Native country unknown. Herb densely tufted, quite glabrous before flowering, but fur-

Tridentate-leaved Saxifrage. Fl. May, June. Pl. ½ foot.

Audes Saxifrage. Pl. ¾ foot.

139 S. uniflora (R. Br, in Parry's first voy. append. p. 275. but not of Sernb.) radical leaves aggregate, trifid: cauline ones linear, undivided, distant; stem one-flowered, and is, as well as the inferior ovary, viscid; down glandular, very short; calyce segments obtuse, petals obovate-oblong. 2. H. Native of the Arctic Islands. S. cespitosa, R. Br in Ross voy. ed. 2. vol. 2. p. 192. S. cespitosa ß uniflora, Hook. fl. bor. amer. 1. p. 244. S. venioz, Haw. enum. sax. p. 28. Flowers milk-coloured.

One-flowered Saxifrage. Pl. ½ foot.

Stellate Saxifrage. Pl. 1 inch.

Var. ß, Hewnkei; leaves densely glandular, 3-5 lobed: lobes ovate; surculi nearly globose; corymb 6-10-flowered. 2. F. Native in valleys on the Cordillera of Peru. S. Cordilleriana var. ß Hewnkei, Presl, in Hcenk. relig. 2. p. 55. Var. ß, ßaxa; stems elongated; leaves densely glandular, 3-5 lobed, loosely imbricated: lobes ovate; surculi cylindrical, loose; corymb many flowered. 2. F. Native of the Cordiller of Peru, in valleys. Petals white. S. Cordilleriana ß ßaxa, Presl, in Hcenk. relig. 2. p. 55.

Bolpland's Saxifrage. Pl. 1 inch.

Var. a, integrifolia (Ser. in D. C. prod. 4. p. 21.) leaves spatulate, usually entire; upper ones puberulous: lower ones glabrous.

Var. ß, triloba (Ser. l. c.) leaves all cuneate, 3 lobed at the apex, chammy. 2. F. S. Magellánica, Sternb. rev. sax. p. 39. t. 11. f. 1.

Magellan Saxifrage. Pl. ½ foot.

143 S. lanceolata (Haw. syn. succ. p. 324. enum. sax. p. 240.) leaves glabrous, eliased; those of the surculi palmately 7-cleft: those of the stolons, which are very short and erect, 3-5 cleft; caluene leaves lanceolate; petals rounded, obturate. 2. H. Native of the Alps of Europe. Flowers white.

Var. ß, minor (Haw. enum. sax. p. 24.) leaves trifid and entire: lower caluene ones lanceolate-spatulate; petals oblong-cuneiform, distinct. 2. H. Two or three times smaller than the species, and the leaves and petioles are very different.

Haw. l. c.

Var. ß, obtusa (Haw. l. c. p. 24.) leaves cuneiform at the base or obturate: those of the roseleaf deeply 1-5-toothed, and brownish; those of the stolons usually abortive: lower caluene leaves elliptic: petals orbicularly obturate. 2. H.

144 S. MÉNÜTOMA (Willd. in Sternb. sax. rev. p. 51.) radical leaves rexiniformly cordate, palmately parted: segments linear; caluene leaves nearly sessile, cuneate, 3-5 parted; flowers in dichotomous panicles; peduncles and calyces plicate: calyce lobes lanceolate, acute, length of the tube. 2. H. Native of Spain. Haw. enum. sax. p. 27. Flowers white.

Dichotomous Saxifrage. Pl. 1 to ¾ foot.

145 S. Exarata (Vill. dauph. 4. p. 674. t. 45.) plant pubescent; radical leaves 5 or 3 parted: those of the surculi 3 parted: segments linear, very blunt, engraved above: stem many flowered; calyce segments ovate-oblong, obturate: petals obovate, with simple nerves. 2. H. Native of the Alps of Dauphiny, Savoy, Piedmont, and the higher Pyrenees; also in North America: frequent on the Rocky Mountains between lat. 52° and 56°. S. nervosa, Lapeyr. pyr. sax. p. 63. t. 39. S. hypnoides, All. pedem. no. 1538. t. 21. f. 4. S. intermédia, Gaudin, fl. hclv. 3. p. 122. S. striata, Hall. fil. in herb. Gaudin, l. c. p. 129. Plant densely tufted before flowering, afterwards
loose and succulent, densely clothed with glandular down. S. chordiiforme, cauline leaves with linear, flat, oblanceolate, 1-flowered, furnished each with a tripartite bract at the base. Flowers in few-flowered; filaments yellow.

Var. γ, intricata (D. Don, l. c.) radical leaves crowded, spreading, cuneate, 3-cleft; peduncles divaricate. 3. H. Native of the Pyrenees. S. intricata, Lapeyr. sax. pyr. p. 58. t. 33.

146 S. Payoni (D. Don, in Lin. trans. 13. p. 434.) plant pubescent; leaves 3-parted; segments linear, acute, nerved; petioles linear, dilated, ribbed beneath; calypine segments linear-lanceolate, acute; petals obovate, with simple nerves. 2. H. Native of the Andes of Peru, in very cold places. Herb growing in dense flat tufts. Surculi short. Stems few-flowered, 3-5-flowered, covered with short glandular hairs. Upper cauline leaves simple, linear, all the rest tripartite. Petioles linear, dilated. Peduncles and calyces densely clothed with short glandular down. Flowers milk-coloured, fading to a yellowish colour.

Paton's Saxifrage. Pl. 4 lip to ½ foot.

Piedmont Saxifrage. Fl. May, June. Pl. ½ lip to ½ foot.

148 S. quinquedens (Haw. syn. succ. p. 325. and enam. sax. p. 30.) naked; leaves of the twigg surculi 3-5-cleft, remote, length of the internodes; lobes subulate, awaded, equal in length to the petioles, which are ciliated; petals orbicular. 3. H. Native country unknown.

Five-toothed-leaved Saxifrage. Fl. May, June. Pl. ¼ lip to ½ ft.

149 S. Paniculata (Hort. madr. ex Horn. horn. hahn. 1. p. 402.) leaves glabrous, 3-parted: lobes trifid, linear; cauline leaves tripartite, with entire lobes; stems ascending. 2. H. Native of Spain.

Pancicled Saxifrage. Pl. ½ foot.

150 S. Moschata (Wulf. in Jacq. misc. 2. p. 128. t. 21. f. 2.) plant pubescent; radical leaves trifid: succulene ones trifid or undivided, nerved; segments linear, acute; stems filiform, somewhat racemose; petals narrow-oval, hardly exceeding the calyx.

Musk Saxifrage. Fl. May, June. Pl. ½ foot.

Var. β, cassinifolia (Gudin, syn. sax. and in fl. helv. 3. p. 31.) leaves nearly sessile, flaccid, for the most part undivided; stems rather paniculate. 2. H. Native of the Alps of Savoy. S. muscoides γ, D. C. prod. 4. p. 26.

152 S. pygmea (Haw. misc. nat. p. 168.) plant quite glabrous; succulene very short, rostrate; leaves lanceolate, nerverless, glabrous, blunt, and rather cut at the apex; calypine segments broadly ovate; petals oval, hardly longer than the calyx. 2. H. Native of the Pyrenees. S. muscoides γ hemispherica, Lapeyr. pyr. sax. p. 60. t. 36. S. moschata, Smith, engl.
culi short, rostrate, very leafy. Stems filiform, slender, few-
leafed, 3-4-flowered, beset with glands. Flowers the smallest
of all the section, of a yellowish colour. Calyx and pedicels

Pygmy Saxifrage. Fl. May, June. Scotland. Pl. 1 to 2
inches.
153 S. Terete'k'ssisa (Bunge, in Ledeb. fl. ros. alt. ill. t. 398. fl. alt. 3. p. 125.) plant small, tufted; radical leaves much
crowded, cuneate, trilobate; segments oblong-linear, obtuse;
cladini  with a few glands; calume leaves few, trilobed or entire;
stem few-flowered, glandular; petals oblong, twice the length of
the calyx. 2. 1. Native of Altaiia, in rough stony places on
tops of mountains, between the rivers Ural and Koksun.
Flowers pale yellow. Allied to S. moschata, but differs in
the flowers twice the size, and in the petals being obovate-

Terekb Saxifrage. Pl. 1/2 foot.
154 S. Sec'un'da (Moretti, tent. sax. p. 20.) plant very vil-
rudous; radical leaves aggre gate, cuneiform, 3-5-clerit: lobes ob-
tuse; stems few-leaved, rather cor ymbosely; flowers secund;
lobes of calyx ovate, obtuse; petals obvate, longer than the
calyx. 2. 2. Native of Italy? S. carpitida, Biroli, fl. acm.
Second-flowered Saxifrage. Pl. 1/2 foot.
155 S. victoria (Haw. ennum. sax. p. 28.) plant almost stems-
less; leaves simple and trifid, nerved; sepals 1-flowered, fur-
nished with linear entire leaves. 2. 2. Native of Melville
Island. Perhaps only a variety of S. muscoidea, uniflora, or
carpitida.

Viey-leaved Saxifrage. Pl. 1 to 2 inches.
156 S. Glare'illa (Bertol. virid. born. 1824. p. 80.) surculi
densely leafy; stems few-flowered, glabrous; leaves all un-
divided, linear or spathulate, glabrous; peduncles and calyces

Petioles
thickened, cili-ated, sometimes larger. Petioles simple,
acutish, many-flowered, 5-lobed, yellowish, crowded, with
the calyx, nearly exceeding the leaves. 2. 2. Native of
Spain, on the mountains near Castelltort. S. cuneifolia, Cav.
icon. 3. p. 25. t. 248. but not of Lin. Lobaria cuneifolia, Haw.
ennum. sax. p. 19. Stems many, ascending. Lobes of leaves
acute. Flowers panicled, white. Peduncles elongated, 1-
flowered, smoothish.

Cuneate-leaved Saxifrage. Pl. 1/2 to 1/2 foot.
161 S. Globuli'ter (Desf. t. 2. p. 96. f. 1.) plant gen erous;
surculi 5-cleft to trifid, and sometimes simple, lanceolate, acutish,
and awned; flowers panicled; calyces segments oval-oblong, obtuse; petals
broad. 2. 2. Native on the top of Mount Atlas. Plant
tufted. Stems erect, filiform, glabrous, furnished with a few
leaves. Segments of divided leaves lanceolate. Petioles cili-
ated. Axils of leaves furnished with globalar buds, which are
pedunculate, and formed of simple, ciliated, imbricated leaves;
these buds shoot out into surculi for the following year. Flowers
white, one half smaller than those of S. hypnoides, 5-7, dis-
posed in a raceme. Pedicels and calyces clothed with cili-
margin. Nerves of petals simple.
Var. B, Gibraltarians (Ser. in D. C. prod. 4. p. 31.) leaves
much smaller; lobes short, ovate, acutish; buds in the axils
of the leaves smaller, oblong, acutish; stems few-flowered.
2. 2. Native of Gibraltar. Styles not exceeding the calyx
at maturity.

Globular-bearing Saxifrage. Pl. 1/2 foot.
162 S. Hypnoides (Lin. spec. p. 575.) plant gen miferous;
surculi very long, procumbent; radical leaves 5 or 3-parted;
surculine leaves simple, linear, stiff, ciliated, m cruncelately
awned; calyces segments triangularly ovate, awned; petals roundish-

Saxifragaceae. I. Saxifraga.

Plant densely tufted, spreading close on the ground. Sur-
culi short, rostrate, very leafy. Stems filiform, slender, few-
leafed, 3-4-flowered, beset with glands. Flowers the smallest
of all the section, of a yellowish colour. Calyx and pedicels
SAXIFRAGACEÆ. 1. SAXIFRAGA.

pyc. sax. p. 57. t. 32. Smith. engl. bot. t. 454. S. elongella, platipetal, densa, curvata, densifolia, Schleih. cat. 1821. Herb densely tufted before flowering, quite glabrous, but afterwards becoming loose, surculose, and villous. Surculi reddish as well as stems, which are erect, shining, brittle, and 2-4-flowered. Surculine leaves furnished with ovate, acute buds in the axils. Cauline leaves few, linear-lanceolate, undivided. Peduncles elongated. 1-flowered, clothed with viscid down as well as the calyxes. Petals white, triple-nerved, rose-coloured on the outside at the apex; nerves simple.

Var. ß, angustifolia (D. Don, l. c.) surculi ascending; leaves longer. ATAL. H. Native of the Alps of Scotland. S. angustifolia, Hortul. S. hypnoides Aitômi, Haw. enum. sax. p. 328. S. Sponihemica, Gmel. fl. bad. 2. p. 224. ATAL. ß, muscosa (D. Don, l. c.) plant one half smaller and slenderer; segments of leaves smaller; flowers smaller. ATAL. H. Native of the Alps of Scotland.

Var. ß, puleghella (D. Don, l. c.) plant more robust; surculi thicker and stiffer, and more crowded; surculine leaves broader, with a furrow on the upper surface. ATAL. H. Native of the Alps of Scotland.

Condensed Saxifrage. Fl. May, in Scotland. Pl. 1 foot. 164 S. elongella (Smith, in Lin. soc. trans. 10. p. 340. engl. bot. 2277. exclusive of the synonyme of Donn, cant.) surculi short; erect; radical leaves 5-leaflet or trifid; surculine leaves for the most part tridentate; teeth mucronate; calyceine segments ovate, awned; petals obovate. ATAL. H. Native of Scotland, on humid rocks near Linrathen, in Angussia. S. hypnoides a, elongella, Ser. in D. C. prod. 4. p. 30. Herb quite glabrous, and densely tufted before flowering, but afterwards becoming loose and rather villous. Stems erect, nearly naked, 2-3-flowered, smoothish. Petioles slender, dilated. Peduncles very long, 1-flowered, best with glandular-hairs. Petals white, triple-nerved; lateral nerves curved, branched; middle one simple, straight.

Longish-stalked Saxifrage. Fl. Apr. May. Scot. Pl. ½ ft. 165 S. leptophylla (Pers. syn. 1. p. 490.) surculi procumbent, very long, slender; radical leaves 5-parted; surculine ones 3-parted or undivided; segments linear-lanceolate, very acute, divaricate; calyceine segments oblong-ovate; petals stipulate, quite entire. ATAL. H. Native of the Alps of Switzerland, and on the mountains of Wales. S. retròfléxâ, Hortul. Plant quite glabrous, and densely tufted before flowering, but afterwards loose, diffuse, and surculose, and beset with viscid villi. Stems numerous, flexuous, smoothish, shining, many-flowered. Leaves without any buds in the axils. Segments of leaves awned. Flowers drooping, white. Peduncles elongated, and are as well as the calyces beset with glandular pili. Calyceine segments ending in a reflexed mucron each. Petals triple-nerved, with the nerves simple.

Var. ß, angustifida (D. Don, in Lin. trans. 13. p. 450.) plant slenderer; segments of leaves narrower. ATAL. H. Native of Wales, on the mountains.

Slesnder-leaved Saxifrage. Fl. May, Ju. Wales. Pl. ½ ft. 166 S. letevires (D. Don, in Lin. trans. 13. p. 451.) surculi procumbent, elongated; leaves 3 or 3-parted; segments linear, acute; calyceine segments lanceolate, mucronate; petals stipulate, emarginate. ATAL. H. Native of the Alps of Scotland, on the loftiest rocks, in moist situations, in Angussia and Aberdeenshire, and on the hills to the north of Loch Lomond. Herb pale green, densely tufted before flowering, and quite glabrous, but afterwards becoming loose, diffuse, and surculose, and beset with long scattered villi. Surculis destitute of buds in the axils of the leaves. Stems erect, few-leaved, usually 3-flowered, rarely 1-flowered. Radical leaves 5-parted: surculine ones 3-parted: lower calyceal ones 5-parted: upper calyceal ones undivided, lanceolate, and acuminate. Flowers campanulate, white, drooping while in the bud. Petals triple-nerved; nerves simple, green.

§ 3. Annual or biennial plants, without surculi. Roots fibrous. Petals usually emarginate.

167 S. arachnoidea (Sternh. rev. sax. p. 23. t. 15. and in Surm, deutschl. fl. 35. no. 7, with a figure) stems weak, diffuse, much branched, very pilose; leaves very thin, somewhat cuneate, obovate, 3-5-nerved; flowers on long peduncles: peduncles divericate: lobes of calyx ovate-lanceolate, shorter than the tube, which is rather villous; petals ovate, entire, hardly exceeding the calyx; styles much shorter than the calyx, parallel. ATAL. (Sternbh.) ß. (Ser.) H. Native of Tyrol, in shady rocky places. Moretti, sax. p. 28. Lobátarea arachnoidea, Haw. enum. sax. p. 20. Flowers white.

Gg

FIG. 46.
SAXIFRACEAE.  I. Saxifraga.

diffusely branched, furnished with glandulariferous hairs. Stems erect, branched at the base; branches elongated, fastigate. Radical leaves on long petioles, somewhat reniform at the base; lobes obtuse; cauline leaves all petiolate; upper cauline leaves undivided, acute at both ends: lower cauline ones tripartite; lobes acute. Peduncles and calyces clothed with viscid down. Flowers white, much larger than those of S. tridactylites. Petals triple nerves; nerved simple.

Rock Saxifrage. Fl. April, May. Clt. 1752. Pl. \( \frac{1}{4} \) to \( \frac{1}{2} \) ft. 159 S. tridactylites (Lin. spec. 578.) primordial leaves entire, and spatulate: cauline ones quinquefid or trifid; calyx urn-formed; with very short, obtuse segments; petals obovate, truncate at the apex. O. H. Native of Europe, in dry sandy places, and on walls and roofs of houses; plentiful in Britain. Curt. Lond. fasc. 2. t. 28. Smith, engl. bot. t. 591. Sternb. sax. p. 44. t. 17. and in Sturm, deutschl. fl. 33. no. 15. S. amnua, Lapeyr. pyr. sax. p. 53. Tridactylites amnua, Haw. enum. sax. p. 21. — Moris. hist. 3. p. 478. sect. 12. t. 9. f. 31. Stems erect, branched, flexuous, many-flowered, furnished with short glandulariferous hairs. Radical leaves crowded. Peduncles ciliated with glands. Peduncles and calyces clothed with viscid down. Flowers smaller, white; petals with 3 nerves.

S. prostrata (Caudin, fl. helv. 3. p. 116.) leaves all oblong-spatulate; stem simple, few-flowered. O. H. Native of Switzerland, Italy, France, &c. S. esilis, Poll. veron. 2. p. 31.

Three-fingered-leaved or Wall Saxifrage. Fl. April, May. Britain. Pl. \( \frac{1}{4} \) to \( \frac{1}{2} \) ft. 170 S. contraversa (Sternb. sax. p. 43. t. 16.) plant beset with glandulariferous viscid hairs; radical leaves crowded, 3-5-toothed, or sometimes nearly entire; calyceal lobes ovate, shorter than the tube at maturity; petals obcordate, larger than the calyx; styles much divaricate, longer than the calyx. O. H. Native of the Alps of Lapland, Norway, Savoy, Carinthia, Piedmont, Dauphiny, Carpathian Mountains, and the Pyrenees. S. tridactylites var. oov. — Lin. spec. ed. 1. p. 104. S. adscendens, Lin. spec. p. 570. mut. p. 884. All. pedem. p. 1537. t. 22. f. 3. Wulf. in Jacq. coll. 1. p. 197. t. 11-12. f. 1-2. S. petrae'a, Gunn. norv. p. 427. t. 9. f. 1-3. exclusive of the syn. and description of Lin. Fl. dan. t. 680. D. C. fil. fr. 4. p. 370. S. hypnoides, Scop. carn. 499. t. 16. Gaudin, fl. helv. 3. p. 117. S. Scopoli, Vill. daphn. 4. p. 673. S. petrae'a integroflora, Gaudin, in Meisn. anz. 1818. p. 67. fl. helv. 3. p. 117. var. \( \beta \). S. contraversa \( \alpha \) and \( \beta \), Ser. in D. C. prod. 4. p. 34. S. tridactylites \( \beta \), alpicola, D. Don, in Lin. trans. 13. p. 441. Tridactylites petrae'a, Haw. enum. sax. p. 22. Flowers corymbose, white, twice the size of those of S. tridactylites. The plant is much larger than S. tridactylites; the radical leaves more crowded; the cauline ones more numerous, and for the most part 5-toothed.

Var. \( \beta \), littoralis (Ser. in D. C. prod. 4. p. 34.) plant small, very leafy; leaves usually quinquefid; petets entire. O. H. In humid places on the banks of Lake Leman, S. petrae'a littoralis \( \epsilon \), Gaudin, fl. helv. 3. p. 117.

Contrary-turned Saxifrage. Fl. May, Ju. Clt. 1800. Pl. \( \frac{1}{4} \) ft. Cult. Saxifraga is a most extensive genus of pretty alpine plants, the greater part of which are well adapted for rockwork, or to be grown on the sides of naked banks to hide the surface. Many of the more rare and tender kinds require to be grown in pots, in light sandy soil, and placed among other alpine plants, so that they may be protected by a frame in winter. The species belonging to sections Micranthes and Hirculus grow best in a peat soil, which should be kept rather moist. The species belonging to the section Porphyroculas are so very pretty little plants as to be worth growing in pots for ornament, being clothed with elegant little red flowers early in spring: a mixture of peat and sand suits them well. S. sarmentosa does best in a greenhouse. All the species are easily increased by dividing. S. ligulata, cordifolia, and erastisoli are strong growing plants, well fitted for ornamenting flower-borders.

II. ERIOGYNA. III. LEPTARRHENEA.

ERIOGYNA (from \( \epsilon \) rao, erian, wool, and \( \gamma \) ryn, gyne, a female; in reference to the ovaries being woolly). Hook. in fl. bor. amer. 1. p. 255. t. 88.

LIN. Syst. Icosandra, Tetra-Hexagynia. Calyx turbinate, 5-cleft. Petals 5, hardly unguiculate. Stamens 20, inserted in the mouth of the tube, monadelphous at the base; anthers 2-celled, roundish. Ovaries 4-6, distinct from the calyx, and from each other, but connected by dense wool. Styles elongated, deciduous, filiform. Carpels 4-6, distinct, oblong, acute, recurved at the apex, opening lengthwise inside. Seeds dust-formed, pendulous, inserted towards the tops of the valves at the margins. Albumen wanting.—A perennial herb, native of North America, with the habit almost of Saxifraga cero-phylla; stoloniferous. Leaves very stiff, coriaceous, 1-nerved, quite glabrous, trifid; segments trifid or quadridif: lobules linear. Flowers white, disposed in racemes, for the most part bracteate; pedicels 1-flowered.

I. E. pectinata (Hook. l. c.). 2. H. Native of Behring's Straits; height of land upon the Rocky Mountains, on the west side, near the sources of the Columbia. Saxifraga pectinati, Pursh, fl. bor. sept. 1. p. 312. Sterile stems tufted, decumbent, stiff, stoloniferous. Lower leaves rosetulate, with 3 trifid segments: lower cauline ones with 3 bifid segments: upper cauline ones or bracteas trifid.

Pectinated-leaved Eriogyna. Pl. \( \frac{1}{4} \) foot.

Cult. This is a beautiful alpine plant. It should be grown in pots, in a mixture of peat and sand; and will be easily increased by dividing, or by cuttings.

III. LEPTARRHENA (from \( \alpha \) ptoev, lepto, slender, and \( \alpha \) ryn, archev, strong; plant strong and slender). R. Br. in chlarn. melv. p. 15. append. to Parry's 1st voy. p. 273. D. C. prod. 4. p. 48. Hook. fl. bor. amer. 1. p. 256. t. 89.

LIN. Syst. Decandria, Digynia. Calyx campanulate, short, 5-cleft (f. 47. a.), with a broad tube. Stamens 10, inserted in the throat of the tube; anthers 1-celled (f. 47. c.), 2-valved. Petals 5 (f. 47. b.), linear. Ovaries 2 (f. 47. c.), free, tapering into the styles, which are permanent. Stigmas obtuse. Carpella 2, opening lengthwise on the inside (f. 47. d.). Seeds sebiform, erect, inserted in the margins of the valves.—Herbs with a habit between Pyrola and those species of Saxifraga belonging to section Micranthes; inhabitants of cold places of North America. Scapes naked. Flowers disposed in racemose panicles. Leaves coriaceous, permanent, entire, coarsely serrated; petioles broad and sheathing.

I. L. pyrolifolia (R. Br. in Parry's 1st voy. append. p. 273. Hook. l. c.). 2. H. Native of the Island of Unalaska, Behring's Straits, height of land on the west side of the Rocky Mountains, in lat. 52°. L. amplexi-

Pyrolo-leaved Leptarrhena. Pl. ½ to 1 foot. Cult. See Erigynia above for culture and propagation.

IV. CHRYSOSPLENIUM (from chrysos, gold, and stenos, spleen, the spleen; in reference to the golden colour of the flowers, and the supposed virtue of the plant in diseases of the spleen). Tourn. inst. t. 60. Lin. gen. 558. Gárt. fruct. 1. p. 208. t. 44. f. 7. D. C. prod. 4. p. 48.

LIN. SYST. Octo-Decandra, Dígynia. Tube of calyx adhering to the ovary; limb 4-5-lobed (f. 48. a.): lobes obtuse. Stamens 8-10, alternating with the sepals, and opposite them. Styles 2. Capsule bissectile (f. 48. c. d.), 2-valved, at length 1-celled, many-seeded. Seeds very smooth, inserted towards the bottom of the capsule.—Perennial herbs. Leaves thickish, simple, petiole, toothed. Flowers somewhat corymbose, yellow.

1. C. alternifólium (Lin. spec. 560.) leaves alternate, reniformy cordate, crenately lobed; flowers corymbose, dichotomous. 2. H. Native of Europe, in moist shady places, and by the borders of shady rivulets, in Siberia and North America; in the woody and principally the barren country of British North America; to the extreme Arctic Islands, and on the Rocky Mountains; also in Kotzebue’s Sound. In many parts of the north of England, but not so common as C. oppositifólium, as in Yorkshire, Portland Heath, near Norwich, in Worcestershire; and in lowlands of Scotland. Smith, engl. bot. t. 54. Fl. dan. t. 366.—Moris. hist. p. 477. sect. 12. t. 8. f. 8. Stems usually 3-cornered. Flowers yellow. Roots having offsets, but not creeping.

Var. g, Silicícum (Ser. in D. C. prod. 4. p. 48.) stems and leaves smaller. 2. H. Native of Siberia, about the Baical, and of Dahuria. C. Silbíicum, Steph.? ex Fisch. in litt.

2 C. ovalifólium (Bieb. herb. ex Led. fl. ross. alt. ill. t. 404. fl. alt. 2. p. 115.) stems with many scattered leaves; leaves ovate-elliptic or elliptic, tapering into the petiole, crenately serrated or entire; corymb dichotomous, loose. 2. H. Native of the Altai region. Root creeping. Stem pilose below. Flowers yellow, solitary in the forks of the corymb.

3 C. oppositifólium (Lin. spec. p. 569.) floriferous stems erect; leaves opposite, reniformly sub-cuneate, crenated; flowers corymbose. 2. H. Native of Europe and America, in moist shady places, and by the sides of rivulets. In Britain, in many places, in like situations. Curt. Lond. 2. t. 27. Smith, engl. bot. 490. Gárt. fruct. 1. t. 44. f. 7. Oed. fl. dan. t. 365. Root creeping. Stems quadrangular. Flowers yellow.

Var. /, Scouleri (Hook. fl. bor. amer. 1. p. 242.) leaves profoundly crenately serrated. 2. H. Native of the north-west coast of America, on the banks of the Columbia river.

6 C. Nipale'nse (D. Don, prod. fl. nep. p. 210.) leaves opposite, orbicularly subcordate, crenately serrated, glabrous. 2. H. Native of the Alps of Nepal. Very nearly allied to C. oppositifólium, but differs in the leaves being more reniform, less manifestly crenated, and in the seeds being opaque, not shining. Leaves like those of Létula nana, but membranous. Flowers yellow.

7 C. nud'vèlète (Bunge, in Led. fl. ross. alt. ill. t. 405.) cauline leaves wanting: radical ones reniformy orbicular, and are as well as the floral ones, which are reniform, petiolate, and deeply lobed; flowers densely glomerate. 2. H. Native of Altaia, near springs at the foot of the Alps, about Chasian, near Tschetcheluchila, at the river Tscharsch. Root creeping, furnished with thick brown fibres. Plant quite glabrous, except sometimes on the under side of the leaves. Flowers greenish, much larger than those of C. alternifólium.

Naked-stemmed Golden Saxifrage. Pl. ½ to ¾ foot.

8 C. Kant'shat'chum (Fisch. in litt. ex D. C. prod. 4. p. 48.) stems erect, nearly naked, 2-leaved, the rest crowded near the flowers, cuneate, obtuse, somewhat crenated, glabrous. 2. H. Native of Kamtschatka.

Kant'shat'cha Golden Saxifrage. Pl. ½ foot.

Cult. A moist shaded situation is the best for the species of Chrysospleniun, as under the shade of trees or bushes, or behind a north wall; and they thrive best in peat soil. Easily propagated by dividing.

V. MITE'LLA (a diminutive of mitra, a mitre; the form of the fruit being somewhat like a mitre). Tourn. inst. 126. Lin. gen. 561. Gárt. fruct. 1. p. 208. t. 44. f. 6. Lam. ill. t. 373. D. C. prod. 4. p. 49.

LIN. SYST. Decándria, Digynia. Calyx campanulate, 5-lobed, rather adnate to the base of the ovary. Petals 5, inserted in the calyx, jagged or toothed, longer than the calyx. Stamens 10. Styles 2, short, joined together in one; stigmas hardly distinct. Capsule 1-celled, 2-valved, adhering to the base of the calyx a little way. Seeds numerous, erect, in the bottom of the capsule.—Perennial herbs. Leaves petiolate, cordate, mostly radical. Flowers on short pedicles, disposed in loose terminal racemes, white or red.

1 M. Dip'ylla (Lin. spec. p. 580.) radical leaves cordate, somewhat 3 or 5-lobed, dentately serrated, on long petioles; cauleine leaves 2, opposite, smaller, and nearly sessile; capsule joined with the calyx only at the base; petals pinnatifidly fringed.

2 H. Native of North America, in the United States; and Canada, about Quebec, Lake Huron, &c. Lam. ill. t. 373. f. 1. Gárt. fruct. 1. t. 44. f. 6. Schkühr, handb. t. 120. Ker. bot. reg. t. 166.—Menz. pug. t. 10. Flowers white.
Two-leaved Mitella. Fl. Apr. May. Cl. 1731. Pl. ½ to ¾ ft. 2 M. su'da (Linn. spec. 580.) plant usually stoloniferous; radical leaves reniformly cordate, thin, bluntly lobed, crenated, and somewhat ciliate; scapes slender, leafless; calyx spreading; petals pectinately jagged; ovarium joined to the calyx only at the very base. 2. H. Native of Canada, from Lake Huron to the Arctic Sea; and from Hudson's Bay to the Rocky Mountains; and of Siberia, at the river Lena. M. reniformis, Lam. ill. t. 573. f. 2. M. cordifolia, Lam. det. 4. p. 196. ill. t. 573. f. 3. Michx. fl. bor. amer. 1. p. 270. M. prostrata. Michx. fl. bor. amer. 1. p. 270.—Gmel. sil. 4. t. 68. f. 2. Flowers white. The plant here characterized is the acknowledged M. cordifolia of all American botanists. A comparison of it with the figure of Gmelin will show that it is the same with his species, and consequently the M. nuda, Lin., and among the numerous specimens gathered by travellers in North America, many throw out runners, which again bearing leaves and capsules, the plant becomes the M. prostrata of Michx.

Naked-stemmed Mitella. Fl. Apr. Ju. Cl. 1738. Pl. ½ to ¾ ft. 3 M. tri'nda (Graham, in edibn. phil. journ. June, 1829. Hook. fl. bor. amer. 1. p. 241. t. 82.) radical leaves cordate, bluntly lobed, crenated; scapes leafless; flowers pentandrous; calyx campanulate, with a spreading limb; petals trifid; ovary adhering to the calyx only at the base. 2. H. Native of North America, in alpine rivulets north of the Smoking River, on the east side of the Rocky Mountains, in lat. 56°, but rare. Plentiful in woody situations, on the low ridge of the Blue Mountains of Lewis and Clark's River, west of the Rocky Mountains, in lat. 46°. M. parviflora, Doug. mss. Flowers white. This species has the petals similar to those of Tellíma parviflora. Differs from the rest of the species in the petals being trifid, and in the stamens being only 5 instead of 10, opposite the lobes of the calyx. Perhaps a species of Drum'mondia.

Trifid-petalled Mitella. Fl. May. Cl. 1829. Pl. ½ to 1 ft. Cult. The species of Mitella are pretty plants, well suited for the front of flower Borders, or to grow on rockwork. They are readily increased by dividing. Any light soil suits them, although they grow most luxuriant in a peat soil.

VI. TELLÍMA (an anagram of Mitella; separated from it). R. Br. in Frankl. narr. journ. p. 766. verm. schrift. 1. p. 545. Doug. in bot. reg. 1178. Hook. fl. bor. amer. 1. p. 239. D. C. prod. 4. p. 49. LIN. SYS'T. Deca'dría, Digí'nia. Calyx adnate to the ovary at the very base, having the free part inrolled, ovate, and 5-toothed (f. 49. b.), and the adhering part conical. Petals 5 (f. 49. c.), inserted in the calyx, jagged. Stamens 10 (f. 49. a.). Styles 2-3, distinct from the base; stigmas subcapitate, angular. Capsule adnate to the calyx at the base: the other half superior and furnished with the permanent flower, 1-celled, 2-valved at the apex; placenta parietal, many seeded (f. 49. f.). This is an intermediate genus between Heuchera and Viá'lia. It differs from Mitella in the styles being distinct, and the different habitat. Perennial herbs. Leaves all radical, roundish, cordate, bluntly lobed, in T. parviflora compound, toothed, and hispid. Flowers of a dirty red colour, rather large, disposed in racemose spikes.

1 T. grandiflóra (Dougl. in bot. reg. t. 1178.) leaves cordate, lobed, dentately serrated; racemes elongated; petals obtuse, long-linear, pinnatifidly jagged; styles 2. 2. H. Native of the north-west coast of America, in shaly pine woods, near springs along the shore. Mitella grandiflora, Pursh. fl. amer. sept. 1. p. 314. This is a fine plant, with leaves as large as those of Mátia rotundifólia. Flowers reddish. Stem and pedioles generally thickly clothed with fulvous hairs.

Great-flowered Tellíma. Fl. April, May. Cl. 1826. Pl. 1 ft. 2 T. parviflóra (Hook. fl. bor. amer. 1. p. 239. t. 78. A.) plant scabrous from hairs; leaves terete; leaflets deeply pinnatifid; racemes short; petals unguiculate, trifid; styles 3. 2. H. Native of North Carolina. Abundant in light gravelly soils, under the shade of sapling pines. North Carolina; plentiful in low hills at the grand raptis of the Columbia; and also at Spoonican river. Root small, rather fusiform, more or less fibrous, and bearing tubers; tubers granular. Racemes terminal, curved. Flowers middle-sized, red. This is a curious and distinct plant, with something of the habit of slender specimens of Saxifraga granulata.

VII. DRUMMON'DIA (named after Thomas Drummond, who accompanied Capt. Franklin and Dr. Richardson in their last journey in North America). D. C. prod. 4. p. 49.—Mitella species, Graham.

LIN. SYS'T. Pentá'ndria, Digí'nia. Calyx with an obconical tube (f. 50. b.), adhering to the capsule a considerable way: limb 5-cleft: lobes triangular, valvate in aestivation (f. 50. a.), and at length reflexed. Petals 5, pectinately pinnatifid (f. 50. e.), alternating with the calycine lobes. Stamens 5, in front of the claws of the petals, nearly sessile. Stigmas 2, spreading, 2-lobed. Capsule 1-celled, 2-valved at the apex, bursting long before the seeds are mature (f. 50. d.). Seeds numerous, disposed along 2 opposite placenta.—An herb, with a habit between Mitella and Heuchéra. It differs from Mitella in the capsule adhering a greater length to the calyx, in the stamens being 5, not 10, and in the stigmas being spreading, not erect, and 2-lobed, not entire; and from Heuchéra in the calycine lobes being valvate, not imbricate in aestivation.

VIII. TIARELLA (a diminutive of tia'ra, a Persian diadem; in reference to the shape of the capsules). Lin. gen. no. 763. Juss. gen. p. 309. Lam. ill. t. 373. D. C. prod. 4. p. 50. LIN. SYS'T. Deca'dría, Digí'nia. Calyx 5-parted, permanent, adhering at the base to the ovarium: lobes obtuse. Petals 5, unguiculate, entire, inserted in the calyx, and alternating with the calycine lobes. Stamens 10. Styles 2, distinct. Ovarium 2-celled. Capsule 1-celled, adnate to the calyx at the base, mem-
branious, 2-valved; valves unequal, opening between the styles (one of the valves or carpels usually abortive). Seeds fixed to the bottom of the capsule, along the margins of the carpels or valves.—Perennial herbs, with the habit of Mitella. Stems erect, naked, or few-leaved. Leaves for the most part radical, petiolate. Rachemes terminal, simple; flowers distant, pedicellate; pedicels incurved pendulous when bearing the fruit. A very heterogenous genus, which may probably be hereafter divided.

§ 1. Leaves simple.

1 T. cordifolia (Lin. spec. p. 580.) stems leafless; stolons creeping; leaves cordate, acute, deeply lobed, serrated: teeth mucronate; rachemes simple. 2. H. Native of Canada, about Montreal; and also of the north of Asia. Sims. bot. mag. 1589. Lam. ill. t. 373. f. 1. Flowers white. Habit of Mitella diphylla.

Cordate-leaved Tiarella. Fl. April, May. Clt. 1731. Pl. ½ ft. 2 T. unifoliata (Hook. fl. bor. amer. 1. p. 238. t. 81.) plant smoothish; stems furnished with one leaf; leaves all petiolate, triangularly cordate, bluntly toothed: teeth mucronate; panicle loose; flowers drooping; calyx campanulate; petals abortive. 2. H. Native of North America, on the height of land on the Rocky Mountains, near the source of the Columbia, and at Portage river. Stems rather pubescent above. Leaves 3-5-lobed; lobes acutely toothed. This species has much the habit of Heuchéra glabrā, and is probably a decadrous species of that genus. The petals, if any exist, must be very fugacious, as none has been seen.

One-leaved Tiarella. Pl. 1 foot.

3 T. Menzie'sii (Pursh, fl. amer. sept. 1. p. 313.) leaves oval-cordate, acute, toothed: cauline ones alternate, distant; racemes filiform, somewhat spicate; calyx tubular. 2. H. Native of the north west coast of America.

4 T. alternifollya (Fisch. in litt. ex D. C. prod. 4. p. 59.) stem leafy; lower leaves cordate; upper ones truncate at the base, all having 3-7 short lobes, and these lobes are lobed again, sharply and coarsely toothed; lobes of calyx oblong, erect. 2. H. Native of the north of Asia, in the island of Sitka. Radical leaves on long, upper ones on short petioles. Flowers twice the size of those of T. polyphylla.

Alternate-leaved Tiarella. Pl. 1 foot.

5 T. polyphylla (D. Don, fl. nep. p. 210.) stem furnished with 3 leaves, beset with glandular hairs; leaves cordate, 3-5-lobed, sharply serrated, pilose on both surfaces; lobes of calyx lanceolate, mucronate, pressed to the fruit; racemes loose. 2. F. Native of Nipaul. Habit of T. cordifolia or Mitella diphylla. Racemes many flowered. Fruit pendulous.

Many-leaved Tiarella. Fl. April, May. Clt. 1820. Pl. ½ to 1 foot.

§ 2. Leaves compound.—Blondia, Neck. clm. 2. p. 115.

6 T. trifoliata (Lin. amoen. acad. 2. p. 355. spec. p. 580.) stem furnished with 1 or 2 leaves, rarely naked; leaves all trifoliat: leaflets rhomboid-ovate, deeply toothed: teeth mucronate; panicle loose; flowers drooping; calyx small, campanulate; petals obovate, lanceolate. 2. H. Native of the north of Asia, and the north-west coast of America; common on the coast, and on the Rocky Mountains, on the west side of the ridge. The specimens from the Rocky Mountains are glabrous, and many of those from the coast, while others are more or less pubescent. Two panielles are often produced on the same stem.

Trifoliate Tiarella. Pl. 1 foot.

7 T. laciniata (Hook. fl. bor. amer. 1. p. 239. t. 77.) plant rough and hairy; stems usually furnished with 3 leaves; leaves trifoliat: middle leaflet trifid; lateral ones bifid, all broadly lanceolate, and pinnatifidly jagged; panicle loose; flowers drooping; calyx short, campanulate; petals wanting? 2. H. Native of the north-west coast of America. Roots rather horizontal. The petals, if any, must be very fugacious, as none have been seen.

Jagged-leaved Tiarella. Pl. ½ to 1 foot.

8 T. stenophylla (Presl, in reliq. Hænk. 2. p. 45.) stems 1-leaved, and are, as well as the branches, clothed with glandular pubescence; radical leaves unknown: cauline one trifoliat: leaflets glabrous, deeply lobed, mucronately toothed, acute: lateral leaflets oblong, oblong-ovate, middle one acute at the base; petals subulate, very narrow; capsules erect, dotted. 2. H. Native of North Sound. Panicle many flowered. Narrow-panicated Tiarella. Pl. 1 foot.

Cult. For culture and propagation see Mitella, p. 228.

Lin. syst. Octo-Decandra, Bigynia. Calyx deeply 4-5-parted, coloured; segments oval, obtuse, concave. Petals wanting. Stamens 8-10, opposite the calyceous lobes; filaments subulate; anthers spherical, 2-celled. Styles 2; stigmas 2, truncate, pruinose. Capsule superior, biorstrate, many-seeded. Petals in robust pilose herbs, with the appearance of Spirea Ariaœus, inhabiting the banks of rivulets. Leaves large, binate; leaflets coarsely serrated; petals much dilated at the base. Flowers small, of a greenish yellow-colour, in spicate racemes, which are disposed in panicles.

1 A. rivulær (Hamilt. l. c.) flowers 4-cleft, octandrous; leaves binate; leaflets ovate, doubly serrated, villous beneath, and on the petiole. 2. H. Native of Nipaul, at Narrainhetti. Bracteas usually jagged at the apex.

Rivulet Astilbe. Pl. 3 feet.

2 A. deca'ndra (D. Don, prod. fl. nep. p. 211.) flowers 5-cleft, deciduous; leaves binate; leaflets cordate, deeply lobed and serrated, beset with glandular pilis beneath, and on the petiole. 2. H. Native of North America. Tiarella biterà, Vent. malm. t. 51. The petals are said to be 5, and linear, in this plant, not as in the first species wanting. Leaflets ovate, broadly and bluntly serrated.

§ 2. Stamens equal in number to the petals, or sometimes fewer, alternating with the petals.

1 H. America'na (Lin. spec. 328.) plant clothed with clammy pubescence, scapes and leaves roughish; leaves on long petioles, somewhat 3-5-lobed, toothed; thryse elongated, panicked; caly- cines lobes short, obtuse; petals lanceolate, length of the calyx:
SAXIFRAGACEae.

230.

2 H. caulescens (Pursh, fl. amer. sept. 1. p. 188.) plant suffrutescent at the base; lower part of scape and petals pilose; leaves glabrous above, but pilose at the nerves beneath, acutely lobed, ciliated, toothed; teeth acute, mucronate; calyx short, the length of the calyx; petals exserted.

2 H. Native of Carolina, on the mountains, and of Kentschata. Petals white.

9 H. Barbarossa (Prel, in reliq. Haenk. 2. p. 56.) plant suffrutescent at the base; floriferous stems clothed with rufous villi; petals very villous from rufous hairs; leaves roundish-cordate, bluntly lobed, mucronately toothed, ciliated, puberulous; panicle loose, many flowered; petals linear-oblong, longer than the calyx; stamens exserted.

2 H. Native of Nootka Sound. Plant small.

Barbarossa Heuchera. Pl. 1 foot.

10 H. cylindrica (Doug. fl. Hook. fl. amer. 1. p. 184.) scape naked, and are, as well as the petals, hairy; leaves cordate, obtuse, and roundly lobed, ciliated, truncate at the base, smoothish above, but very pilose at the veins beneath; teeth piliferous; panicule compact, cylindric, rather spicate; flowers rather large, apetalous; stamens inclosed.

2 H. Native of North America, on the declivities of low hills, and on the steep banks of streams on the west side of the Rocky Mountains. Like H. Richardsonii, but differs from it in the truncate base of the leaves, and in the spicate panicle, by having less oblique calyces, very short stamens, and by the absence of petals.

Cylindric-spiked Heuchera. Pl. 1 to 1 1/2 foot.

11 H. Richardsonii (R. Br. in Franklin, 1st journ. ed. 1. append. p. 766. t. 29.) scape naked, and are, as well as the petals, rather pilose; leaves cordate, with a deep recess, bluntly lobed, ciliated, crested, rather pilose on both surfaces: teeth piliferous; panicule loose, thyrsoid; flowers large; mouth of calyx oblique; petals obvolutely cuneated, hardly longer than the calyx; stamens a little exserted.

2 H. Native of North America, on the dry banks of rivers from lat. 54° to 64°.

12 H. Menziesii (Hook. fl. bor. amer. 1. p. 257. t. 80.) plant hispid from pili; stems leafy, leaves cordate, acutely lobed, deeply serrated; flowers racemose, apetalous; calyx cylindrically funicel-shaped; stamens exserted; ovary free. 2 H. Native of the north-west coast of America; at Banks's Isles, and from the coast of Columbia to Puget's Sound. Tiarella Menziesii? Pursh. fl. amer. sept. 1. p. 313. Racemes terminal, elongated, solitary, many flowered. Stamin 3, exserted. Petals 5, linear, reflexed. (f. 51.)

FIG. 51.

Far. 1; plant less hairy. 2 H. Native along with the species, in shady woods. H. triumf, Dong. ex Hook. 1. c. Monticola, Heuchera. Pl. 1 to 2 feet.

13 H. braezelanae (Ser. in D. C. prod. 4. p. 52.) plant pubescent; scape racemose; leaves orbicularly cordate, serrately cut: teeth mucronate; flowers bracteate; petals narrow, hardly

stamens much exserted.

There is a variety of this species having 2 of the petals longer than the rest. Flowers reddish. Perhaps H. reniformis and H. glauces, Rafin. med. fl. 1. p. 244. are not distinct from this.

Tar. 1, glabriuscula (Schultes, syst. 6. p. 216.) leaves smoothish; panicle rather crowded.

Far. 2, foliosa (Moricand, ms.) scapes furnished with a few long distant leaves. Native of Peru.

2 H. Divaricata (Fisch. in litt. ex D. C. prod. 4. p. 51.) scapes naked, glabrous; leaves glabrous, somewhat 5-lobed; lobes toothed: teeth mucronate; branches of panicle divaricate; teeth of calyx bluntish; petals lanceolate, acute. 2 H. Native of the north of Asia, in the islands of Kadiak and Sitka; also in Kentschata.

Divaricate Heuchera. Pl. 1 1/2 foot.

3 H. Pumisca (Pursh, fl. amer. sept. 1. p. 187.) plant covered with powder down; lower part of scape and under side of leaves glabrous; leaves somewhat acutely lobed, toothed; teeth rounded, mucronate; branches of panicle short, crowded with flowers; calyx broad, campanulate; petals spatulate, longer than the calyx; stamens exserted.

2 H. Native from Pennsylvania to Virginia, on the Blue Mountains. H. pulvulenta, Rafin. med. bot. 1. p. 213. Petals pale red, variegated with yellow. Flowers larger than in many other species.

4 H. Nuda (Pursh, fl. amer. sept. 1. p. 188.) plant hispid and sebaceous; scapes, petioles, and under side of leaves glabrous; leaves acutely lobed, toothed, hispid from vili above: teeth short, rather retuse, mucronate; branches of panicle few-flowered; calyx middle-sized, with acutish lobes; petals spatulate, length of calyx; stamens exserted.

2 H. Native of Virginia and Carolina, on high mountains. Flowers reddish.

Hispid Heuchera. Fl. May, June. C1. 1826. Pl. 2 to 3 ft.

5 H. microstachia (Doug. fl. in bot. reg. 1302.) lower part of scape and petioles beset with long fulvous hairs; leaves roundish-cordate, nearly naked, bluntly lobed, crenate: leaves mucronate; lower bracteae foliaceous, cut: upper ones setaceous; panicle loose; petioles linear, one-half shorter than the long exserted stamens.

2 H. Native of the north-west coast of America; on the steep rocky banks of the Columbia, near the Grand Rapids. Flowers greenish-yellow.

6 H. Villosa (Michx. fl. bor. amer. 1. p. 172.) lower part of scape and petioles beset with deflexed soft hairs; leaves cordate, acutely lobed, mucronately serrated, a little cut, nearly naked above, but very villous on the nerves beneath; panicle loose; peduncles caipillary, dichotomous; bracteae linear, ciliated; flowers small; petioles very long, narrow-spatulate, and are, as well as the stamens, much exserted.

2 H. Native of Upper Canada, and on the higher mountains of Virginia and Carolina. The leaves are very different from those of H. Americana, the flowers are smaller, and the petals regularly long and narrow, with few.

7 H. Glabra (Willk. in Schultes, syst. 6. p. 216.) scape leafy; leaves cordate, acutely lobed, glabrous, mucronate and acutely toothed; lower stem ones or bracteas toothed; panicle loose; flowers small; calyx pubescent; petals linear; stamens exserted.

2 H. Native of the north-west coast of America; Nootka, in the vicinity of the Columbia river; Rocky Mountains, at Providence and Portage rivers. Hook. fl. bor. amer.
longer than the calyx; stamens not exerted. 2. H. Native of North America, on the Rocky Mountains. **Siadella** bracteata, Torrey, in Ann. Lyc. 2. p. 204. Habit of a species of *Saxifraga*.

**Bracteolate-flowered Heuchera.** Pl. 1 foot.

14 H. LONGIFOLIA (Moc. pl. nooth. med. with a figure, ex D. C. prod. 4. p. 52.) scape pubescent; panicle secedum; petals linear, revolute at the apex, longer than the calyx.  2. H. Native of the north-west coast of America. Lobes of leaves broad, rather distinct, acutely toothed. Petals and styles white.

**Long-petalled Heuchera.** Pl. 1 foot.

15 H. ACERIFOLIA (Rafin. med. fl. 1, p. 211. t. 49.) petioles hairy; leaves smooth, glaucous beneath, acutely 5-lobed, unequally toothed; teeth mucronate; scapes smooth; panicle elongated, loose; petals short; stamens exerted.  2. H. Native of North America, on hills and in the fissures of rocks, in Kentucky, Tennessee; and west of Virginia, Maryland, and Ohio, &c.

**Maple-leaved Heuchera.** Pl. 1 foot.

16 H. squamosa (Rafin. med. fl. p. 244.) petioles pilose; leaves rather hairy, ciliated, cordate, acutely 7-lobed, dentilcated, glaucous beneath; scape pilose, furnished with distant ovate scales; panicle short, oval, crowded, scaly; pedicels short; lobes of calyx obtuse; stamens exerted.  2. H. Native on the mountains of Maryland, Virginia, and Kentucky. Perhaps the same as H. bracteata.

**Scaly Heuchera.** Pl. 1 foot.

**Cult.** The species of *Heuchera* thrive in any light garden soil, and are readily increased by dividing at the roots. None of the species are showy.

**Lin. syst. Triandra, Trigynia.** Tube of calyx turbinate, adnate to the ovary; limb truncate, with 2 triangular acuminate nearly opposite teeth. Bracteoles linear, adnate to the tube of the calyx. Petals 5 (f. 52. c.), (8-10 ex Forst.) linear-oblong. Stamens 3 (f. 52. f.), short, alternating with the petals. Styles 3 (f. 52. b.) -5, filiform. Ovarium 2-5-celled. Ovula numerous, fixed to the top of the cells. Fruit capsular.-A nearly stemless herb, with the habit of *Saxifraga caespitosa*. Stems tufted. Leaves alternate, linear, oblong, permanent, imbricated, thick, glabrous, woolly in the axils. Flowers terminal, sessile, solitary, white. Perhaps the petals are 6, and the stamens 6, 3 of them antheriferous, and the other 3 converted into petals. 1 D. MAGELLANICA (Forst. t. 1. c.)  2. H. Native of the Straits of Magellan, on humid rocks. Lam. ill. t. 51. Polycarpum Magellanicum, Lin. fil. suppl. 115.

**Magellan Donatia.** Pl. ½ fl. **Cult.** This plant will require to be grown in a small pot, well drained, in a mixture of sand, peat and loam; and placed among other alpine plants. It will be easily increased by dividing.

XII. LEPUROPETALUM (from λεπυρων, lepiron, a little scale, and petalos, petalon, a petal; in reference to the small scale-formed petals). Elliot, sketch 1. p. 370. D. C. prod. 4. p. 53.

1 L. SPATULA.TUM (Ell. t. c.)  2. F. Native of North America, in Georgia, in shady places. Pyxidanthéra spatulata, Muhl. cat.

**Spatulate-leaved Lepuropetalum.** Pl. ½ foot.

**Cult.** See Donatia above for culture and propagation.

**Lin. syst. Pentándria, Digynia.** Tube of calyx adhering to the ovum: limb 5-parted, permanent, valvate in aestivation. Petals 5, spreading, undivided, shorter than the calyx. Stamens 5: anthers versatile. Styles 2, capitate at the apex. Capsule 1-celled, 2-valved, truncate at the apex, 5-furrowed, crowned by the limb of the calyx, many seeded; placenta loose, hanging from the top of the cavity of the seed. Seeds convex on the outside, and concave on the inside.—Rather villous somewhat dichotomous herbs. Leaves opposite, exstipulate, linear or lanceolate. Flowers white, axillary, pedicellate; pedicels twining, 1-flowered, short.

* African species.

1 V. CAPEensis (Thumb. fl. cap. p. 246.) leaves linear or narrow-lanceolate; branches velvety at the top; pedicels twining, 1-flowered; styles exerted; capsules oblong.  2. G. Native of the Cape of Good Hope. Russel Capensis, Lin. fil. suppl. p. 175. Plant almost without a habit of a *Silene*, from ¼ to ½ foot high. Flowers white.

**Cape Vahila.** Pl. ¾ to 1 foot.

2 V. WELDENS (Reich, hort. bot. t. 91.) leaves ovate, acute; pedicels twining, 1-flowered; capsule globose.  0. H. Native of Upper Egypt, of Nubia near Dongolab; and of Senegal. Bistella ginniwolera, Caill. and Delil. pl. afr. p. 97. t. 63. f. 2. A much branched herb, beset with glandular hairs. Flowers white.

**Welden's Vahila.** Pl. ½ to ¾ foot.

3 V. RAMOSISSIMA (Alph. D. C. diss. med. ex D. C. prod. 4. p. 54.) stem much branched, hairy: hairs bearing viscid glands at the apex; leaves linear, pubescent; peduncles 2-flowered, shorter than the leaves; capsule ovate.  0. H. Native of Senegal. Flowers white. Habit of a *Silene* or *Arvensia*.

**Much-branched Vahila.** Pl. ½ to ¾ foot.

4 V. SILENOIDES (Alph. D. C. diss. med. ex D. C. prod. 4. p. 54.) stem branched, clothed with soft hairs; leaves linear, pubescent; peduncles 2-flowered, shorter than the leaves; capsule globose.  0. H. Native of the Cape Verd Islands. Flowers white.

**Catchfly-like Vahila.** Pl. ½ foot.

5 V. TOMETOSA (Alph. D. C. diss. med. ex D. C. prod. 4. p. 54.) stem branched, tomentose; leaves linear-lanceolate, rather hairy; peduncles 2-flowered, shorter than the leaves: flowers on short pedicels; capsule nearly globose.  0. H. Native of the north of Africa, in the kingdom of Cayor. Flowers white.
Tomentose Vahlia. Pl. ½ to ¾ foot.

** Asian species.**

6 V. Oldenlandiæ (D.C. prod. 4, p. 54.) stem erect; leaves linear, pubescent; peduncles axillary, 2-colored, shorter than the leaves. Ø. F. Native of Tranquebar. Oldenlandia pentándra, Retz, obs. 4. p. 22. Heuchéra dichotoma, Murr. comm. goett. 1772. p. 64. f. 1. Oldenlandia dichotoma, Spreng, pag. 2. p. 36. Flowers white. Perhaps Oldenlandia biloba, Roth, nov. spec. 97, but not of Linn. is sufficiently distinct from this; there are varieties of it with 4-5-parted flowers.

Oldenlandia Vahlia. Pl. 3 foot.

7 V. sessileflora (D.C. prod. 4, p. 54.) stems decumbent; leaves lanceolate; flowers axillary, sessile. Ø. H. Native of Tranquebar. Oldenlandia digyna, Retz, obs. p. 23. Oldenlandia sessileflora, Smith in Rees' cycl. vol. 25, no. 2. Flowers pentapetalous, dignous, white.

Sessile-flowered Vahlia. Pl. decumbent.

Obs. The Oldenlandia depressa of Willd. and Smith will probably make an eighth species to this genus when properly examined.

Cult. The seeds of all the species should be reared on a hot-bed; and in the month of May, when the plants will have obtained a considerable size, they may be planted out in the open border, in a warm sheltered situation. The F. Capensis, as being a herbaceous perennial shrub, will require the treatment of other green-house plants.

XIV. Cryptopetalum (from cryptos, hidden, and πεταλον, petals, a petal; petals minute, inclosed in the calyx). Hook. et Arn. in bot. misc. 3. p. 254.

Lin. syst. Penádustria, Trigynia. Calyx turbinate, 5-lobed, green: segments ovate, acute, spreading. Petals 5, inserted in the tube of the calyx, and alternating with its segments, inclosed, minute, spatulate. Stamens 5, inserted in the tube of the calyx, small, and almost inclosed, alternating with the petals; filaments filiform; anthers minute, roundish, orange-coloured, 2-celled. Ovarium subglobose, with the lower part adhering to the calyx: upper part free, 1-celled; placenta free, parietal, linear, divaricately bilamellate, many ovulate; ovula very slender, membranous. Styles 3, short, hardly united at the base; stigmas minutely papillose. Capsule globose, inclosed in the permanent calyx, 1-celled, opening at the cells, and 3-valved in the free part; each of the valves terminated by a permanent style. Seeds numerous, pale, oval, obtuse at both ends, dotted; albumen thin, fleshy. Embryo straight, central.—A small annual smooth herb, about half an inch high. Stems erect, dichotomous, branched; branches divaricate. Leaves alternate, spatulate, quite entire, fleshy, hardly nervèd. Flowers terminal, large for the size of the plant, emulating those of Chrysopélinum.

1 C. penillum (Hook. et Arn. l. c.) Ø. H. Native of Chili, at Quinanco. This curious plant is placed at the end of Saxifragaceae, because it seems more nearly allied to that order than to any other; it agrees with Chrysopélinum in many particulars.

Small Cryptopetalum. Pl. ½ inch.

Cult. Sow the seed in a small pot filled with a mixture of peat and sand.

Tribe II.

HYDRA'NGEA (plants agreeing with Hydrangea in being shrubby). D.C. prod. 4, p. 13. Shrubs, with opposite simple exstipulate leaves. Flowers disposed in corymbs, having 5 petals, 10 stamens, and 2-3 styles; outer ones, and sometimes all, are often sterile; these sterile ones are more ample and dilated than the fertile ones.

XV. HYDRA'NGEA (from υδρος, hydor, water, and αγγειον, aggéion, a vessel; some of the species grow in water, and the capsule has been compared to a cup). Lin. gen. 557. Geert. fruct. 1. p. 150. t. 50. f. 7. Lam. ill. t. 370. D.C. prod. 4. p. 13.—Hydrangea and Hortensia, Juss.

Lin. syst. Decondria, Bi-trigynia. Flowers usually different (f. 53, a. b.), but some of them are fertile and hermaphrodite (f. 53, b.). Tube of calyx hemispherical, 10-ribbed, rather truncate, adnate to the ovary; limb permanent, 5-toothed (f. 53, b.). Petals 5, regular. Stamens 10. Styles 2 (f. 53, c.), distinct. Capsule 2-celled, with introflexed valves, crowned by the teeth of the calyx and styles (f. 53, b. c.), flatish at the top, opening by a hole between the styles. Seeds reticulated, numerous.—Shrubs, with opposite leaves. Flowers corymbose, red or yellow, but usually white: the marginal ones sterile, and large, in consequence of the teeth of the calyx being dilated into broad petal-like coloured segments, the rest of the flower having the other parts abortive.

* Species natives of America.

1 H. arbo'rescens (Lin. spec. p. 568.) leaves ovate, rather cordate: superior ones lanceolate, coarsely toothed, pale and puberulous beneath; corymbs flatish; flowers nearly all fertile; alabastra obtuse. Ø. H. Native from Pennsylvania to Virginia. Flowers white, small, having an agreeable odour.

Var. b, discolor (Ser. l. c.) leaves almost white beneath from tomentum.

2 H. corda'ta (Parsh, fl. amer. sept. 1. p. 399. of the synonyme of Michx.) leaves broadly ovate, acuminated, rather cordate at the base, coarsely toothed, glabrous beneath; flowers all fertile. Ø. H. Native of Carolina, on the mountains, and on the banks of the Missouri above St. Louis. Wats. destr. brit. t. 42. Flowers small, white, sweet-scented. According to Torrey, this is merely a variety of H. arboréscens.

3 H. Pervu'nia (Moric. mss. with a figure, ex D.C. prod. 4, p. 14.) leaves oval, loosely serrated, coriaceous, reticulately veined, glabrous, rustily beneath, at the nerves, and on the petals; young branches and peduncles clothed with purplish tomentum; outer flowers of the corymb large and sterile; inner ones hermaphrodite and petandrous. Ø. G. Native of Peru, near Huayaqapi. Perhaps a species of Cornúdia, and probably C. Pervu'nia.

Pervu'nia Hydrangea. Shrub 4 to 6 feet.

4 H. nivea (Michx. fl. bor. amer. 1. p. 268.) leaves cordate, oval, acuminated, sharply toothed, clothed with white tomentum beneath, or pubescence; corymbs flatish; scapals of sterile flowers entire; alabastra depressed. Ø. H. Native of North America, about the Savannah river. Wats. destr. brit. t. 43. Lam. ill. t. 307. f. 2. H. radiata, Walt. fl. car. 251. ex Michx. but not of Smith. Flowers white, rather large.

Var. b, glabèlla (Ser. in D.C. prod. 4. p. 14.) leaves nearly glabrous beneath; flowers all fertile. Ø. H. This variety has probably originated from culture.

5 H. querchiifolia (Bartlam, trav. ed. germ. p. 336. t. 7. ex Willd. spec. 2. t. 634.) leaves large, ovate, sinuate lobed, and toothed, pilose beneath; coryms rather panicled, flat-topped; sepals of sterile flowers entire; alabastra depressed. F. H. Native of Florida. Sims, bot. mag. t. 975. H. radiata, Smith, icon. pict. p. 12. but not of Walt. Flowers white; sterile or outer ones of the coryms large.

* * * Species natives of Asia.

6 H. altissima (Wall. tent. fl. nep. 2. t. 50.) leaves ovate-lanceolate, acuminate, sharply serrated, almost glabrous above, but clothed with white tomentum beneath, as well as on the branches; coryms flatish, large; peduncles villous; sterile flowers few, glabrous; alabastra of fertile flowers nearly globose. F. H. Native of Nipaul, on the mountains. Flowers white; sepals of sterile flowers obovate, very blunt, quite entire. Styles 2, thick, diverging.

** Tallest Hydrangea. Shrub 4 to 6 feet.

7 H. vestita (Wall. tent. fl. nep. 2. t. 49.) leaves ovate-lanceolate, acuminate, sharply serrated, almost glabrous above, but clothed with white tomentum beneath, as well as on the branches; coryms flatish, large; peduncles villous; sterile flowers few, glabrous; alabastra of fertile flowers nearly globose. F. H. Native of Nipaul, on the mountains. Flowers white, rather large. Sepals of sterile flowers serrated. (f. 53.)

Var. b. fimbriata (Wall. 1. c.) sepals of sterile flowers obovate, acuminate, serrated. F. H. Native of Nipaul, on the higher mountains.

** Clothed Hydrangea. Shrub 4 to 6 feet.

8 H. aspera (Hamilt. ex D. Don, prod. fl. nep. p. 211.) leaves lanceolate, acuminate, sharply serrated, pubescent above, but densely clothed beneath with hoary tomentum, as well as on the branches; coryms paniculate, diffuse; peduncles villous; rays or sepals of sterile flowers obovate, mucronate, sharply serrated, pubescent; alabastra of fertile flowers globose. F. H. Native of Nipaul, in watery places at Narainhetty. Horténisias aspera, Hamilt. Leaves a hand long, and 2½ inches broad. Sterile flowers not near so large as those of the preceding species, white.

9 H. oblincoglossa (Bhum. bijdr. p. 920.) leaves oblong, acuminated, doubly toothed, glabrous above, but clothed with white tomentum beneath, as well as on the branches; coryms divaricate; sepals of sterile flowers oval, glabrous, serrated; fertile flowers containing 3-4 styles. F. G. Native of the western parts of Java, in woods on the higher mountains. Very like the two preceding species, but differs in the teeth of the leaves being unequal, and not so sharp.

** Oblong-leaved Hydrangea. Shrub 4 to 6 feet.

11 H. anomala (D. Don, prod. fl. nep. p. 211.) leaves ovate, acuminated, nearly naked, sinuate-crenated; pedicels and nerves pilose; cymes terminal, hairy; flowers uniform; rays or sepals of sterile flowers wanting. F. H. Native of Nipaul. Leaves 4 inches long, rounded at the base; pedicels an inch long. Flowers small. Styles very short, thick, recurved.

** Anomala Hydrangea. Shrub 3 to 6 feet.

12 H. Horténisias (Shld. in act. bom. 14. p. 688.) leaves ovate, acuminated, sinuate-crenated, acuminated; flowers disposed in ample corymbs or cymes, all diffused, with 4-5 segments; segments obovate-roundish, quite entire; fertile flowers very few, containing 2-3 styles. F. H. Native of China and Japan, but now cultivated almost every where in gardens for the sake of its beauty. Horténisias opuloides, Lam. dict. 3. p. 136. Dum. Cours. bot. cult. ed. 2. vol. 4. p. 345. Duham, ed. nov. 3. p. 97. t. 214. Hydrangea horténisias, Smith, icon. pict. 1. t. 12. Curt. bot. mag. 458. Horténisias speciosa, Pers. Primula mutabilis, Lour. eoh. p. 104. Viburnum serratum, Thumb. fl. jap. p. 124. ex Ramm. et Schultes, or Viburnum tomentosum, Thumb. ex Curt. but the descriptions of neither of these two plants agree with the present. The plant is called Tsuberdemi, i.e. globe-flowers, by the Japanese; and Fun-Dan Kwa by the Chinese. Flowers varying from rose-coloured to blue according to the soil in which the plant is grown; the sterile flowers are nearly always 4-cleft; but the fertile flowers are small and perfect. The plant is much valued on account of the great profusion of its very elegant flowers, which are monstrous, in the same manner as the Snow-ball Guelder Rose. It was introduced by Sir Joseph Banks in 1790. The plant was first called Peaulita by Commerson, in honour of Dr Hortence Lapeau.

13 H. Azisai (Shld. in act. bom. 14. p. 689.) leaves ovate, acuminated, attenuated at the base, crenately serrated; flowers disposed in cymes, diffused; corolline segments 4; F. H. Native of Japan, along with the preceding species. The cymes of flowers are very ample. Flowers for the most part greenish, rarely white. The plant is called Azisai by the Japanese, and Zu-kats-sen by the Chinese. There is a variety of it with variegated leaves, called Furi-Azisai by the Chinese.

** Azisai Hydrangea. Shrub 2 to 3 feet.

14 H. Jaráonka (Shld. 1. c. p. 689.) leaves ovate-oblong, acuminated, finely and glandularly serrated, quite glabrous on both surfaces; cymes crowded; flowers diffused; corolline segments 6-10, unequal, ovate-rhomboid. F. H. Native of Japan, where it is called Kakosuz. An elegant shrub, cultivated by the Japanese, about the size of the last.

Var. a. flowers red. Benkaku.

Var. b. flowers grey. Kombou.

** Japan Hydrangea. Shrub 2 to 3 feet.

15 H. Thunbergii (Shld. 1. c. p. 690.) leaves oblong, serrated, entire at the base, pale beneath; cymes crowded; flowers diffused; corolline segments 4-8, broadly obcordate, constantly of a greynish lilac-colour. F. H. Native of Japan, on the highest mountains. Viburnum serratum, Thumb. jap. p. 124. H. serrata, D. C. prod. p. 4. p. 115. Shrub climbing. The plant grows in the mountains of Aiva and Sonaki, where the natives use the dried leaves instead of tea, and is called by them Annatsja, i. e. sweet tea; and Do-Nioo-San by the Chinese. According to the Japanese, there is a variety with bitter leaves, which they call Rakosoo.
SAXIFRAGACEÆ. XV. HYDRANGEA. XVI. CORNYDIA. XVII. CIANITIS.

Thunberg's Hydrangea. Shrub cl.

Green Hydrangea.

17 H. paniculata (Sbdh. l. c. p. 609.) leaves elliptic, acuminate, glabrously toothed, scabrous, torn on the floricorous branches; panicule branched, rather secund; flowers discolored, very numerous; corolline segments 3-4, ovate, white. F. Native of Japan. Shrub climbing, 5 feet high. The plant is called Tsuridemonari by the Japanese, and Tse-sinkijine by the Chinese.

There is a variety with very pale red flowers, cultivated near the town of Posaka, very like the species, but does not climb, called Jamudomai by the Japanese. Perhaps Viburnum plicatissimum, Thum. is only a variety of H. paniculata.

Panicled-flowered Hydrangea. Shrub 5 feet.

18 H. involucratia (Sbdh. l. c. p. 609.) leaves ovate, acuminate, glabrously serrated, rufecently veined, hispid on both surfaces, crowded before flowering (involucrum caducous, 2-3-leaved), crowded; flowers discolored; corolline segments 8, nearly orbicular. F. Native of Japan. Plant suffruticose, hardly a foot high.

Var. a; corolla lilac. Kinbassoo of the Japanese; cultivated near the town of Oosaka.

Var. b; corolla yellow. Kinbassoo of the Japanese; cultivated near the town of Oosaka.

Involucrated Hydrangea. Shrub 1 foot.

19 H. alternifolia (Sbdh. l. c. p. 609.) leaves alternate; flowers cymose, polyandrous, discolored; corolline segments 2-6, 3 of which are constantly ovate and acute. F. Native of Japan, where it is called the natives Kasamisots-Ke.

Alternate-leaved Hydrangea. Shrub 1 foot.

20 H. Sisitan (Sbdh. l. c. p. 609.) leaves ovate, acuminate, acutely serrated, with the veins pubescent beneath; flowers cymose, discolored, double; corolline segments elliptic, of a fine rose-colour. F. Native of Japan. Shrub 2 feet high. Cultivated about the town of Mliko, where it is called Sisitan by the natives. Perhaps only a double flowering variety of H. Hortensia.

Sisitan Hydrangea. Shrub 2 to 4 feet.

† Species natives of Japan, but hardly known.

21 H. macropyllea (D. C. prod. 4. p. 15.) branchlets rather pilose; leaves ovate, acuminate, sharply serrated, rather pilose on both surfaces; umbels terminal, compound, radiating. F. Native of Japan. Viburnum macropylleum, Thumb. fl. jap. 125.

Long-leaved Hydrangea. Shrub.

22 H. hirita (Sbdh. ex flora, 1829. nov. 21.) leaves ovate, serrated, villous; petioles and peduncles hairy; umbels terminal, not radiating; stigma 2-lobed. F. Native of Japan. Viburnum hirtum, Thum. fl. jap. 124.

Hairless Hydrangea. Shrub.

Cult. The hardy species, or those natives of North America, are dwarf shrubs, and therefore proper for the front of shrubberies.

H. quercifolia does best against a south wall. Those species natives of Asia will require protection in winter, either by placing them in a frame or greenhouse. Cuttings of all the species root readily if plated under a glass-house. H. Hortensia is in general cultivation for the sake of its showy flowers; the blue-flowered variety is in greatest request, which may be obtained by planting out the common pink variety in a bed of peat soil, and letting it remain there 2 or 3 years; for the longer it remains the deeper blue the flowers will become: the plants may then be potted before the buds begin to burst, and they will then flower in perfection, and the flowers will be of a beautiful blue colour.

XVI. CORNYDIA (in honour of Joseph Cornide, a Spanish naturalist). Ruiz et Pav. fl. per. 1. p. 45.—Sarcostyles, Pers. in reliq. Hemk. 2. p. 55. t. 6; D. C. prod. 4. p. 15. L. syst. Octádria. Native in Japan, the mountains. Calyx superior, 4-toothed, equal, deciduous. Stamens 8; filaments linear; anthers ovate, 2-celled, dehiscing longitudinally inside. Ovarium inferior, nearly globose, 3-celled, rarely 4-celled, many ovulate. Styles 3, rarely 4, thick, fleshy, at length divaricate; stigmas obtuse, oblique. Capsule nearly globose, crowned by the permanent calyx and styles, dehiscing between the styles, 3-celled, rarely 4-celled, many seeded; disseminations entire, plectereous. Seeds cylindrical.—Shrubs, with glabrous opposite serrated leaves, and involucrated cymes or corymbes of white flowers, with the habit of Hydrangea.

1 C. Peruviana (Ruiz et Pav. fl. per. l. c.) leaves oval or oblong, acuminate or obtuse, coriaceous, serrated at the apex; corymb terminal, many rayed, involucrated by 4 large deciduous bracteas. F. Native of Peru, on the mountains. Sarcostyles Peruviana, Pers. in Hemk. reliq. 2. p. 54. t. 60. Peruvian Cornidia. Shrub.

2 C. integmakima (Hook. et Arn. in bot. misc. 3. p. 254.) leaves roundish-elliptic, glabrous, hardly acute at the base and apex; corymb numerous, disposed in a terminal raceme, which much exceeds the leaves. F. Native of Chili, about Valparaíso, and near Bustamente. Hydrangea scandinops, Poep. ex D. C. prod. 4. p. 666. Entire-leaved Cornidia. Shrub cl.?

3 C. serratifolia (Hook. et Arn. l. c.) leaves oblong-oblong, acute, obtuse at the base, serrated upwards; floral ones or ramal ones smaller, ovate, with a few denticulations; corymb numerous, disposed in a terminal raceme, which hardly exceeds the leaves. F. Native of Chile. Closely allied to the last species, but apparently distinct. Both, but especially the present, have several decussate, patent, concave, stiff bracteas, along the stalks of the corymb.

Serr-leafed Cornidia. Shrub.

Cult. The culture and propagation of the species of Cornidia are the same as that recommended for the species of Hydrangea. They require to be protected in winter by placing them in a frame or greenhouse.

XVII. CIANITIS (from cyanos, kyaneos, blue; colour of berries). Reinw. in Blume, bijdr. p. 321. D. C. prod. 4. p. 16. L. syst. Decandria, Tri-Petagynia. Tube of calyx adhering to the ovary: limb 5-toothed. Petals 5, rather fleshy, inserted in an epigynous disk. Stamens 10; anthers oblong, erect, dehiscing at the sides. Styles 3-5, spreading; stigmas ob- tum, adnate. Berry crowned by the teeth of the calyx, half 3-5-celled, many seeded; disseminations incomplete, infixed, fleshy, seminferous.—A shrub, with opposite, petiolate, obo- long-lancolate, smoothish leaves, which are serrated from the middle to the apex; and panicled terminal cymes of flowers, with trifid branches.

1 C. stylactica (Reinw. l. c.) cymes nearly undivided, on short peduncles, disposed in a coricate panicle. F. S. Native of Java, on the mountains, where it is called the natives Tivereg-gil-gil. Flowers probably white.

Var. b. paniculata (Blum. misc.) cymes branched, on long peduncles, disposed in an elongated panicle. F. S. Native of Java. Perhaps distinct from the species.
Var. γ. corymbosa (Blcm. mss.) cymes branched, on long peduncles, disposed in somewhat fastigate corymbs. [b.] S. Native of Java. Perhaps a proper species.

Wood Ceanitis. Shrub 2 to 3 feet.

Cult. A mixture of loam, peat, and sand will suit these plants; and cuttings will root readily in the same kind of soil, under a hand-glass.

XVIII. ADAMIA (in honour of John Adam, some time Governor-General of India; a promoter of natural history). Wall. tent. fl. nep. p. 46. t. 36. D. C. prod. 4. p. 16.

Lin. syst. Decândria, Pentângnia. Tube of calyx adnate to the ovary; limb with 5 short teeth, having the recesses between the teeth broad and obuste. Petals 5, alternating with the teeth of the calyx, surrounding the top of the ovary. Stamens 10. Styles 5, ending in rather clavate, somewhat 2-lobed stigmas. Berry crowned by the limb of the calyx, somewhat 5-celled, many seeded. Embryo terete, straight, in a fleshy albumen, with the radicle turned towards the hilum.—A smooth branched shrub. Leaves opposite, exstipulate, petiolate, oblong-lanceolate, serrated. Panicle corymbose, terminal, many flowered. Flowers bluish. Berries blue. Perhaps not distinct from Ceanitis.

1 A. cyanea (Wall. l. c.) [b.] G. Native of Nipaul, in rocky places, on mountains near the Great Valley, where it is called Bansook by the natives. Hook. bot. mag. t. 3046. Wall. pl. rar. asiat. 3. t. 213.

Cult. See Ceanitis above for culture and propagation.

XIX. BROUGHSAISIA (in honour of the celebrated M. Broughsais, M.D. author of physiological medicine). Gaud. in Freyce. voy. t. 69. D. C. prod. 4. p. 17.

Lin. syst. Decândria, Monogyânia. Calyx 5-parted, hemispherical, distinct from the ovary: lobes ovate-deltoid, bluntish, equal. Petals oblong, acuminate, with a reflected point (nearly as in umbelliferous plants) twice the length of the calyx, valvate in activation. Stamens 10, hypogynous, surrounding the base of the ovary; filaments subulate, distinct; anthers ovate. Ovarium roundish, crowned by the short style and truncate stigma, 5-celled; cells many seeded.—A shrub, with opposite oval petiole sharply serrated leaves, and corymbs of fertile flowers. The shrub has the habit of Hydrangea, but differs in the ovary being distinct from the calyx, in the style being short and solitary, not 2-3, and in the fruit being 5-celled.

1 B. arguata (Gaud. l. c.) [b.] G. Native of the Sandwich Islands, at the altitude of from 1200 to 1500 feet above the level of the sea. A middle-sized tree.

Sharp-serrate-leaved Broughsaisia. Tree.

Cult. See Ceanitis above for culture and propagation.

Calyx with the tube adhering to the ovary (f. 55. F. h. f. 55. C. c.), limb 5-toothed (f. 55. F. c.), or entire (f. 55. G. f.); lobes or teeth deciduous or permanent. Petals 5 (f. 57. c.). f. 59. g.), inserted in the top of the tube of the calyx, and alternating with its lobes, either entire (f. 57. c.), emarginate (f. 61. b.), or 2-lobed, sometimes plain at the apex, but usually drawn out into a replicate or involute point (f. 61. f. f. 63. c. f. 55. C. i.), somewhat imbricate in activation, rarely valvate; the outer flowers of the umbel or ray of the umbel sometimes larger than the rest, the rest equal among themselves, rarely abortive. Stamens 5 (f. 55. C. b. &c.), alternating with the petals, and inserted along with them, and therefore opposite the calycine teeth or lobes, always distinct, replicate in activation (f. 59. g. &c.); anthers ovate, 2-celled, somewhat dillymus, opening by a double longitudinal chink. Ovarium inferior, 2-celled (f. 55. E. c. f. 55. D. d. &c.), (very rarely, and probably from abortion, 1-celled), adnate to the calyx; styles 2, distinct (f. 55. F. i. f. 55. G. i. f. 59. c. &c.), when young erect, but at length thickened at the base into stylopodium (f. 64. a.), which covers the whole disk, forming a sort of crown to the fruit, diverging more or less, usually permanent, the outer one directed to the outside of the umbel, and the inner one tending to the centre. Fruit (called Diachesã, Polachedã, and Cremocharp by many botanists) consisting of 2 carpella (called mericarps because (f. 55. D. d. f. 56. C. h. &c.) they adhere to the calyx the half of their length, and therefore cannot be carpella or achenia in the strict sense of those terms), separable from a common axis (called a caraphore), to which (f. 56. G. a. f. 56. C. a. b. &c.) they adhere by their face (called the compressor); the fruit or crenocarp traversed by 10 elevated primary ridges, of which the 5 that represent the middle of the sepalis are called carinal, because they are drawn out into calycine teeth at the apex; the other 5, alternating with the first-named ones are called sutable, because they indicate the sutures where the divisions of the calyx are joined, and therefore tend to the recesses between the calycine teeth; besides these there are others which are apparent in some called secondary, because they alternate with the 10 primary nerves, and therefore indicate the sides of the divisions of the calyx; all the sutable, carinal, and secondary ribs are either filiform, winged, or crested; these ridges or nerves are separated by channels or furrows called vallecula, below which, but usually in the channels, are placed in the substance of the pericarp, certain linear receptacles of coloured oily matter, called vitae, which are directed from the apex to the base; they are solitary, twin, or numerous, rarely wanting, and sometimes they are inclosed in a proper membrane, which is probably a true pericarp. Seeds solitary in each carpel, hanging from the top of the axis or carphophore, inclosed in a proper membrane, the spermederm, which is but rarely separable from the pericarp. Albumen large, fleshy; or rather horny, more or less convex on the out.
UMBELLIFERÆ.

side. Embryo minute, hanging from the top of the carpophore, and therefore the radicle is superior; cotyledons 2, oblong, changing into seminal leaves through germination.—Herbs or subshrubs. Roots various, but often fusiform. Stems cylindrical or angular, simple or branched, annual or perennial, with the bark or skin usually full of aromatic resinous gum; medulla in some, as in Fērula, large, with medullary fibres in its substance, similar to the stems of monocotyledonous plants. Leaves alternate, very rarely opposite, except the seminal ones, usually divided into various segments; petioles usually sheathing at the base; in some, as in the genus Euplētum, the petioles are changed into phyllidia, as in the section of Actīcia called Phylldiaceæ. Flowers umbellate, white, yellow, pink, or blue, often with either the styles or stamens abortive, monoecious, dioecious, or polygamous, and some of them sterile. Umbels usually perfect, both general and partial, in both the rays are numerous, the general umbel usually surrounded by an involucrem, and the partial ones by an involucel.

FIG. 54.

UMBELLIFERÆ hardly differs from Araliæceæ, the next order. With Saxifragæceæ it agrees in habit, if Hydrocotylæ is compared with Chrysosplenium, and if the sheathing and divided leaves of the two orders are considered. To Geraniæceæ, De Candolle remarks, that they are allied in consequence of the cohesion of the carpella around a woody axis, and of the umbellate flowers, which grow opposite the leaves, and also because the affinity of Geraniæceæ to Vitis, and of the latter to Araliæceæ, is not to be doubted. The arrangement of this order has only within a few years arrived at any very definite state; the characters upon which genera and tribes could be formed, were for a long while unsettled; it is, however, now generally admitted, that the number and development of the ribs of the fruit, the presence or absence of the reservoirs called vitte, and the form of the alburnum, are the leading peculiarities, which require to be attended to. The plants are chiefly extra-tropical, inhabiting groves, thickets, plains, marshes, and waste places.

The properties of this order require to be considered under two points of view; firstly, those of the vegetation; and secondly those of the fructification. The character of the former generally is suspicious, and often poisonous in a high degree; as in the case of hemlock, fool’s-parsley, water-hemlock, and others, which are deadly poison. Nevertheless, the blanched petioles and stems of celery, the leaves of parsley and sausphere, the roots of skirret, the carrot, the parsaip, the arracacha, and the tubers of Ænäthe pimpinellöides, and Bānium balβocastanum, are wholesome articles of food. The fruit, vulgarly called the seeds, is in no case dangerous, and is usually a warm and agreeable aromatic, as caraway, coriander, dill, anise, &c. From the stem, when wounded, sometimes flows a stimulant, tonic, aromatic, gum-resinous concretion, of much use in medicine; as opōpōnax, which is produced from Opōpōnax Chirōntium in the Levant, and assafoetida from the Fērula of that name in Persia. Gum annōmoniæ is obtained from Dorēnca Ammoniācæ. It is a gum resin of a pale yellow colour, having a faint, but not unpleasant, smell, with a bitter nauseous taste. Internally applied, it is a valuable deobstruent, and expectorant. It is said by Dr. Paris to be, in combination with rhubarb, a useful medicine in mesenteric affections, by correctising viscid secretions. (Ainslie i. p. 160.) The substance called galbanum is produced by Galbanum officinale, a plant of this order. It is a stimulant of the intestinal canal and uterus, and is found to allay that nervous irritability, which often accompanies hysteria. (Ainslie i. p. 143.) Eηθάηa cυφηημιον has been found by Professor Ficinus, of Dresden, to contain a peculiar alkali, which he calls Cynapηη. (Turner, p. 654.) The fruit of Ligistīcum Ajwainī of Rosh, the Pηήγηηrhis Ajwunī of D. C. is prescribed in India in diseases of horses and cows. (Ainslie i. p. 38.) The Prūngos pabulāriā is a valuable fodder-plant in Tibet.

Synopsis of the genera.

Suborder I. Orthospermæ. Albumen flat or flattish inside, neither involute nor convolute.

§ 1. Umbels simple or imperfect. Fruit destinate of vitte.

Tribe I.

HYDROCOTYLEE. Fruit contracted from the sides; mericarps convex or acute on the back; with the 5 primary ribs at length obsolete: lateral ones marginaing or in the commissure, which is flat; intermediate usually more than carinal. Petals entire.

1 HYDROCOTYLE. Margin of calyx obsolete; and the tube rather compressed. Petals ovate, with a straight point. Fruit bicaceous. Mericarps with 5 filiform ribs: carinal and lateral ones often obsolete: the 2 intermediate ones joined.—Involucrum few-leaved.

2 CRANTZIA. Tube of calyx subglobose; limb very short, hardly any. Petals roundish, obtuse. Fruit roundish. Mericarp unequal, with 3-5 filiform ribs. Vitte 1 in each furrow and 2 in the commissure.—Involucrum 5-6-leaved.

3 DIMEΤΩRIA. Teeth of calyx obsolete. Petals oval-oblong. Styles short. Fruit didymous. Mericarps somewhat contracted at the commissure, unequal, one muricated with tuberces, and the other echinate with conical prickles.—Involucrum of 5 linear leaves.

4 DIGEΘENIA. Margin of calyx obsolete. Petals equal, obovate. Styles long. Fruit oval, laterally compressed. Mericarps gibbously convex, marked by 3 stripes. Commisurus narrow, flat.—Umbels imperfect. True involucrum none, but in place of it there is a multifid leaf. Involucels of a few unequil leaflets.
5 Micropleur'ra. Margin of calyx obsolete. Petals equal, acute. Fruit deeply 2-lobed at the base, and emarginate at the apex; mericarps obliquely ovate, 7-ribbed; ribs curvilinear, ventricose at the base, marginal 2 straight. Commisur e narrow.

6 Diod'c's. Margin of calyx obsolete. Petals oval, bluntish, imbricate in aestivation (f. 57. c.). Fruit didymous, emarginate at the base. Mericarps rough from pilose stripe, 5-ribbed: 2 middle ribs approximating the commissure.—Involucre of many leaves which are concrete at the base (f. 57. a.).

7 Thracymene. Margin of calyx 5-toothed. Petals elliptic, acutish, somewhat valvate in aestivation. Fruit didymous. Mericarps gibbously convex, 5-ribbed: the 3 dorsal ribs and the furrows between them muricate; and the 2 lateral ones marginalig.—Umbels compound. Involucrum of many leaves.

8 Aströtrich'a. Margin of calyx hardly 5-toothed. Petals oval, acutish, permanent (f. 58. b.), velvety on the outside from stellate down. Styles thickened at the base (f. 58. c.). Mericarps contracted at the commissure, having 3 primary dorsal ribs, and 2 acute nearly obsolete marginaling ones, and 4 secondary ones. Commisur e furnished with 2 vitice, which are covered by a spongy pellicle, but none in the furrows.—Involucrum of a few linear leaves.

9 Xantho'sia. Margin of calyx 5-lobed. Petals stipitate, oval, cuspidate and replicate at the apex. Styles filiform, rising from the base of the stylopodium on the inside. Fruit compressed. Mericarps contracted at the commissure, with 7-9 filiform ribs: 2 lateral ribs marginalig.

10 Bowke'sia. Margin of calyx 5-toothed; tube compressedly somewhat tetragonal. Petals elliptic, entire, acute. Fruit ovate, much contracted at the raphis, turgid, somewhat tetragonal, flattish on both sides at the back. Mericarps marked with an oval impression on the back, having 5 obsolete ribs: 2 lateral ribs flat, seated in the commissure.

11 Fragra'sia. Margin of calyx 5-toothed, permanent. Petals oval. Fruit didymous. Mericarps somewhat compressed from the back, and contracted at the commissure, having filiform ribs.—Involucrum equal in length to the pedicels.

12 Azore'lla. Margin of calyx 5-toothed, permanent. Petals oval. Fruit ovate, contracted at the raphis, and rather compressed from the back. Mericarps semi-ovate, having the ribs hardly evident.—Involucrum about equal in length to the pedicels.

13 Pecto'phy'tum. Margin of calyx entire. Petals unequal, with an acute inflexed point. Fruit ovate-elliptic; mericarps rather convex on the back, semi-oval, having 5 filiform ribs; com missure flattish.—Flowers in crowded fascicles at the tops of the branches, solitary in the axils of the bracteas.

Tribe II.

Muline'se. Mericarps contracted at the commissure, flat or flattish on the back, without vitice, hence the fruit is square or parallelly bisulate. Petals entire.

14 Böla'x. Margin of calyx entire. Petals oval. Fruit tetragonal; mericarps with 5 nerve-formed ribs, 1 dorsal, and the 2 middle ones form the corners of the angles of the fruit, and the 2 inner ones are filiform; commissure very narrow.—Involucre of 4 leaves, equal in length to the pedicels.

15 Mulinum. Margin of calyx 5-toothed, permanent. Petals oval-oblong, acute. Fruit 1-winged; mericarps furnished with 5 ribs: middle one dorsal: 2 lateral ones nerve-formed: 2 intermediate ones expanded into lateral ample wings.—Involucre of many leaves, shorter than the pedicels.

16 Lare'tia. Margin of calyx 5-toothed. Petals ovate, entire. Fruit elliptic, square, flatly compressed from the back; mericarps lenticular, with dorsal ribs and 2 lateral marginal ones, destitute of vitice. Seed flat.

17 Dru'sa. Margin of calyx entire. Petals oval. Mericarps furnished with 5 ribs: the dorsal one and the 2 inner ones linear and hardly prominent: but the 2 intermediate ones are drawn out into marginal wings, which are repandly sinuated, having the angles expanding in a stellate tuft of uncinate spines.—Involucrum wanting.

18 Huana'ca. Margin of calyx hardly 5-toothed. Petals lanceolate. Fruit ovate, acutish; mericarps flat and furrowed on the inside, but convex on the back, and furnished with 3 elevated lines. Carpophore bifid.—Involucrum of many leaves.

19 Dipö'sta. Margin of calyx bluntly 5-toothed. Petals oval. Fruit orbicular, constituting 2 parallel disks (f. 55. a. b.); commissure narrow; mericarps having 5 ribs: dorsal one filiform: 2 lateral ones hidden: and the 2 middle ones girding the disk; furrows broad and flat.—Umbels compound.

20 Span'anth'e. Margin of calyx 5-toothed. Petals elliptic, acutish, with a straight point. Fruit ovate, much compressed at the raphis; mericarps having 5 slender equal ribs: 3 intermediate ones dorsal: and the 2 lateral ones seated in the flat commissure.—Umbels rather compound. Involucrum of many leaves.

21 Homalo'car'pus. Margin of calyx 5-toothed; teeth subulate. Petals ovate, concave. Fruit roundish-ovate; mericarps having 5 filiform ribs, hidden in the substance of the pericarp, 1 dorsal: 2 lateral ones near the raphis: 2 middle ones forming the angles.

22 Poz'a'a. Margin of calyx 5-toothed, permanent. Fruit prismatic, tetragonal, 5-ribbed, emarginate at the apex; mericarps concave and channelled on the back; ribs lateral, dense, straight.—Involucrum erenately lobed, obsolescetly toothed.

23 Aster'scium. Calyx 5-toothed, permanent; teeth ovate. Petals emarginate, with an inflexed point and a callous recess. Fruit compressed, tetragonally prismatic; mericarps with 5 ribs: the 2 intermediate ones expanded into wings; the carinal one and the 2 placed near the raphis stripe-formed; commissure very narrow.—Involucrum of many leaves.

Tribe III.

Sanie'lee. Fruit ovate-globose. Mericarps destitute of vitice, with 5 primary ribs; secondary ribs wanting or obliterated by being covered with scales. Petals erect, emarginate, from being bent back from the middle by a point.
UMBELLIFERÆ.

24 ACTINOUS. Tube of calyx contracted at the apex; limb 5-lobed; lobes oval-oblong. Petals wanting. Styles thickened and villous at the base. Fruit ovate, crowned by the lobes of the calyx, villous, 5-striped.—Involucrum of many radiating leaves, which are longer than the flowers.

25 PETAGNIA. Flowers dioecious, having the calyxes different in the distinct sexes. Styles filiform. Fruit ovate, compressed, 8-nerved, vacant inside, 1-seeded.—Umbelules 3-flowered: central flower hermaphrodite, sessile; lateral ones male, pedicellate; pedicels rather concrete at the base, with the calyx of the female flower.

26 SANICULA. Tube of calyx echiuated; lobes foliaceous (f. 59. c.), permanent. Petals connivent, obovate, emarginate, with an inflexed point (f. 59. g.). Fruit nearly globose, echiuated; carpophore not distinct.—Umbels compound. Leaves of involucrum few, divided; of the involucel numerous, linear.

27 HACQUE'TIA. Tube of calyx 10-ribbed; lobes foliaceous, permanent. Petals obovate, emarginate, with a bent in point. Fruit contracted from the sides; mericarps gibbously convex; ribs 5, filiform, with a deep channel on the inside.—Involucrum of 5-6 obovate toothed leaves, which are longer than the umbel.

28 ASTRA'N'THA. Tube of calyx 10-ribbed, tuberculate plicate; lobes 5, foliaceous. Petals erect, connivent, oblong-obovate, with an inflected point. Fruit rather compressed from the back; mericarps with 5 elevated, obtuse, plicately toothed, inflated ribs, inclosing in the cavity a smaller fistular rib. Carpophore not distinct.—Involucrum variable: involucrel of many leaflets.

29 ALEPIDEA. Tube of calyx minutely tubercular. Petals inflexed. Mericarps without ribs, and without vittae. Carpophore adnate the whole length of the seeds.—Habit of Erýgium, but the umbels are like those of Astra'n'tha.

30 HORSPLE'DIA. Margin of calyx quite entire. Petals ovate, cuspidate, flat. Fruit compressed, villous; mericarps 3-ribbed on the back.—A prickly shrub. Umbels capitate, sessile; receptacle chaffy. Involucrum of many leaves.

31 ERYN'GUM. Tube of calyx rough from scales or vesicles; lobes foliaceous. Petals erect, connivent, oblong-obovate, emarginate, with an inflected point. Fruit obovate, scaly, or tubercular; mericarps semi-terete, without ribs, and without vittae; carpophore adnate its whole length to the seeds.—Flowers crowded into dense heads; the lower bracteas forming an involucrum to them.

32 ACTINA'NSTHÉS. Flowers monoeocious: female ones capitulate: male ones in capitule umbels, with the receptacle destitute of calyx. Teeth of calyx permanent. Petals oblong, complicated at the apex, and rather cirrhose. Fruit compressed from the sides; mericarps with 5 alternate, stronger, sutural ribs; vittae 1 in each furrow, and 2 in the commissure. Carpophore adnate.—Involucrel wanting; involucels of many leaves.

§ 2. Umbels compound or perfect. Vittae on the fruit variable, rarely wanting.

* Fruit having only primary ribs present.

Tribe IV.

AMM'NEE. Fruit compressed from the sides or didymous; mericarps with 5 filiform ribs, which at length become a little winged: lateral ones marginating, all equal. Seeds terec or gibbously convex, flatish in front.

33 RU'MIA. Margin of calyx 5-toothed. Petals ovate, entire, with a short, coarctate, incurved point. Fruit roundish or ovate, plicately wrinkled; mericarps solid, with 5 thick, very obscure, twisted plicate ribs, covering the furrows, which are ornamented with plicate tubercules, and furnished with 1 vitta each. Carpophore bipartite.—Involucrum wanting or few-leaved; involucels of 3-8 leaves. Flowers yellow.

34 CIC'UTA. Margin of calyx 5-toothed, foliaceous. Petals ordinate, with an inflexed point. Fruit roundish, contracted from the sides; mericarps with 5 flattish ribs, having the furrows between the ribs furnished with 1 vitta each, and the commissure 2 vittae; vittae filling the furrows, a little more elevated than the ribs, all concealed under a loose membrane. Carpophore bipartite.—Involucrum wanting, or few-leaved; involucels of many leaves.

35 ZITIA. Margin of calyx obsolete, or with 5 very short teeth. Petals elliptic, tapering into a long inflexed acumen. Fruit contracted from the sides, roundish or oval; ribs filiform, rather prominent; furrows furnished with 1 vitta each, and the commissure with 2; carpophore bipartite.—Involucrum wanting; involucels of few leaves, variable. Flowers yellow, rarely white or dark purple.

36 PENTACRY'THA. Calyx unknown. Petals equal, lanceolate, with an inflexed point. Fruit oblong-elliptic; the 3 dorsal ribs elevated, acute; furrows furnished with 1 vitta each. Albumen with 5 roundish angles. Flowers polygamous, dark purple.

37 A'TUM. Margin of calyx obsolete. Petals roundish, entire. Stylopodium depressed. Fruit roundish, contracted from the sides; ribs filiform; furrows furnished with 1 vitta; outer ones with 2-3 vittae. Carpophore undivided.—Involucrum and involucrel wanting. Flowers greenish white.

38 PETROSÉLI'NUM. Margin of calyx obsolete. Petals roundish, incurved, hardly emarginate, with an inflexed point at the apex. Stylopodium short, conical, suberectulate. Styles diverging. Fruit ovate, contracted from the sides; ribs filiform; furrows furnished with 1 vitta each, and the commissure with 2. Carpophore bipartite.—Involucrum few-leaved, and the involucels of many leaves. Flowers white or greenish.

39 WEYDE'RIA. Margin of calyx obsolete (f. 60. a.). Petals ovate-lanceolate, entire, with an incurved point (f. 60. c.). Fruit ovate, crowned by the short stylopodium and reflexed styles (f. 60. b.). Mericarps somewhat semi-terete, with contracted margins; ribs filiform, blundish; furrows broad, furnished with 1 vitta each, and the commissure with 2.—Involucrum wanting, or of 1 leaf; involucels of many leaves. Flowers white.

40 TRISIA. Margin of calyx obsolete. Flowers usually dioecious from abortion. Petals of the male flowers lanceolate,
ending in an involute point; of the hermaphrodite flowers ovate, with a short inflexed point. Fruit ovate; ribs filiform, rather prominent; furrows without vitta, or furnished with 1 vitta each. Carpophore flat, bipartite from the base. — Umbels disposed in a panicule or thyrsus, without any involucre; involucels usually wanting.

41 Helosciadium. Margin of calyx 5-toothed, or obsolete. Petals ovate, entire, with a straight or inflexed point. Styles short. Fruit ovate or oblong; ribs filiform, rather prominent; furrows furnished with 1 vitta each. Carpophore entire. Involucre variable in the different sections.

42 Discipleura. Teeth of calyx 5, subulate, permanent (f. 61. c). Petals ovate, emarginate (f. 61. b), with a replicate point (f. 61. f). Fruit ovate (f. 61. c). Three dorsal ribs filiform, exserted, and acutish: 2 lateral ones somewhat concretes with the thick accessory margin, forming a disk on both sides of the fruit; furrows furnished with 1 vitta each. Carpophore biform. — Involucels of a few linear setaceous leaves (f. 61. g.).

43 Leptocaulis. Margin of calyx obsolete (f. 62. a.). Petals elliptic, entire. Styles permanent. Fruit ovate (f. 62. a); ribs hardly prominent; furrows furnished with 1 vitta. Carpophore biform at the very apex. — Involucre wanting; involucels short, few-leaved.

44 Ptychoitites. Margin of calyx 5-toothed. Petals ovobovate, biformly emarginate, furnished by a transverse plait in the middle, which emits a little segment. Fruit ovate or oblong; ribs filiform; furrows furnished with 1 vitta each. Carpophore biform. — Involucrem variable; involucels of many leaves.

45 Falcaria. Margin of calyx 3-toothed; tube wanting in the sterile flowers, but cylindrical in the fertile ones. Petals ovocorovate, curved, having a broad emarginate recess, with a reflected point. Styles divaricate. Fruit oblong; ribs filiform; carpophore distinct, bifid; furrows furnished with 1 filiform vitta each. — Involucrem of many leaves. Involute somewhat dilated from the inner leaflets being small on one side.

46 Sinon. Margin of calyx obsolete. Petals roundish, curved, deeply emarginate, with an inflexed point. Styles very short. Fruit ovate; ribs filiform; vitta 1 in each furrow, short, rather club-shaped; carpophore bipartite. — Involucre and involucels of few leaves.

47 Schultzia. Margin of calyx obsolete. Petals elliptic, with a short inflexed point. Stylododium conical. Styles erect, somewhat capitate at the apex, permanent. Fruit cylindrically prismatic; ribs filiform; vitta 1 in each furrow. Carpophore undivided. — Involucre and involucels of many multifid leaves.

48 Aml. Margin of calyx obsolete. Petals ovobovate, with an inflexed point, emarginately 2-lobed; lobes unequal, irregular; those on the outside of the umbels the largest. Fruit ovobovate-oblong; ribs filiform; vitta 1 in each furrow. Carpophore distinct, 2-parted. — Involucre of many trifid or pinnafid leaves; involucels of many leaves.

49 Lagerodium. Margin of calyx obsolete. Petals ovobovate, emarginate, with an inflexed point. Stylododium distinct, conical, terminated by the long deflexed styles. Fruit ovate; ribs filiform; furrows without vitta; carpophore setaceous, forked at the apex. — Involucre and involucels wanting.

50 Carum. Margin of calyx obsolete. Petals regular, ovate, emarginate, with an inflexed point. Stylododium depressed; styles deflexed. Fruit ovate or oblong, contracted from the sides; ribs filiform; vitta 1 in each furrow, and 2 in the commissure, which is flat; carpophore distinct, forked at the apex. — Involucre and involucels variable in the different species.

51 Chamaesidaeum. Margin of calyx toothed a little. Petals ovate-lanceolate, quite entire, with an oblique or inflexed point. Stylododium depressed; styles at length deflexed. Fruit ovate-oblong; mericarps solid; ribs filiform; vitta 3-4 in each furrow, and 4-6 in the commissure; carpophore adnate, bifid at the apex. — Involucre and involucels of many leaves.

52 Bunium. Margin of calyx obsolete. Petals ovobovate, emarginate, with an inflexed point. Fruit linear-oblong; ribs filiform, obtuse; vitta 2-3 in each furrow, and 4 in the commissure, all superficial. Carpophore distinct, bifid. — Involucre variable in the different species; involucels of few leaves.

53 Cryptotaenia. Margin of calyx obsolete. Petals ovate, nearly entire, narrowed into an inflexed point. Fruit contracted from the sides, linear-oblong, crowned by the short stylododium and straight styles; ribs filiform, obtuse: 2 lateral ones placed in front of the margins; vitta numerous in the furrows, covered by a corky pericarp, and are not visible, unless when the pericarps are cut transversely. — Involucre wanting; involucels few-leaved.

54 Pimpiellula. Margin of calyx obsolete. Petals ovobovate, emarginate, with an inflexed point. Fruit ovate, contracted from the sides, crowned by the cushion-like stylododium and styles, which are reflexed and somewhat capitate at the apex; ribs filiform; vitta numerous on the furrows; carpophore distinct, bifid. — Involucre and involucels wanting.

55 Stium. Margin of calyx 5-toothed, but at length obsolete. Petals ovobovate, emarginate, with an inflexed point. Stylododium pulvinate, with a depressed margin. Styles divergingly reflexed, somewhat capitate at the apex. Fruit compressed or contracted from the sides, crowned by the stylododium and styles; ribs filiform, bluntish; vitta many, both in the furrows and commissure. Carpophore bipartite, having the mericarps adhering to its parts. — Involucre of many leaves, rarely of 1 leaf; involucels of many leaves.

56 Bupleurum. Margin of calyx obsolete. Petals roundish, entire, closely involute, ending in a broad retuse segment. Fruit crowned by the depressed stylododium; ribs winged, acute, filiform, or obsolete; furrows either with or without vitta, smooth or granular. — Involucre variable in the different species. Flowers white, yellow, and greenish.

57 Heteromorpha. Margin of calyx 5-toothed. Petals roundish, entire, closely involute, ending in a broad retuse point. Fruit ovobovate pear-shaped, 3 winged; mericarps of 2 forms: outer one 2-winged; inner one 3-winged; the wings running from the teeth of the calyx; vitta 1 in each furrow, and 2 in
the commissure. — A shrub with yellow flowers and ternate leaves. Involutua and involucels of many short leaves.

Tribe V.

*Sebelsae*.* Fruit terete, or nearly so, with a transverse section; or the mericarps are rather compressed on the back, with 5 filiform or winged ribs: the lateral ones margination, equal to the others, or broader. Seeds tertely convex on the back. Raphe marginal or submarginal.

58 *Lichtensteinia*. Margin of calyx acutely 5-toothed. Petals elliptic, with a long, inflexed point. Fruit nearly terete, crowned by the conical stylopodium and short styles; ribs filiform, equal; vitte large solitary under the ribs, but none in the furrows nor commissure. — Involucra and involucels of many short leaves. Flowers yellow.

60 *Eenanthae*. Margin of calyx 5-toothed, permanent. Petals obovate, emarginate, with an inflexed point. Stylopodium conical. Fruit cylindrically ovate, crowned by the long erect styles; ribs rather convex, obtuse, margination ones rather the broadest; vitte 1 in each furrow; carpophore indistinct. — Involucra variable in the different species, sometimes wanting; involucels of many leaves.

61 *Anseroidea*. Margin of calyx 5-toothed, permanent. Petals elliptic, with an inflexed point. Fruit prismatically quadrangular, crowned by the calyx and reflexed styles; mericarps of 2 ribs, one 3-winged, and the other 4-winged from the ribs; vitre 1 in each furrow and 2 in the commissure. Carpophore bipartite. — Involucra and involucels of many leaves.

62 *Scleroschium*. Calycine teeth 5, conical, permanent (f. 55, F. h.). Petals obcordate, with an inflexed point (f. 56, F. b.), which is bi or tridentate at the apex. Stylopodium conical; styles filiform (f. 56, F. c.). Fruit ovate-globose, solid (f. 56, F. g. h.); ribs much elevated, bluntish, equal; vitte 1 in each furrow and 2 in the commissure; carpophore distinct, undivided (f. 56, F. k.). — Involucra almost wanting; involucels of 5-7 leaves.

63 *Dasylopa*. Margin of calyx obsolete. Petals unknown. Stylopodium depressed; styles short. Fruit ovate; mericarps not separating at maturity; ribs corky, cellular: 3 dorsal ones small; 2 lateral ones large and obtuse; furrows narrow, and furnished with 1 vitte each, but the commissure is flat, and furnished with 2; carpophore indistinct. — Involucra and involucels wanting.

64 *Cynoschium*. Calycine teeth 5 (f. 63, c.), subulate, permanent. Petals obovate, or nearly elliptic, entire, with an inflexed point (f. 63, c.). Stylopodium conical; styles short, reflexed (f. 62, d). Fruit oval-oblong or ovate (f. 63, b.), tapering at the apex; ribs thick, corky; vitre 1 in each furrow, and 2 in the commissure. — Involucra and involucels of many leaves (f. 63, f, g.).

65 *Letuana*. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point; outer petals radiating. Fruit ovate-globose; ribs elevated, thick, acutely keeled: lateral ones rather the broadest; vitte 1 in each furrow, and 2 arched ones in the commissure; carpophore bipartite. — Involucrum wanting or of 1 leaf; involucels of 1-3-5 leaflets, on one side of the umbellule.

66 *Femculum*. Margin of calyx tumid, obsolete. Petals roundish, entire, involute, with a rather quadrate retuse point; ribs rather prominent, bluntly keeled: lateral ones rather the broadest; vitre 1 in each furrow, and 2 in the commissure. — Involucra and involucels wanting, or nearly so. Flowers yellow.

67 *Kunhmannia*. Margin of calyx 5-toothed. Petals roundish, entire, involute, with a broad retuse point. Stylopodium conical. Fruit terete, 10-furrowed; mericarps with 5 filiform, obtuse, equal ribs; vitte many, both in the furrows and commissure; carpophore undivided. — Involucra and involucels of many filiform reflexed leaves.

68 *Devrekra*. Margin of calyx obsolete. Petals ovate, with an inflexed acumen. Styles short. Fruit ovate or roundish, hispid from scales or hairs; mericarps semi-terete, with obsolete ribs; vitte 1 in each furrow, and 2 in the commissure. Carpophore bipartite. — An aromatic almost leafless shrub. — Involucra of 4-6 leaves; involucels of 4-6 ovate-lanceolate leaves.

69 *Soranthus*. Margin of calyx obsolete toothed. Petals broadly ovate, acuminate, permanent, with an inflexed point. Fruit a little compressed from the back: crowned by the divaricate styles; mericarps with 5, hardly prominent ribs; vitte 1 each furrow, and 4 in the commissure. Carpophore bipartite. — Involucra nearly wanting; involucels of 5-7 spreading reflexed leaves.

70 *Selell*. Margin of calyx 5-toothed; teeth short, thickish. Petals obovate, emarginate or nearly entire, with an inflexed point (f. 55, E, i.). Fruit (f. 55, E, d. f. 55, D, a, b.) oval or oblong, crowned by the reflexed styles (f. 55, E, b.); ribs filiform or ovate, rather prominent, thick, corky: lateral ones a little broader than the rest; vitte 1 in each furrow, sometimes 2 in the outer furrows, but always 2 or 4 in the commissure. — Involucra almost wanting; involucels of many leaves.

---

**FIG. 55.**

The diagram illustrates various morphological features of the plant species described in the text, including the structure of the calyx, petals, involucra, and involucels. It highlights the diversity in the shape and arrangement of these components across different species within the Umbelliferae family.
71 Libanotis. This genus agrees in every respect with Sâseli, but differs in the lobes of the calyx being slender, subulate, elongated (f. 55. F. c.), and coloured, deciduous.—Involucra and involucels of many leaves.

72 Cenolophium. Margin of calyx obsolete. Petals obovate, emarginate (f. 55. G. b. f.), with an inflexed point (f. 55. G. L.); ribs equal, sharp, a little winged, hollow inside; vittae 1 in each furrow, and 2 in the commissure.—Involuca wanting, or of 1 leaf; involucels of many leaves (f. 55. G. a.).

73 Cnidium. Differs from Cenolophium in the ribs of the fruit being furnished with membranous wings.—Involucra variable in the different species; involucels of many leaves.

74 Petúria. This genus differs from Sâseli and Libanotis by the margin of the calyx being entire; and from Cnidium in the petals not being emarginate, and in the ribs of the fruit not being winged.

75 Endrèmissa. This genus differs from all the rest in the present tribe, in the fruit being compressed from the sides, in the ribs being obtuse and filiform, not winged; vittae 6 in the commissure, and 3 or 4 in the furrows.

76 Tha'sium. Margin of calyx 5-toothed. Petals elliptic, with a long inflexed acumen. Fruit nearly elliptic; ribs winged; vittae 1 in each furrow, and 2 in the commissure.—Involucra wanting; involucels of 3 leaves on one side.

77 Trochanèthes. Margin of calyx 5-toothed. Petals long claws, spatulate-obovate, with a triangular inflexed segment; ribs sharp, rather winged, equal; vittae 3-4 in each furrow, and 8 in the commissure. Carnophore bipartite.—Involucra wanting, or of 1 leaf; involucels of 2-5 leaves.

78 Athamantha. Margin of calyx 5-toothed. Petals obovate or entire; with a very short, inflexed, unguiculated point; fruit attenuated into a neck; ribs filiform, wingless, equal; vittae 2-3 in each furrow.—Involucra few-leaved; involucels of many leaves.

79 Lioustricium. Margin of calyx 5-toothed or obsolete. Petals obovate, acute, emarginate, with an inflexed point; ribs short, rather winged, equal; vittae many, both in the furrows and commissure.—Involucra variable; involucels many-leaved.

80 Silicas. Margin of calyx obsolete. Petals obovate-oblong, entire, or rather emarginate, with an inflexed point; ribs sharp, rather winged, equal; vittae many in each furrow, and so close together as to appear one; commissure furnished with 4-6 vittae.—Involucra wanting or of few leaves; involucels of many leaves. Flowers cream-coloured or greenish.

81 Wâlrokthia. Calycine teeth 5, ovate-lanceolate, acute (f. 56. A. b.). Petals elliptic, entire, acute at both ends (f. 56. A. d.). Mericarps with rather prominent, equal ribs; vittae numerous in the furrows.—Involuca of 1-3 unequal leaves; involucels of 5-8 unequal leaves.

82 Me'um. Margin of calyx obsolete. Petals entire, elliptic, acute at both ends. Mericarps with rather prominent, equal, keeled ribs; vittae many in each furrow, and 6-8 in the commissure.—Involucra wanting; involucels of many leaves.

83 Gáya. Margin of calyx obsolete. Petals obovate, more or less emarginate, with a broad inflexed point. Fruit oval, a little compressed; ribs elongated, wing-formed, contiguous at the base, at equal distances, obscure; vittae none. Carnophore bipartite.—Involuca few-leaved.

84 Conioselinum. Margin of calyx obsolete. Petals obcordate or obovate, with an inflexed point. Styles at length reflexed. Fruit compressed or convex from the back; ribs winged; lateral ones twice the breadth of the rest; vittae 3 in each furrow, but in the dorsal furrows sometimes only 2: and 4-8 unequal ones in the commissure; carnophore bipartite.—Involucra wanting, or of few leaves; involucels of 5-7 linear-sabulate leaves.

85 Chithem. Margin of calyx obsolete. Petals roundish, entire, involute, with an obvate point. Mericarps with 5 elevated, sharp, somewhat winged ribs; the lateral ribs a little broader than the rest; pericarp spongy from large cells.—Involucra and involucels of many leaves. Seed semi-terete, constituting a distinct nucleus, covered with copious vittae.

Tribe VI.

Angelíceæ. Fruit compressed from the back, girded by 2 wings on each side, from the raphe being central, or nearly so; mericarps furnished with 5 ribs: the 3 dorsal ribs filiform or winged: and the 2 lateral ones always expanded into wings, and broader than the dorsal ones. Seed rather convex on the back, and flatish in front.

86 Levísticum. Margin of calyx entire. Petals incurved, roundish, entire, with a short point. Mericarps with 5 wings; wings of the lateral ribs the broadest; vittae 1 in each furrow, and 2-4 in the commissure. Carnophore bipartite.—Involucra and involucels of many leaves.

87 Sélium. Margin of calyx obsolete. Petals obovate-emarginate. Mericarps with 5 membranous wings; the wings of the lateral ribs twice the breadth of the rest; vittae 1 in each furrow, but in the outer ones usually 2, and always 2 in the commissure. Carnophore bipartite.—Involucrum of few leaves; involucels of many leaves.

88 Ostérícum. Calyx 5-toothed; teeth broad. Petals unguiculate, obovate, emarginate, with an inflexed point. Mericarps with 5 ribs: the 3 dorsal ones elevated and filiform: the 2 lateral ones dilated into wings, much broader than the rest; vittae 1 in each furrow. Carnophore bipartite.—Involuca of few leaves; involucels of many leaves.

89 Angélíca. Margin of calyx obsolete. Petals lanceolate, entire, with a straight or incurved point. Mericarps with 5 ribs: the 3 dorsal ones filiform and elevated: and the 2 lateral ones dilated into membranous wings, which are broader than the rest: vittae 1 in each furrow. Carnophore bipartite.—Involucrum wanting, or of few leaves; involucels of many leaves.

90 Archangelíca. Margin of calyx with 5 short teeth. Petals elliptic, entire, with an incurved point. Mericarps with 5 thickish, keeled ribs: the 3 dorsal ones elevated: and the 2 lateral ones dilated into wings. Seed not adhering to its covering, but constituting a free nucleus, covered all over with copious vittae. Carnophore bipartite.—Involuca nearly wanting; involucels of many leaves, unilateral.

Tribe VII.

Pucèda'nee. Fruit compressed from the back, or lenticularly I
compressed, girded by a smooth, winged, flattened, or rather convex, dilated, entire margin. Mericarps with 5 filiform ribs, rarely winged; lateral ribs contiguous to the dilated margin, or lost in it. Raphe marginal, hence the fruit is only furnished with 1 wing on each side, not with 2 wings, as in the last tribe, where the raphe is central. Seed flattened, or rather convex on the back.

91 Op'panax. Margin of calyx obsolete. Petals roundish, entire, involute, with an acutish point. Stylopodium broad, thick; styles very short; mericarps with 3 dorsal filiform, very slender ribs: the 2 lateral ones wanting, or not distinct from the margin; vitæ 3 in each furrow, and 6-10 in the commissure. Seed flat.

—Involuca and involucels of many leaves. Flowers yellow.

92 Fe'kula. Margin of calyx with 5 short teeth. Petals ovate, entire, with an ascending or incurved point. Fruit girded by a dilated flat margin; mericarps with 3 dorsal filiform ribs: the 2 lateral ones very obsolete, or not distinct from the dilated margin; vitæ 3 or more in the dorsal furrows, and 4 or more in the commissure. Seed flat. Carphophore bipartite.

—Involuca and involucels variable. Flowers yellow.

93 Do'rema. The large, cup-shaped, epigenous disk, and the solitary vitæ in the furrows of the fruit, distinguish this genus from Fěkula and Op'panax. The flowers being completely sessile is also a remarkable character.

94 Eros'yia'phi. Calyx bluntly 5-toothed. Petals ovate, entire, with a short, incurved point (f. 56, E. f.). Fruit compressed (f. 56. E. k.) from the back, girded by a thickish margin; the 3 dorsal ribs filiform; and the 2 lateral ones running into the thickish margin, which is spongy inside; furrows broad, 2-3-striped, bearing 2-3 vitæ in each; and the commissure is without vitæ, but marked with a middle nerve and 2 marginal ones, rather hollow and tomentose between the nerves. Seed flattish.—Involuca and involucels wanting. Flowers yellow.

95 Pa'limia. Margin of calyx obsolete. Petals elliptic, with an acute inflexed point. Fruit oblong or oval. Mericarps compressed from the back: with 5 filiform, bluntish ribs: 2 marginal ones a little broader than the rest; vitæ 3 in each furrow, and 2 broad ones in the commissure. Seed oblong, free, striped.

—Involuca few-leaved or wanting. Flowers cream-coloured.

96 Pecess'danum. Margin of calyx 5-toothed. Petals oblong, emarginate, or entire, with an inflexed point. Fruit girded by a flat margin; the 3 dorsal ribs filiform; and the 2 lateral ones more obsolete, contiguous to the dilated margin; vitæ in each furrow usually 1, and in the commissure 2. Carphophore bipartite. Seed flat in front.—Involuca variable in the different species; involucels of many leaves.

97 Imperatôria. All as in Pecess'danum, but the margin of the calyx is obsolete.—Involuca wanting; involucels of few leaves.

98 Callis'aie. "Margin of calyx rather 5-toothed, or nearly obsolete. Petals oval, with an incurved point. Fruit nearly orbicular, emarginate at the base, with a winged margin; the 3 dorsal ribs obtuse and nerve-formed: the 2 lateral ones expanded into wings, which lie over the whole surface: vitæ 1 in each furrow, and 1 on each side of the commissure. Forks of carphophore adhering to the mericarps.—Involuca wanting, or of few leaves; involucels of many scanty leaves.

99 Bu'don. Margin of calyx obsolete. Petals obovate, entire, with an acute involute point. Fruit girded by a flattened, dilated margin; the 3 intermediate ribs filiform, and the 2 lateral ones going into the margins; vitæ covering the whole seed, 4 dorsal and 2 in the commissure. Carphophore bipartite. Seed flat in front and convex on the back.—Cape shrubs. Involuca and involucels of many leaves. Flowers greenish yellow.

100 An'éthum. Margin of calyx obsolete. Petals roundish, entire, with a rather square retuse point. Fruit girded by a flat margin; the 3 intermediate ribs acutely keeled, and the 2 lateral ones more obsolete, and running into the margin; vitæ broad, solitary in the furrows, and filling them, and twin in the commissure. Seed rather convex on the back.—Involuca and involucels wanting. Flowers yellow.

101 Co'ntia. Teeth of calyx elongated, acute. Petals lanceolate, acuminate, entire. Stylopodium conical; styles diverging. Fruit elliptic, rather retuse at both ends; ribs winged: lateral one the broadest; vitæ 1 in each furrow, and 2 in the commissure, which is flat. Seed flattish.—Involuca of 2-5 multifoil leaves; involucels of 5 linear, entire, or 2-3-cleft leaves.

102 Carnoph'ilium. Margin of calyx obsolete. Petals oblong, rather emarginate, tapering into an inflexed acumen. Fruit girded by a flat, dilated margin; the 3 intermediate ribs thickish, keeled, rather flexuous, tubercular: the 2 lateral ones going into the dilated margin; vitæ 1 in each furrow, and 2 in the commissure. Seed rather convex on the back.—Involuca and involucels of 3-6 leaves.

103 Tiedem'ania. Margin of calyx 5-toothed (f. 64. a.). Petals acuminate, reflexed. Fruit nearly ovate (f. 64. c.); mericarps with 5 filiform, subcarinated, approximate ribs: lateral ones dilated into a membranous margin, which is nearly the breadth of the fruit; vitæ solitary in the furrows, and filling them, and twin in the commissure. Carphophore bipartite. Seed flat.—Involuca and involucels of 4-5 subulate leaves.

104 Archem'ora. Margin of calyx 5-toothed. Petals obcordate, with an inflexed point. Fruit compressed from the back, oval or obovate; mericarps with 5 filiform, rather keeled, approximate ribs: lateral ribs dilated into a broad membrane; vitæ solitary in the furrows, and filling them, and twin in the commissure. Carphophore bipartite. Seed flattened.—Involuca wanting or few-leaved; involucels of many leaves.

105 Pastina'ca. Margin of calyx obsolete, or minutely dentilicate. Petals roundish, entire, involute, with a broad retuse point. Fruit compressed from the back, girded by a flat dilated margin; the 3 intermediate ribs filiform, equidistant: lateral ones contiguous to the dilated margin; vitæ linear, acute, hardly shorter than the ribs, solitary in the furrows, and twin or more in the commissure. Carphophore bipartite. Seed flattened.—Involuca and involucels wanting or few-leaved. Flowers yellow.

106 Re'stelus. Teeth of calyx obsolete. Petals roundish, entire, involute, with a broad retuse segment. Fruit compressed, with a thickened dilated smooth margin; the 3 intermediate ribs approximate, and the 2 lateral ones marginal and remote; vitæ 1 in each furrow, filiform, distant in the commissure. Involuca wanting; involucels of a few very fine leaves.
UMBELLIFERÆ.

107 Astydamia. Margin of calyx 5-toothed (f. 56. D. a. d. f.). Petals obovate, entire, with an inrolled point. Stylopodium thick; styles very short (f. 56. D. g. r.). Fruit compressed from the back (f. 56. D. k.), girded by a thick dilated margin; the 3 dorsal ribs crested, approximate: the 2 lateral ones running into the margin; dorsal vittæ very few, the commissural ones wanting or covered.—Involucra and involucels of many leaves. Flowers yellow.

108 Symphytum. Margin of calyx obsolete. Petals equal, emarginate, with an inrolled point. Stylopodium without a margin; styles reflexed. Fruit elliptic, compressed from the back; mericarps closely conate by their margins; with 5 filiform ribs: 3 dorsal ribs equidistant: lateral ones more remote, marginating; vittæ wanting or obsolete. Seed flattened. Carpophore none. Flowers red.

109 Heracleum. Calyx 5-toothed. Petals obovate, emarginate, with an inrolled point: exterior petals usually radiating and bifid. Fruit compressed from the back, girded by a flat, dilated margin; mericarps with very fine ribs: 3 dorsal ones equidistant: 2 lateral ones remote, contiguous to the dilated margin; vittæ 4 on the back, solitary in the furrows, but usually with 2 in the commissure, all shorter than the fruit, and usually club-shaped; carpophore bipartite. Seed flat.—Involucra caducous, usually of few leaves; involucels of many leaves.

110 Zoënia. Calyx 5-toothed. Petals obovate, emarginate, with an inrolled point. Fruit compressed from the back, rather convex in the middle, hairy, girded by a smooth, thickened, dilated margin; ribs very thin: dorsal ones at equal distances: 2 lateral ones more remote, contiguous to the dilated margin; vittæ covering the whole seed, solitary in the furrows, and twin in the commissure. Carpophore bipartite. Seed flat.—Involucra and involucels of many leaves.

111 Polytrichum. Calyx 5-toothed. Petals oval, emarginate, with an inrolled point. Fruit oval, compressed on the back, convex in the middle, glabrous; with a smooth tumid margin, and a depressed furrow on the back; ribs very slender, hardly distinct; vittæ twin between the ribs, but 6 in the commissure; carpophore indistinct. Seed flat.—Involucra none; involucels setaceous.

112 Johnënia. Teeth of calyx obsolete, very blunt. Petals unknown. Stylopodium short, conical, furrowed a little. Styles short, diverging. Fruit oval, lenticularly compressed on the back (f. 56. C. b.), quite glabrous; with a smooth tumid margin, and a flat, dorsal, coloured furrow; mericarps with 3 dorsals, filiform ribs, which probably contain vittæ: 2 lateral ones running into the dilated margin, hardly distinct, usually rufous, and the form of vittæ; commissure spongy, furnished with 2 lines, but without vittæ. Carpophore 2-parted (f. 56. C. b. a.). Seed flat.—Involucrum wanting, or of 1 leaf; involucels of 4-5 linear, setaceous leaves.

Tribe VIII.

Tordylëœæ. Fruit lenticularly or flatty compressed from the back, girded by a thickened, nodulose, or pleated, dilated margin. Mericarps with 5 very fine or obsolete ribs: lateral ones contiguous to the dilated margin, or forming the same. Seeds flattened. This tribe differs from Peucedanum in the margin of the fruit being plaited or nodulose, not smooth and entire.

113 Hasselquistia. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inrolled point; outer petals radiating and bifid. The outer fruit of the umbel are compressed, girded by an accessory, winged, thickened margin, which is hardly wrinkled; those of the disk dissimilar: one of the mericarps contracted into an hemispherical urceolus around the other, which is abortive; ribs very slender: the 3 dorsal ones equidistant: and the 2 lateral ones contiguous to the thickened margin, or hidden by it; vittæ 1 in each furrow, and 2 in the commissure. Carpophore bipartite. Seed flat.—Involucra of many leaves.

114 Tordylium. All as in Hasselquistia, except that the vittæ are either solitary or numerous in the furrows, and either 2 or more in the commissure; and in the fruit being equal, and girded by a tubercularly wrinkled, accessory, thickened margin.—Involucra of many leaves.

115 Tordylides. Margin of calyx 5-toothed; teeth acute: outer teeth the largest, dilated at the base, and cuspidate at the apex. Outer petals of umbels larger, and obcordately 2-lobed: the rest smaller, ovate, and cuspidate, usually entire, rarely somewhat 2-lobed. Stylopodium conical. Styles erect, elongated. Fruit hairy.—Involucra and involucels of 3-6 lanceolate-linear leaves.

** Fruit furnished with both primary and secondary ribs.

Tribe IX.

Silberœœæ. Fruit lenticularly compressed from the back. Mericarps with 5 primary ribs: the lateral ones marginating; and usually with 4 secondary, less prominent ones; all filiform and wingless. Seeds flatish in the front.

116 Kruberœæ. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inrolled point. Mericarps with 5 plicately crenated, thick ribs: the 3 intermediate elevated, obtuse, and keeled: 2 lateral marginating and roundish, keeled near the raphe; vittæ none. Carpophore bifid.—Involucra 2-5-leaved; involucels 4-5-leaved.

117 Pachypleœrum. Margin of calyx obsolete, or minutely denticulated. Petals permanent; those of the inner flowers obovate-oblong, emarginate, with an acute, inrolled point; those of the ray flowers of 2 forms: the 3 inner, ovate, hardly emarginate, with an acute inrolled point: 2 outer nearly orbicular, and profoundly marginate, also with an inrolled point. Mericarps with elevated, thick, and corky ribs: the lateral ones marginating, and a little broader than the others; vittæ none.—Involucra and involucels of many leaves.

118 Agasëllis. Margin of calyx obsolete. Petals lanceolate, incurved. Fruit oval. Mericarps with 5 primary ribs: the 2 lateral ones placed in front of the accessory margin; the secondary ribs hardly visible. Seeds furnished with 8-10 dorsal vittæ, and 5-6 commissural ones.—Involucra wanting; involucels of many setaceous leaves.

119 Stenocoeæum. Margin of calyx 5-toothed. Petals obovately orbicular, somewhat emarginate, with an inrolled
UMBELLIFERÆ.

point. Mericarps with 5 rounded, thick, equal ribs; vittæ 1 in each furrow.—Involucra and involucels of many leaves.

120 *SILER.* Margin of calyx 5-toothed. Petals obvate, emarginate, with an inflexed point. ribs filiform, elevated, obtuse: primary ones 5: lateral ones of these marginating: secondary ones 4, less prominent; vittæ 1 in each furrow, under the secondary ribs.—Involucra none, or few-leaved, caducous.

121 *GALLENIUM.* This genus differs from *Siler* in the absence of dorsal vittæ to the fruit, and the commissure being furnished with only 2.

**Tribe X.**

*CUMINUM.* Fruit contracted from the sides; mericarps with 5 filiform, primary ribs: the lateral ones of these marginating; and 4 secondary more prominent ones; all wingless. Seed straight, flattened in front.

122 *CUMINUM.* Calyx with 5 lanceolate, unequal, permanent teeth. Petals oblong, emarginate, with an inflexed point. Primary ribs minutely mucronated: secondary one pricky: vittæ 1 in each furrow under the secondary ribs. Carpophore bipartite. Seed concave in front, and convex on the back.—Involucral of 2-4 simple or divided leaves; the involucels dimidiate, of 2-4 reflexed leaves.

123 *TREPONÆUS.* Calyx with 5 subulate teeth, which fall off at length. Petals obcordate, emarginate, obtuse. Fruit pyramidal angular, nearly terete; mericarps convex on the back; primary ribs margined with a fuscous, vitæ-like formed line on each side; secondary ones furnished with 1 vitta on their inner side; commissure thick, furrowed in the middle, and furnished with vitæ inside. Seed straight, rather compressed on the back.—Involucra 1-3-leaved; involucels dimidiate, of 4-5 linear, unequal leaves.

**Tribe XI.**

*THAPSÆA.* Fruit compressed from the back; mericarps with 5 filiform primary ribs, which are now and then bristly: lateral ones seated in the flat commissure; secondary 4: inner ones of these filiform, and the outer ones or all are winged; wings undivided, hence the fruit is either 8-winged, or furnished with 2 wings on each side. Seed flattened, or tetralobed, convex, flat in front.

124 *THAPSIA.* Margin of calyx 5-toothed. Petals elliptic, entire, with an inflexed or involute point; 2 lateral secondary ribs winged, hence the fruit is 2-winged on each side; furrows under the secondary ribs furnished with 1 vitta each. Carpophore bipartite. Seed flattened.—Involucra and involucels wanting, or of few leaves. Flowers yellow.

125 *CYPÆTERUS.* Calyx minutely 5-toothed. Petals roundish-oval, inflexed at the apex. Fruit nearly elliptic, compressed, 7-8-winged, from all the secondary ribs being winged; wings undulated; furrows flat, 1-nerved; commissure naked, 3-striped. Carpophore not separable from the mericarps.—Involucra wanting; involucels dimidiate, 5-7-parted.

126 *LAPÆÆTUM.* Margin of calyx 5-toothed (f. 55. C. f.). Petals obvate, emarginate (f. 55. C. a.), with an inflexed point (f. 55. C. i.). Fruit compressed from the back (f. 55. C. g.), or nearly terete, 8-winged, in consequence of the 8 secondary nerves being winged; vittæ 1 in each furrow, under the secondary ribs. Carpophore free, bipartite (f. 55. C. b.).—Involucra and involucels of many leaves.

127 *LOPHOSCHÆTA.* Margin of calyx 5-toothed. Petals elliptic, entire, acuminate, involute at the apex (f. 55. B. d.). Fruit compressed (f. 55. B. e.) on the back; the 2 lateral secondary ribs expanded into a subcontrary wing each: the 2 dorsal ones expanded into an interrupted wing each, at first sight appearing like a retrograde scale (f. 55. B. e.). Involucræ of 5-7 ovate-lanceolate leaves (f. 55. B. a.); involucels of 5-7 narrower leaves (f. 55. B. b.). Flowers yellow.

128 *MELANOSILINUM.* Margin of calyx 5-toothed. Petals obvate, emarginate, with a reflexed point. Fruit compressed from the back; the 2 inner secondary ribs filiform and very slender: the 2 outer ones expanded into a membranous serrated wing each; with 2 oleiferous canals under all the ribs. Carpophore bipartite. Seed flat.—A shrub. Involucra and involucels of many leaves, the first composed of cut leaves, and the second of entire leaves.

**Tribe XII.**

*Daucynæ.* Fruit lenticularly compressed from the back; mericarps with 5 bristly, filiform primary ribs; lateral ones of these seated in the flat commissure, as in *Thapsia*: and with 4 secondary ones, which are more prominent and prickly; the prickles free, or joined into a wing. Seeds flattened, or subsemicircular, or convex on the back; and flattened in front.

129 *ARTEDIA.* Margin of calyx obsolete. Petals obvate, emarginate, with an inflexed point: those on the outer part of the umbel radiating and bipartite. Secondary ribs 4: the inner ones filiform: the outer ones expanded into a sinuate lobed wing each; vittæ none. Carpophore bipartite. Seed flat.—Leaves of involucra and involucels divided into linear lobes.

130 *ORLAYA.* Margin of calyx 5-toothed. Petals obvate, emarginate, with an inflexed point: those in the ray of the umbel profusely bident. Secondary ribs of fruit furnished with 2 or 3 rows of prickles, outer ones more prominent, or a little winged; prickles hooked or rayed at the apex; vittæ 1 in each furrow under the secondary ribs. Carpophore bifid or undivided? Seed convex on the back.—Involucra variable; involucels of many leaves.

131 *DAUCUS.* Margin of calyx 5-toothed. Petals obvate, emarginate, with an inflexed point: outer ones usually radiating, and profusely bident. Fruit oval or oblong; the 4 secondary ribs more prominent and winged, divided into a simple series of prickles; vittæ 1 in each furrow, under the secondary ribs. Seed flattened in front.—Involucra of many trifid or pinnatifid leaves; involucels of many entire or trifid leaves.

**Suborder II. CAMPYLOSPERMAE.** Albunæ involute, or marked by a longitudinal furrow or channel on the inner side.

§ 1. Mericarps furnished with both primary and secondary ribs.

**Tribe XIII.**

*ELIÓSENIÆ.* Fruit cylindrical, more compressed from the
back than from the sides; mericarps with 5 primary filiform ribs; and 4 secondary ones: the 2 dorsal ones of these last nerve-formed, but the 2 lateral ones are expanded into a wing each; with the margins nerve or rib-formed. Seeds involute, semi-lunate.

132 Eleoese linum. Margin of calyx hardly 5-toothed. Petals obvolute, emarginate, with an inflexed point. Fruit nearly terete, 4-winged; the 2 lateral primary ribs seated between the wings and the nerve-formed margins; vittae under all the ribs abounding in oil, those under the primary ribs narrower and slenderer: in the commissure there are 4.—Involucra and involucles of many cispidate, linear leaves. Flowers yellow.

**Tribe XIV.**

Caucalineae. Fruit contracted from the sides, or nearly terete. Mericarps with 5 filiform, briskly, or prickly, primary ribs: lateral ones of these seated in the commissure, which is flat; the secondary 4 more prominent and very prickly. Seeds involute, or inflexed on the margin.

133 Caucalis. Teeth of calyx 5, ovate-lanceolate. Petals obvolute, emarginate, with an inflexed point: outer ray ones profoundly bifid. Fruit rather compressed from the sides; secondary ribs deeply cleft into a simple series of prickles; vittae solitary in each furrow, under the secondary ribs, and 2 in the commissure. Carpophore stiff, cleft at the apex.—Involucra none, or of 1-2 leaves; involucels of 3-8 lanceolate leaves.

134 Turgenia. Teeth of calyx 5, setaceous. Petals obvolute, emarginate, with an inflexed point: outer ones radiating and bifid. Fruit subbilobidum; lateral primary ribs with a simple series of warts or prickles, all the rest furnished with 2 or 3 rows of equal prickles; furrows furnished with 1 vittae each under the secondary ribs. Carpophore setaceous, bifid.—Involucra and involucels of 3-5 ovate, concave, equal leaves.

135 Torilis. Teeth of calyx 5, triangularly lanceolate, acute, permanent. Petals obvolute, emarginate, with an inflexed point: outer ones larger and bifid. Secondary ribs having abundance of prickles occupying the whole furrows, which are furnished with 1 vittae each under the prickles. Carpophore setaceous, bifid. Involucra of 1-5 leaves; involucels of 5-6 lanceolate ciliated leaves.

§ 2. Mericarps only furnished with primary ribs.

**Tribe XV.**

Scandicaeae. Fruit evidently compressed, or contracted from the sides, usually beaked; mericarps with 5 filiform ribs, which are at length winged: lateral ribs margining, all equal, but sometimes all obliterated at the base, and only conspicuous at the apex. Seeds tetradely convex, having a deep furrow in front, or somewhat involute on the margin.

136 Scandix. Margin of calyx obsolete, or somewhat 5-toothed. Petals obvolute, truncate, or emarginate, usually furnished with an inflexed point. Fruit compressed from the sides, with a very long beak; vittae wanting, or nearly obsolete. Carpophore undivided, forked at the apex.—Involucra wanting, or of 1 leaf; involucels of 5-7 leaves.

137 Anthriscus. Margin of calyx obsolete. Petals obvolute, truncate, or emarginate, with a very short inflexed point. Fruit contracted from the sides: having a beak, which is shorter than the seed; mericarps nearly terete, destitute of ribs, the beak alone being furnished with 5 ribs. Carpophore bifid at the apex.—Involucra wanting; involucels of many leaves.

138 Cerophyllum. Margin of calyx obsolete. Petals obvolute, emarginate, with an inflexed point. Fruit compressed from the sides, without any beak; commissure deep; vittae 1 in each furrow. Carpophore bifid.—Involucra wanting, or of few leaves; involucels of many leaves.

139 Caldasia. Margin of calyx obsolete. Petals ovate, with an entire somewhat involute point. Fruit ovate-oblong, rather compressed from the sides, crowned by the short diverging styles; furrows between the ribs broad, flat, striated, and furnished with 1 vittae each; commissure furrowed in the middle. Carpophore bipartite. Seed rather cuneolate at the commissure.—Umbels simple, surrounded by a 20-leaved involucre.

140 Sphalerocharpus. Teeth of calyx 5, subulate. Petals obvolute-cuneated, emarginate, with an inflexed point (f. 56. L. b.): the outer ones of the umbel radiating. Stylodium rather urceolate, toothed; styles short. Fruit elliptic-oblong (f. 56. L. d.), contracted from the sides, without a beak; furrows between the ribs convex, furnished with 2-3 vittae each, and the commissure with 4-6. Carpophore bipartite (f. 56. L. h.).—Involucra wanting; involucels of 5-6 lanceolate leaves (f. 56. L. a.).

141 Molopospermum. Calyx 5-toothed, foliaceous. Petals lanceolate, entire, ending in a long ascending point. Fruit contracted from the sides. Mericarps with 5 winged ribs. Seed bluntly tetragonal or angular; channels empty between the seed and the commissure of the pericarp; furrows having 1 broad brown vittae each, but the commissure is very narrow, and without any vittae. Carpophore bipartite.—Involucre of many elongated, membranous leaves, which are sometimes multifid; involucels of many leaves.

142 Velaea. Margin of calyx obliterated. Petals unknown. Stylodium conically depressed, short (f. 56. G. b.); styles erect, filiform. Fruit ovate (f. 56. G. e. b.), without a beak; mericarps rather compressed from the sides, with 5 ribs: the 2 lateral ones filiform, and the 3 dorsal ones winged; vittae 3, and sometimes 2 in each furrow, and 4 in the commissure. Carpophore bipartite (f. 56. G. h.) from the base.—Involucra and involucels none.

143 Myrrhis. Margin of calyx obsolete. Petals obvolute, emarginate, with an inflexed point. Fruit compressed from the sides. Seeds involute, covered by a double membrane: outer membrane furnished with 5 acutely keeled, sharp, equal ribs, hollow inside: inner one adnate to the seed; vittae none. Carpophore cleft at the apex.—Involucra none; involucels of many lanceolate ciliated leaves.

144 Osmorniza. Margin of calyx obsolete. Petals obvolute, hardly emarginate, with a short inflexed point. Fruit elong-
gated, tapering into a tail at the base, solid, acutely angular; mericarps with hispid, rather furrowed angles; ribs 5, acute; commissures furrowed; furrows flat, without vitre. Carpopore semi-bifid.—Involucra of 2-3 lanceolate, ciliate leaves; involucels of 5 lanceolate, ciliate leaves.

145 Grammoscadium. Teeth of calyx stiff (f. 56. H. g.), permanent. Petals obcordate, with an inflexed point. Styles short, conical (f. 56. H. b.), diverging. Fruit cylindrical (f. 56. H. a. b.), without a beak; mericarps with 5 primary, flattish white ribs; furrows flat, furnished with 1 vitta each, and the commissure with 2.—Involucra of 5-7 multifid leaves; involucels of linear-subulate, rarely cut leaves (f. 56. H. c.).

Tribe XVI.

 Smyræe. Fruit turgid, usually compressed, or contracted from the sides; mericarps with 5 ribs: lateral ones marginating, or situated in front of the margin; the ribs sometimes almost obliterated. Seed involute, or with a furrow on the inside, or outer, or ciliate or compliate.

146 Lagercia. Calycine lobes large, pectinated. Petals obcordately bifid, shorter than the calyx; lobes awned. Ovarium 2-celled, with 1 of the cells abortive. The fruit is therefore ovate, crowned by the calyx, subessent: marked by a furrow on one side, indicating the place of the abortive seed.—Involucra of 8-10 pectinated leaves; and the involucel of 4.

147 Oliveæa. Margin of calyx 5-toothed. Petals profoundly obcordate; lobes involute on the margin of the base, and excavated at the sides, undulated and reflexed at the apex. Fruit obovate, hairy; mericarps nearly terete; with 5 blunt ribs. Carpophore bifid at the apex.—Involucra of 3-4 trifid leaves, with the lobes usually tridentate; involucels of many cuneiform, trifid leaves.

148 Anisoscadium. Calycine lobes of the outer flowers of the umbel, large, ovate, and foliaceous: of the outer central ones stiff and hooked: of the other inner ones wanting or tooth-formed. Petals very unequal: outer ones obcordately bifid: inner ones small. Fruit rather downy, oblong-cylindrical, crowned by the calyx, and stiff conical style; mericarps with 5 blunt ribs; vittæ brown, 1 in each furrow, but none in the commissure.—Involucra of 4-5 oblong, acute, unequal leaves; involucels of 4-5 leaves.

149 Echinosphora. Margin of calyx 5-toothed. Petals emarginate, with an inflexed point: outer ones larger and bifid. Styles of the female flowers elongated, filiform (f. 65. b.). Fruit ovate (f. 65. c.), nearly terete, inclosed in a hollow receptacle: with a short, emersed beak; mericarps with 5 undulated, equal depressed ribs; vittæ covered with a cobwebbed membrane, 1 in each furrow.—Involucra and involucels of many leaves (f. 65. a.).

150 Exacanthæ. Flowers polygamous: central ones fertile, the rest sterile. Calyx in the sterile flowers obsolete. Petals obcordate, equal, inflexed. Young fruit of the sterile flowers obovate, striated; of the central flowers much more ovate, somewhat papilllose, and crowned by 15 elongated stiff bristles.—Involucra of 10-12 large, channelled, spinose leaves; involucels of 7-11 spinose, very unequal leaves on one side.

151 Acroæus. Flowers polygamous. Margin of calyx 5-toothed. Petals lanceolate, with an incurved acute entire point. Fruit ovate, beaked, crowned by the calyx, conterrinated from the base to the middle with the involucrum, depressed in front, and marked by a furrow, not separable into 2 parts, but bilateral, 1 of the cells abortive.—Involucra of 4-5 concrete leaves.

152 Caëræys. Margin of calyx 5-toothed, rarely obsolete. Petals ovate, entire, involute at the apex or inflexed. Stylopodium depressed, hardly distinct in the mature fruit. Mericarps with 5 thick ribs, variable in the different sections of the genus; commissure almost the breadth of the mericarps. Seed constituting a free nucleus covered with abundance of vitte.—Involucra and involucels of many leaves. Flowers yellow.

153 Prænos. Margin of calyx 5-toothed. Petals ovate, entire, involute at the apex. Stylopodium depressed, hardly prominent in the fruit. Commisurage broad. Mericarps compressed from the back, with 5 smooth ribs, which are thick at the base, and ending in vertical membranous wings on the back. Seed girdled by an abundance of vitte.—Involucra and involucels of many undivided leaves.

155 Leöræa. Margin of calyx with 5 short teeth. Petals ovate, with an inflexed point. Stylopodia 2, distinct. Styles subulate. Fruit ovate, didymous, with a narrow commissure; mericarps semi-terete, with 5 obtuse, spongy ribs, which are beset with prickles on all sides. Seeds girdled by copious vitte. Involucels of 5-8 subulate leaves.

156 Magnýæris. Margin of calyx obsolete. Petals obcordate, with an inflexed point. Fruit ovate (f. 56. I. b.), tomentose; mericarps with 5 thick, blunt ribs, and narrow furrows. Seeds clothed on every side with very slender vitte, convex on the outside, and involute with a deep furrow on the inside.—Involucra and involucels present, of many undivided leaves.

157 He'ræmas. Margin of calyx 5-parted, foliaceous, permanent. Petals oval-oblong, acute, keeled, entire, equal. Fruit ovate; mericarps rather inflated, compressed from the back, 5 ribbed: the dorsal rib exerted: the 2 middle ones larger: and the 2 marginal ones small, under the commissure; vitte many in the furrows between the ribs, which are broad. Seed not adnate to its covering, rather hollow inside.—Involucra of many leaves; involucels of 3 leaves.

158 Cönæum. Margin of calyx obsolete. Petals obcordate, rather emarginate, with a short inflexed point. Fruit compressed from the sides, ovate; mericarps with 5, rather prominent, equal ribs, which are undulately crenulated; having the furrows between the ribs, furnished with many stripes, but without any vitte. Carpophore bifid at the apex. Seed with a
deep narrow furrow inside.—Involucra of 3-5 leaves; involucels of 3-5 leaves, dimidiate.

159 Vicaria. Margin of calyx obsolete. Petals unknown. Styles short. Fruit ovate-oblong; mericarps nearly semi-terete, with 5 filiform, hardly prominent ribs; vittae small, many in the furrows, which are broad and flat; commissure narrow. Carpophore thick, somewhat bifid at the apex. Alburnum furnished with a furrow at the commissure, convex outside.—Involucra, and generally the involucels, are wanting.

160 Arraca'cha. Margin of calyx obsolete. Petals lanceolate or ovate, entire: with an inflexed point, which is curved above the middle nerve. Fruit ovate-oblong, somewhat compressed from the sides; mericarps with 5 equal ribs; vittae many in the furrows. Alburnum nearly semi-terete, furnished with a furrow at the commissure.—Involucra wanting, or of 1 leaf; involucels of 3 leaves. Flowers polygamous.

161 Pleurosper'mum. Margin of calyx 5-toothed. Petals obvolute, entire, flat, or attenuated and inflexed at the apex. Fruit ovate, somewhat compressed from the sides; mericarps furnished with a double membrane: outer one furnished with 5 winged hollow ribs: the inner one adnate to the seed, and furnished with 5 elevated ribs under those of the outer membrane; furrows of the inner membrane furnished with 1-2 vittae each, and the commissure with 2. Carpophore filiform, binate.—Involucra and involucels of many leaves.

162 Hymenole'xa. Margin of calyx obsolete. Petals obovate, entire, flat, or attenuated and inflexed at the apex. Fruit ovate or oblong; mericarps with 5 exerted, nearly equal wings; commissure flat, furnished with 2 vittae, and the furrows with 1. Seed with a furrow in front, convex on the outside. Carpophore binate.—Involucra and involucels of many leaves.

163 Physosper'mum. Margin of calyx 5-toothed. Petals obvolute, somewhat emarginate, with an inflexed point. Fruit contracted from the sides; mericarps reniformly globose, didymous, with 5 filiform equal slender ribs: the lateral ribs placed before the margins; vittae broad, 1 each furrow. Seed semi-lunar.—Involucra and involucels of many leaves.

164 Smy'rinum. Margin of calyx obsolete. Petals lanceolate or elliptic, entire, with an inflexed point. Fruit contracted from the sides; mericarps reniformly globose, didymous: with 3 dorsal, rather prominent ribs, and 2 lateral, margining, nearly obliterated ones; vittae many in each furrow; carpophore binate. Seed involute.—Involucra and involucels variable in the different species.

165 Eu'ropus. Margin of calyx 5-toothed (f. 56. K. b.). Petals unknown. Fruit a little contracted from the sides (f. 56. K. a.); mericarps ovate, rather didymous, with 5 hardly prominent ribs; furrows having 3 convex stripes, more prominent than the ribs, which are hollow inside and filled with oil; commissure furnished with 4 similar vittae. Seed semi-lunar. Carpophore binate.—Involucra and involucels of many linear leaves (f. 56. K. c.).

166 Scaligé'ria. Margin of calyx entire. Petals obcordate, with a short inflexed obtuse point. Stylopodia thick (f. 56. B. h.), parallel. Styles filiform, bent outwards. Fruit rather didymous; mericarps ovate, contracted at the raphe, hardly compressed from the sides, with 5 filiform ribs; vittæ 2-3 in the furrows, which are rather convex, and 4-6 in the commissure, which is flatish. Alburnum furnished with a furrow on the inside.—Involucra wanting; involucels of a few small linear leaves.

FIG. 56.

Suborder III. Cori'sper'mae. Alburnum involutely curved from the base to the apex.

Tribe XVII.

Cora'ndeae. Fruit globose, or of 2 subglobose mericarps. Mericarps furnished with 5 primary, depressed, and flexuous ribs: lateral ribs placed before the accessory margin; and 4 more prominent secondary ones; all wingless.

167 Bifora. Margin of calyx obsolete. Petals obvolute, emarginate, with an inflexed point: outer ones nearly equal or radiating and bifid. Fruit didymous; mericarps ventricosely subglobose, granularly wrinkled: marked with 5 impressed, obsolete stripes: the 2 lateral stripes semicircular, placed in front of the accessory margin; vittæ wanting; commissure having 2 holes. Carpophore binate, adnate on both sides.—Involucra and involucels wanting, or of 1 leaf.

168 As'toma. All as in Bifora, but the fruit is evidently didymous; and the commissure is narrow, not perforated, nor dilated at the apex; styles rather diverging.—Involucra of 5-6 lanceolate leaves; involucels of 4-5 leaves.

169 Atre'ma. Teeth of calyx 5, acute, small, permanent. Petals obvolute, emarginate, with an inflexed point. Fruit rather didymous; mericarps nearly globose, ventricose, marked with 5 rather prominent ribs, without any vittæ; commissure narrow, closed.—Involucra and involucels of many leaves.

170 Coria'ndrum. Teeth of calyx 5, acute, unequal, permanent. Petals obvolute, emarginate, with an inflexed point: outer ones radiating, bifid. Fruit globose, 10-ribbed, hardly divisible; the 4 secondary ribs on each mericarp are more prominent than the primary ones, and keeled; vittæ 1 in each furrow, and 2 in the commissure; carpophore free in the middle, but adnate at the base and apex. Seed hollow in front, covered by a loose membrane.—Involucra none; involucels usually of 3 leaves, dimidiate.

171 Cymboca'rum. Margin of calyx obsolete. Petals equal, obcordate, with an inflexed point. Stylopodium depressed; styles...
UMBELLIFERÆ.

reflexed. Fruit nearly globose; mericarps solid, hemispherical: with 5 primary, filiform, usually obliterated ribs, without any secondary ribs or vitice. Carpophore bipartite, free in the middle, but adnate at the base and apex. Seed hollowed in front.—Involucra and involucels composed of linear leaves.

Suborder 1. ORTHOSPERMÆ (from ὄρθος, orthos, straight, and σπέρμα, sperma, a seed). D. C. prod. 4. p. 58. Albumen flat on the inner side, neither involute, nor convolute.

§ 1. Umbels simple or imperfect. Fruit destitute of vitice.

Tribe 1.

HYDROCOTYLEÆ (plants agreeing with Hydrocotyle in important characters), or Orthospermae. Imperfecte, Umbellata, Compressæ, D. C. prod. 4. p. 58.—Hydrocotyleae, Spreng. in Schultes, syst. 6. p. 52. Koch, umb. p. 141. exclusive of many genera. Fruit contracted from the side; back of carpellæ or mericarps convex, rarely acute; the 5 primary ribs or nerves becoming immediately obsolete: lateral ribs marginating, or thrown back into the flat commissure: secondary ones permanent and filiform, sometimes absent or nearly so. Albumen flattish in front. Petals spreading, entire, acute, straight, or rather in- flexed at the point. This tribe represents the forms of nearly all in the different genera; it is distinguished from nearly all the suborder Orthospermae, in the umbels of flowers being imperfect; from Sambuceæ in the lateral compression of the fruit, and from Malvaæ in the commissure not being gradually contracted.

Lin. syst. Pentádtia, Décúdia. Tube of calyx rather compressed: limb with an obsolete margin. Petals ovate, entire, acute, with a straight apex. Fruit flatly compressed from the sides, bicarpellate. Mericarps or carpellæ without vitice: having the 5 ribs or nerves nearly filiform: the carinal and lateral ones usually obsolete, and the 2 intermediate ones joined. Seed carinately compressed.—Usually slender bog herbs, rarely subshrub. Umbel simple, surrounded by a few-leaved involu- crum. Flowers sessile or pedicellate, white. This genus is composed of a heterogeneous mass of species, and is therefore probably divisible into several genera.

Sect. 1. Euhydrocotyle (this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 59. Hydro- cotyle, Lin. gen. no. 325. Stems herbaceous, of nearly all the species, creeping. Fruit compressed; mericarps furnished with 1-2 ribs on each side.

§ 1. Leaves peltate.

I. HYDROCOTYLE.

2. H. vulgàris (Lin. spec. p. 328.) leaves peltate, orbicular, doubly crenated, 9-nerved; petioles pilose at the apex; umbels capitulate, usually 5-flowered; fruit somewhat emarginate at the base, of one colour. 3. H. Native nearly throughout the whole of Europe, in marshy boggy places, and on the margins of clear rivulets, particularly on a peat soil: plentiful in some parts of Britain; also of North America, in Canada. Fl. dan. t. 90. Smith, engl. bot. t. 751. Curt. lond. 6. t. 19. Schkuhr, handb. t. 59. Rich. hydr. no. 1. t. 50. f. 1. and t. 52. f. 1. exclusive of the variety. Stems creeping, rooting at the nodi. Peduncles of the umbels or scapes much shorter than the petioles. Flowers reddish white or rose-coloured. There is a variety, but it is rather rare, with smooth petioles, and with the limbs emarginate at the base or nearly entire, and with the scapes drawn out beyond the umbels of flowers, and bearing 2 umbels each. Gerarde calls this plant water penny-wort, sheep-killing penny-grass; in the north of England it is called white-root, to distinguish it from red-root; in Norfolk Fluck-wort, from its being supposed to occa- sion the fluxes in the liver of rotten sheep; and by the husband- man sheep's-bane, "because it killeth sheep that do eat thereof." This, however, is a vulgar error; for the root in sheep is owing to their feeding in wet grounds, and perhaps to an insect (the Fasciolâ hepática), which from its shape is called a fluke or flounder, and abounds in such situations, adhering to stones and plants, as well as to the liver and biliary ducts of sheep af- fected with the root. This, together with Astrâca or Sândem, and Pinguicula or Butter-wort, are common in marshy places, and therefore the root in sheep has been ascribed to these; but it is pretty certain that neither sheep nor any other quadruped feed on these plants.

3. H. pusílla (Rich. hydros. p. 27. t. 53. f. 2.) plant rather hairy; leaves orbicular, not emarginate at the base, obsolescently crenated, 7-nerved; flowers umbellate; umbels hardly contain- ing so many as 12 flowers; scapes equal in length to the petioles. 3. F. Native about Monte Video, in arid places; and on shady rocks at Rio Pauquaper, in the province of Rio Janeiro; also of Buenos Ayres. Cham. et Schlecht. in Linnaea. 1. p. 53. Perhaps one of the smallest. Postulated with Astrâca or Sândem, if they were minutely stipulate (Rich.). Fruit smooth; mericarps marked with a single elevated line on each side. The Buenos Ayrenian plant differs from the Brazilian one in being perfectly glabrous.

Small Penny-wort. Pl. creeping.

4. H. modoëtá (Cham. et Schlecht. l. c. p. 358.) leaves on long petioles, orbicularly reniform, glabrous, 9-nerved; petioles pilose at the apex, as well as the young branches; umbels on short peduncles, many rayed; fruit small, emarginate at both ends. 3. F. B. F. Native of Brazil, in the province of Monte Video; and of Chili about Valparaíso. Petioles 9-12 inches long. Peduncles an inch long, rarely more, and sometimes only 3 lines. Fruit smaller than in any other species; mericarps marked with a hardly elevated line on the sides.

Medest Pennywort. Pl. cr.

5. H. barraro'ssa (Cham. et Schlecht. l. c. p. 360.) leaves on long petioles, peltate, orbicular, 8-nerved, 8-lobed, and cre- ated, and are, as well as the petioles, clothed with rufous hairs; umbels on long peduncles, many (50-60) rayed; fruit nearly globose, ovoid, rather emarginate, acutely ribbed. 3. F. Native of Brazil, in shady woods near New Friburg. Petioles 4-8
inches long, but rather shorter than the peduncles; pedicels 3-6 lines long.

Bonariæsia Penny-wort. Pl. cr.

H. umbellata (Lam., spec. p. 324.) plant glabrous; leaves petaloid, orbicular, emarginate at the base, doubly crenated, usually 11-12 nerves; ultimate pinnules with 20-30-flowered; flowers distinctly pedicellate. 2. B. F. Native of the Western Indies, Peru, and at Tampico in the Bay of Mexico, as well as of Cuba and North America. Spreng. umb. l. t. 1. f. 1. Rich. hydr. p. 28. t. 52. f. 3. Umbels prolificus in the species received from Tampico, but simple in those from Cuba. Corolla white.—Acaciea, Piso, bras. p. 9.—Côtyledon aquatica, Sloane, jan. p. 212.

Pl. cr.

7 H. Bonariæsis (Lam. dict. 3. p. 147.) plant glabrous; leaves petaloid, orbicular, 15-20-nerved, doubly crenated; scapes hardly longer, but often shorter than the petioles, umbellate at the apex, and umbellately branched; flowers disposed in interrupted whorles along the branchlets. 2. B. F. Native of South America, in marshy places not far from the sea, where it assumes various forms. Cham. et Schlecht. in Linnaea. 1. p. 337. H. umbellatula ß, Bonariësis, Ramm. et Schult. syst. 6. p. 345.

Var. ß, multiflora (Ruiz et Pav. fl. per. 3. p. 24. t. 216. f. a.) rays of umbel 6-10; whorles consisting of 15-20 flowers each. 2. B. G. Native of Brazil, Peru, Bucnos Ayres. H. Bonariësis, Rich. Cav. ion. 5. t. 488.

Var. ß, tribarilys (Ruiz et Pav. l. c. f. b.) rays of umbel 3; whorles 3-6-flowered. 2. B. Native of Peru and Brazil. H. polystachia ß, Rich. hydr. p. 31.

8 H. petiolalis (D. C. prod. 4. p. 60.) plant quite glabrous; leaves petaloid, orbicular, 10-12-nerved, simply and broadly crenated, on long petioles; scapes equal in length to the petioles, umbellate at the apex, and umbellately branched; branches 2-5, interruptedly verticillate. 2. B. F. Native of the Mauritius. H. vulgàris, Bory, voy. ex Rich. H. quinquerviála, Pet. Th. miss. ex Rich. H. polystachia ß, Rich. hydr. p. 31. Nearly allied are the Petiolaris seen in the leaves of the plant being simply crenated, in the petioles and scapes being nearly a foot high. Fruit nearly orbicular, emarginate at the base; mericarps furnished with one rib on each side.

Petiolar Water Penny-wort. Pl. 1. f. cr.

9 H. Langedorffii (D. C. prod. 4. p. 60.) plant glabrous or rather pilose on the leaves while young; leaves petaloid, nearly orbicular, with 5-7 short lobes, crenated, 5-7-nerved; peduncles much longer than the petioles; umbel simple, containing 15-20 pedicellate flowers, surrounded by an 8-10-leaved reflexed involucrum. 2. E. F. Native of Brazil, in the Island of St. Catharine. Stems long, creeping, slender. Peduncles 5-8 inches high. Adult leaves glabrous on both surfaces; lobes either acute or obtuse. Pedicels 3 times the length of the involucrum.

Langedorffii's Penny-wort. Pl. cr.

10 H. grâcicula (Ruiz et Pav. fl. per. 3. p. 26. t. 247. f. 6.) leaves petaloid, orbicular, 7-angled, 7-nerved, glabrous, crenated; pedicels and scapes hairy; scapes shorter than the pedicels; umbels 5-7-flowered. 2. B. F. Native of Peru, in stagnant watery places, and on the edges of rivulets. Rich. hydr. p. 32. Stems creeping. This species differs from all others in the present section in the leaves being acutely angled.

Slender Penny-wort. Pl. cr.

11 H. Humboldtii (Rich. hydr. p. 53. t. 53. f. 6.) leaves petaloid, 5-6-lobed, hairy on both surfaces; lobes short, ovate, acute, doubly serrated; pedicels, stems, and pedicelles glabrous; umbels 20-flowered, 20-petalled, nearly without ribs. 2. B. F. Native of the kingdom of Quito. B. et Kunth, nov. gen. amer. 5. p. 32. But H. Humboldtii, Wild. herb. is distinct from this, but is referable to H. Bonplandii.

Humboldti's Penny-wort. Pl. cr.

12 H. Asterias (Cham. et Schlecht. in Linnaea. 1. p. 381.) stems decumbent, at length glabrous; leaves petaloid, petiolate, 3-5-nerved, at length glabrous; lobes lanceolate, unequally serrated; pedicels longer than the petioles; umbels simple, 14-18-flowered; fruit tuberculate, emarginate at the base, with conspicuous ribs. 2. B. S. Native of Brazil, within the tropics. Lobes of leaves usually 4, of various breadths. H. varians, Pohl, in litt.

Starry Penny-wort. Pl. decumbent.

13 H. acontifolia (Rich. hydr. p. 35. t. 53. f. 5.) leaves petaloid, orbicular, hairy on both surfaces, 7-flowered, 7-nerved: lobes lanceolate, acute, doubly serrated; pedicels, peduncles, and stems glabrous; umbels simple, 20-30-flowered; fruit orbicular, nearly without ribs. 2. B. G. Native of New Granada, in shady places. H. B. et Kunth, nov. gen. amer. 5. p. 23.

Monk's-hood-leaved Penny-wort. Pl. cr.

14 H. macropodis (Pohl, in litt. 1828.) plant creeping; leaves petaloid, 7-cleft, 7-nerved, rather hispid above, especially along the nerves, glabrous beneath; lobes lanceolate, doubly serrated; pedicels and pedicelles very long, glabrous; umbels simple, 40-50-flowered; fruit ribbed, emarginate at both ends. 2. B. F. Native of Brazil. Leaves 6 inches in diameter. Hairs crowded at the tops of the petals at the insertion of the leaves.

Large-leaved Penny-wort. Pl. cr.

15 H. quinqueloba (Ruiz et Pav. fl. per. 3. p. 25. t. 248. f. b.) plant hairy; leaves petaloid, 5-nerved, palmately 5-cleft; lobes acute, doubly serrated; the terminal or middle lobe longer than the rest; pedicels equal in length to the petioles; umbels simple, many flowered, globose. 2. B. F. Native of Peru, in woods at Pillao; and of Brazil near Corvo-Sico. Rich. hydr. p. 54. Cham. et Schlecht. in Linnaea. 1. p. 360. The whole plant is rufous from pili. Pedicels 40-50 in each umbel, and when bearing the fruit they are about 3 inches long. Fruit emarginate at the base; mericarps acutely 3-ribbed on the back.

Fire-lobed-leaved Penny-wort. Pl. cr.

16 H. Stella (Pohl, in litt. 1828. ex D. C. prod. 4. p. 61.) stems decumbent, villous; leaves on long petioles, petalate, 5-nerved, 5-cleft, villous on both surfaces: lobes broad-lanceolate, doubly serrated, rather unequal; umbels on long peduncles, many rayed; fruit pilose, ribbed, emarginate at the base. 2. B. F. Native of Brazil. Perhaps sufficiently distinct from the preceding species.

Star-leaved Penny-wort. Pl. decumbent.

17 H. batrachioidea (D. C. prod. 4. p. 667.) plant glabrous; stems rooting at the nodi; leaves on long petioles, somewhat petalate, 3-5-parted: lobes cuneate, obtuse at the apex, entire or 2-3-cleft; pedicels much shorter than the petioles; umbels 5-7-flowered. 2. B. F. Native of Chili, in inundated places near Rancagua, and in ditches. H. ranuncoloidea, Berttero, herb.; but not of Lin. Habit almost of Ranunculus aquatilis or R. tripartita.

Batrachium-like Penny-wort. Pl. cr.

18 H. Poppertii (D. C. l. c.) plant furnished with a few scattered hairs; stems weak, elongated, not rooting at the nodi; petioles long, hairy at the apex; leaves orbicular, cordinate with the recesso open, 9-nerved, bluntly 9-lobed, toothed; pedicelles axillary, and opposite the leaves, shorter than the pedicels; Kk
flowers 15-20 in an umbel, on long pedicels. 2 B. F. Native of Chili. Habit of *H. Zeylanica*, but the flowers are not capitulate. The inflorescence is that of *H. geranioides* or *H. achillemitoides*, but the stems are not radiate.

*Poepigg's* Penny-wort. Pl. trailing.

§ 2. *Leaves more or less cordate at the base.*

*Flowers umbellate, distinctly pedicellate.*

19 H. *acutifolia* (Ruiz et Pav. fl. per. 3. p. 25. t. 248. f. 8.) plant rather villous; leaves cordate, acute, situated at the base, unequally crenate-toothed on all sides; peduncles a little longer than the petioles; umbels many flowered, simple, globose; pedicels of flowers distinct; fruit almost didymous, bicusitate on both sides. 2 B. F. Native of Peru, at Pilako. Suananche simiata, Spreng, syst. 1. p. 878. Allied to *H. ginquefolia*, but differs in the leaves not being peltate.

*Acute-leaved* Penny-wort. Pl. cr.

20 H. *geranioides* (Rich. hyd. no. 32. f. 21.) plant hairy; leaves orbicular-reniform, 9-nerved, bluntly 9-lobed, crenated; petioles pubescent, rather higher than the peduncles; umbels 20-flowered; flowers pedicellate. 2 B. F. Native of Peru. Petioles a finger in length. Pedicels 3-4 lines long. Involucrum many leaved: leaflets ovate, acute, small. Fruit nearly orbicular, didymous.

*Geranioid-like* Penny-wort. Pl. cr.

21 H. *Achillemitoides* (Rich. hyd. no. 28. f. 31.) plant beset with spreading hairs; leaves orbicular-reniform, 9-nerved, a little lobed, doubly crenated, cleft at the base into a narrow cleft; petioles elongated, pilose; pedicels slender, shorter than the petioles; umbels 10-15-flowered; flowers distinctly pedicellate; mericarps of fruit 3-ribbed. 2 B. F. Native of Peru, in shady humid places; and of New Andalusia, on Mount Cocollar. H. B. et Kunt, nov. gen. amer. 5. p. 24. Petioles 6-8 inches long. Pedicels 4-5 inches long.

*Alchemilla-like* Penny-wort. Pl. cr.

22 H. *Laniflora* (D. C. prod. 4. p. 61.) plant villous; leaves orbicular, cordate, 9-nerved, 9-lobed; lobes obtuse, denticulated; peduncles opposite the cauline leaves, above twice the length of the petioles; umbels 10-35-flowered; flowers and fruit glabrous. 2 B. F. Native of New Holland. Pedicels about 3 lines long; the rest of the plant very like *H. densiflora*.

*Loose-flowered* Penny-wort. Pl. cr.

24 H. *Chilensis* (Cham. et Schlecht. in Linnaea. 1. p. 283.) umbels more dense; pedicels very short; leaves 7-lobed, 7-nerved; petioles an inch and a half long. 2 B. F. Native of Chili, near Talaguanos.

*Bowland's* Penny-wort. Pl. cr.

25 H. *Mexican* (Cham. et Schlecht. in Linnaea. vol. 5. p. 208.) stems creeping; branches erect; leaves reniform, usually 9-nerved, deeply lobed, hairy; umbels on long peduncles, many flowered, loose, globose; hairs on the pediuncle and pedicels reversed; styles spreading. 2 H. Native of Mexico, near Jalapa in shaly woods. Said to be allied to *H. Lecocëphala* and *H. Boumplantii*.

*Mexican* Penny-wort. Pl. cr.

26 H. *Humifusa* (Pollh. in litt. 1828. ex D. C. prod. 4. p. 62.) plant creeping, glabrous; leaves on long petioles, reniform, nearly orbicular, broadly crenated, 9-nerved; peduncles length of the petioles; umbels 20-flowered; flowers distinctly pedicellate; fruit ribbed, emarginate at both ends. 2 B. G. Native of Brazil. Leaves nearly like those of *H. Americana*, but differs in the flowers being umbellate, not capitulate. Perhaps *Hydrocotyle*, Loeft. itin. p. 231, is referrible to this species.

*Trailing* Penny-wort. Pl. tr.

27 H. *Leucocëphala* (Cham. et Schlecht. in Linnaea. 1. p. 364.) plant creeping; leaves orbicular-reniform, usually 9-nerved, doubly toothed or crenated, beset with a few scattered hairs on both surfaces, as well as on the peduncles and petioles; umbels 20-30-flowered, nearly globose; flowers distinctly pedicellate; mericarps of fruit smooth, at first cream-coloured, and acutely 3-ribbed. 2 F. Native throughout the whole of Brazil. Link et Otto, abbild. t. 21. Petioles 2-4 inches long. Pedicels of the umbel, which is milk-coloured, a line and a half long.

*White-headed* Penny-wort. Pl. cr.

27 H. *Natans* (Cyr. pl. rar. neap. 1. t. 6. f. 3.) plant creeping, glabrous; leaves orbicular, with a narrow crenate recess, reniform, bluntly and unequally 9-11-lobed, and 9-11-nerved, crenated; peduncles much shorter than the petioles; umbels capitate, 5-6-flowered; flowers on short pedicels. 2 B. H. Native of the kingdom of Naples, in bogs, ditches, and rivers; and in the river Anapo near Syracuse, and elsewhere in Sicily; Doubey gathered the same plant in Peru, and Chamisco at St. Francisco in North California.—Column. cephr. p. 316. with a figure. Rich. hyd. no. 23. f. 20. Cham. et Schlecht. in Linnaea. 1. p. 373. Petioles 3-10 inches long. Peduncles hardly an inch long. Stems having numerous roots, issuing from the joints. Fruit cordate, wrinkled a little.

28 H. *Multifida* (Rich. hyd. no. 44. f. 34.) plant glabrous; leaves palmately cut; segments 5, somewhat 3-lobed; middle segment the longest; peduncles glabrous, longer than the petioles, which are pilose; umbels 5-6-flowered; flowers distinctly pedicellate; fruit didymous, furnished with 2 ribs on both sides. 2 B. F. Native of New Granada, on the Andes, in humid shady places near Almaguer. H. B. et Kunt, nov. gen. amer. 6. p. 25. Wildld, in Schultes, syst. 6. p. 650.

*Multifid-leaved* Hydrocotyle. Pl. cr.

** Umbels capitate, 5-6-flowered, sometimes the lower ones are only 1-flowered.**

29 H. *Asiaëtica* (Linn. spec. p. 234.) plant rather villous; leaves orbicular-reniform, equally crenated, 7-nerved; petioles and peduncles in fascicles, pubescent; umbels capitate, on short peduncles, 3-4-flowered; fruit orbicular, furnished with 4 ribs on both sides. 2 B. F. Native nearly throughout the southern hemisphere, as well as within the tropics, in humid water places. Rich. hyd. no. 13. f. 11. Spreng. in Schultes, syst. 6. p. 348. Cham. in Schlecht. Linnaea. 1. p. 365. This species assumes many forms, especially in Manilla, Radacca, Chili (where it becomes *H. triloba*, Ruiz et Pav. fl. per. 3. p. 24. t. 245. f. 6.), Brazil, and the Cape of Good Hope (which is *H. Thunbergiana*, Spreng. nee endl. 1. p. 283, exclusive of the synonyme *H. natans*, Thunb, which is not obvious).

30 H. *Rephanda* (Pers, enc. 1. p. 502.) plant villous; leaves cordate, reniform, on long petioles, 9-nerved, rather toothed; pedicels villous, much exceeding the peduncles; umbels capitate, 3-flowered; fruit orbicular, furnished with 4 ribs on each side. 2 B. H. Native of Louisiana, Carolina, Georgina, Chili, and the West India Islands, in humid and inundated places. Rich. hyd. no. 13. f. 14. exclusive of the synonyme of Ruiz et Pav.
UMBELLIFERÆ.

1. Hydrocotyle. 251

Ficaria-like Penny-wort. Pl. cr.

32. H. diauntha (D. C. prod. 4. p. 63.) plant glabrous; leaves distant, on short petioles, reniform, 7-9-toothed, nearly veinless; umbels opposite the leaves, on short peduncles, 2-flowered; fruit flatly compressed, orbicularly cordate, with the mericarps having 2 ribs on both sides. 2. B. F. Native of New Holland, and King George's Sound. Stems weak, dichotomous, climbing a little. Leaves hardly twice the size of the fruit. Pedicels of the fruit longer than the peduncles of the umbel.

Two-flowered Penny-wort. Pl. trailing or climbing.

33. H. aberrantata (Rich. hydr. no. 17. f. 19.) leaves reniform, with a broad recess, shorter than broad, with 9-11 crenatures, 7-nerved, glabrous; petioles pubescent, longer than the limbs; peduncles longer than the petioles; fruit rather turgid, furnished with 4 ribs on each side, reticulated. 2. B. F. Native of Madagascar and Cochinhina, in humid places. Trisâmtus Cochinchinensis, Lour. cooh. p. 176. Stems tufted, creeping. Petioles 7-8 lines long; limbs of leaves 6 lines broad, and 2 lines long. Pedicels an inch long. Involucrum 2-leaved. Very nearly allied to H. dentatum, but differs in the leaves being much shorter.

Short-leaved Penny-wort. Pl. cr.

34. H. sumulatoanalis (Rich. hydr. no. 11. f. 9.) leaves cordately reniform, 5-nerved, completely crenated, with a narrow recess; petioles pubescent, longer than the limbs; umbels capitate, 5-flowered, on short peduncles; fruit orbicularly subglobose, striated. 2. B. S. Native of the Island of Bourbon, creeping along river banks. H. Asiatica var. Cham. et Schlecht. l. e. Leaves 4-5 lines in diameter. Petioles 8-12 lines long. Peduncules 2-3 lines long. The central flower in each umbel is fertile, and the 2 lateral ones sterile.

Money-wort-like Penny-wort. Pl. cr.

35. H. hebecarpa (D. C. prod. 4. p. 63.) leaves orbicularly reniform, toothed at the base, 7-9-nerved, crenated at the apex, glabrous, on long petioles; surculi sarmentose, prostrate; peduncles axillary, villous, much shorter than the petioles; umbels capitate, few-flowered; fruit villous, reticulated; mericarps furnished with 2-3 ribs on each side. 2. B. F. Native of the Island of Timor. Petoioles of radical leaves 4 inches long; limbs of leaves 2 inches broad. Three of the fruit in each umbel coming to perfection, rather large.

Hairy-fruited Penny-wort. Pl. prostrate.

36. H. isequirpes (D. C. prod. 4. p. 62.) leaves when young, rather villous, but glabrous in the adult state: radical ones on long petioles, with a reniform crenated 9-nerved limb, and a broad recess; umbels radical, on very short incurved, rather villous peduncles; leaflets of involucrum 2, ovate; fruit glabrous; mericarps furnished with 4 stripes on each side. 2. B. S. Native of Rio Janeiro. Petioles of radical leaves nearly a foot long. Pedicules half an inch long. Stems short, rather sarmentose, bearing leaves, which stand on short petioles.

Unequal-petioled Penny-wort. Pl. 1 foot.

37. H. pallida (D. C. prod. 4. p. 63.) leaves reniform, glabrous, broadly and shortly crenate-toothed; petioles rather dilated at the base, longer than the peduncles; leaves of involucrum 2, ovate, oblong-obovate, glabrous; umbels 3-flowered. 2. B. F. Native of the Cape of Good Hope. Burch. cat. geogr. no. 1907.

Cystocostus coriaceus, (D. C. prod. 4. p. 63.) leaves nearly entire, broadly reniform; peduncles rather villous, shorter. 2. B. F. Native of the Cape of Good Hope.

Pale Penny-wort. Pl. prostrate.

38. H. brevipes (D. C. prod. 4. p. 63.) stems elongated, prostrate, rooting at the nodi; leaves on long petioles, reniform, with broad large obtuse, loke-like teeth, pilose above, and on the petioles, smooth and beneath; peduncules axillary, very short; umbels few-flowered, capitulate, villous. 2. B. S. Native of Jamaica. H. leptostachys ex Jamaica, Spreng. syst. 1. p. 876. Allied to H. eriântus, but differs in being prostrate, as well as to H. macradus, but differs in the teeth of the calyx being blunt; also to H. leptostachys, but the inflorescence is truly distinct.

Short-pedunculated Penny-wort. Pl. prostrate.

39. H. erecteata (D. C. prod. 4. p. 668.) leaves reminantly coriaceous, bluntly crenated, on long petioles; nerves, petioles, and peduncles rather hairy; peduncles much shorter than the petioles; umbels capitulate, 2-3-flowered; leaves of involucrum 2, permanent, ovate, rather villous on the outside; mericarps very much compressed, reticulated 3-5-nerved, having the back hairy at the apex. 2. B. S. Native of Africa, at Cape Verd, in marshes at Khami. Allied to H. eriântus and H. yaldia.

Braacted Penny-wort. Pl. cr.

Hairy-flowered Penny-wort. Pl. sarmentose.

41. H. macrodus (Spreng. syst. 1. p. 877. exclusive of the synonymes) the whole plant covered with spreading hairs; leaves cordately reniform, coarsely 3-5-toothed; teeth or lobules acute, equal, quite entire; peduncles shorter than the petioles; umbels capitulate, few-flowered; leaves of involucrum 2, large, ovate, acuminate, pilose; fruit ovate, with many ribs, wrinkled. 2. G. Native of the Cape of Good Hope, on the Table Mountain. Cham. et Schlecht. in Linnæa. 1. p. 372. H. muschata, Spreng. in Schultes, syst. 6. p. 351. but not of Thumb.

Long-toothed-calyx Penny-wort. Pl. cr.

42. H. callidus (Cham. et Schlecht. in Linnæa. 1. p. 371.) leaves reniformly orbicular, 5-nerved, coarsely and unequally toothed, glabrous; peduncules more or less pubescent, capillary, in fascicles, almost longer than the petioles; leaves of involucrum smooth, one-half shorter than the fruit, which is obovate and many ribbed. 2. G. Native of the Cape of Good Hope. Allied to H. eriântus, but easily distinguished from it by its smoothness, by the teeth of the calyx being acute, and by the nerves of the leaves being 5, not 7, &c.

Beautiful-toothed-leaved Penny-wort. Pl. prostrate.

43. H. azteca (Lin. spec. 234.) plant quite glabrous; leaves orbicularly reniform, a little lobed, doubly crenated, 9-nerved; umbels capitulate, 5-flowered; upper ones nearly sessile; lower ones on short peduncles. 2. B. H. Native of North America, in boggys or swampy places, from Canada to k k 2
UMBELLIFER.E.

Carolina; and probably of South America, if the synonyme of Leafling, inam. p. 281. is referrible to the species. Lam. dict. 3. p. 192. Rich. hydr. no. 19. f. 10. Spreng. umb. no. 3. t. 2. f. 3.

Var. a. flexicaulis (Michx. fl. bor. amerc. 1. p. 162.) stems more firm, shorter, and as if they were flexuous.

Var. b. gracilis (Michx. l. c.) leaves more slender, filiform, not flexuous; leaves smaller.

American Penny-wort. Fl. May, Aug. Clt. 1790. Pl. cr. 44 H. mutica (Pohl. in lit. 1838. ex. D. C. prod. 4. p. 64.) plant creeping; leaves on long petioles, glabrous, reniformly orbicular, 8-nerved, and somewhat 9-lobed: each lobe with 3 crenatures; pedicels shorter than the peduncles, both bearded with pili at the apex; umbels capitate, 15-20-flowered; fruit glabrous, ribbed, emarginate at both ends. 2. B. S. Native of Brazil. Leaves and inflorescence like those of H. Americana.

Many-stemmed Penny-wort. Pl. cr.

45 H. cotyledonia (Roxb. hort. beng. 21.) plant tufted and creeping; leaves petiolate, reniformly orbicular, 7-nerved, bluntly 7-lobed, dentately crenated, hispid beneath, glabrous above; umbels opposite the leaves, nearly sessile, 7-9-flowered; fruit glabrous, acutely 3-ribbed. 2. B. F. Native of the east of Bengal, in Sinhet. Petioles twice the length of the limbs of the leaves, and arc as well as the stems glabrous.

Round-leaved Penny-wort. Pl. cr.

46 H. tenella (D. Don, prod. fl. nep. p. 183.) plant tufted and creeping; leaves reniform, somewhat 7-lobed, crenated, quite glabrous, shining; umbels capitate, sessile, few-flowered. 2. B. S. Native of Nipaul. Allied to H. nitidula, but differs in the leaves being less lobed, in the petioles being shorter, and in the umbels being sessile.

Plant Penny-wort. Pl. cr.

47 H. alta (Rich. hydr. no. 50. f. 28.) plant quite glabrous; stems erect, winged, compressed; leaves cordate, bluntly hastate, on short petioles; peduncles longer than the petioles; umbels 4-6-flowered; pedicels quite distinct; fruit lenticular, compressed, furnished with 10 ribs on both sides. 2. B. F. Native of New Holland. H. pusilla, R. Br. incd. but not of Rich.

Winged Penny-wort. Pl. 1/2 to 1 foot.

48 H. muscosa (R. Br. in Rich. hydr. no. 45. f. 27.) plant rather airy; leaves palmate; segments 3-5, narrow, cuneated, truncate at the apex; peduncles shorter than the petioles; umbels somewhat capitate, 6-8-flowered; fruit orbicular, rather compressed, having 3 ribs on both sides. 2. F. Native of New Holland. Petioles nearly an inch long, glabrous.

Massy Penny-wort. Pl. cr.

49 H. tripartita (R. Br. in Rich. hydr. no. 46. f. 25.) plant rather pilose; leaves palmate; segments 3, cuneated, deeply toothed; lateral ones usually bicolat; pedicules much shorter than the peduncles; umbels rather capitate, 6-10-flowered; fruit orbicular, didymous, furnished with 2 ribs on both sides. 2. F. Native of New Holland. Sieb. pl. exsic. nov. holl. no. 628. Flowers nearly sessile in the umbel, but after the flowers have decayed the pedicels lengthen a little.

Tripartite-leaved Penny-wort. Pl. cr.

*** Umbels capitate, many-flowered, especially with from 8 to 30 nearly sessile flowers.

50 H. plebeia (R. Br. in Rich. hydr. no. 20. f. 23.) plant glabrous; leaves reniform, doubly crenated, 7-9-nerved; peduncles shorter than the petioles; umbels capitate, globose, 12-16-flowered; fruit furnished with 2 ribs on each side. 2. B. F. Native of New Holland. Heads of flowers small; leaves of involucre ovate, acute. Stems trailing. Petioles 1-2 inches long.

I. HYDROCYTLE.

Plebeian Penny-wort. Fl. May, Aug. Clt. 1825. Pl. tr. 51 H. polyrhiza (D. C. prod. 4. p. 65.) plant trailing, rooting at the joints; leaves orbicular, cordate, with a narrow recess, crenated, 9-11-nerved, glabrous on both surfaces, as well as on the pedioles; peduncles villous at the apex; umbels 20-flowered, densely capitate; pedicels elongated after flowering, the fruit is therefore pedicellate; fruit orbicular, minutely dotted; mericarps furnished with one rib on each side. 2. B. S. Native of Brazil, in the neighbourhood of Rio Janeiro. Peduncles shorter than the petioles, rarely longer. The disposition of the flowers is intermediate between the first and second division of the genus.

Many-rooted Penny-wort. Pl. cr.

52 H. incrassata (Ruiz et Pav. fl. per. 3. p. 26. but not of Rafin.) plant glabrous; leaves reniform, 7-9-lobed, crenated serrated; serratures thickened, whitish; pedicels long; umbels many-flowered, globose. 2. G. Native of Peru, in shady places at Tarma. Rich. hydr. no. 47.

Thickened Penny-wort. Pl. cr.

53 H. Nepaliensis (Hook. exot. fl. 1. t. 30.) the whole plant scabrous from short scattered hairs; leaves orbicularly reniform, 7-lobed, crenately toothed; flowers monoeocious; umbels globose, many-flowered, dense; fruit turgitid, without ribs. 2. B. H. Native of Nipaul, in wet places. Some of the umbels apparently contain only male flowers, while others contain only female ones; these flowers are on short pedicels while young, but afterwards these pedicels gradually lengthen out. It comes very near to H. capitata, and according to Sprengel is probably not distinct from it.

Var. a. brevipes (D. C. prod. 4. p. 65.) pediciles on their greatest length shorter than the petioles.

Var. b. longipes (D. C. l. c.) pediciles when bearing the fruit longer than the petioles. H. hispida, D. Don, fl. nep. p. 183.

54 H. capitata (Petr. Th. fl. trist. d'ac. p. 43. t. 12. but not of Wild. nor Banks.) the whole plant hispid from long bristles; leaves orbicularly reniform, bluntly and obscurely 7-lobed, unequally crenated; flowers monoeocious; umbels globose, many-flowered, dense, on short peduncles; fruit rather turgitid, dotted, almost without ribs. 2. B. F. Native of the Island of Tristan da Cunha. Rich. hydr. no. 22. t. 62. f. 29. Carm. fl. no. 15. H. crinita, Petr. Th. in herb. Juss.

Capitate-flowered Penny-wort. Pl. cr.

55 H. clavata (Ruiz et Pav. fl. per. 3. p. 25. t. 247. f. a.) plant hairy from short down; leaves roundish-reniform, 13-lobed, rather lobulate, crenated; pediciles a little shorter than the peduncles; umbels globose, many-flowered. 2. B. F. Native of Peru, in humid places in woods by stagnant water, near Muna. Nerves of leaves and fruit fuyous. Leaves of involucre numerous, linear, and short. Flowers in each umbel about 200.

Globeflowered Penny-wort. Pl. cr.

56 H. citrinodora (Ruiz et Pav. fl. per. 4. p. 26.) leaves reniform, 7-9-lobed, crenated, and are, as well as the petioles, hairy, but pubescent beneath, as well as on the branches; peduncles densely villous, length of the petioles; umbels small, many-flowered, globose. 2. B. F. Native of Chili, in shady humid places about Concepcion; and of Peru, in the tract of Huancaro, as well as of Brazil according to Pohl.

Citron-scented Penny-wort. Pl. cr.

57 H. ranunculoidea (Lin. fl. suppl. p. 177.) plant glabrous; leaves orbicularly reniform, 5-nerved, and somewhat 5-lobed; lobes obtuse, somewhat crenated; middle lobe more prolonged than the rest; peduncles shorter than the pedioles; umbels 5-12-flowered; flowers pedicellate. 2. B. H. Native of North America, in Pennsylvania and Mexico; and of South

Sibthorpsia-like Penny-wort. Pl. May, July. Chl. 1806. Pl. creeping. 60 H. G'LEGANS (Rich. hydr. no. 33. f. 32.) plant glabrous; leaves semi-5-cleft; lobes tridentate at the apex; peduncles 3 times shorter than the pedicels; umbels capitati, 6-8-flowered; fruit didymous, furnished with 2 ribs on each side. 2. B. F. Native of New Holland. Leaves 4 lines in diameter; petals nearly an inch long.

Elegant Penny-wort. Pl. cr. 61 H. PULCHELLA (R. Br. in Rich. hydr. no. 34.) plant glabrous; leaves reniform, rather peltate, 5-nerved, 5-lobed; lobes bluntly tridentate; peduncles equal in length to the pedicels; umbels capitati, 10-flowered; fruit didymous, furnished with 2 ribs on each side. G. F. Native of New Holland. near Port Jackson. Petioles an inch long. Heads of flowers small.

Neat Penny-wort. Pl. cr. 62 H. KITT'DULA (Rich. hydr. no. 35. f. 33.) plant quite glabrous; leaves orbiculariy reniform, 5-7-lobed; lobes tridentate; pedicels 2 or 3 times longer than the peduncles; umbels capitati, 6-10-flowered. 2. B. S. Native of Java. Hook. exot. fl. 1. t. 29. Alluded to H. pulchella. Perhaps the same as H. rannunculoides var. incisa, Blum. bijdr. p. 884.

Small-shining Penny-wort. Pl. cr. 63 H. IREXRA (D. C. prod. 4. p. 66.) stems creeping; leaves on short petioles, orbicular, cordate, with a narrow recess, crenated, 7-nerved, pilose above, and on the upper part of the pedicels; peduncles rather peltate, 3 times longer than the pedicels; umbels 8-10-flowered, rather capitati; fruit small, roundish. 2. B. F. Native of Brazil. Petioles 2 lines long. Limb 2-3 lines in diameter. There is a variety with glabrous leaves according to Pohl.

Minute Penny-wort. Pl. cr. 64 H. INDEKTA (D. C. prod. 4. p. 668.) stems creeping, smoothish; petioles hairy, 5 longer than the limbs of the leaves, which are orbiculariy cordate, 3 lobed, toothed, and rather peltate; peduncles hairy, a little shorter than the pedicels; fruit small, ovate, glabrous, densely aggregate into a globose head, 30-flowered, furnished with one rib on each side. 2. B. F. Native of Chili. Poehl. exsic. no. 99. Habit of H. sibthorpsiae or H. minuta.

Undecked Penny-wort. Pl. cr. 65 H. HETEROMIA (Rich. hydr. no. 36.) plant glabrous; leaves reniform, 7-nerved, 7-lobed; lobes obtuse, crenated; peduncles much shorter than the pedicels, which are falcate; umbels 6-8-flowered, capitati; fruit smooth on one side, and tuber-
cular on the other, wrinkled and discoulered, furnished with one rib on both sides. 2. B. H. Native of New Zealand. H. flaccida. R. Br. miss. Petioles 2-4 inches long.

Variable-period Penny-wort. Pl. cr. 66 H. COMPACTA (Rich. hydr. no. 37.) plant villous; leaves orbiculariy reniform, small, 7-nerved, deeply toothed; peduncles very short, in fascicles; umbels 15-20-flowered, densely capitati; fruit rather didymous, furnished with 2 ribs on each side. G. B. Native of New Zealand. H. capitata, Banks and Sol. miss. but not of Pct. Th.

Compact-headed Penny-wort. Pl. cr. 67 H. PEDUNCULAIRIS (R. Br. in Rich. hydr. no. 38. f. 26.) leaves small, orbiculariy reniform, deeply toothed, rather 5-cleft, glabrous above, hairy beneath; peduncles equal in length to the pedicels; umbels capitati, 6-8-flowered; fruit lenticular, with 2 nearly obsolete ribs on both sides. G. B. F. Native of New Holland. Perhaps the same as H. pedunculairis, Sieb. nov. holl. exsic. no. 114. which is said to be glabrous; or it is perhaps referrible to H. pulchella.

Peduncular Penny-wort. Pl. May, Aug. Chl. 1822. Pl. cr. 68 H. INTERESTE'TA (R. Br. in Rich. hydr. no. 39.) plant glabrous; leaves irregularly 3-5-lobed, 3-5-nerved; lobes denticulated; middle lobe more prolonged than the rest; petioles and peduncles equal among themselves; umbels densely capitati, 12-15-flowered; fruit scabrous from wrinkles, furnished with 2 ribs on both sides; carpophore permanent, undivided. 2. F. F. Native of New Holland.

Interwoven Penny-wort. Pl. cr. 69 H. HIRTA (R. Br. in Rich. hydr. no. 40.) leaves orbiculariy reniform, hairy on both surfaces, 7-nerved, obliquely 7-lobed, crenated; petioles hairy; peduncles one-half shorter than the pedicels; umbels densely capitati, 20-flowered; fruit rather didymous, furnished with 2 ribs on each side. 2. B. F. Native of New Holland. Leaves distant. Petioles hardly an inch long. Stipulas membranous, permanent.

Hairy Penny-wort. Pl. cr. 70 H. NOYEE-ZELLECI'NE (D. C. prod. 4. p. 67.) leaves orbiculariy reniform, hairy on both surfaces, as well as on the pedicels, 7-nerved, obliquely 7-lobed, acutely and irregularly toothed; peduncles glabrous, 4 times shorter than the pedicels; umbels densely capitati, 10-12-flowered; fruit rather didymous, furnished with one rib on each side. G. F. Native of New Zealand. Petioles 12-13 lines long. Stipulas as in H. hirta.

New-Zealand Penny-wort. Pl. cr. 71 H. RUMIC'TA (D. C. prod. 4. p. 66.) plant hairy; leaves orbicular, cordate at the base, 7-9-nerved, 7-9-lobed; lobes broad, hardly acute, a little toothed; peduncles opposite the leaves, about equal in length to the pedicels; umbels densely capitati, 30-40-flowered; fruit rather didymous, and are as well as the pedicels glabrous; mericarpis furnished with one rib on both sides. G. F. Native of New Holland. Nearly allied to H. hirta, but differs from it in the pedicels being the length of the pedicels, not very short, and in the leaves being cordate, not reniform.

Dense-flowered Penny-wort. Pl. cr. 72 H. HIRTA (Blum. bijdr. p. 884. but not of Swartz nor Spreng.) stems creeping; leaves orbicular, cordate, somewhat 5-lobed, crenated, villous; umbels capitati, 7-11-flowered, pedunculate, usually solitary; mericarpis furnished with 3 ribs; G. S. Native of Batavia, in grassy places by the sea side. It differs in the inflorenscence from H. hirsuta of Swartz, which is the H. speciosa of Lam. H. hirsuta of Spreng, is a congeries of species very different from each other.

Hairy Penny-wort. Pl. cr. 73 H. GLOBA'TA (Blum. bijdr. p. 883.) stems creeping; leaves roundish-cordate, angular, and are, as well as the peduncles,
UMBELLIFERÆ. I. HYDROCOTYLE.

**HYDROCOTYLE**

**UMBELLIFERÆ. I. HYDROCOTYLE.**

**Flowers disposed in verticillate interrupted spikes.**

81 H. spicata (Lam. dict. 3. p. 153.) leaves reniformly cor- date, roundish, 7-nerved, crenated, rather hairy on both surfaces from scattered hairs; pedicels and peduncles hairy, peduncles 3 times longer than the pedioles; flowers in glomerate whorles, disposed in interrupted spikes; fruit didymous, without ribs. S. B. S. Native of St. Domingo and Porto Rico, &c. in humid parts of mountain woods. Rich. [hyd. no. 25. f. 15. Spreng, in Schultes, syst. 6. p. 351. H. hisruta, Swartz, f. ind. occ. 2. p. 560. but not of Spreng. nor Blum.]

**Spic-flowered Penny-wort.** Pl. July. Aug. Clt. 1810. Pl. cr. 82 H. BRACHYSTACHYIA (D. C. prod. 4. p. 68.) stems filiform, low, smoothish; leaves reniform-roundish, 7-nerved, crenated, pilose on both surfaces; pedicels shorter than the leaves, hairy; pedicelles twice the length of the pedioles, hairy; spikes oblong, continuous; fruit didymous, without ribs. 2. S. Native of St. Domingo.

**Short-spiked Penny-wort.** Pl. cr. 83 H. LEFTOSTACHYI (Rich. hyd. no. 26. t. 16. exclusive of the variety) leaves uniform, 7-nerved, crenated, rather pilose above, glabrous beneath; pedicels nearly 3 times longer than the limbs, and are, as well as the pedicels, pilose; flowers disposed in interrupted spikes, with the whorles of flowers very remote; fruit orbicular, didymous, without ribs. 2. B. S. Native of Cuba, in humid places near the Caribbean. H. et Kunth, nov. gen. amer. 5. p. 23. Spreng. syst. 1. p. 875. exclusive of the variety from Jamaica. Very like H. spicata, but differs in the leaves being glabrous beneath, in the whorles being remote, and containing few flowers; and in the pedicelles not exceeding the leaves.

**Slender-spiked Penny-wort.** Pl. cr.

**SCIENT. II. CENTELLA** (meaning unknown to us). Lin. gen. 1051. Log. obs. aparas. 26. D. C. prod. 4. p. 68. Stems shrubby, erectish. Leaves cuneated at the base, with the exception of only one species, neither peltate nor cordate, as in the first section. Fruit less compressed, with many ribs.—This section will perhaps form a distinct genus when the fruit of the species is better known.

*Petals villous.*

84 H. villosa (Lin. fil. suppl. p. 175.) the whole plant more or less villous; leaves cordate, acute, nearly entire, 3-nerved; stem crenated, branched; pedicels shorter than the pedioles; umbels 3-flowered, capitulate. S. G. Native of the Cape of Good Hope. Thunb. diss. 2. p. 413. Cham. et Schlecht. 1. c. p. 275. Mercurialis Astra, Lin. mant. p. 298. Centella villosa, Lin. syst. veg. 15. p. 763. There is a larger variety with leaves an inch long, and a smaller variety with leaves hardly 3-4 lines long. Leaves nearly entire, obtuse, with a little point. Pedicels 1-flowered, some of them shorter than the pedicels, but usually longer.

85 H. tridentata (Lin. fil. suppl. 176. Thuin. prod. p. 49. diss. 2. p. 415. t. 3.) the whole plant clothed with tomentum; leaves oblong-cuneiform, narrow, 5-5-toothed at the apex; stem crenated; pedicelles rising in fascicles, very short; fruit elliptic, compressed, furnished with 4 ribs on each side. S. G. Native of the Cape of Good Hope. Rich. hyd. no. 51. f. 57. Spreng, in Schultes, syst. 6. p. 334. B. B. S. Native of the Cape of Good Hope. Spreng. umb. prod. p. 34. Allied to H. villosa from the villous petals, and to H. SOLANDRA in the form of the leaves.

**Tridentate-leaved Penny-wort.** Pl. ¾ foot.

*Petals glabrous.*

86 H. TELIOBA (Thunb. diss. 2. p. 416. t. 3.) plant glabrous; leaves broadly wedge-shaped, 3-5-nerved, 3-5-toothed at the apex; teeth broad, acute; pedicules shorter than the
petioles; umbels capitate, 3-flowered; fruit compressed, somewhat dilateous, furnished with 2 ribs on each side. G. Native of the Cape of Good Hope. Rich. hydr. no. 35. Lam. in Schlecht. Linn. 1826. p. 284. Rétzel tubérisé. Spreng. umb. prod. p. 34. Allied to H. tridentata, but differs in the smoothness of all parts of the plant. Bracteas longer than the flowers. Middle flower in each umbel fertile: lateral 2 sterile.

87 H. SOLANDRA (Linn. fil. suppl. 176.) the whole plant clothed with hoary tomentum, the petals only excepted; leaves petiolate, obovately cuneiform, bluntly 7-toothed at the apex; umbels pedunculate, 3-5-flowered; flowers on short pedicels; leaves of involucrum ovate-lanceolate, glabrous inside. G. Native of the Cape of Good Hope, on hills. Lam. dict. 3. p. 153. Rich. hydr. no. 55. H. tomotenua, Thunb. obscr. 2. p. 416. Spreng. in Schultes, syst. 6. p. 593. Solandra Capensis, Lam. spec. 1407. exclusive of the synonyms. Perhaps numerous species here are confused.

Var. a, longipes (D. C. prod. 4. p. 69.) peduncles exceeding the leaves in length.

Var. b, communis (D. C. l. c.) peduncles length of the leaves.

—Lam. ill. t. 188. f. 5. Sibb. cap. excis. no. 140.

Var. γ, longifolia (D. C. l. c.) peduncles much shorter than the leaves; leaves cuneate, elongated. Native of the Cape of Good Hope. Burchell. Perhaps a proper species.

Solander's Penny-wort. Pl. 3/4 foot.

88 H. CENTELLA (Cham. et Schlecht. in Linnaea. 1. p. 375.) plant shrubby; leaves oblong, cuneate or lanceolate, 3-nerved, quite entire; umbels pedunculate, 3-5-flowered, with usually only one male flower; leaves of involucrum ovate-lanceolate; petals glabrous. G. Native of the Cape of Good Hope, where the plant varies much in form and habit.

Var. b, latiséllis (D. C. l. c.) leaves glabrous, cuneiformly oval. H. luteurifolia, Rich. hydr. no. 55. f. 39.

Var. e, plantaginea (D. C. l. c.) leaves canescent from hairs, oblong.—H. plantaginea, Spreng. neuve entd. 1. p. 284. grundz. t. 8. f. 5-7.

Centella Penny-wort. Pl. 3/4 foot.

89 H. MONTANA (Cham. et Schlecht. in Linnaea. 1. p. 374.) plant shrubby, when young villous, at length glabrous; leaves lanceolate, quite entire or somewhat tridentate, 3-nerved; petioles villous; umbels 3-flowered, on short pedicels; leaves of involucrum 2, twice the length of the nearly orbicular corrigate fruit. G. Native of the Cape of Good Hope, on the tops of mountains. A humble depressed branched shrub. Microcarps tumid, with 5 filiform ribs, and flattish furrows. Mountain Penny-wort. Shrub depressed.

90 H. VIRGATA (Linn. fil. suppl. p. 176.) plant shrubby, erect, branched; leaves linear-filiform, quite entire, umbels pedunculate, 1-3-flowered; flowers hardly pedicellate; leaves of involucrum lanceolate; fruit orbicular, obturate, furnished with 2 ribs on each side. G. Native of the Cape of Good Hope, ex Cham. et Schlecht. in Linnaea. 1. p. 379.

Var. a, glàberrima (D. C. prod. 4. p. 69.) plant twiggy, quite glabrous; flowers polygamous and monocious. H. virgata, Lam. ill. t. 188. f. 3. Spreng. syst. 1. p. 878.

Var. b, lanuginosa (D. C. l. c.) plant twiggy, clothed with lanuginous villi; flower polygamo-monocious; leaves expanded into linear lamina at the apex. Cham. et Schlecht. Var. γ, macrocarpa (D. C. l. c.) plant twiggy, glabrous; flowers polygamo-dioecious; fruit larger.—H. macrocarpa, Rich. hydr. no. 57. f. 40.—Pl. am. i. 510. f. 7.

Var. ε, nana (D. C. l. c.) plant short, glabrous; flowers polygamo-dioecious. Twigs Penny-wort. Pl. 1/4 to 1/2 foot.

† Species not sufficiently known.

91 H. FLUVIANTS (D. C. prod. 4. p. 69.) stems submersed, straight, filar; leaves peltate, orbicular, shining, floating; petioles thickened from the base to the apex. G. W. H. Native of Louisiana, floating in lakes and tranquil rivers, through immense tracts. H. incressatam, Rafin. fl. bul. p. 51, but not of Ruiz et Pav. Hydrocotyle Robin, Lonis. p. 461. ex Rafin. It grows also in water in Florida, very common. The stems have numerous fibres, issuing from the joints. The leaves are on long petioles, orbicular, peltate, and 15-20-nerved, glabrous, bluntly somewhat lobed, and crenated. Very like H. nátans, but differs in the leaves being peltate.

Floating Penny-wort. Pl. floating.

92 H. HEDERÉFÓLIA (Burch. cat. geogr. no. 558. trav. 1. p. 46.) plant decumbent, villous; leaves reniform, 3-angled; angles acute. G. Native of the Cape of Good Hope. The rest unknown.

Ivy-leaved Penny-wort. Pl. decumbent.

93 H. RACENóDA (Moc. et Senes, fl. mex. icon. incl. ex D. C. prod. 4. p. 70.) plant glabrous; leaves petiolate, orbicular-reniform, broadly crenated, with a narrow recess; peduncles twice the length of the leaves; flowers pedicellate, verticillate, disposed in interrupted racemes; fruit nearly globose. G. Native of Mexico. Stems creeping. Leaves rising from the nod of the stems in fascicles; petioles 12-15 lines long. Allied to H. interrupta, but the leaves are not peltate; and to H. spicata, but the flowers are evidently pedicellate.

Racenóda-flowered Penny-wort. Pl. cr.

94 H. GRUMÓSA (Moc. et Senes, fl. mex. icon. incl. ex D. C. prod. 4. p. 70.) plant glabrous; stems ascending; root grumose, fascicled; leaves pedicellate and stem-clasping at the base; leaves orbicular, cordate, crenated; umbels in fascicles; flowers distinctly pedicellate. G. B. F. Native of Mexico.

Grumose-rooted Penny-wort. Pl.

95 H. PINNATIFÍDA (Spreng. pag. 2. p. 47.) stems erect, glabrous; leaves pinnatifid; segments oblong, a little cut; umbels usually 3-flowered, involucrated.—Native country unknown. In Sprengel's subsequent works this plant is not admitted, and the name is omitted as a synonym: it is therefore very doubtful.

Pinnatifida-leaved Pennywort. Pl.?

Cult. All the species are of the most easy culture, but require to be kept moist. The stow, greenhouse, and frame kinds should be grown in pots, under which should be placed pans of water.

LIN. syst. Pentádria, Dígyánya. Tube of calyx nearly globose; limb very short or hardly any. Petals roundish, entire, obtuse. Styles obtuse. Fruit roundish, with the commissure nearly orbicular from the excavation; microcarps unequal, furnished with 3 ribs on the back (ex Nutt.), but according to Koch 5 filiform ribs: the lateral ones marginal, broader, thick

UMBELLIFERÆ. 1. HYDROCOTYLE. 2. CRANTZIA. 253
UMBELLIFERÆ. II. CRANZIA. III. DIMETOPIA.

white and spongy inside; the channels between the ribs furnished with 1 brown distinct vitta each, and the commissure with 2 vittae.—Small, glabrous, creeping herbs. Leaves sessile, narrow, obtuse, quite entire, lined with 5 transverse nerves, as the seminal leaves and petals of Erigerion cornuta. Peduncles axillary, erect. Umbels simple, 8-10-flowered. Involution 5-6-leaved. Flowers white, pedicellate, hermaphrodite, uniform.

C. lineata (Nutt. l. c.) leaves sessile, cuneate-linear, obtuse; peduncles length of leaves; umbels 8-10-flowered. 

E. B. F. Native of Illinois, Indiana, and Ohio. From C. lineata remarkably in its much longer and attenuated foliage.

Attenuated-leaved Cranzia. Fl. cr. Cult. See Hydrocytola above for culture and propagation.

III. DIMETOPIA (from dimetopos, having 2 faces; in reference to the mericarps of the fruit being unlike each other). D. C. coll. 4. p. 71.

LIN. SYST. Pentadria, Digynia. Teeth of calyx obsolete. Petals ovate-oblong, entire. Styles short. Fruit didymous; mericarps nearly globose, rather contracted at the commissure, of unequal shape and size: the one muricate with rows of blunt compressed tubercles, the other echinate by conical tubercles, which are drawn out at the apex into soft prickles. Seed?—An annual herb, hardly a finger in height. Stem short, branched,iset with scattered pilis. Leaves tripartite; lobes cuneate, linear-oblong, bluntly tridentate at the apex, or trifid. Peduncles opposite the leaves, and longer than them. Umbels simple, usually 5-flowered.

Involucrem of 5 linear-lanceolate leaves, which are the length of the flowers. Flowers white.—Habit almost of Erigenia; the fruit agrees with that of Santolina, and the petals with those of Hydrocytola.

1. D. pusilla (D. C. l. c.). S. H. Native of New Holland, at King George's Sound, and at Port Western. Small Dimetopia. Fl. ½ foot. Cult. See the seeds in a warm sheltered situation, in the open ground.

IV. ERIGENIA. V. MICROPLEURA. VI. DIDISCUS.

white and spongy inside; the channels between the ribs furnished with 1 brown distinct vitta each, and the commissure with 2 vittae.—Small, glabrous, creeping herbs. Peduncles opposite the leaves, and longer than them. Umbels simple, usually 5-flowered. Involucrem of 5 linear-lanceolate leaves, which are the length of the flowers. Flowers white.—Habit almost of Erigenia; the fruit agrees with that of Santolina, and the petals with those of Hydrocytola.

1. D. pusilla (D. C. l. c.). S. H. Native of New Holland, at King George's Sound, and at Port Western. Small Dimetopia. Fl. ½ foot. Cult. See the seeds in a warm sheltered situation, in the open ground.

IV. ERIGENIA. V. MICROPLEURA. VI. DIDISCUS.
the appearance of a head of the flowers of *Scabiosa Caucásica*, but the flowers are on longer pedicels; pedicels, after flowering, twisted inwards, bearing the fruit, which lies within the involucre, but erect at maturity. Fruit, when young, rather hairy, but in the adult stage it is covered with minute tubercles. This is one of the most showy plants of the order.

2. **D. albihörus** (D. C. prod. 4. p. 72.) plant glabrous; radical leaves on long petioles, palmate; segments dilated at the apex, cut, toothed; cauline leaves few, small; umbels simple, on long peduncles. 2. G. Native of New Holland, at Port Jackson. Trachymene incisa, Rudg. in Lin. trans. 10. p. 300. t. 21. f. 2. Fruit much compressed, beset with minute tubercles. Petals white.

**White-flowered Didiscus.** Cite. 1819. Pl. 1 1/2 foot. Cult. Sow the seed of these plants on a slight hot-bed in spring, and when the plants are 3 inches high, plant them separately into small pots, and shift them from size to size of pots as they grow.

**Lin. syst. Pentádria, Digynia.** Margin of calyx 5-toothed. Petals elliptic, entire, acutish, straight at the apex, rather valvate in activation; styles diverging. Fruit didymous, compressed, and contracted from the sides; mericarps gibbously convex, without any vittae, 5-ribbed: the 3 dorsal ribs and their channels mucrinated with tubercles; lateral ones marginal. Carpophore undivided. Seed gibbously convex, flattish in front.—Herbs or subshrubs, all natives of New Holland. Umbels compound, many-rayed: umbellules containing 5-12 flowers. Involucrum of many leaves. This genus agrees with *Hydrocystyle* in the fruit being compressed; the rest agrees with *Azoréllula*. *Por桑théra* of Rudge agrees with this genus in habit, but the structure of the flowers is very different, and most probably belongs to the order *Tremándræae*.

1. **T. aëccps** (D. C. prod. 4. p. 73.) plant glabrous, nearly leafless; stem 2-edged, branched; leaves also at the tops of the branches cut into a few fine lobes. 2. G. Native of New Holland. It agrees with *T. compressa* in the stem being compressed, but it is one half narrower, the leaves more finely cut, the umbel more slender. The fruit has not been seen, but the analogy of the herb with the following species is sufficient to indicate its belonging to the same genus.

**Two-edged-branched Trachymene.** Pl. 1 foot.

2. **T. cornacias** (Spreng. umb. spec. p. 9. exclusive of the Chili specimen) plant glabrous; fruit, leafless; leaves very few, small, binate or ternate: upper ones linear, entire; stem 2-edged, branched. 2. G. Native of New Holland, on the sandy coast. Azoréllula compressa, Labill. nov. holl. 1. p. 75. t. 101. Fruit compressed, obovate; mericarps convex on the back, 3-ribbed: ribs wrinkled from the tubercles. Involucrum shorter than the pedicels.

**Compressed Trachymene.** Pl. 1 foot.

### Sect. II. Dendromene (from ἄνεσις, dendron, a tree; in reference to the species being shrubby). D. C. prod. 4. p. 73. Plants shrubby. Leaves entire.

**Linear-leaved Trachymene.** Fl. Ju. Aug. Cite. 1824. Sh. 1 to 2 feet.

4. **T. tenuis** (D. C. prod. 4. p. 73.) shrubby; branches terete, beset with glandular hairs at the apex; leaves scattered, spreading, linear, acute; umbels few-flowered. 2. G. Native of New Holland. Branches very slender. Leaves hardly 1/4 line broad, and 3-4 lines long. Umbel trifid: umbellules 3-5-flowered. Ribs of fruit scabrous from tubercles. Very like *T. erícoides*.

**Slender Trachymene.** Shrub 1 foot.

5. **T. subvelutina** (D. C. l. c.) shrubby; branches terete; leaves linear, thickish, acute, velvety from short crowded down, as well as the branchlets; umbels crowded. 2. G. Native of New Holland, at Port Jackson. The leaves are almost like those of *T. erícoides*, but differ in being velvety and crenatish. Branches hardly diverging.

**Rather-velvety Trachymene.** Shrub 1 foot.

6. **T. erícoides** (Sieb. pl. exsic. nov. holl. no. 121.) shrubby; branches rather angular, glabrous; leaves linear, acute, spreading; umbels crowded. 2. G. Native of New Holland. Branches numerous, spreading. Leaves a fine broad, with the margins hardly revolute when dried. Umbels 5-cleft: umbellules 3-5-flowered. Fruit hairless from tubercles on the ribs.

**Heath-like Trachymene.** Shrub.

7. **T. lanceolata** (Rudge, l. c. Spreng. syst. 1. p. 879.) shrubby; branchlets rather angular, glandular, and velvety when examined by a lens; leaves lanceolate-linear, nerved, erect; umbels crowded, many-flowered. 2. G. Native of New Holland. Azoréllula lanceolata, Labill. nov. holl. 1. p. 74. t. 99. Leaves an inch and a half long, and 2 lines broad. Leaves of the involucrum the length of the umbel. Umbels 5-8-rayed; umbellules 8-10-flowered. Branches sometimes terminated by an 8-10-flowered, simple umbel.

**Lanceolate-leaved Trachymene.** Shrub 1 foot.

8. **T. myrtifólia** (Sieb. pl. exsic. nov. holl. no. 125.) shrubby; branches rather angular, hardly glandular or puberulous, even when examined by a lens; leaves oval-oblong, rather attenuated at both ends; umbels crowded, many-flowered. 2. G. Native of New Holland. Very nearly allied to *T. lanceolata*, but differs in the leaves being 9-10 lines long, and 3 lines broad. Umbels 8-10-rayed; umbellules 8-12-flowered.

**Myrtle-leaved Trachymene.** Shrub.

9. **T. ovális** (D. C. prod. 4. p. 73.) shrubby; branches densely clothed with short hairs; leaves oval, nerved, scattered, nearly sessile, hardly attenuated at either end; umbels many-flowered, crowded. 2. G. Native of New Holland. T. o'atá; Spreng. umb. spec. p. 8. (exclusive of the syn. of Labill.). Sieb. pl. exsic. nov. holl. no. 124. Perhaps only a variety of *T. myrtifólia*.

**Fur. 2. confèrta** (D. C. l. c.) leaves and branchlets much crowded. 2. G. Native of New Holland, at Port Jackson. Perhaps a proper species.

**Oval-leaved Trachymene.** Shrub 1 foot.

10. **T. o'atá** (Rudge, l. c. but not of Spreng. nor Sieb.) shrubby; branches smoothish; leaves broadly ovate, nearly sessile, hardly longer than broad; umbels crowded, many-flowered. L 1
G. Native of New Holland. Azorella ovata, Labill. nov. holl. 1. p. 74. t. 100. T. buxiifolia, Sieb. pl. exsic. nov. holl. no. 122. Leaves 4 lines long, and 3 lines broad. Umbels much crowded, small, 8-10-rayed.

Ovate-leaved Trachymene. Shrub.

Cult. All the species of Trachymene will grow well in a mixture of loam, peat, and sand; and they may be increased by cuttings, under a hand-glass, or by seeds.

VIII. ASTROTRICHA (from astro'v, astron, a star, and τρις τρίχως, thrice trichos, a hair; in allusion to the starchy down on the outside of the petals). D. C. coll. mem. 5. p. 29. t. 5. and 6. prod. 4. p. 74. —Bolax species, Sieb. ex X. Rudge, fl. nov. holl. exsic. no. 248.)

Lin. syst. Pentandria, Digyna. Tube of calyx ovate; limb small, hardly 3-toothed. Petals oval, acutish (f. 58. b.), permanent, flat, velvety from stellate down on the outside. Styles 2, filiform (f. 58. c.), not gradually thickening to the base. Fruit crowned by the calycine lobules and petals; mericarps ovate-oblong, contractcd at the commissure; ribs very blunt, hardly prominent; of the primary ones there are 3 dorsal, and 2 marginal, which are more acute and not so evident: of the secondary ones 4; vittae wanting on the back, but there are 2 rather prominent ones in the commissure, which are covered by a spongy pellicle.—Australian, branched subshrubs, having the branches, petioles, under side of leaves, and umbels beset with white stellate hairs. Peduncles panicked, each ending in a simple, many-flowered umbel. Bracteas under the branches and bracteolts solitary. Leaves of involucrum few and linear. Habit almost of Hérnus, but the fruit is very different. It differs from Bolax in habit, and in the fruit not being tetragonal.

1 A. floccosa (D. C. I. c. t. 5.) the whole plant is clothed with fleshy lanuginose down; leaves ovate-lanceolate, obtuse at the base, and acuminate at the apex.

G. Native of New Holland. Bolax floccosus, Sieb. exsic. nov. holl. no. 258. Leaves 3-6 inches long and 15-15 lines broad; petioles half an inch long.

Fleshy Astrotricha. Shrub.

2 A. lepidophila (D. C. I. c. t. 7.) plant clothed with short adpressed down; leaves oblance-linear, coriaceous, acutish at both ends.

G. Native of New Holland. Bolax lepidophila, Sieb. exsic. nov. holl. no. 257. Leaves 20 lines long and 3 broad; petioles 2 lines long.

Lanced-leaved Astrotricha. Shrub.

Cult. See Trachymene above for culture and propagation.

Lin. syst. Pentandria, Digyna. Tube of calyx ovate, compressed; limb 5-toothed; lobes ovate, acute, colored a little. Petals stipitate, oval, cuspitate at the apex, replicate. Stamina opposite the calycine lobes. Stylopodia (glands, Rudge) 2, thick, villous at the tops of the mericarps. Styles 2, filiform, rising from the inner bases of the stylopodia. Fruit compressed, striated; mericarps contracted at the commissure, 7-9-ribbed: ribs filiform: 2 lateral ones marginal; channels without vittae, as well as the commissure, which is very narrow. —Australian shrubs, usually covered with stellate hairs. Leaves alternate, simple, or tripartite. Umbels variable.

Sect. I. Eexanthosia (this section is supposed to contain the true species of Xanthosia, from eu, well, and Xanthosia). D. C. prod. 4. p. 74. Umbels axillary, simple, or bifid. Leaves of involucrum small.

1 X. montana (Sieb. fl. nov. holl. exsic. no. 248.) the whole plant clothed with villi: some of them starry, and others simple and elongated; leaves ternate, rarely 3-lobed; umbels axillary, nearly sessile, simple, 1-flowered; involucre and involucels 2-leaved. G. Native of New Holland, on the mountains. X. pilosa, Rudge; the flowers are only referrible to this plant.

Mountain Xanthosia. Shrub.

2 X. hirsuta (D. C. prod. 4. p. 74.) the whole plant clothed with hairs, some of which are stellate, and others simple and elongated; leaves sinuate, nearly 3-lobed; umbels axillary, pedunculate, bifid; umbelles 1-flowered; involucrum 2-leaved; involucels 3-leaved. G. Native of New Holland, near Port Jackson. X. pilosa, Rudge, only in the form of the leaves. Sieb. pl. exsic. nov. holl. no. 247.

Hairy Xanthosia. Shrub.

3 X. tridentata (D. C. prod. 4. p. 75.) young branches strigose: adult ones glabrous; leaves cuneate, acutely tridentate at the apex, tomentose from starry down beneath, but glabrous in the adult state; umbels pedunculate, axillary, bifid; umbelles 1-flowered; involucrum 2-leaved; involucels 2-3-leaved: leaves lanceolate. G. Native of New Holland, at Port Jackson. Leucola’na tridentata, R. Br. ex herb. mus. par.

Tridentate-leaved Xanthosia. Shrub.

Sect. II. Leucola’na (from leukos, leucaos, white, and χλαώνα, eklaina, a garment; in reference to the involucrum). D. C. prod. 4. p. 75. Umbels terminal, 3-4-rayed. Leaves of involucrum large, white.

4 X. rotundifolium (D. C. prod. 4. p. 75.) branches densely clothed with hairs, or rather rough from deciduous down; leaves reniformly orbicular, coarsely and acutely toothed; umbels 3-4-rayed: umbelles many-flowered; involucrum and involucels 3-leaved. G. Native of New Holland, on the eastern coast. Crucílina cándida, Lessch. in herb. Juss. Leaves of involucrum lanceolate, hairy at the base: those of the involucels broader, somewhat cordate, apiculated, glabrous. Fruit more compressed in the young state.

Round-leaved Xanthosia. Shrub.

Cult. For culture and propagation see Trachymene, above.

Lin. syst. Pentandria, Digyna. Tube of calyx compressedly tetragonal; limb 5-toothed. Petals elliptic, entire, acute. Fruit ovate, much contracted at the raphe, turigid, rather tetragonal, flatish on both sides at the back; mericarps without vittae, marked on the back by an oval impression; with 5 obsolete ribs: the 3 middle ones on the back: and the 2 lateral ones placed in the commissure, which is flat. —Weak, South American herbs, usually scabrous from stellate down. Leaves petiolate, opposite, simple, lobed, or toothed. Umbels simple, axillary, few-flowered. This genus is allied to Spandinthe.

1 B. palma’ta (Ruiz et Pav. fl. per. 3. t. 251. f. a.) plant
leaves palamately parted; segments 3-5, jagged; umbels 3-flowered: upper ones on short, and the lower ones on long peduncles. O. H. Native of Peru, in the province of Chancay, on sandy hills. Plant 2 feet high, brittle, perhaps erect.

**Palmate-leaved Bowlesia.** Pl. 2 feet.

2 B. lobata (Ruiz et Pav. l. c. t. 251. f. b.) plant decument, covered all over with fascicles of bristles or stiffer hairs; leaves reniform, 5-7-cleft, or with 5-7 deep crenatures; umbels 3-5-flowered, pedunculate. O. H. Native of Peru, in bushy places, on the Andes towards Pillao. The bristles on the upper surface of the leaves are 3-5 in a fascicle: those on the rest of the plant are 8, and stellate.

**Lobed-leaved Bowlesia.** Pl. decumbent.

3 B. inca'na (Ruiz et Pav. l. c. t. 268. f. a.) plant procumbent, hoary from crowded stellate fascicles of hairs; leaves reniform-roundish, bluntly 5-7-cleft; lobes entire or tridentate; petioles axillary, on short peduncles. O. H. Native of Peru, on hills in the tract at Huancayo, Rondos and Pillao. Spreng. umb. spec. p. 13. t. 5. f. 10. Petioles permanent, rather tendril-formed. In cultivation the plant however becomes smoother, longer, and more procumbent than in the wild state.

**Hoary Bowlesia.** Pl. procumbent.

4 B. tropo/zech/folia (Gill. and Hook. in bot. misc. 1. p. 325.) plant clothed with stellate down; stems procumbent, slender; leaves palmately 5-7-parted; segments lanceolate, bluntish, quite entire, with acute sinuses; peduncles 5-flowered; fruit small. F. F. Native of Chili, in shady places at El Salto de San Isidro, and in the valleys of the Andes, towards Mendoza. Stems filiform.

Var. β, trip'ar/ta (Hook. et Arn. in bot. misc. 3. p. 346) the 2 lower lobes of the leaves approximating, small, coarsely tridentate from the middle. F. F. Native of Chili, about Valparaiso.

**Tri'plexema-leaved Bowlesia.** Pl. pr.

5 B. te/nera (Spreng. syst. 1. p. 860.) plant clothed with stellate pubescence; stems procumbent, slender; leaves on long petioles, reniform, 5-7-lobed: lobes obtuse, bifid or trifid; peduncles short, bearing a 3-flowered umbel each. F. H. Native of Chili, about Concepcion, Valparaíso, Buenos Ayres, and Talcahuana; of Peru, on the mountains about Huancayo; and of Brazil, in dry fields about Monte Video, and at Porto Allegretto. Link. et Otto, abbild. t. 4. B. nodiflorus, Pers. in Huenk. herb. ex D. C. prod. 4. p. 75. B. geraniifólia, Cham. et Schlecht. in Linnaea. 1. p. 382. Hook. et Gill. in bot. misc. 1. p. 324. B. incana, Hort. par.

6 B. dich'otoma (Peppig, diar. no. 363. pl. exsicc. 95.) plant erect, dichotomous, hoary from stellate fascicles of hairs; leaves short, petiolate, obovate, coarsely tridentate at the apex; umbels 5-7-flowered, on long theads. O. H. Native of Chili, about Valparaíso and the baths of Collina. Peduncles of umbels about equal in length to the leaves, or longer; sometimes simple, bearing an umbellule at the apex: sometimes bifid at the apex, bearing 2 linear leaves, each of the branches bearing an umbellule. This species, like the others, varies much in the proportionate length of the peduncles; they are, however, usually much shorter than the petioles.

**Dichotomous-peduncled Bowlesia.** Pl. 1 foot.

Cult. The seeds may be reared on a hot-bed in spring; and when the weather gets warm, the plants may be planted out into the open ground, in any warm sheltered situation.

---

**XI. FRAGOSA** (in honour of John Fragosa, first physician to Philip II. King of Spain.) Ruiz. et Pav. fl. per. prod. p. 45.

---

**XII. AZORELLA** (meaning not explained). Gaud. in ann. L 1 2
UMBELLIFERÆ. XII. AZORELLA.

366. UMBELLIFERÆ. XII. AZORELLA.

1. A. ARETIÓIDES (Willd. herb. ex D.C. prod. p. 47.) leaves imbricate, tripartite, coriaceous; lobes oblong, acutish; petals thick and rather coryck, villous at the apex; umbils nearly sessile, 2-8-flowered; pedicels about equal in length to the involucre. Perhaps this genus is hardly distinct from Fragósa.

2. A. LYCORÓIDES (Gaud. in ann. sc. nat. p. 105. t. 5. f. 1.) leaves imbricate, sheathing at the base, trifid, coriaceous; lobes subulate, acute; sheaths funnel-shaped, ciliate toothed; umbels almost sessile, 3-4-flowered; leaves of involucre somewhat ciliate and bristly. 2. F. Native of the mountains of Magellan and the Maclowe Islands. 

3. A. FILAMENTÓSUS (Lam. ill. t. 189. f. 1.) leaves oblong, coriaceous, quite entire, crowded; pedicels dilated, ciliate with long bristles; umbels nearly sessile; leaves of involucre somewhat ciliate and bristly. 2. F. Native of the mountains of Magellan and the Maclowe Islands. A. chaititis, Pers. enchy. no. 3. D'Urv. fl. mal. p. 46. Bó lax filamentosus, Spreng. in Schultes, syst. 6. p. 359. There are varieties of this plant with either an elongated or crowded habit; and with the umbels either few or many-flowered, and the lower ones 1-flowered. Perhaps the same as Chamaétis integrifólia, Gaertn. fruct. t. 22. f. 4.

FILAMENTOSEAZORELLA. Pl. 1/2 foot.

4. A. Gilliesii (Hook. et Arn. in bot. misc. p. 346.) plant densely tufted; leaves petiolate, trifid; umbels pedunculate, 4-10-flowered; fruit utricular. 2. F. Native of Chili, in the valley of Usqualita, on the Andes of Mendoza, at the elevation of from 6000 to 12,000 feet. Bó lax Gillissii, Gill. et Hook. in bot. misc. 1. p. 323. t. 63. Root long, descending. Plant 2 inches high. This plant yields abundantly a gummy substance, which is gathered by the natives, and employed by them in the cure of headache.

Gillees's AZORELLA. Pl. 2 inches.

5. A. CESPTRÓSUS (Cav. icon. 5. p. 57. t. 484. f. 2.) leaves imbricated, spreading at the apex, thick, quite entire, and quite glabrous; umbels on short peduncles, 6-8-flowered; leaves of involucre one half shorter than the pedicels. 2. F. Native of Chili, on the higher mountains, called the Cordillera del Planchón. A. crassifólia, Pers. enchy. 1. no. 2. Fruit ovate; having the mericarps furnished with 3 slender stripes on the outside, as in the genus Fragósa.

TUFFED AZORELLA. Pl. 1/4 foot.

6. A. RÁCOIDES (D'Urv. fl. mal. p. 45.) leaves all radical, long pinnate; segments or leaflets remote, opposite, short, pinna-tild; lobes alternate, acutely cut; scapes short, very hairy; involucre 8-10-leaved; fruit glabrous, striated, nearly sessile. 2. F. Native of the Straits of Magellan, along the rivulet called Bougainville River. Root thick, fusiform. Umbels 3-8-flowered. Leaves hardly an inch long, but still longer than the sepal.

Carrot-like AZORELLA. Pl. 1 inch.

7. A. RANUNCULUS (D'Urv. fl. mal. p. 46.) stem stolonicerciform, very short; leaves on long petioles, 5-parted; partitions 3-lobed at the apex, obtuse; umbels axillary, on short peduncles; leaves of involucre 5, lanceolate, acute, ciliated at the base, about equal in length to the flowers. 2. F. Native of the Straits of Magellan, along with the last. Habit of a small Hydrocotyle or Ramunculus. Fruit round, hardly pedicellate, crowned by the calyeene teeth. Umbels 4-8-flowered. Petals greenish yellow.

CHIFFLE-foot-like AZORELLA. Pl. 1/4 foot.

Cult. See Fragósa, p. 259. for culture and propagation.

XIII. PECTOPHYTUM. XIV. BOLAX.

MULTIÆ (this tribe contains plants agreeing with Malúnum in important characters), or Orthospermeae imperflecti Umbelláte, parallelo bisnatis, D. C. prod. p. 78. Hydrocotyle Multíneae, D. C. coll. mem. 5. p. 32. Mericarps much contracted at the commissure, without any vitce; ribs 5, usually filiform. Fruit compressed from the back, hence it is square. Petals spreading, flat, entire in all the genera, with the exception of Asteriscium.

LIN. SYST. Penhátria, Digitiá. Margin of calyx entire. Petals oval, entire. Styles short. Fruit tetragonal, concave in the disk; mericarps with 5 nerve-formed smooth ribs, 1 dorsal, 2 in the middle forming the angles, and 2 filiform inner ones; commissure very narrow.—A tufted herb, with the habit of Arítia. Leaves imbricate, trifid, glabrous, coriaceous; lobes ovate, obtuse; petioles meunbranous, rather coryck, with the margins not ciliated. Umbels simple, nearly sessile, 4-flowered. Leaves of involucre 4, about equal in length to the pedicels. Fruit while young furnished with stellate down.

1. B. CLEBARIA (Comm. ined. ex Gaud. ann. sc. nat. 5. p. 104. t. 3. f. 2.) 2. F. Native of the Straits of Magellan, on the mountains; in the Maclowe or Falkland Islands; Chili and
UMBELLIFERÆ. XV. MULINUM. XVI. LARETIA. XVII. DRUSA. XVIII. HUANACA.

and 65. ex D'Urv. Hydrocotyle gummifera, Lam. dict. 3. p. 156.
ill. p. 189, f. 21. Bôlax gummifera and B. complicata,
Spreng. emb. spec. p. 9. and p. 10. Azorîlla cæspitosâ, Valîh,
symb. 3. p. 428.
Clathria Bolax. Pl. 3/4 foot.

Cult. See Frâgôsûa, p. 259, for culture and propagation.

林. syst. Pentândria, Digînîa. Limb of calyx 5-toothed, permanent. Petals oval-oblong, acute, flat. Styles acute. Fruit 4-winged or parallelly bissette; mericarp without vitae, very much contracted at the commissure, compressed on the back, 5-ribbed; middle rib on the back nerve-formed, as well as the 2 lateral ones, the 2 intermediate ones expanded into ample lateral wings.—Suffruticose tufted herbs, natives of Chili. Leaves 3-5-cleft or undivided; petioles sheathing. Umbels simple; pediols longer than the many leaved involucre. Flowers yellow.

This genus, according to Lagasca, is probably divisible into several;

1 M. spinôsùm (Pers. ench. 1. p. 309.) cauline leaves triâd; segments subulate and spiny; lateral segments bipartite; petioles sheathing, glabrous; peduncles longer than the leaves; leaves of involucre distinct, short, spreading a little; fruit orbicular. 2. F. Native of Chili, on the highest mountains, called Cordillera del Planchon and del Portillo, towards Mendoza; between Los Ojos de Aâga, and El Rio de Los Ojos de Agua; Andes of Chili, and Cordillera of Chili, at the elevation of 5,500 or 7,000 feet. Selinum spinosum, Cav. icon. 5. p. 59. t. 487. f. 1. Bôlax spinous, Spreng. in Schultes, 6. p. 352. exclusive of the synonyms. Stems half a foot high. Umbels 10-12-flowered. Petals of a reddish yellow-colour.

Spîny Mulínum. Pl. 3/4 foot.

2 M. prolîfêrûm (Pers. 1. c.) cauline leaves triâd; segments subulate, spinose; petioles sheathing, glabrous; leaves of involucre short, distinct, rather spreading; umbels pedunculate, longer than the leaves; fruit orbicular. 2. F. Native of South America, at Port Desire; and of Chili, on the Andes of Mendoza between San Isidro and Portezuela, on the declivities of mountains at the elevation of 5,000 to 10,000 feet. Selinum proliferum, Cav. icon. 5. p. 58. t. 486. f. 1. Bôlax prolifer, Spreng. in Schultes, syst. 5. p. 361. Root twisted. Stems 3-4 inches high, covered by the sheaths. Leaves glabrous. Umbels 5-7-flowered, sometimes proliferous. Petals yellow.

Proliçerous Múlímum. Pl. 3/4 foot.

3 M. cenæànum (Hook. and Arrn. in Beech. bot. 1. p. 26.) leaves wedge-shaped, triad, and sometimes 5-6-cleft: each lobe ending in a spiny point; sheaths of leaves elongated, stiff, ciliated; umbels many flowered, on short peduncle. 2. F. Native of Chili, about Valparaiso, and on the mountains of Valparaiso; and at Huilequima, in the province of Raro. Azorîlla spinaçà, Pers. ench. 1. p. 303. Frâgôsûa spinosa, Ruiz et Pav. fl. pcr. 5. p. 27.

Cûmuedâted-leaved Múlímum. Pl. 3/4 foot.

4 M. elîcinûm (Gilît. and Hook. in bot. misc. 1. p. 328. t. 64.) leaves triadii: segments subulate, spiny; umbels nearly sessile, terminating the very short branches; fruit elliptic. 2. F. Native of Chili, near La Clieera de Bonilô, near the tops of the Usaplata range of mountains, at the elevation of 9,500 feet. M. cëlinus, D. C. prod. 4. p. 79. Bôlax cëlinus, Presl. mss. A glabrous, much branched, humble, odoriferous plant. Petals marked by an elevated longitudinal line in the middle. Leaves of involucre linear-subulate.

Fûrzî-like Múlímum. Shrub 3/4 to 4 foot.

5 M. microscopy (Pers. 1. c.) cauline leaves imbricate, minute, tripartite: lobes linear-lanceolate, each terminated by a petiole; petioles stem-clasping, ciliated at the base. 2. F. Native of South America, at Port Desire. Selinum microphyllum, Cav. icon. 5. p. 59. t. 486. f. 2. Petals reddish, yellow in the dried state. Stem shrubby, 3 inches long, branched, covered by the sheaths.

Small-leaed Múlímum. Pl. 3/4 foot.

6 M. alrovâgîmânum (Gilît. et Hook. in bot. misc. 1. p. 328.) leaves triad; segments ovate-lanceolate, mucronate; umbels axillary, small, few-flowered, sessile. 2. F. Native of Chili, at Ætreno de la Póuletra, on the Andes of Mendoza. Shrub branched, dichotomous.

White-sheathed Múlímum. Pl. 3/4 foot.

Cult. See Frâgôsûa, p. 259, for culture and propagation.

XVI. LARETIA (Lareta) is the vernacular name of the plant). Gill. et Hook. in bot. misc. 1. p. 329. t. 65.

林. syst. Pentândria, Digînîa. Margin of calyx 5-toothed. Petals ovate, entire. Fruit elliptic, square, flatly compressed from the back, 4-winged; mericarps lenticular, with dorsal ribs, and 2 lateral marginal ones, destitute of vitae. Seed flat.

Stealeus Laretia. Pl. 3/4 foot.

Cult. See Frâgôsûa, p. 259, for culture and propagation.

林. syst. Pentândría, Digînîa. Limb of calyx entire, not perspicuous. Petals oval, entire. Fruit oval; mericarps much compressed on the back, without any vitae: the dorsal rib and the 2 inner ones linear, and not prominent: the 2 intermediate ones are drawn out into marginal re pandly sinuated wings, having the sinuses obtuse, and the angles furnished with hooked stellate spinules. Seed much compressed.—A decumbent slender stonîferous herb, native of Tenerife. Leaves opposite, petiolate, broadly 3-lobed, crenated. Hairs on divers parts of the plant very different, some of which are still, stellate, and hooked at the apex; others are soft, simple, solitary, or in stellate fascicles. Umbels axillary, pedunculate, 1-2-flowered, without any involucre. Flowers small, white. Plant with the habit of Bowrâisìa, but the fruit is very different.

1 H. Cavannille (D. C. prod. 4. p. 81.) stems scape-formed, trifid at the apex, and bearing 2 opposite sessile tripartite leaves; umbels on 3 stems each: lateral ones on long, and the middle one on a short peduncle; segments of leaves filiform, multifid. 2. F. Native of South America, at the Straits of Magellan, and Port Desire. H. acalis, Cav. icon. 6. t. 528. f. 2. Oenanthe Huanaeca, Spreng. umb. prod. p. 37. and in Schultz, syst. 6. p. 628. Spanantha Huanaeca, Lag. l.c.

Cavannille’s Huanaeca. Pl. 1/4 foot.

Cult. See Fragisia, p. 259. for culture and propagation.

XX. Spananthe. XXI. Homalocarpus. XXII. Pozoa.

Linn. syst. Pentandra, Digynia. Margin of calyx 5-toothed. Petals elliptic, entire, acute, with a straight apex. Fruit ovate, much compressed at the raphe, flattened, and compressed from the back on both sides; mericarps flat, without any vitre; ribs 5, very slender, equal, 3 intermediate ones on the back, and the 2 lateral ones seated in the commissure, which is flat. Seed flat.—A South American branched erect herb, glabrous in every part, except on the petioles, which are ciliated along the sheaths, and ornamented with a collar of hairs under the origin of the limb. Leaves cordate, toothed, acute. Umbels rather compound, proliferous. Involucra composed of many leaves. Flowers white on long pedicels.

1 S. paniculata (Jacq. l. c. and icon. rar. 3. t. 350.) C. S. Native of South America, in Trinidad, and the Spanish Main, as well as of Peru. Hydrocolitea spananthe, Willd. spec. 1. p. 1363. Phellandrium ciliatum, Wild. herb. Perhaps the Peruvian plant is the same as that from the Spanish Main, but it is much smaller and hardly panicked.

Panicled Spananthe. Fl. July, Aug. Cilt. 1795. Pl. 1 to 2 ft. Cult. The seeds of this plant should be raised on a hot-bed, and when the plants are of sufficient size plant them into separate pots, and then place them in the stove, where they will flower and seed; and some may be planted out in the open ground. Not worth cultivating except in botanical gardens.

XXI. Homalocarpus. (from ἕμαλος, homalos, equal, and καρπος, karpos, a fruit). Hook. and Arn. in bot. misc. 3. p. 348.

Linn. syst. Pentandra, Digynia. Margin of calyx 5-toothed; teeth subulate, minute, hardly permanent. Petals ovate, concave, entire. Styles 2, divaricate, short. Fruit roundish-ovate; mericarps compressed on the back, flat, wingless, constituting 2 parallel disks; commissure very narrow; ribs 5, filiform, very slender, hidden in the substance of the pericarp, one dorsal, 2 lateral ones near the raphe, 2 middle ones forming the angles, without any vitre; carpopetalous entire. Seed less than the cavity of the fruit.—Herb annual, erectish, hoary from stellate hairs, dichotomously branched. Root slender, simple. Leaves petiolate, reniform-roundish, somewhat 5-lobed; lobes equal, ovate, obtuse, quite entire or deeply lobed; lower leaves alternate; superior ones opposite. Peduncles axillary and terminal, about equal in length to the petioles. Umbels simple, 3-6-flowered. Teeth of calyx pilose, almost emulating a fascicle of hairs. Fruit nearly twice the length of their pedicels, which are a fine long. This genus comes near to Spananthe.

1 H. bowlesioides (Hook. et Arn. l. c.) C. H. Native of the Cordillera of Chili. The ridges or ribs of the fruit are only to be seen on a transverse section of the fruit, because they are sunk in a thin substance of the pericarp. The middle ridges do not expand into wings as in Mullossum, and some other allied genera.

Bowlesia-like Homalocarpus. Pl. 1/2 to 1/4 foot. Cult. See Spananthe above for culture and propagation.

Linn. syst. Pentandra, Digynia. Calyx 5-toothed, perma-
nent. Petals entire. Fruit prismatically tetragonal, 5-ribbed, crowned by the calyx, emarginate at the apex; mericarps concave and channelled on the back: lateral ribs close, nearly in straight lines; commissure much contracted.—Herb. Leaves on long petioles, simple, cuneate, profoundly toothed at the apex, quinquangular. Umbels simple. Involucrum obliquely lobed, crenately toothed, many nerves: bracts branch a little.—This genus is allied to Astrantia and Malminum.

N. B. There are two other species of this genus mentioned by Lagasca in nat. 2. p. 94. under the names of P. denticulata and P. incisa, but these he has not described.

Cult. See Fragosa, p. 259, for culture and propagation.

Lin. syst. Pentandria, Digynia. Calyx 5-toothed, permanent: teeth ovate. Petals ending in an indented point, emarginate, with the recess callous. Fruit compressed, tetragonally prismatic, crowned by the calyx, rounded at the base; mericarps 5-ribbed, 2 intermediate ribs expanded into wings, central one as well as the 2 placed near the raphe stripe-formed: having the furrows between the ribs destitute of vitre; commissure very narrow. Seed unknown.—Quite glabrous perennial herbs. Stems terete, branched, few-leaved. Leaves petiolate, simple, roundish-cuneate, unequally toothed, somewhat 3-lobed, 3-15-nerved, rather coriaceous. Umbels simple, nearly globose. Involucrum many leaved, shorter than the umbel. Flowers either sterile and male, or long pedicellate, or fertile and hermaphrodite in the same umbel.—This genus differs from Poza and Malminum in the petals being emarginate, not entire.

1 A. Cuillnes (Cham. et Schlecht. l. c.) leaves 3-lobed, deeply serrated; peduncles elongated, scattered; petals deeply emarginate, ending in a long involute point; fruit narrowest at the base; leaves of involucrum lanceolate, cut. 1/2. F. Native of Chili, in dry sandy places about Talagucano, and about Concepcion; Cuesta de Zapata, at the elevation of 6,000 feet; cliffs by the sea side at Valparaiso. Hook. bot. misc. 1. p. 332. t. 67. A. Anisillus vulgo Mouchu, Feuil. clin. 3. t. 2. Var. 3. He'necki (D. C. prod. 4. p. 82.) lower leaves roundish, undivided, acutely few-toothed at the apex: upper leaves trifid. 1/2. F. Native of Chili. Cassidicarpus Chilenis, Presl, in herb. Henke. Erjungia tricuspidatum, Domb. herb. Chilli Asteriscium. Pl. 1/2 foot.

2 A. Poeppigt (D. C. prod. 4. p. 82.) leaves deeply trifid; lobes obovate, obtuse, usually toothed. 1/2. F. Native of Chili. Very like the preceding, but differs in the lobes of the leaves and recesses being obtuse, and regularly toothed all around.

Poeppig's Asteriscium. Pl. 1/2 foot.

3 A. Polycthalum (Gill. et Hook. in bot. misc. 1. p. 332. t. 67. 1/2.) plant leafless; peduncles corymbose, numerous, sometimes abortive and spinose; petals entire, acute, with an involute apex; fruit broadly oblong; leaves of involucrum linear, entire. 1/2. F. Native of Chili, in the valleys on the Andes near Ladera de la Jaula, and towards Usquilata in the province of Mendoza, at the elevation of 7,500 feet. Matumin Diperygia, D. C. prod. 4. p. 80. The reflexed petals of this species and the next forbid their being united to Matumin.

Many-headed Asteriscium. Pl. 1/2 foot.

4 A. Isatisdicarps (Hook. et Arn. in bot. misc. 3. p. 352.) stem much branched; branches terete; umbels many, few-flowered, disposed in panicles; involucra of few leaves; fruit oval, particularly bicuspid; mericarps approximate. 1/2. F. Native of the Cordillera of Chili. Matumin isatidicarpum, D. C. prod. 4. p. 80. Dipteryx isatidicarpa, Presl, miss. Umbels small, very numerous. Carpohpore bipartite; mature mericarps yellow, rather cuneate at the base.

Isatis-fruited Asteriscium. Pl. 1/2 foot.

Cult. See Fragosa, p. 259, for culture and propagation.

Tribe III.

SANICULEE (this tribe contains plants agreeing with Sanicula in important characters). D. C. prod. 4. p. 82. or Umbellata imperfecta Orthospermea turgidae, Koch. umb. 185.—Umbellata diciscentes, Spreng. in Schultes, syst. 6. p. 30. exclusive of 3 genera. Transverse section of fruit nearly terete. Mericarps covered with scales, furnished with 5 equal primary ribs, without any secondary ones, and destitute of vitre. Transverse section of seed semi-terete, flattish in front. Petals erect, bent downwards from the middle, and emarginate. Umbels fasciculate or capitulate. Simple or irregularly subcompound.

Lin. syst. Pentandria, Digynia. Tube of calyx ovate, contracted at the top; limb 5-lobed: lobes oval-oblong. Petals wanting. Stamens opposite the calyceine lobes. Styles 2, thickened at the base and villous, but secalous at the apex. Ovary 1-ovulate. Fruit ovate, villous, marked by 5 stripes, and crowned by the calyx.—Erect branched Australian herbs. Leaves alternate, petiolate, variously cut. Umbels simple, many flowered, capitate; pedicels very short; involucrum many leaved, radiating, longer than the flowers.

1 A. Hella'snit (Labill. nov. holl. 1. p. 67. t. 92.) the whole plant clothed with tomentose wool; leaves bipinnatifid; lobules bluntish; involucrum 10-18-leaved, clothed with softomentum. 1/2. F. Native of New Holland, about Port Jackson, &c. Ericoalia major, Smith, exot. bot. t. 78. Involutex expanded 1 1/2 of 2 inches in diameter, yellow. Flowers white.

2 A. Minor (D. C. prod. 4. p. 83.) plant smoothish; leaves clothed with adpressed villi beneath, tinate; segments or leaflets trifid, acute; involucrum 9-10-leaved, acute, clothed with silky villi. 1/2. F. Native of New Holland, on the Eastern coast. Ericoalia minor, Smith, exot. bot. t. 79. Sieb. pl. exsic. nov. holl. no. 127. Involutex expanded, 5 lines in diameter, red. Smaller Actinotus. Pl. 1 foot.

Cult. The seeds of these plants may be reared on a hot-bed in spring, and in the month of May the plants should be planted out in the open border in a warm situation, where they will flower and seed freely.

Lin. syst. Pentandria, Digynia. Umbellae containing only
3 flowers; central one hermaphrodite, fertile, sessile; 2 lateral ones male, pedicellate; the pedicels rather coarse at the base, with the calyx of the fertile or central flower. Male flowers with the tube of the calyx almost wanting, but with an obsolete somewhat 5-toothed limb; petals oval-oblong, acute at both ends, inflexed at the apex; stamens 5, alternating with the petals, and longer than them. Female or hermaphrodite flowers, having the tube of the calyx ovate and compressed, and the limb obsolete: petals the same shape as those of the male flowers, rather membranous, permanent; stamens 5, caducous; styles 2; filiform, divaricate, very long; fruit ovate, compressed, 8-ribbed, with 3 nerves on each side, particularly one central, indicating where the raphes is, 2 in the middle, and 2 more conspicuous, seated on the dorsal angle of the mericarps. Mericarps and carpophore not distinct. Fruit empty or containing one ovulm, from one of the mericarps being abortive.—Herb perennial, smooth. Root or rhizome like that of Atëska or Hacquetia. Leaf radical, on a long petiole, rather petulate, 5-parted; partitions ovate-cuneated, somewhat 3-lobed at the apex, and toothed: teeth mucronate. Stem solitary, hardly half a foot high, bearing at the apex 2 almost sessile opposite 3-lobed toothed leaves. Branches 2, bifid at the apex. Bracteas or leaves of involucrum 2, opposite, oblong-acute, mucronately serrated, seated just under the branches. Branches or rays of umbel 2, short, bearing each 2 flowers at the apex, furnished with 2 small bracteas under the ramifications. This very singular genus is allied to Hacquetia and Sanicula.  

Sect. I. Sanicula (an alteration from the generic name). Tube of calyx ciliated. Leaves palmate lobed.  

1. S. europaeae (Lin. spec. 339) leaves radical, palmate-parted; leaves trifid, toothed; flowers polygamous, all nearly sessile, disposed in umbellae; lobes of calyx denticulate.  

2. H. Native throughout the whole of Europe and Caucasus, in woods and groves, and particularly by the sides of rivulets. Oed. fl. dan. 293. Schkuhr, handb. t. 60. Hoffin. umb. p. 67. Smith, engl. bot. t. 98. Blaekew. herb. t. 63. S. officialinarum, Neck. gallo. p. 137. Astrantia Dipiflora, Scop. carn. 304. S. mas. Fuchs. hist. p. 671. S. officinalis, Gouan. horst. 131. Caeulis Sanicula, Crantz. Flowers white or tinged with red, sessile, disposed in little heads. The plant was much cultivated formerly as a vulnerary. It discovers to the taste a bitterness and roughness. It has, however, been long discarded in medi-
numerous, pedicellate. 

2. S. Native of Java, on the top of Mount Gede. Perhaps this is the same as S. Javanica, Juss., from the description of the leaves; but the umbels are nakedish above, in the forks of the stem, and on the tops of the branches, each umbel bearing 3 nearly sessile fruit afterwards.

Java Sanicle. Pl. 1 foot.

9 S. montana (Reinw. in Blum. bijdr. p. 832.) leaves all ternate; leaflets somewhat 3-lobed, rather ovate-ellipsoid, deeply and sessilately serrated; flowers all pedicellate. 2. S. Native of Java, in mountain woods in humid places. Said to be nearly allied to S. Canadensis.

Mountain Sanicle. Pl. 1 to 2 feet.

Triclinium Sanicle. Pl. 1 to 2 feet.

11 S. bipinnatifida (Doulg. miss. ex Hook. fl. bor. amer. 1. p. 258. t. 92.) plant caulescent; leaves bipinnatifid: lower ones on long petioles; segments remote, obovate or obovate-lanceolate, acute, deeply serrated; serratures very acute; rachis winged, acutely toothed; peduncles elongated; umbels compound, somewhat proliferous; umbellules globose. 2. H. Native of the north-west coast of America, at Fort Vancouver, on the Columbia. Root rather fusiform. Plant glabrous. Stem erect, branched, furnished with a few leaves. Segments of the upper caulin leaves narrow. Male flowers on short pedicels.

Bipinnatifid-leaved Sanicle. Pl. 1 foot.

12 S. Arctopus (Hook. et Arn. in Beech. voy. pt. bot. p. 141.) plant almost stemless; leaves on long petioles, profoundly 3-parted; segments long, cuneate: lateral ones bifid: intermediate one trifid; all are somewhat ciliately pinnatifid; peduncle hardly longer than the leaves; leaves of involucrum foliaceous, lanceolate, quite entire, longer than the simple compact umbel. 2. H. Native of the north-west coast of America (Hood and North California. Hook. fl. bor. amer. 1. p. 258. t. 91.) Root fusiform. Habit of the genus Arctopus. Arctopus-like Sanicle. Pl. 1/2 foot.

FIG. 59.

moist situation, and they are easily propagated by dividing at the root. Some of the species being natives of warm climates, will require to be protected in winter.

Lin. syst. Pentantria, Digitaria. Tube of calyx furnished with 10 ribs, and 5 lobes: lobes foliaceous, permanent. Petals erect, connivent, obovate: with the segment at the apex length of the limb of the petal, and bent in from the middle. Fruit crowned by the calyx, contracted from the sides; mericarps gibbously convex, furnished with 5 filiform ribs.—A small perennial herb. Leaves radical, petiolate, palmate; leaflets 3-cuneate, 2-3-lobed, mucronately serrated. Scapes 1-3, bearing at their tops simple umbels. Involute of 5-6 obovate leaves, which are toothed at the apex, and longer than the umbels. Flowers yellow, on short pedicels, some male, and some female. Fruit compressed from the sides; mericarps with 5 broad ribs, which are rather conate at the base, but separated by channels above.

Cult. See Saniclea above for culture and propagation. The plant, however, does best in a pot in a mixture of sand and peat, placed among other alpine plants.

Lin. syst. Pentantria, Digitaria. Tube of calyx 10-ribbed, with tubercular teeth; lobes 5, foliaceous. Petals erect, connivent, oblong-obovate: bent in from the middle by a segment, which is nearly the length of the petal. Fruit rather compressed from the back; mericarps without any vitre, but having 5 elevated obvolute plicately toothed inflated ribs, inclosing in the cavity of each a smaller fistular rib; carpophore not distinct. Seed semi-terete.—Perennial herbs, natives of Europe and Caucasus. Roots blackish. Radical leaves petiolate, palately lobed; cauline ones few, sessile. Universal umbels irregular, of few rays, surrounded by variable involucra: partial umbels regular, and containing many flowers, surrounded by many leaved involucres. Flowers white or rose-coloured, pedicellate, usually polygamous, the female ones alone fertile.

Var. b, macrodonta (D. C. prod. 4. p. 86.) segments of leaves lanceolate-linear, profoundly and sharply serrated; leaves of involucrum exceeding the umbel. 2. H. Native of the Alps of Piedmont.—Bocc. pl. sic. p. 10. t. 5. f. 111.

M m
Smaller Master-wort. Fl. May, June. Clt. 1866. Pl. $\frac{1}{2}$ to $\frac{1}{4}$ foot.

2 A. fauchëllà (Bertol. journ. bot. 1813. p. 76. am. inun. 96. and 347.) leaves palmate; segments 5-7, entire at the base, but finely and sharply serrated from the middle to the apex; leaves of involucre entire, exceeding the umbel. 2. H. Native of the mountains of Abruzzo and Naples. Very like A. minor. There is a variety having the segments of the leaves linear or oval-oblong.

3 A. Carriñéicà (Jacq. fl. austr. 6. t. 10.) radical leaves palmate-parted: leaves 5-7, oblong, acuminated, unequally serrated, toothed; leaves of involucre 12-13, quite entire, exceeding the umbel. 2. H. Native of Carinthia, Carinola, in alpine meadows. Sturm, deutsch. fl. with a figure. A. major $b$, Spreng. in Schultes, syst. 6. p. 341. A. minor, Scop. fl. corr. no. 305. t. 7. Smith, exot. bot. 2. t. 77. Habit of A. minor, but with the character of A. major. Leaves of involucre linear, with a green line running along the middle of each, tinged with red. Petals white. Caluna leaves 2-lobed or simple. Root dark brown, having an aromatic balsamic smell, with a taste at first slightly aromatic, but nauseous, and afterwards acid.

Carniolan Master-wort. Fl. May, June. Clt. 1812. Pl. $\frac{1}{2}$ to 1 foot.

Var. a; leaves of involucre white; flowers white.

Var. $b$; leaves of involucre purplish; flowers tinged with red.

5 A. intermedia (Bieb. suppl. p. 194.) radical leaves palmate-parted: leaves 5, rarely only 3, ovate-oblong, deeply biserated, and ciliated with bristles; caluna leaves nearly palmate; leaves of involucre 12-13, oblanceolate, bearing from 1 to 3 spines each at the apex, exceeding the umbel a little. 2. H. Native of Caucasus, in mountain meadows. A. trifida, Hoffm. emb. ed. 2. vol. 1. p. 8. A. Caucaicide, Spreng. umb. p. 17. syst. 8. p. 874. exclusive of the synonyms. Flowers pink?

Var. $a$; leaves of involucre nearly entire. 2. H. Native of Caucasus and the mountains of Naples. A. major, Bieb. fl. and suppl. no. 599.

6 A. helóbórròfíà (Sálshis, par. loud. 1. t. 66.) radical leaves palmate-parted; leaves 3, ovate-lanceolate, unequally serrated, ciliated with bristles; leaves of involucre 12-13, ovate-lanceolate, exceeding the umbel a little, ciliated with bristles their whole length. 2. H. Native of Eastern Caucasus, in the more elevated meadows. A. máxima, Pall. nov. act. petrop. 7. p. 357. t. 11. Sims, bot. mag. 1553. A. heterophylla, Willd. nov. act. berol. 3. p. 119. Bieb. fl. taur. 1. p. 202. suppl. p. 196. Involuture and flowers pink. There are varieties of this species having the caluna leaves either 3-lobed or undivided.

Cult. The species of this genus grow well in any common garden soil, and are well adapted for ornamenting flower-borders, being rather pretty; they are easily increased by dividing at the root. A. minor and A. Canadique, being more tender than the rest, should be grown in pots, and placed among other alpine plants.

Lin. syst. Pentándria, Digýnia. Tube of calyx beset with minute tubercles. Petals inflexed. Transverse section of fruit terete, ovate, tubercular on the outside; mericarps without ribs, and without vitre; carpophore adnate its whole length to the seeds.—An herb, with the habit of Eryngium nudicladæ, native of the Cape of Good Hope. Radical leaves petiolate, oblong, ciliated toothed from sinuencest bristles. Stems nearly naked, branched, umbellate at the apex. Leaves under the branches small, and stem-clasping. Umbels like those of Astrantia. An intermediate genus between Astrantia and Eryngium.

Ciliolated-leaved Alepide. Pl. 1 foot.

Cult. Any light rich soil will suit this plant, and it will be easily increased by dividing at the root.

1 H. acetéa (Blum. l. c.) ? E. S. Native of Java, on Mount Tjerimai, in the province of Cheribon, where it is called Gampung. The rest unknown.

Priëck Horsfieldia. Shrub.

Cult. Any light rich soil will suit this shrub, and cuttings will easily root in the same kind of earth under a glasshouse, in heat.

Lin. syst. Pentándria, Digýnia. Tube of calyx rough from vesicles and scales; lobes 5, foliaceous. Petals erect, connivent, oblong-obovate: bent in from the middle by a segment as long as the limb of the petal, which consequently appears emarginate. Fruit obovate, seamy or tuberculare, with the transverse section nearly terete; mericarps semi-terete, without ribs, and without vitre; carpophore adnate its whole length to the seeds.—Herbs, usually perennial and spiny. Radical leaves, as well as the caluna ones, sheathing more or less at the base. Flowers congested into oblong or roundish dense heads. Lower bracteas usually the largest, and forming an involucre round the head of flowers; the rest like chaff, mixed among the flowers.

§ 1. Ramossînèrîva (from ramosus, branched, and nereus, a
UMBELLIFERACE.

267

sinew or nerve; in reference to the nerves of the leaves being more or less branched and diverging). D. C. prod. t. p. 88.

* Limbs of radical leaves multifid.

1 E. Camp'stre (Dodd. pempt. 730. f. 2. Lin. spec. 337.) radical leaves nearly ternate; segments pinnatifid: lobes ovate; caune leaves aniciated; stem panicked; leaves of involucren linear-lanceolate, nearly entire, exceeding the head of flowers, which is roundish; paleae among the flowers subulate. 2. H. Native of South and Middle Europe, and Caucasus; very common in dry sandy fields. In Britain not very common; on the coast near the ferry from Plymouth to Cornwall; and near the Devil's Point at Stonehouse, Plymouth; near Newcastle upon Tyne; on the shore called Frier's Goose, below Melling, in Yorkshire; also far inland opposite Bockhall, near Daventry, in Northamptonshire. Laroch. eryng. p. 52. Oed. fl. dan. t. 554. Hayne. arz. gew. t. 1. Smith, eng. bot. 57. Jacc. austr. 2. t. 155. Plench. t. 173. E. vulgäre, Bauh. pin. 358. E. Méditerranéen, Ger. 999. Corollas blue, but sometimes white and yellow. Roots creeping. Plant rather glaucous.

Far. β; radical leaves nearly entire. 2. H. Native of Portugal and the Levant.

2 E. Bourgqi (Goun. ill. p. 7. t. 3.) radical leaves orbicular, tripinnatifid: lobes pinnatifid or cut in a forked manner, quite entire orbicular. tripinnatifid: lobes lanceolate, a little branched at the apex; leaves of involucren 10-12, lanceolate, pungent, erect, furnished with 1 or 2 teeth on each side, much longer than the head of flowers, which is ovate; paleae among the flowers entire. 2. H. Native of the Pyrenees, but has not been found elsewhere. D. C. fl. fr. 4. p. 355. Laroch. eryng. p. 24. Tratt. arch. t. 207. E. amethystinum. Lam. fl. fr. 3. p. 401. but not of Lin. E. Bourgqti, E. planum, and E. alpinum, Lapeyr. abr. p. 137. There are varieties of this species with either sky blue or pale flowers; and with the stems either bearing one or more heads of flowers. Plant glaucous.

3 E. Billardie (Laroch. eryng. p. 25. t. 2.) radical leaves nearly orbicular, tripinnatifid: lobes lanceolate or cut in a forked manner, quite entire orbicular. tripinnatifid: lobes lanceolate, a little branched at the apex; leaves of involucren 8, linear-lanceolate, 3 times higher than the head of flowers, which is globose; paleae among the flowers entire. 2. H. Native of the Levant; and in fields on the mountains at the limits of the Turkish districts called Khör, in the province of Abeeridjeen. Tratt. arch. t. 326. Very nearly allied to E. Bourgqti, but differs in the lobes of the leaves being toothed all round, and in the paleae being hardly longer than the calyxes. Flowers blue.

La Billardie's Eryngo. Pl. 1 foot.

4 E. Spina-alba (Vill. dauph. 2. p. 660. t. 15.) radical leaves 3-5-parted; lobes profusely toothed, or cut in a forked manner; stem thick, nearly simple; leaves of involucren 2-10, pinnatifid, very stiff, pungent, about equal in length to the head of the flowers, which is of an ovate-cylindrical form; paleae among the flowers entire, or usually tripinnatispdate. 2. H. Native of Dauphiny, Provence, &c. in arid exposed places of mountains. D. C. fl. fr. p. 356. Laroch. eryng. p. 26. t. 3. E. rigidum, Lam. dict. 4. p. 752. E. alpinum, Lin. mant. p. 349. but not of his spec. E. alpinum β, Schultes, syst. 6. p. 328. E. palléssens, Mill. dict. no. 9. Spina alba, Dalech. l. 1462. Both heads of flowers and herb are white. There are varieties with either dwarf stems, or a foot high.

5 E. Dilatatum (Lam. dict. 4. p. 735.) radical leaves pinnatifid: lobes spiny-toothed; upper leaves the largest; petioles pinnatifid; lower leaves pinnatifid; lower leaves more or less distinct from the petioles; having the nerves more or less branched, and diverging, but never parallel.

6 E. cinereum (Presl, cl. prag. p. 139.) radical leaves pinnatifid: outer lobes trifid, spiny toothed: lower ones much smaller and bristly, or jagged into bristle-formed teeth; petioles furnished with bristles from the base; stems nearly simple, bearing few heads; leaves of involucren 5-6, lanceolate, spiny ciliated, exceeding the head of the flowers, which is roundish; paleae exceeding the flowers, outer ones spiny ciliated. 2. H. Native of Spain. Very nearly allied to E. dilatatum, but it differs from it and all the others in the bristles being yellowish, and rather spiny along the petioles and the lower lobes of the leaves. Flowers blue.

Hair Eryngo. Pl. 1 to 2 feet.

Eryngium. (Lin. spec. p. 337. var. a.) radical leaves pinnatifid: lobes cut, spiny, somewhat pinnatifid; petioles entire at the base; stems smoothish, corymbosely branched at the apex; leaves of involucren 7-8, lanceolate, furnished with a few teeth at the base, much exceeding in length the head of flowers, which is globose; paleae among the flowers entire; outer ones hardly furnished with a tooth on each side. 2. H. Native of Dalmatia, Croatia, and Belgium, but in the last mentioned country it has probably escaped from the gardens. Waldst. et Kt. lung. 3. t. 215.—Besl. hort. syst. ord. t. 8. f. t. Tratt. arch. 206. E. campéstre azurium, Lejœm, in herb. Gay. E. caeruléum, Bauh, hist. 3. t. 86. f. 1. The upper part of the stem, and also the heads of flowers, are of the finest amethyst colour, so that they make a very fine appearance. This species is often confused with E. dilatatum, but is easily distinguished from that species in the petioles being entire, not pinnatispdate.

9 E. Andersoni (Lag. in litt. Lond. hort. brit. p. 101.) radical and caune leaves pinnatifid: 3 terminal segments large, lanceolate, and 3-lobed at the apex: the rest of the segments small; all spiny toothed; stem smooth, striated, corymbosely and trichotonemously branched; leaves of involucren 7-8-lanceolate, spiny toothed, much longer than the head of the flower, which is round, furnished with retrograde forked or simple prickles on the lower side at the very base; upper paleae among the flowers linear, entire, and the lower ones trifid, ending in spiny points, about the length or longer than the flowers. 2. H. Native country unknown. E. amethystinum, Hort. Chelsea. Upper part of stem, and heads of flowers of a beautiful blue.

9 E. Scariosum (Laroch. eryng. p. 28. t. 5.) leaves pinnatifid: lobes linear, distant, trifid, or entire; petioles with scarios margins; stem furrowed, branched at the apex; leaves of involucren 5-8, linear, much longer than the head of flowers, which is globose; paleae among the flowers entire. 2. H. Native of the Levant. Tratt. arch. t. 775. E. pentechiun, Sieb. herb, palest. Allied to E. amethystinum. Heads of flowers pale green.

126
16. *E. maritimum* (C. B. B. p. 386. *Lin. spec.* p. 337.) leaves of a whitish glaucous hue, coriaceous; radical leaves on long petioles, roundish, cordate, spinly-toothed: superior ones stem-clasping, palmately lobed; leaves of involucrem 5-7, ovate, spinly-toothed, exceeding the head of flowers, which is roundish; paleae among the flowers, tricuspitate, about equal in length to the calyces. 2. H. Native throughout Europe, among the sand along the sea-shore; and on both sides of the Mediterranean Sea. It is to be found plentiful in some parts of Britain, on the sea-shore. Oed. fl. dan. t. 718. Tratt. arch. t. 295. *Woodly. med. bot.* t. 102. *Smith, engl. bot.* t. 718. Roots creeping. Flowers very pale blue. By English writers the Sea eryngo has been called *sea holly, sea bulbous, and sea boluce.* The young flowering shoots of the plant, eaten like asparagus, are very nourishing, according to Linnaeus. The leaves are sweetish, with a slightly aromatic warm pungency. The roots are supposed to have the same aphrodisiacal virtues as the Orchis tribe. They are kept in the shops candied, and are still regarded by the Arabs as an excellent restorative. Eryngo roots were first candied at Colchester about the beginning of the 17th century by Robert Buxton, apothecary. His apprentice, Samuel Great, continued this business, and it has ever since been carried on by the posterity of the latter.—Morant's Colchester, p. 161.

*Sea Eryngo* or *Holly.* Fl. July, Oct. Brit. Pl. 1 to ½ ft. 17. *E. oliveri'ana* (Laroch. eryng. p. 37. t. 12.) radical leaves on long petioles, roundish cordate; lower cauline leaves petiolate, 3-lobed, and deeply toothed: upper cauline leaves stem-clasping, 3-parted, and cut; leaves of involucrem 10-12, lanceolate, stiff, having 5-6 teeth on each side, which are more crowded towards the base, exceeding the head of flowers; paleae among the flowers, tricuspitate, and entire. 2. H. Native of the Levant. *E. alpinum* g. *Schulz.* sest. p. 323. Heads of flowers blue. Nearly allied to *E. alpinum,* but is constant to its characters, even in cultivation: it differs from it in the radical leaves being much less cordate, in the lower ones being more dissected, and in the leaves of the involucrem being still, and having fewer teeth. The colour of the herb is green. *Oliver's Eryngo.* Pl. 1 to 2 feet.

18. *E. gigante'um* (Bieb. fl. taur. l. p. 201.) radical leaves on long petioles, profoundly cordate, crenate-toothed; cauline leaves stem-clasping, deeply lobed, spiny-serrate; leaves of involucrem 8-9, large, ovate-lanceolate, deeply spiny-serrated, longer than the head of flowers, which is ovate; paleae among the flowers tricuspitate. 2. H. Native of the Alps of Caucasus, Armenia, and Iberia. *E. glaucum,* Wield. herb. ex Stev. in litt. *E. asperifolium,* Laroch. eryng. p. 36. t. 11. Poir. suppl. p. 289. Tratt. arch. t. 355. Stem dichotomously branched, 3-4 feet high, blue at the top as well as the heads of flowers. Lower leaves roughish, pubescent or glabrous beneath, reticulated with anastomosing nerves.

*Giant Eryngo.* Fl. Jul. Aug. Clt. 1820. Pl. 3 to 4 feet. 19. *E. alp'imum* (*Lin. spec.* p. 337.) radical and lower cauline leaves on long petioles, deeply cordate, serrate-toothed: upper cauline leaves palmately lobed, ciliately serrated; serratures spinulous; leaves of involucrem 10-20, rather soft, a little longer than the head of flowers, pinnatifidly serrated, having 12-15 cilia-formed serratures on each side; and with the lower serratures pinnatifid; paleae among the flowers tricuspitate or entire. 2. H. Native of Switzerland, Piedmont, Germany, Croatia, Carniola, &c. in alpine pastures. *Jacq.* icon. rar. l. t. 55. Sims, bot. mag. t. 922. Tratt. arch. t. 205. Involutricem along with the upper part of the herb and the flowers are of a beautiful blue colour; but there is also a variety which is white in the last-mentioned parts; and another which has the paleae among the flowers pinnatifid. Herb green.

**Scariosus-petiolate Eryngo.** Pl. 1 to 2 feet. 10. *E. glomerat'um* (Lam. dict. 4. p. 755.) leaves pinnatifid; lobes linear, very sti/th, deciduous; heads of flowers small, collected into a thyrsus; flowers small; leaves of involucrem much longer than the head of flowers, and are as well as the paleae nearly entire, and spinose. 2. H. Native of Crete. Laroch. eryng. p. 29. t. 6. Tratt. arch. t. 760. E. parviflorum, Smith, prod. fl. grace. 1. p. 175. Herb white, densely beset with leaves. Perhaps the *E. glomeratum,* Sieb. herb. crete, which he gathered at the foot of Mount Ida, is the same, but it differs from the figure given by Laroco, in the heads of flowers being disposed in a corymb, in the lobes of the leaves being broader, and in the leaves of the involucrem being furnished with a spine-like subulate deciduous tooth on each side.

**Glomerate-headed Eryngo.** Fl. Jul. Aug. Clt. 1826. Pl. 1 fl. 11. *E. rostrat'um* (Gau. icon. 6. t. 552.) radical leaves long, lanceolate; outer ones spinous-ciliolate: inner ones pinnatifid; stems a little branched; leaves of involucrem entire, rather shorter than the head of flowers, which is globose; paleae among the flowers, entire; upper paleae ending in a horn each, much longer than the flowers. 2. H. Native of Chili, at Talcahuano, Concepcion, &c. Laroch. eryng. p. 29. This species is intermediate between the sections *Ramosinerea* and *Parallelinerea.*

**Bent-knoted Eryngo.** Pl. 3 to 4 feet. 12. *E. cono'sum* (Laroch. eryng. p. 30. t. 7.) radical leaves pinnatifid; lobes linear, winged; stem dichotomous at the apex, bearing many heads; leaves of involucrem 5-6, trifid, longer than the head of flowers, which is ovate; paleae among the flowers simple; upper paleae spinous-toothed, drawn out into a tuft. 2. H. Native of Mexico, in temperate places between Rio Sacra and Tolloc. H. B. et Kuntl, nov. gen. amer. 5. p. 30. Flowers blue?

**Cretan Eryngo.** Pl. 1 to ½ foot. 14. *E. mul'tatimid* (Sibth. et Smith, fl. grace. t. 259. prod. 1. p. 175.) leaves all pinnatifid, somewhatly lyrate, and palmate-parted at the apex; lobes deeply lobed; stems corymbose, coloured at the top; leaves of involucrem linear-lanceolate, pinnatifid, or nearly entire, exceeding the head of flowers, which is ovate; paleae among the flowers, entire. 2. H. Native of the hills of the Morea and Sicily. E. alpinum, chatum, &c. Cup. pamp. 1. t. 29. Guss. prod. fl. sic. 1. p. 305. Top of stem and heads of flowers blue. Allied to *E. amethystinum* and *E. Cre'ticum.*

**Multiple Eryngo.** Pl. 2 feet. 15. *E. ov'ertim* (Cuming, in Field's new south wales, p. 558.) stems erect, furrowed, dichotomous; leaves pinnatifid; lobes linear, stiff, spinose, deciduous; leaves of heads of flowers spherical, pendent; leaves of involucrem linear, mucronate, stiff. 2. H. Native of New Holland, near Baradur. Flowers white. The plant when young is much sought after by sheep.

**Limbs of radical leaves cordate at the base, undivided, or a little lobed.**

20 E. planum (Math. comm. p. 505.4 with a figure. Lin. spec. p. 337.) lower leaves on long petioles, oval, cordate at the base, crenated, flat; middle cauline leaves sessile, undivided: superior ones 5-parted, serrated; leaves of involucrum 6-7, lanceolate, remotely spiny-serrate, spreading, about equal in length to the head of flowers, which is round; palea among the flowers entire, but the lower or outer ones are tricispidate. 1. 11. Native of Austria, Russia, Siberia, Transylvania, Galicia, Caucasus, Mauritania, Provence, &c. in meadows. Jacq. aust. t. 591. Tratt. arch. t. 214. Laroch. eryng. p. 40. Upper part of the stem, leaves of involucrum, and heads of flowers blue; there is, however, a variety equally common in the gardens with white flowers. Herb green.

22 E. falsatum (Laroch. eryng. p. 40. t. 13.) radical leaves on long petioles, cordate, unequally 3-5-parted; cauline leaves sessile, palmately parted: lobes lanceolate, spreading, spiny-serrate; leaves of involucrum 5-8, lanceolate, furnished with 1-2 teeth on each side, twice the length of the head of flowers; outer palea tricispidate: middle ones entire. 1. 11. Native on Mount Lebanon. Tratt. arch. t. 365. E. dichotomum μ, Schultes, syst. 6. p. 321. The plant is easily distinguished from E. dichotomum by the form of the radical leaves.

Heads of flowers blue?

Falcatum Eryngium. Pl. 1 to 2 feet.

23 E. dichotomum (Desf. atl. 1. p. 226. t. 55.) radical leaves petiolate, oblong, cordate at the base, toothed; cauline leaves palmately parted, spreading: lobes spiny-toothed; leaves of involucrum lanceolate, furnished with a few spiny teeth, much longer than the head of flowers; which is globose; outer palea tricispidate, the rest entire. 1. 11. Native of Asia Minor, Caucasus, Mount Lebanon, Candia, Mauritania, Sicily, and about Montpellier, in exposed places. Upper part of stems, leaves of involucrum, and heads of flowers blue.

Var. β; stems dwarf; flowers crowded at the neck of the plant. Laroch. eryng. p. 40. t. 14.

24 E. diffusum (Torr. rock. mount. no. 177.) leaves all digitately palmate; segments oblong, deeply serrated, spinose; stem dichotomously branched, diffuse; heads of flowers globose; leaves of involucrum 4-6, tridif, deeply serrated, longer than the head of flowers; ovaries septic. 1. 11. Native of North America, on the banks of the Canadian river. Perhaps this species will form a proper section.

Diffuse Eryngium. Pl. 1 foot.

*** Lims of radical leaves oblong-obovate, or oval, never cordate at the base.

25 E. pusillum (Lin. spec. p. 337.) radical leaves lanceolate, entire, toothed or pinnatifid, attenuated at the base, petiolate: cauline leaves palmately parted, sessile; heads of flowers sessile: leaves of involucrum subulate, longer than the head of flowers, furnished with an appendage, or tooth at the base; palea among the flowers, entire. 1. 11. Native of Spain, Portugal, Mauritania, Sicily, Sardinia, &c. Laroch. eryng. p. 44. Tratt. arch. t. 212.—Barrel. icon. t. 1247. Heads of flowers greenish. This species is nearly allied to E. dichotomum, but differs from it in the radical leaves being attenuated at the base, never in any way cordate.

Var. γ, galoides (D. C. l. c.) stem erect; lower leaves somewhat pinnatifid, small; heads few-flowered. Laroch. l. c. E. galoides, Lam. dict. 4. p. 757.

Var. ε, paludosum (D. C. l. c.) stem nearly erect; lower leaves pinnatifid, large; heads few-flowered. Laroch. l. c. t. 16. E. paludosum μ, Lam. l. c.

26 E. teretum (Poir. suppl. 4. p. 295.) radical leaves undivided, linear, spiny-toothed; cauline leaves tripartite; leaves of involucrum lanceolate, cuspitate. 1. 11. Native of Candia, on hills in rugged places. Tausch. hort. canal, with a figure and description. E. Tournefortinum, Sternb. synll. fl. nov. 17. p. 32. ex Tausch. E. trifolium, P. Alp. exot. 132, with a figure.—Mor. ex. 3. sect. 7. t. 36. f. 24. Laroch. eryng. p. 63. Heads of flowers blue? 

Ternate-leaved Eryngium. Clt. 2. Pl. 1 foot.

27 E. tridif (Desf. cat. hort. par. 1828.) radical leaves glabrous, petiolate, tridif; leaves obovate-oblong, cuneate at the base, coarsely serrated: serrations distant, ending in spiny points; stem much branched; cauline leaves nearly sessile, 3-5-parted: lobes lanceolate, coarsely serrated; leaves of involucrum twice the length of the head of flowers, which is ovate-globose; outer palea tricispidate: inner ones undivided. 1. 11. Native country unknown.

Tripartite-leaved Eryngium. Pl. 1 foot.

28 E. angoloides (Cav. ann. sc. nat. 3. p. 32.) radical leaves oblong-obovate, nearly sessile, attenuated at the base, coarsely ciliated or spiny-toothed from the base; cauline leaves somewhat spiny-toothed, broadest at the base; leaves of involucrum 8, ovate-lanceolate, spiny-toothed, longer than the head of flowers, which is roundish; palea ending in 3 or 5 points. 1. 11. Native of Spain. Laroch. eryng. p. 34. t. 10. Tratt. arch. t. 753. E. maritimum μ, Pers. ench. p. 299. exclusive of the syn. of Fl. dan. Heads of flowers blue. The plant cultivated under this name has the lower leaves much longer and narrower at the base than those in the figure cited. Plant glaucous.

29 E. corniculatum (Lam. dict. 4. p. 758.) radical leaves oblong-lanceolate, spiny-toothed; petals fistulifer, septiferous; cauline leaves stem-clasping, tridif; leaves of involucrum 5, linear-subulate, quite entire, pungent; palea among the flowers, entire: ultimate ones drawn out each into a long horn at the apex. 1. 11. Native of Portugal and Spain, in boggy places. Brot. fl. lus. 1. p. 416. Laroch. eryng. p. 32. t. 15. Tratt. arch. t. 756. Sims. bot. mag. 1427. E. cornutum, Dorn. hort. cant. ed. 4. E. suavioles, Brouss. inded. E. odoratum, Hort. par. E. paludosum, Hort. madr. Heads of flowers whitish, sweet-scented. Plant glaucous. The leaves of the involucrum when the plant grows in dry places, about equal in length to the head of flowers. Horns sometimes on 2-3 of the pales, which are usually joined together.

30 E. tricuspidatum (Lin. spec. p. 337.) Desf. atl. 1. p. 224.) radical and lower cauline leaves on long petioles, orbicular,

UMBELLIFER.E. XXXI. ERYNGIUM. 269
cordate, acutely toothed; cauline leaves sessile, palmate-parted; lobes lanceolate, spiny-serrate; leaves of involucre lanceolate, spiny-serrate, exceeding the head of flowers, which is nearly globose; palea tricuspidate, longer than the calyces.

E. cauline floral leaves pales; stem leaves trilobed, with linear lobes; heads of flowers lateral, on short peduncles; leaves of involucre 3, lanceolate-subulate, and are as well as the palea entire; calyx papulose.

XXXI. ERYNGIUM

37 E. vesiculosis (Lodd. nov. holl. 1. p. 73. t. 98.) spherical creeping; radical leaves lanceolate, cuneate, and attenuated at the base, deeply toothed, almost pinnatifid; floral leaves trilobed, with linear lobes; heads of flowers lateral, on short peduncles; leaves of involucre 5, lanceolate-subulate, and as well as the palea entire; calyx papulose.

38 E. subspallani (Cav. flor. 6. t. 556. f. 2.) radical leaves petiolate, lanceolate, nearly quite entire; scape naked, bearing only 1 head of flowers, longer than the leaves; leaves of involucre 8, lanceolate, spiny, spreading, furnished each with 1 tooth on each side, longer than the head of flowers, which is hemispherical; palea subulate, shorter than the calyx.

Native of Mexico, in Chalma. Laroch. cryg. p. 56. Tratt. arch. t. 778. Plant hardly more than a finger in height.

39 E. radoresii (Tratt. arch. t. 764.) radical leaves sessile, ovate, spiny-serrate; heads of flowers solitary, roundish, sessile at the neck of the plant; leaves of involucre 6, ovate-lanceolate, tridentate at the apex, discoloured, longer than the head; palea entire.

Native of New Granada, on the mountains of Pasto. E. humile y. Laroch. cryg. p. 34. t. 18. f. 2. H. B. et Kunth, nov. gen. amer. p. 34.

40 E. praediculum (Hook. et Arn. in bot. misc. 3. p. 350.) radical leaves flaccid, on long petioles, deeply pinnatifid; segments linear, spinaceous, bent downwards; stem slender, panicled at the apex; leaves of involucre linear-lanceolate, stiff, acute, quite entire, about equal in length to the head of flowers, which is elliptic; palea hardly equal in length to the flowers.

Native of Buenos Ayres.

XXI. ERYNGIUM

41 E. coronatum (H.-ok. et Arn. in bot. misc. 3. p. 350.) radical leaves lanceolate, spinously pinnatifid; segments lanceolate-subulate, spreading; stem panicled at the top, many-headed; leaves of involucre linear-subulate, spiny, quite entire, reflexed, about equal in length to the head, which is cylindrical; palea oblong, acute, pale, equal in length to the flowers, the 2 or 4 superior ones protruding in long horns, which emulate the sepals of the involucre.

Native of Buenes Ayres. Stem 6-8 inches high.

42 E. humile (Cav. flor. 6. t. 556. f. 1.) radical leaves on long petioles, oval-oblong, spinoserrate; cauline leaves 1 or 2, oblong, sessile, serrate; stems bearing only 1 head of flowers, shorter than the radical leaves; leaves of involucre 10, ovate-lanceolate, tridentate at the apex, colourless above, exceeding the head of flowers, which is globose and depressed at the apex; palea entire.

Native of Peru, on the mountains of Chimborazo and St. Antonio. E. humile a, Laroch. cryg. p. 55. Tratt. arch. t. 763.

UMBELLIFERÆ.

Y. G. Native of Santa Fe de Bogota. Tratt. arch. t. 777. H. B. et Kuntth, nov. gen. amer. 5. p. 53. Leaves of involucre smooth, yellow above.

Stellate Eryngo. Pl. 1 foot?

44 E. PHYTREMA (Laroch. eryng. p. 51. t. 21.) cauline leaves few, petiole, linear-lanceolate, unarmured, crenate; crenate mucronate; stem nearly simple, bearing 2 heads of flowers; heads oblong, crowned by exerted foliaceous paleae; leaves of involucre 3-10, linear, deflexed. Y. F. Native of Mexico, in meadows, near the town of Toluco. H. B. et Kuntth, nov. gen. 5. p. 50. Heads of flowers white.

Phlyctena-like Eryngo. Pl. 1 to 1 1/2 foot.

45 E. GRAFTE (Laroch. eryng. p. 54. t. 24. but not of Nutt.) radical leaves petiolate, elliptic, very blunt at the base, crenate; stem nearly naked, few-flowered; leaves of involucre 8, linear-lanceolate, pungent, a little toothed, twice the length of the head of flowers; paleae subulate, entire, longer than the calyxes. Y. F. Native of Mexico, in humid places. H. B. et Kuntth, nov. gen. amer. 5. p. 53. Plant a foot high. Heads of flowers of an amethyst blue colour. Leaves of involucre smooth and yellow above, but green beneath.

46 E. Bonplandii (Laroch. eryng. p. 52. t. 22.) radical leaves petiolate, ovate-oblong, crenate; stem nearly naked, 1-3-flowered; leaves of involucre 8, and are as well as the palea lanceolate; paleae scarcely exceeding the calyxes, of equal size and shape. Y. G. Native of Mexico, in shady woods. Tratt. arch. t. 754. E. Bonplandianum, H. B. et Kuntth, nov. gen. amer. 5. p. 51. Tube of calyx tubercular.

Bonplandii's Eryngo. Pl. 1 to 1 1/2 foot.

47 E. syrpheale (Lam. dict. 4. p. 759. t. 187. f. 2.) radical leaves obvate, coarsely spiny-toothed; teeth ciliated; stem dichotomous, nearly naked, bearing few heads; leaves of involucre lanceolate, spinose, equal in length to the head of flowers, which is roundish; paleae subulate. Y. H. Native of Monte Video; and of Chili, in the province of San Louis, on the tops of the mountains called Cerro del Morro, at the elevation of 4500 feet. Laroch. eryng. p. 51. Tratt. arch. t. 769. Cham. et Schlecht. in Linneæa. 1. p. 251. There are varieties of this species with bracteas all entire; or the outer ones are spiny-toothed, and the rest entire; or all spiny-toothed ex Cham. et Schlecht. et L. The teeth of the leaves are sometimes entire and not again ciliated, and this brings the species very near E. serratum.

Naked-stemmed Eryngo. Pl. 1/2 foot.

48 E. serratum (L. p. 132. 1c. 6. t. 554.). radical leaves petiolate, lanceolate, profusely serrated; stem nearly naked, and almost simple, few-flowered; leaves of involucre 8-10, subulate, spreading, length of the head of flowers, which is globose; paleae entire, subulate, exceeding the flowers a little. Y. G. Native of Mexico. Laroch. eryng. p. 55. Tratt. arch. t. 776. Calyx covered with white scales. Stem a foot high. Perhaps the same as E. serratum, Link, enum. 1. p. 260. but the leaves are not doubly serrated as described by him, but acutely crenate. Heads of flowers blue?

49 E. carlsinæ (Laroch. eryng. p. 53. t. 23.) radical leaves lanceolate, deeply spiny serrated, acute; cauline leaves palmatifid; lobes deeply serrated; stem branched, bearing few heads; leaves of involucre 7-8, lanceolate, deeply serrated; paleae subulate, simple. Y. G. Native on the mountains about the town of Mexico, and between Joya and Las Vagas, near Perote, and on Mount Orizaba. H. B. et Kuntth, nov. gen. amer. 5. p. 52. Leaves of involucre yellow above. Flowers blue.

Var. a. erectum (D. C. prod. 4. p. 94.) stem erect, solitary; leaves of involucre ovate, twice the length of the head of flowers Y. G. Laroch. eryng. l. c. with a figure. Tratt. arch. t. 358.

Var. β, decumbens (D. C. l. c.) stem simple, diffuse; leaves of involucre equal in length to the head of flowers, which is oblong. Y. G.

Carline-like Eryngo. Pl. 1 foot.

50 E. hirundinosus (D. C. prod. 4. p. 94.) leaves glabratis: radical leaves obovate-lanceolate, peltately serrated; teeth entire, stalk, blunt; stem naked, bearing 1-3 heads; heads elliptic, ciliated from the paleae, which are subulate acuminate and smooth, and exceed the flowers; leaves of involucre similar to the paleae. Y. G. Native of Brazil, in the provinces of Cisplatine and Rio Grande, in fields. Heads coloured, 8-9 lines long. Ciliated-leaved Eryngo. Pl. 1 foot.

52 E. elegans (Cham. et Schlecht. in Linneæa. 2. p. 248.) leaves linear-lanceolate, spiny-serrate, ciliated, tricuspidate at the apex; stem bearing many heads; heads globose, ciliated; leaves of involucre 10, lanceolate, spiny-toothed, tricuspidate at the apex; paleae tricuspidate, a little longer than the flowers, smooth. Y. G. Native of Brazil, in the provinces of Monte Video and Rio Grande do Sul. Root nearly globose, size of a fist. Leaves 10-inches long and 9 lines broad. Heads of flowers small, of one colour.

Elegant Eryngo. Pl. 1 foot.

53 E. sudave (Gill.-et Hook. in bot. misc. 1. p. 334.) stem tall, panicked; leaves linear-subulate, channeled, spiny-ciliated: spines 2-3 together; heads of flowers globose. Y. G. Native about Buenos Ayres, in the plains called the Pampeas. Stem 4-5 feet. Allied to E. ebracteatum, Lam.

Naked Eryngo. Pl. 4 to 5 feet.

54 E. divaricatum (Hook. et Arn. in bot. misc. 3. p. 350.) stems prostrate, dichotomiously divaricate, leafy, rigid; lower leaves bipinnatifid: cauline leaves pinnatifid: segments linear, spineless, divaricate; peduncles short, axillary, and in the forks of the stem; leaves of involucre subulate, reflexed, 4 times shorter than the head of flowers, which is elliptic. Y. F. Native of Buenos Ayres.

Divaricate Eryngo. Pl. 1 foot.

55 E. serrea (Cham. et Schlecht. in Linneæa. 2. p. 246.) leaves ensiform, spiny-serrate, ciliated; stem panicked, bearing many heads; heads ovate, ciliated; leaves of involucre and outer palea lanceolate, subulate acuminate, spiny-toothed, smooth: inner palea entire, a little smaller than the outer ones. Y. F. Native of Brazil, in the province of Cisplatine, and near Monte Video. Radical leaves half a foot long. Heads ungulicular, of one colour.

San-leaved Eryngo. Pl. 1 foot.

56 E. unicornatum (Cham. et Schlecht. in Linneæa. 2. p. 247.) leaves lanceolate, serrated; sutures ending in recurved spines, ciliated; stem bearing few heads; heads globosse, ciliated; paleae scabrous, tricuspidate; leaves of involucre spinosely pinnatifid. Y. G. Native of the south of Brazil.

H. obed-spined Eryngo. Pl. 1 foot.

57 E. florenodum (Cham. et Schlecht. in Linneæa. 1. p. 245.) leaves ensiform, spiny-serrate, ciliated; stem panicked, bearing many heads; heads ciliated by scabrous, subulate muronulolate paleae; leaves of involucre ovate, acuminate, flowers
subulate, hardly different from the pales. \textit{U. G.} Native of the south of Brazil. Stem festuciform at the base.

\textit{Buddle-flowered Eryngium.} \textit{Fl.} \textit{B.} \textit{f.} \textit{S.} \textit{X.} \textit{Y.} \textit{Z.} \\

59 \textit{E. foetidum} (Lin. spec. \textit{p.} 336, exclusive of the syn. of \textit{Gron.}) radical leaves lanceolate, bluish, attenuated at the base, spinulously serrated; floral leaves palmate-parted, sessile; heads nearly sessile, cylindrical; leaves of involucre lanceolate, spiny-serrate, much longer than the heads; pales among the flowers entire. \textit{Y. G.} Native of Jamaica, Cayenne, Demerara, Florida, Brazil, \&c. in fields and woods. \textit{Laroch. eryng.} \textit{p.} 50. Michx. \textit{fl. bor.} \textit{amer.} \textit{t.} \textit{p}. \textit{163.} Sloane, \textit{hist.} \textit{t.} \textit{156.} \textit{f.} \textit{3}-\textit{4}.—Herm. \textit{Indg.} \textit{t.} \textit{237.} Plant with an ungrateful odour when bruised. Flowers white. Calyx ornamented with roundish vesicles, not scales. The radical leaves are sometimes trifid at the apex in the plants we have seen growing in Brazil. The plant named \textit{E. foetidum} by Ucria, a native of Sicily, is probably distinct from this. All parts of the plant are reckoned very powerful anthelmintics, and much used by the negroes and poorer whites on all occasions of that nature, whence they call it \textit{fweed}. It is chiefly administered in decoctions or infusions.

\textit{Fried Eryngium.} \textit{Fl.} \textit{Aug. Oct.} \textit{Ch.} \textit{1714.} \textit{Pl.} \textit{1 foot.} \\

§ 2. \textit{Parallelinœria} (from \textit{parallelus}, parallel, and \textit{nervus}, a nerve; \textit{nerves} of \textit{leaves} parallel). \textit{D. C. prod.} \textit{p.} \textit{95.} \textit{Nerves} of \textit{radical leaves} \textit{parallel} and \textit{longitudinal}. \textit{Leaves} narrow, and probably reduced to the dilated petioles.

\textit{Tiggy Eryngium.} \textit{Fl.} \textit{June. July.} \textit{Ch.} \textit{1810.} \textit{Pl.} \textit{2 feet.} \\

\textit{Virginia Eryngium.} \textit{Fl.} \textit{July. Sept.} \textit{Ch.} \textit{?}. \textit{Pl.} \textit{2 feet.} \\

\textit{Virginia Eryngium,} \textit{Fl.} \textit{July. Sept.} \textit{Ch.} \textit{?}.
273

UMBELLIFER.

68. E. angustifolium (D. C. prod. 4. p. 95.) radical leaves linear, with parallel nerves, lobately serrate; serratures distant; cauline leaves few, opposite; heads of flowers short; scales of involucre and palea very long, linear-subulate, very acute. 2. G. Native of New Holland. Stem terete, a foot high, striated, twice trifid, erect. Leaves of involucrem and palea half an inch long, much longer than the flowers.

Narrow-leaved Eryngo. Pl. 1 foot.

69. E. canaliculatum (Cham. et Schlecht. in Linnaea. 2. p. 238.) leaves very narrow, channelled, with parallel nerves, shining, spiny eiliated; spines often accessory; stem panicked, bearing many heads: heads nearly unarmed, globose; leaves of involucre conuate at the base, smooth, hardly larger than the pales. 2. G. Native of the interior regions of Brazil. Habit of E. pristis. Radical leaves 2 lines broad. Spines 7-8 in the space of an inch.

Channelled-leaved Eryngo. Pl. 1 foot.

70. E. pristis (Cham. et Schlecht. in Linnaea. 2. p. 237.) leaves with parallel nerves, very narrow, flat, striated, spiny-ciliated, often with accessory spines; stem panicked, bearing many heads: heads globose, eiliated from subulate-spinescent bractes; leaves of involucre ovate, acuminate, subcoriaceous, twice the length of the calyxes, hardly different from the pales. 2. G. Native of Brazil, in the province of Rio Grande. Stem 4 feet high and more, solid. Radical leaves tufted, a foot and a half long.

Gromppus Eryngo. Pl. 4 feet.

71. E. pandanifolium (Cham. et Schlecht. in Linnaea. 2. p. 236.) leaves with parallel nerves, linear, obsoletely and remotely spiny-toothed; stem panicked, bearing many heads: heads globose, eiliated from subulate-spinescent bractes; leaves of involucre ovate, acuminate, subcoriaceous, twice the length of the calyxes, hardly different from the pales. 2. F. Native of Brazil, in the province of Gisplatine. Heads semi-unguicular, coloured. Radical leaves 18 lines long, broad at the base.

Seven-panicle-leaved Eryngo. Pl. 2 to 3 feet.

72. E. petiolatum (Hook. fl. bor. amer. 1. p. 259.) leaves with parallel nerves, lanceolate, tapering into long petioles, remotely spiny-ciliated; upper leaves narrow, sessile; leaves of involucre and palea subulate, spiny-ciliated, still, twice the length of the flowers. 2. H. Native of north-west America, in moist soils on the plains of the Mulnomak river. Petioles 4-6 inches long. Heads eiliated.

Petiole-leaved Eryngo. Pl. 2 feet?

73. E. paniculatum (Laroch. cryogn. p. 59. t. 26.) leaves with parallel nerves, linear, spiny-ciliated: floral ones very short; stem nearly naked, bearing at the apex umbellate branches; branches bearing 1-3 heads; leaves of involucre 9-10, lanceolate, and are as well the palea entire. 2. G.

Var. b. oligodon (D. C. l. c.) leaves of involucre hardly different from the palea; lower leaves entire, or scarcely eiliated on the edges. 2. G. Native of Brazil. E. paniculatum, var. a. Cham. et Schlecht. in Linnaea. 2. p. 234.

Var. c. bracteatum (D. C. l. c.) leaves of involucre elongated and reflexed. 2. G. Native of Brazil, in the province of Gisplatine. Cham. et Schlecht. l. c.

Panicle-leaved Eryngo. Pl. 1 foot.

74. E. cymosum (Laroch. cryogn. p. 63. t. 31.) leaves with parallel nerves; lower ones linear, channelled, bearing very long, acuminated, subulate teeth; upper leaves pinnatifid; floral branches umbellate; leaves of involucre 8-10, linear, quite entire, at length reflexed, longer than the head of flowers, which

is round; palea subulate, a little longer than the calyces. 2. F. Native of Mexico, in the higher plains near Tясco. Tratt. arch. t. 361. H. B. et Kunth, nov. gen. 5. p. 35.

Cynose-leaved Eryngo. Pl. 2 feet.

75. E. lucellefolium (Cham. et Schlecht. in Linnaea. 2. p. 240.) leaves with parallel nerves, linear, denticulated; lower teeth subteres; upper ones obsoletely spinulose; stem bearing few heads; heads unarmed, globose; leaves of involucre ovate, acute, roughish, hardly different from the palea. 2. G. Native of the south of the province. Leaves 2-3 lines broad. Heads pale straw-coloured, as also the rest of the plant.

Luzita-leaved Eryngo. Pl. 1 foot.

76. E. graminium (Laroch. crygn. 60. t. 27.) leaves with parallel nerves, narrow-linear, remotely spiny-ciliated; stem bearing only 2 heads; leaves of involucre 8-9, lanceolate-subulate, nearly entire, spreading, a little shorter than the head of flowers, which is ovate; palea subulate, a very little longer than the flowers. 2. F. Native of Mexico, in shady woods near Santa Rosa. H. B. et Kunth, nov. gen. amer. 5. p. 54. Tratt. arch. t. 761. Stem simple, 2 feet high. Heads of flowers of an amethyst colour.

Grassy-leaved Eryngo. Pl. 2 feet.

77. E. bromeliifolium (Laroch. crygn. 60. t. 28.) leaves with parallel nerves: bearing large subulate teeth, which are shorter than the breadth of the leaves; radical leaves very long, broadly lanceolate-linear: floral ones opposite, keeled; arched; leaves of involucre 10, lanceolate, acuminated, few-toothed, exceeding the head of flowers, which is round; palea entire, twice the length of the calyxes. 2. F. Native of Mexico, in humid woods. Tratt. arch. t. 557. H. B. et Kunth, nov. gen. amer. 5. p. 34. Flowers white?

Pine-apple-leaved Eryngo. Pl. 3 to 4 feet.

78. E. fectinatum (Ypres, in herb. Haenk. ex D. C. prod. 4. p. 96.) leaves with parallel nerves, bearing twin, subulate teeth, 1 in each pair, very short, and the other longer than the breadth of the leaves; radical leaves long, lanceolate-linear: floral ones opposite; leaves of involucre 10, lanceolate, acuminated, cosily spiny-toothed at the base. 2. F. Native of Mexico. E. Depp. et Schlecht. et Cham. in Linnaea. 5. p. 207. Very like E. bromeliifolium, but differs in the leaves being much narrower. Branches of stem bearing either 1 or 3 heads.

Pectinate-leaved Eryngo. Pl. 2 to 3 feet.

79. E. humboldtii (Laroch. crygn. 61. t. 29.) leaves with parallel nerves, lanceolate-linear, closely spiny-toothed; spinules in pairs; stem branched above; heads of flowers oblong, conglomerate; leaves of involucre 7-8, lanceolate, toothed, usually shorter than the head of flowers; outer palea toothed: inner ones entire. 2. G. Native of New Granada, on Mount Quindiu. Tratt. arch. t. 785. E. Humboldtianum, H. B. et Kunth, nov. gen. amer. 5. p. 34.

Humboldt’s Eryngo. Pl. 2 to 3 feet.

80. E. proteiflorum (Laroch. crygn. 62. t. 30.) leaves with parallel nerves; cauline leaves densely crowded, rather inbredicate, lanceolate, cosily spiny-toothed; heads of flowers large, oblong; leaves of involucre 20-22, large, toothed, lanceolate, exceeding the head of flowers; palea entire. 2. F. Native of Mexico, at the foot of the burning Mount Jorullo, and on Mount Orizaba. Tratt. arch. t. 773. H. B. et Kunth, nov. gen. amer. 5. p. 35. Leaves of involucre smooth and yellow above.

Protea-flowered Eryngo. Pl. 2 to 3 feet.

81. E. monspeliense (Cav. ann. 3. p. 116. icon. t. 553.) lower leaves with parallel nerves, linear, channelled, bearing unequal, terete, subulate teeth; upper leaves pinnatifid; stem bearing only 1 head of flowers; leaves of involucre 20-24, lanceolate, furnished each with 1-2 spreading spines, exceeding N

VOL. III.
the head of flowers, which is roundish. 2. F. Native of Mexico, near Huamajato and Chilpancingo. Laroch. eryng. p. 62. Tratt. arch. t. 767.

One-headed Eryngo. Pl. 4 feet.

82 E. JUICEUM (Cham. et Schlecht. in Linnaea. 3. p. 241.) leaves with parallel nerves, very narrow, inconspicuously spiny-denticulated, acute; stem bearing few heads; heads nearly unarmd, globose; leaves of involucrum 10-12, ciliate at the base, ovate, 5-nerved, acuminated, and are as well the pale and smooth. 2. G. Native of Brazil. Heads of one colour, 5 lines in diameter.

Rushy Eryngo. Pl. 1 to 2 feet.

83 E. Sencymum (Cham. et Schlecht. in Linnaea. 3. p. 212.) leaves very narrow, linear, with parallel nerves, quite entire, fringed with villi at the base; stem bearing 1 or few heads; heads between egg-shaped and globose, unarmd; leaves of involucre as well as the palea elongated, acuminate, and striated. 2. G. Native of Brazil, in the province of Cipatlan and Rio Grande. Stem bearing few leaves, from 1 to 2½ feet high. Leaves a line broad: radical one a foot and more long. Bracteas longer than the flowers. Habit almost of a Cypérus.

Wood-bearing Eryngo. Pl. 1 to 2 feet.

84 E. Sanguisorba (Cham. et Schlecht. in Linnaea. 3. p. 239.) leaves linear, with parallel nerves, spiny-serrate: serrations towards the apex of the leaf blunt and retrograde; stem naked, bearing few heads; heads ovate; leaves of involucre as well as the palea subulate acuminate, a little longer than the flowers. 2. F. Native of the south of Brazil, in the province of Rio Grande. Tube of calyx clothed with scarious scales at the angles. Heads echinated, coloured, 5-10 lines long.

Sanguisorba-like Eryngo. Pl. 1½ feet.

85 E. SECTAM (Lam. dict. 4. p. 759.) leaves linear, with parallel nerves, usually ciliated at the base with long bristles; stem trichotomously corynose; heads cyllindrical, unarmd; leaves of involucre as well as the palea entire, shorter than the flowers. 2. G. Native of the south of Brazil. Laroch. eryng. p. 64. t. 32. Tratt. arch. t. 758. Cham. et Schlecht. in Linnaea. 2. p. 244. E. nudiflorum, Willd. herb. which was collected about Ibagu, in New Granada, is the same, according to Cham. et Schlecht. 1. c. Stem erect, 2 feet high. Habit of the last species. Calyx rough from scales.

SARGENTII H. LESSONIA (in honour of - Lesson, a writer on compositae). Bertero, miss. Hook. bot. misc. 3. p. 351. Small shrubs or trees, with dichotomous branches, which are marked below by the cicatrices of the fallen leaves, but densely leafy at the extremities. Peduncles terminal, bearing a solitary, globose, or hemispherical head of flowers each.

87 E. SARCOPHYLLUM (Hook. et Arn. in bot. misc. 3. p. 352.) arborescent; leaves cylindrical, fleshy; leaves of involucrum wanting. ½. G. Native at Massa Fueria, near Juan Fernandez. The heads of flowers are exactly globose, without any involucre. Branches dichotomous.

Fleshy-leaved Eryngo. Shrub 5 to 6 feet.

† Species not sufficiently known.

88 E. FALIE'CESCENS (Mill. dict. no. 5.) radical leaves roundish, multifid; heads pedunculate. 2. H. Native of Europe. E. alpinum amethystinum, capitulum majore pallescente, Tourn. inst. 327. Allied to E. amethystinum, according to Mill. but distinct from it.

89 E. AMERICANUM (Walt. fl. carol. p. 102.) leaves entire: radical ones roundish: cauleine ones ovate-lanceolate; upper-most ones trifid; stem procumbent. 2. H. Native of Carolina.

American Eryngo. Pl. procumbent.

90 E. carthamoídes (Smith, in Rees’ cycv. vol. 13.) leaves oblong, toothed, undivided, cordate at the base, and stem-clasping; stem nearly simple, bearing few heads; leaves of involucre few and ovate. 2. H. Native of Mauritania. Perhaps the same as E. aquifolium?

Cathamomus-like Eryngo. Pl. 1 foot.

Starry-blue Eryngo of Mount Lebanon. Pl. 1 foot.

92 E. PARVUM PALLARE FOLLIS SERRATIS. Mor. oxon. sect. 7. t. 36. f. 13.

Small Eryngo with serrated leaves.

Mexican Eryngo with long toothed leaves. Pl. 1 foot.

N.B. E. lateriflorum (Lam. dict. 4. p. 473.) or Grimen orientale squacatum (Tourn. cor. p. 39.) is not a Cenchrus, as has been supposed by Linnaeus, nor an Eryngium but Coriandrum pungens.

Cult. Most of the species of this genus are extremely handsomé and beautiful, and particularly so the hardy kinds, which are therefore well fitted for decorating borders. They all succeed well in common garden soil; but the lighter and more sandy the soil is the better they will grow. The greenhouse or frame kinds should be grown in pots, so that they may be sheltered in winter. All are readily increased by dividing at the root, or by seed.

XXXII. ACTI'ANANTHUS (from actin, actin, a ray, and anthus, anthos, a flower; involucels). Ehrenb. in Linnaea. 4. p. 398. D. C. prod. 4. p. 668.

LIN. Syst. Pentaédrä, Digynia. Flowers monocous, female ones capitata: male ones in capitata umbels: marginal ones joined, abortive, and spinescent, having the receptacle destitute of palea. Teeth of calyx permanent. Pedals oblong, complicate at the apex, rather ciliate. Fruit compressed from the sides; mericarps with the 5 alternate sutural ribs strongest: having the furrows between the ribs furnished with 1 vitice each, and the commissure with 2 vities; carpophore adnate.—A stiff, squarrose plant. Lower leaves ternately bipinnate. Involucrum none; involucels of many leaves. Flowers white. This genus comes between Oenanthae and Eryngiæm, according to the fruit, but from the infrorseence it is analogous to Echinophora.

I. A. SYRACUSÆ (Ehrenb. l. c.). 2. H. Native of Syria, between the towns of Sacheh and Balbec.

Syrian Actinanathus. Pl. 1 foot.

Cult. See Eryngium above for culture and propagation.

§ 2. Unbels compound or perfect. Vitice on the fruit variable, rarely wanting.

* Fruit having only primary ribs present.

Tribe IV.

AMMI’NÆE (plants agreeing with Ammi in important
UMBELLIFERA. XXXII. RU'MIA. XXXIV. CICUTA.

[Text content not provided in the image]
stronger, they carefully avoid it; that goats, however, devour it greedily with impunity, and that horses and sheep eat it with safety. Strong enemics are the most approved remedy for this poison.

*Var. b. tenenifolia* (Schrhark, akad. munch. philos. class. 7. p. 56, t. 4, f. 1.) trunk of root slender, bearing fascicles of cylindrical fibres; leaves bipinnate; segments linear, entire, and subseriat: umbels opposite the leaves, and terminal. 2. W. H. Native of Germany, near Fussan.

Poisonous Water Hemlock or Cowbane. Fl. July. Britain. Pl. 2 to 3 feet.

* * * American species. Fibres of roots oblong and fleshy.

Cult. The species should be planted in ponds or ditches, where they will increase without any further care.

—Smýmýnium species of Lin.—Smýmýnium, Ell. sketch. p. 139.—Smýmýnium and Tháspium, Nutt. gen. amer. 1. p. 195 and 196.—Smýmýnium species of authors.

Lin. syst. Pentádraea, Dígyinía. Margin of calyx oblong-ovate, or with 5 very short teeth. Petals elliptic, tapering into a long inflexed acumen. Fruit contracted from the sides, rather didymous, roundish or oval; mericarps with 5 filiform, prominent, equal ribs; lateral ribs marginal; furrows between ribs furnished with 1 vitta each, and the commissure with 2 vittae; carpophore bipartite. Seed teretely convex, scarcely flattened in front.—Perennial herbs, natives of North America. Stems nearly simple, erect. Leaves ternate or biternate; segments oblong-ovate, or cordate. Involutamer wanting; involucres few-leaved, variable. Flowers yellow, rarely white, or dark purple. This genus differs from Smýmýnium in the seed being not involuted, and from Alpium in the petals ending in a long inflexed acumen each.

*Var. b. angucinátum* (D. C. prod. 4. p. 100.) intermediate segment of leaves nearly pinnate, with 5 segments. 2. W. H. Growing along with the species. Smýmýnium angucinátum, Smith, in Rees' cycl. vol. 33. no. 8.

2 Z. Zizii (Koch. l. c.) radical leaves undivided, cordate, crenated, petiolate; caudine ones nearly sessile, ternate; leaflets petiolate, ovate-cordate, serrated; involucres usually 1-leaved. 2. W. H. Native of Carolina, on moist mountains and pastures; and probably on the mountains of Virginia and Pennsylvania, plains of the Red River, Saskatchewan, and the river Winnege and prairies of the Rocky Mountains. Smýmýnium cordátum, Wilt. fl. carol. 1. p. 635. Schultes, syst. 6. p. 438. Torrey, fl. un. st. 1. p. 307. Sison trifoliátum, Michx. fl. bor. amer. 1. p. 168. Smýmýnium trifoliátum, Muhl. ed. p. 31. Nutt. gen. amer. 1. p. 195. Flowers golden yellow, very like those of the preceding species; but according to Nutt, they are white, and according to Elliot either white or yellow; there are therefore probably two species confused.

Cult. A moist soil suits the species of this genus best; and they are easily increased by dividing or by seeds.

1 P. atropérfre (Lehm. in sem. hort. lamb. 1828. p. 16.) 2. F. Native of Mexico. Mature fruit brownish, and have a strong scent of parsley, as well as every part of the plant. Dark-purple-flowered Pentacrypta. Pl. 2 feet.

Cult. This plant will require to be protected in winter; it can only be increased by seeds.

Lin. syst. Pentâdriaea, Monogynía. Margin of calyx oblong-ovate. Petals roundish, entire. Stylopodium depressed. Fruit roundish, contracted from the sides, didymous; mericarps with 5 filiform equal ribs; lateral ribs marginal: furrows between the
ribs having one vitex each, but the outer ones have 2-3 vitæ; carpophoræ unilocular. Seed gibbously convex, flatish in front.

- Herbaceous, with the roots thickish at the neck. Stems furrowed, branched. Leaves pinnate; leaflets cuneiform, cut. Umbels axillary on the branchlets, and nearly sessile at the top of the stem. Involucrum and involucelles wanting. Flowers white or greenish.

**Sect. I. Eucelarium** (from eu, well, and apium, celery; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 101. Point of petals closely involute.

1. A. graveolens (Lin. spic. 379) plant glabrous; leaves pinnate; upper parts ternate; leaflets cuneate, cut and toothed at the apex. δ. H. Native nearly throughout the whole of Europe, even to Caucasus, in ditches; and also of Chili, near Mendoza, and of the Falkland Islands. D. Urv. fl. mal. p. 457. In Britain it is a common weed by the sides of ditches, brooks of water, and marshy ground, especially towards the sca. Smith, engl. bot. t. 1210. Schultes, syst. 6. p. 429. Hayn. arz. gew. 7. t. 24. Fl. dan. t. 790. Plessch. icon. t. 217. Sessile graveolens, Scop. carn. no. 360. Sium A. rium, Roth, germ. 1. p. 128. Sium graveolens, Vest. man. bot. p. 517. Celery is known in Britain in its wild state under the name of smallage. The seeds and whole plant in its native ditches are acrid and dangerous, with a peculiar rank coarse taste and smell, and the effects of cultivation in producing from it the mild sweet stalks of celery are not a little remarkable; for which, and its name, we are indebted to the Italians, and which has now supplanted our native Alexanders (Smýrýttum Úlasáttrum).

**Cec.—** The blanched leaf-stalks are used raw as a salad from August till March; they are also stewed, and put in soups. In Italy the unblanched leaves are used for soups, and when neither blanched nor the green leaves can be had, the seeds bruised form a good substitute. The root only of the variety called the *celeriac*, is used, and is excellent in soups, in which, whether white or brown, slices of it are used as ingredients, and readily impart their flavour. With the Germans it is also a common salad, for which the roots are prepared by boiling, until a fork will pass easily through them; after they are boiled and become cold, they are eaten with oil and vinegar. They are also sometimes served up at table, stewed with rich sauces. In all cases before they are boiled, the coat and the fibres of the roots, which are very strong, are cut away, and the root is put in cold water on the fire, not in water previously boiling. The varieties are as follow:

**Var. β, dióices** (D. C. prod. 4. p. 101.) leaves erect; petiolo very long; leaflets 5-lobe, serrated. A'pium dióice, Mill. dict. no. 5. A'pium Celleri, Gaertn. fruct. 1. t. 22. *Celery* of the English; *celeri* or *ache* of the French; *cuppich* of the Germans; and *oppio* of the Italians. There are several sorts of the common or sweet celery, viz. 1. Common upright Italian. 2. Large hollow upright. 3. Solid stalked upright. 4. Large red stalked upright.

**Var. γ, rapóceum** (D. C. l. c.) leaves spreading; petiolo short; segments of leaves 5, serrated; root roundish. A'pium rapóceum, Mill. dict. no. 5. *Celeria* of the English; *celeríte* of the French; and *knot-l战机* of the Germans. There are 2 or 3 sorts of celeriac, viz. 1. Common celeriac or turnip-rooted celery. 2. Celeri-rave of the French; and 3. Knot-l战机 of the Germans. This last is harder than the others, and will continue longer in spring. It is grown to a large size in the neighbourhood of Hamburg, and is sometimes imported for the London market.

**Var. ε, Lusítanii*um (D. C. l. c.) radical leaves 3-lobe; cauline ones 5-lobe, crenated. A'pium Lusítaniium, Mill. dict. no. 7.

**Estimate of sorts.**—The first three sorts of var. β are preferable for general culture. The red variety is rather coarse for salads, but is hardly to stand the winter, and well adapted for soups and stews. The sorts of var. γ are cultivated for their roots, under the name of *celeriac*, which are fit for use in September and October, and may be preserved in sand through the winter. Celery may be grown to 10 lbs. weight, and averaging 6 lbs. each head. A head of celery, we are informed (Cal. mem. vol. 2. p. 297.), was dug up on the 4th of October, 1815, at Longford, near Manchester, which weighed 9 lbs. when washed, with the roots and leaves still attached to it, and measured 6 feet 6 inches in height. It was the red sort, perfectly solid, crisp, and firm, and remarkably well flavoured.

**Propagation.**—All the sorts are raised from seed; and half an ounce is reckoned sufficient for a seed-bed 4 feet and a half wide by 10 feet in length, of the upright sorts; but for celeriac, a quarter of an ounce will be enough for a bed 4 feet square.

**Soil.**—Celery delights in a soil rather moist, rich in vegetable mould, but not rank from new unmorted dung.

**Times of sowing.**—The most forward crop is slightly forced, any of the varieties may be sown in the spring in the open garden, at 2 or 3 different times, from the 21st of March until the first week of May; but the principal sowing should be made in the first fortnight of April.

**Early crop.**—For early summer and autumn celery, sow a small portion towards the end of February, in a moderate hot-bed. When the young plants are about 2 inches high, put out some into a warm border, 2 or 3 inches apart, or rather into a second slight hot-bed, if before the 21st of March, as well to protect the plants, as to expedite their growth for final planting. As soon as the leaves are 6 inches high, in May or June transplant them into trenches for blanching, as directed below for the main crops. But as these early sown plants will not continue long in full growth before many of them will pipe or run, you should plant only a moderate crop, for a temporary supply; when they are advanced in the trenches from 8 to 12 inches in growth, begin to earth them up several inches on both sides of each row; continue earthing up by degrees as they rise higher, till they are whitened from 6 to 12 inches in length; when they may be dug up as wanted.

**Main crop.**—To raise the main crops for summer, autumn, and winter, make a considerable sowing at the commencement of April. Sow in beds of light mellow earth, and rake in the same as soon as covered with soil. In very dry weather give moderate waterings, both before and after the plants come up. When they are 2-3 or 4 inches high, thin the seed-bed, and pick out a quantity at successive times into intermediate beds, 3-4 inches asunder. Water those removed, and till they have struck fresh root. D. Judd sows the middle of January in a warm situation, on very rich ground, protecting it by mats at night. When the plants are from 2-3 inches high, he pricks them out into a nursery-bed, immersing the plants, as he draws them, in water, so as they may remain moist while out of ground. The plants remain in the nursery-bed until they become very strong. John Walker, a gardener near Manchester, grows the red celery; sows for the early crop about the 1st of March, and for the late crop about the 1st of April. "The seed-bed is formed of fresh dark loamy soil, mixed with old rotten dung, half and half, and placed on a hot-bed. The nursery or transplanting bed is formed with old hot-bed dung, very well broken, laid 6 or 7 inches thick, on a piece of ground which has lain some time undisturbed, or has been made hard by compression. The situation should be sunny. The plants are set 6 inches apart in the dung, without soil, and covered with hand-glasses. They are watered well when planted, and frequently afterwards. By hardening the soil under the dung in which the plants are set,
the root is formed into a brush of fibres; and by thus preventing the pushing of a tap-root, the plant never runs to seed before the following spring."—Cal. hort. mem. vol. 2.

Transplanting into trenches.—When either the plants left in the seed-bed, or those removed, are from 6 to 12 inches high, or when the latter have acquired a stalky growth, by 4 or 5 weeks' nurture in the intermediate bed, transplant them into trenches for Blanching. For this purpose allot an open compartment. Mark out the trenches a foot wide, and from 3 feet to 3½ distant; dig out each trench lengthwise, a spade in width, and a light spout deep, that is, 6 or 8 inches, or even a foot. Lay the excavated earth smoothly in the intervals, making the edges of the trenches equally full and straight; also loosen the bottom moderately, in a level order, to receive the plants. Before inserting them, it would essentially strengthen the soil, to apply some good rotten dung in each trench 3 inches thick, and let it be dug into the bottom regularly a moderate depth. Then having lifted the plants, just thin any long straggling tops of the leaves and fibres of the roots; also slip off side-shoots; plant a single row along the bottom of each trench, 4 or 5 inches apart. Give a good watering directly, and occasionally after, if the weather be dry, till the plants take root, and show renewed growth. Continue planting out a monthly succession in June, July, August, September; thus providing a supply from July and August of the present summer throughout the course of autumn and winter, till May in the following spring. Judd prepares his ground for transplanting by trenching in 2 spades deep, mixing with it the operation a good dressing of well-reduced dung from the old forcing beds. He says, "I give it a second trenching in order that the dung may be better incorporated with the mould, and then leave it in as rough a state as possible, till my plants are ready to be put out." In the ground thus prepared, he forms trenches 20 inches deep, and 6 feet distant from each other, measuring from the centre of each trench. Before planting he reduces the depth of the trenches to 3 inches, by digging in sufficient dung to fill them so much up. At the time of planting, if the weather be dry, the trenches are well watered in the morning, and the plants are put in, 6 inches apart in a row, in the evening, care being taken by the mode above mentioned, to keep the fibres quite wet whilst out of ground; as they are drawn from the nursery-bed, the plants are dressed for planting, and then laid regularly in the garden pan. The trenches, in which his rows of celery are planted, being so very shallow, the roots of the plants grow nearly on a level with the surface of the ground: this he considers particularly advantageous; for as considerable cavities are necessarily formed on each side when the moulding takes place, all injury from stagnant water or excess of moisture is prevented. The trenches when planted are watered, as may be required. Here he prepares his ground for celery during the winter, and avoids putting much of a crop in the space between the trenches, especially one that grows tall, as he finds celery does best when it grows as open as possible. Walker makes his trenches at 4 feet distance, and 18 inches wide, 12 deep, and filled 9 inches with a compound of fresh strong soil, and well-rotted dung; three-fourths dung, and one-fourth soil. Old hot-bed dung is the best. The plants should be taken up with as much soil as will conveniently adhere to the roots, and the side-shoots are removed from the stems; they are then set with the hand at 9 or 10 inches apart, in the centre of each trench; it is necessary to wait until they are ready to be earthed, but not afterwards.

Landing or earthing up.—As the plants in trenches rise from 10 to 15 inches high, Abercornbe begins to land-up for blanching, observing "to trim in the earth gently when first raised to the stems, with a hoe or spade, but mostly the latter. When the plants are of a more advanced growth, earth them up equally on both sides each row, 3½ or 5 inches, according to the strength and height of the different crops. Repeat this once a week or fortnight, till by degrees they are landed-up from 12 inches to 2 feet, in order to Blanch them of some considerable length. Continue thus landing-up the different crops from July till February. As the autumnal and main winter crops attain full growth, give them a final landing-up near the tops, which will increase the length of the blanched part, and also protect the later crops more effectually during the winter." In landing-up, Judd does "not think it well to level the plants with too much mould at first. The two first mouldings, therefore, are done very sparingly, and only with a common draw-hoe, forming a ridge on each side of the row, and leaving the plants in a hollow, to receive the full benefit of the rain and the waterings. When the plants are strong enough to bear 6 inches high of mould, the moulding is done with the spade, taking care to leave bases enough to support the masses of mould, which will ultimately be used in the ridge, and still keeping for some time the plants in a hollow, as before directed. The process of moulding is continued through the autumn, gradually diminishing the breadth of the top, until at last it is drawn to as sharp a ridge as possible to stand the winter. In the operation it is necessary, in order to prevent the earth from falling into the hearts of the plants, to keep the outer leaves as close together as possible; for this purpose, before I begin the moulding I take long bands of bass matting, tied together till of sufficient length to answer for an entire row, and I fasten this string to the first plant in the row, then pass it to the next plant, giving it one twist round the leaves, and so on till I reach the other, where it is again fastened; when the moulding is finished, the string is easily unravelled, by beginning to untwist it at the end where it was last fastened." Walker, removing the lateral shoots, the leaves of each plant being held together with one hand, the soil pulverized, is drawn round with the other, taking care not to earth up too high at once, nor too close. The heart should always be left quite free. This may be repeated about once a fortnight until the plants are ready for use.

Late crop.—For late spring celery to stand till the end of May in the returning spring, without running considerably, it is expedient to make a small late sowing at the commencement of May. The plants when 6 weeks old may be pricked on intermediate beds, 6 inches by 3 asunder; to remain till September or October, then transplant them into moderate trenches; as they advance in growth, earth them up a little in winter, and finally in the spring in February and March.

Occasional shelter.—On the approach of frost take up a part of the crop, and lay it by under dry sand for winter use. To preserve the plants left in the bed, lay some long dry litter over the tops, which remove in every interval of mild weather. It is a common complaint, that very fine looking celery is often found to be rotten at the base of the leaf-stalks; the fact being, that when it is full grown, and the blanching completed, it begins to decay, and will not keep good in the ground for more than a month at most. Some, therefore, take up and preserve in dry sand, but in that situation it soon becomes tough and dry. The best mode seems to be that of forming successive plantations.

Taking the crop.—It is best to begin at one end of the row, and dig clean down to the roots, which then loosen with a spade, that they may be drawn up entirely without breaking the stalks.

Cultivation of celeriac.—The times of sowing are the same as that for other sorts of celery. The plants require a rich well-manured soil, and according to an account communicated by Lord Stanhope to Mr. Sabine, the plants are reared on a hot-bed under glass, and transplanted when 2 or 3 inches high to another hot-bed, and set an inch and a half apart. In the be-
ging or middle of June they are transplanted into flat beds in the open air, at the distance of 15 inches from each other, and not in trenches like other celery. They must be abundantly watered as soon as they are set out, and the watering must be repeated every other day, or, if the weather should be warm, every day. As they increase in size they will require a greater quantity of water, and they must be occasionally hoed. The roots will be fit for use in September or October. Mr. Sabine states that he has been informed, that the plan of giving excess of water is peculiar, and that the vigorous growth of the plant is more dependent on richness of soil than on any other cause. Abercrombie directs to earth up the bulbs 4 or 5 inches to blanch them, when they are full grown.

To save seed.—Either leave some established plants in the spring where growing; or in February or March dig up a competent number, cut down the top leaves, and set the plants in the ground full 2 feet asunder. They will produce seed in autumn. Walker grows only red celery, and in preparing plants for seed, chooses the most solid, of the reddest colour, and the smallest size. When taken out of the transplanting bed, the lateral shoots being removed, they should be planted in a dry warm situation, where the seed will ripen well.

2 A. CHILENSE (Hook. et Arn. in bot. misc. 3, p. 333,) plant glabrous; stem nearly terete, hardly angular; leaves spreading, bipinnate: lobes cuneate, somewhat trifidly cut, quite entire; petals involute at the apex.  9. II. Native about Valparaiso. The plant is much stouter than A. graveolens, and the stem is not deeply furrowed. The leaves resemble those of common parsley, but are much smaller, and more flaccid. The peduncles or short lateral branches are stout and firm. Fruit much larger than that of A. graveolens. Involucre and involucres wanting. Chili Celery. Pl. 2 feet.

SEC. II. OROSOLIDÆM (oëos oëos, oros oros, a mountain, avus avus, an umbel; habitat of plants). D. C. prod. 4. p. 101. Petals denticulated, with an inflexed point.

4 A. RANUNCULIFÖLUM (H. B. et Kunth, l. c. p. 18. t. 421,) leaves somewhat terete; leaflets obovate-cuneate, lateral ones 5-lobed: intermediate one 3-parted: segments 2-5-lobed.  9. F. Growing along with the preceding, of which it is probably only a variety. Crowfoot-leaved Celery. Pl. 2 to 3 feet.

5 A. GLAUCESCENS (H. B. et Kunth, l. c.) leaves subternate; leaflets obovate-cuneate, tripartite; lobes bifid or trifid.  9. F. Growing along with the two preceding species, of which it is perhaps only a variety. Glaucescent Celery. Pl. 2 to 3 feet.

6 A. COMMERSONII (D. C. prod. 4. p. 101,) leaves pinnate; leaflets multifid: lobes linear.  9. F. Native of South America. Styles a little longer and more divaricate than any other of the species. It is very nearly allied to A. ranunculifolium, but the segments of the leaves are narrower and more acute, and the lower leaves are pinnate. Commerson's Celery. Pl. 2 to 3 feet.

† Species not sufficiently known.

7 A. BRACHYPHYLLUM (Horn. hort. hafn. suppl. p. 128,) segments of radical leaves cordate, and truncate at the base, and trifid at the apex.  9. H. Native country unknown. The fruit is very like that of A. graveolens.

Cult. The species will grow in any common soil, and are increased by seeds.

Lin. syst. Pentádria, Dingyín. Margin of calyx obsolete. Petals roundish, incurred, entire, hardly emarginate, with an inflexed point. F. Styles somewhat short, conical, rather crenulat. Styles diverging. Fruit ovate, contracted from the sides, somewhat didymous; mericarps with 5 equal filiform ribs: lateral ribs marginal; having the furrows between the ribs furnished with one vitta each, and the commissure with 2. Carphopodi bipartite. Seed gibbously convex, flattish in front.—Branched glabrous herbs. Leaves decomposed, with cuneate segments. Involucra few-leaved; involucres many-leaved. Flowers white or greenish, uniform; those in the dish of the umbel frequently sterile. Stamens longer than the corolla.

1 P. SATIVUM (Hoffin. et Koch, l. c.) stem erect, angular; leaves decomposed, shining; lower leaflets ovate-cuneate, trifidly toothed: superior ones lanceolate, nearly entire; leaves of involucrus filiform.  9. II. Native of Sardinia, Greece, Archipelago, Turkey, Chili about Concepcion, &c. on shaded rocks; and now cultivated in every culinary garden. Nees. off. pflanz. 16. t. 21. A'pium Petroselinum, Lin. spec. 379. Hayn. arz. gew. 7. t. 23. A'pium vulgäre, Lam. fl. fr. 3. p. 1027. A'pium tenuifolium, Riv. pent. irr. with a figure. The Parsley is called Persil in French, Petersilie in German, and Petroselino in Italian. It is a hardy biennial; introduced to England in 1548 from Sardinia. It is now so common as to be naturalised in several places both in England and Scotland. The root leaves are much curled in some varieties. The flowers are yellow, and appear in June; they have usually one leaf at the origin of the universal umbel; and the involucre often of from 6 to 8 short small leaves, fine almost as hairs to the partial umbels.

It may be right to notice, that the poisonous plant called fools-parsley (Athasá Cynápin), a common weed in rich garden soils, has sometimes been mistaken for common parsley. They are very easily distinguished: the leaves of fools-parsley are darker green, of a different shape, and, instead of the peculiar parsley smell, have when bruised a disagreeable odour. When the flower-stem of the fool's-parsley appears, the plant is at once distinguished by what is vulgarly called its beard, the 3 long pendant leaves of the involucre. The timid may shun all risk of mistake by cultivating only the curled variety. This last it may be remarked, makes the prettiest garnish." Neill.

Varieties.—There are:

1. The common plain leaved, which is the true species, is seldom cultivated.

2. The curled-leaved. This is the most esteemed variety. A'pium crispum, Mill. dict. no. 2. P. sativum β crispum, D. C. prod. 4. p. 102.

3. The broad-leaved or large-rooted Hamboigh, which is cultivated for its carrot-shaped roots. A'pium latifolium, Mill. dict.
UMBELLIFERÆ. XXXVIII. Petroselinum. XXXIX. Wydleria.

no. 3, but not of Poir. P. sativum var. latifolium, D. C. prod. 4. p. 102.

UMBRELLIFERiE. leaves radiate. September, October.

The leaves of the two first varieties are used as pot-herbs at all seasons of the year; also as a garnish. The third kind is esteemed for its large white carrot-shaped roots, drawn in winter like parsnips for the table; and occasionally to be used in medicine, being a good remedy for the gravel.

Culture of the pot-herb kinds.—" One sowing in spring will mostly furnish young leaves all the year, though to answer a constant demand, many persons make successive sowings from February to May. Some also sow early in autumn for young parsley in winter and spring; but such a supply is better provided by cutting down established plants. Sow in a single drill along the edge of any compartment, or occasionally in rows 9 or 12 inches asunder. Draw small drills, something less than an inch deep, in which to drop the seed moderately thick, and cover a little above half an inch. The plants will come up in 3 or 4 weeks, and when 2 or 3 inches high, may be gathered as wanted all the summer, winter, and following spring till May, when they will go to seed. Have always a young crop sown timely in the spring, to succeed the declining old plants. In gathering pot-herb parsley, cut close and regular. In summer, when the plants grow rank, yielding more leaves than can be used, cut them in close to the bottom, and they will shoot up stocky in a regular close growth. Observe also to do the same in autumn, about the end of September, that the plants may form heads of fresh young leaves before winter. On the approach of frosty weather protect them with h ± m and reed-pa nnels, laid upon branches of birch or other light supports."

Culture of Humberg parsley.—" To obtain large roots allot a compartment where the soil is deep, and has been well dug. Any common mould will suit, if dry and not too rank. Sow in February, March, or early in April, in one or more beds; either in drills 9 inches asunder, or broad-cast, and rake it. The plants should be thinned to 9 inches distance, to give room for proper growth in the roots, for use in August, September, October, and thence till the following spring. On the approach of frost take up some roots, and preserve them in sand. A sowing may be made in the third week in June, when young roots are wanted in winter."

To save seed.—" Permit some old plants to run to stalks in May; they will produce plenty of seed, ripening in July or August." Abercrombie.

3 P. selinoides (D. C. prod. 4. p. 102.) stem striated; radical leaves tripinnate; cauline ones bipinnate; leaflets pinnatifid; lobes linear-lanceolate, acute, entire, or tripartite; umbels drooping a little; involucrum almost absent. § H. Native country unknown. Selinum peregrinum, Willd. cmmn. p. 306. This plant differs from GaUium apar i, to which it is joined by Sprengel, in the segments of the leaves being much larger, in the petals being cream coloured, not white, and in being entire, not obcordate.

Selinum-like Parsley. Pl. 2 feet.

5 P. prostra t'um (D. C. prod. 4. p. 102.) stem procumbent, flexuosus; leaves pinnate; leaflets pinnatifid: lobes 5-7-lanceolate; ultimate ones trifid at the apex; umbels nearly sessile, opposite the leaves; involucrum usually of one leaf. 2 F. Native of Van Diemen's Land. A pium prostratum, Labill. nov. holl. 1. p. 76. t. 103. Vent. malm. t. 81. Schultes, syst. 6. p. 430. Herb edible.

Prostrate Parsley. Pl. prostrate.

5 P. se'g'etum (Koch, umb. p. 128.) stem erect, twiggy, nearly naked; leaves pinnate; leaflets nearly sessile, roundish-ovate, pinnatifidly cut, mucronately toothed: upper lobes linear; involucrum 2-3-leaved; rays of umbel very unequal. 0 F. Native of Britain, France, Caucasus, and Switzerland, in corn-fields, vineyards, and gardens. In Britain in a chalky rather moist soil, but not very common; as about Mapledurham, Hants; at Binham, Norfolk; near Kelmarsh, Northamptonshire; at Walthamstow, Essex; and in the island of Tiree, Scotland. Sison se'getum, Lin. spec. 362. Jacq. Hort. vild. t. 134. Smith, ent. bot. 228. Sium se'getum, Lam. dict. 1. p. 406.—Mor. hist. 3. p. 283. sect. 9. t. 5. f. 6. Flowers and fruit agreeing with the rest of the genus Petroselinum, but the habit is that of Pimpinella. Flowers all fertile, white or even reddish. Teeth of calyx rather conspicuous. Perhaps Sison arvensis, Brotn. fl. lus. 1. p. 424. and Schultes, syst. 6. p. 418. is not distinct from this. The whole account of this herb by that accurate observer Gooolyer, with the origin of honewort, from its cur ing a swelling in the cheek, called a hone, &c. is a model of precise information.

Cow's Honewort. Fl. July, Aug. Britain. Pl. 1 to ½ feet. Cult. The species will grow in any soil, and they are only to be propagated by seed.

XXXIX. WYDLERIA (in honour of H. Wydler, who has written a monograph of the genus Scrophulariaceae). D. C. coll. mem. v. p. 36. t. 7. prod. 4. p. 103.

Lin. syst. Pentaudiaria, Digynia. Margin of calyx obsolete (f. 60. c.). Petals ovate-lanceolate, entire, acuminate (f. 60. c.); acumen incurred. Fruit ovate, rather didymous, crowned by the short stylopodium, and short reflexed styles (f. 60. b.); mericarps somewhat semi-terete, and rather contracted at the margins; furnished with 5 filiform thickish obtuse ribs at equal distances; having the furrows between these ribs furnished with one vitta each, but the commissure is narrow, and furnished with 2 vittae; all the vittae are very narrow. Carpophore bifid.—A smooth West Indian herb, with a terete branched cest stem; terete leaves, with multifid leaflets, and cuneate lobes. Involucrum none or only of one leaf, but the involucres are many leaved. Flowers white, not sufficiently known. This genus, according to Koch, is allied to Petroselinum, but differs both from it and Feniculum, in the petals ending in long taper points. It is also to be distinguished from GaUium, in the fruit being somewhat contracted at the sides, and in the ribs not being winged; from Scutellaria, in the calyx being toothless, and from both these last genera in the petals being entire.

1 W. portoricie'sis (D.C. 1. c.) in F. Native of Porto Rico, on the west coast, where it is cultivated along with Misis paradoxa and Lepidium Virginicum. Plant a foot high and more.
Leaves rather stiff. Umbels numerous, 12-14-raycd. (fig. 90.)

Porto-Rico Wydleria. Pl. 1 foot.

Cult. A plant of easy culture, and only to be propagated by seeds.

LIN. SYST. Penæaëria, Digiyaria. Margin of calyx obolate. Flowers usually dicoccous from abortion, rarely monoecious. Petals of the male flowers lanceolate, ending in an involute segment; those of the female or hermaphrodite flowers ovate, and ending in a short reflexed point each. Fruit ovate, compressed from the sides; mericarps furnished with 5 filiform, rather prominent equal ribs; lateral ones marginal; having the furrows between the ribs either without vitrea, or with one in each furrow; carpophore flat, bipartite from the base. Seed gibbosely convex, flattish in front.—Much branched biennial herbs. Stems angular. Leaves bipinnatifid; leaflets triterate; lobes linear, pale or glaucous. Umbels numerous, of many rays; without any involucrum, either disposed in a thysure or panicle. Umbels usually naked, seldom furnished with an involucre, sometimes proliferous or somewhat racemose. Flowers white, dicoccous or polygamous.

4 T. ramosissima (Fisch. ex Koch, in nov. act. bonn. 12. p. 127.) germs glabrous; ribs of mericarps very blunt, rounded; umbelles few flowered, furnished with involucres; fruit bearing discs much larger than the merocarps. H. Native of Altaiia, in plains at the river Irtysh near Krasnojezarsk, and elsewhere; and about Buchtorminsk. It differs from T. Kitaibèlîi, in the involucres being present, and in the pedicels being more slender and elongated.

Much-branched Trinia. Pl. ½ foot.

5 T. Hoffmannin (Bieb. suppl. p. 244.) plant glabrous; involucres wanting or of one leaf; ribs of fruit, especially the carinal ones, acute. H. Native of Russia and Tauria. Trinia glaberrima var. Hoffm. umb. 93. Flowers white.

Hoffmanni's Trinia. Fl. June, July. Pl. ½ to 1 foot.

6 T. nîsîria (Hoffm. umb. 94.) stem, leaves, and fruit furfuraceous, from short scattered down; involucrum none, but when present of only one leaf; ribs of fruit acute. H. Native of the south of Russia and Tauria, in dry desert places. T. Hoffmannii var. β, Bieb. suppl. p. 245. Pimpinella dioica Râssica, Fisch. hort. gorenk. 1812. Pimpinella dioica, D'Urâ. enum. pl. orient. p. 34. Perhaps only a variety of the preceding. Flowers white.

Hispid Trinia. Pl. 1 foot.

7 T. Dufoîrî (D. C. prod. 4. p. 104.) stem and leaves smooth; involucres almost wanting; fruit puberulous, roundish, with obtuse ribs. H. Native of Spain, near Tudela. Sélesi dioïcum, Dufoîr in litt. Pedicels after flowering time very short, hardly longer than the fruit. The species of this genus are very variable, and by no means easily distinguished.

Dufoîr's Trinia. Pl. 1 foot.

Cult. A light sandy soil suits the species, in which the seeds should be sown in spring.

LIN. SYST. Penæaëria, Digiyaria. Margin of calyx 5-toothed, or obsolete. Petals ovate, entire, with a straight or inflexed apex. Styles short. Fruit compressed from the sides, ovate or oblong; mericarps furnished with 5 equal, rather prominent filiform ribs, lateral ribs marginal; having the furrows between the ribs furnished with one vitta each; carpophore entire, distinct. Seeds gibbosely or teretely convex, flattish in front.—Herbs. Umbels compound. Flowers white. Involucre variable in the different sections, which are probably genera.

SECT. I. MAUCIÆRA (in honour of Bure, Dav. Manchart, author of Dissertationes Botanicae Catoe, 4to. Tubingen, 1735). D. C. prod. 4. p. 104.—Necck. elem. no. 286.? Common involucres composed of from 1 to 3 leaves, rarely wanting; involucres of 5-6 leaves.—Procumbent or creeping aquatic herbs, with pinnate leaves.

1 H. crâssîpes (Koch, l. c.) stems creeping at the base, ascending; leaves pinnate; upper ones ternate; leaflets obovate, deeply toothed at the apex; umbels 3-5-eilet, without any involucre; pedicels of umbelles stiff, a little thickened at the base, and rather cuneate. H. Native of Corsica, in watery places about Bonifacio and Porto Vecchio; and of Sardinia. Reich. icon. bot. 3. p. 16. no. 365. t. 218. Sium limosum, Moris, in herb. Balk. Sium crâssipes, Spreng. Lois. Flowers white.

Thick-pedicelled Heloscidiæum. Pl. creeping 1 foot.

2 H. soñoflorîn (Koch, umb. p. 126.) stem rooting, pro- cumbent, striated; leaves pinnate; leaflets oblong, equally serrated; umbels opposite the leaves, sessile or on short pedicules; involucre wanting or few-leaved, deciduous. H. Native of O
of many parts of Europe, in ditches and rivulets; plentiful in some parts of Britain. Sium nolidiformum, Lin. spec. 361. Woodv. med. bot. 3. t. 182. Smith, engl. bot. t. 629, but not of the Flora Danica. Sison nolidiformum, Brot. fl. lus. 1. p. 423. Sēsēli nolidiformum, Scop. carn. 2. p. 553. Flowers white. There is a dwarf variety of this mentioned in D. C. fl. fr. 4. p. 300, which is hardly a finger in height; and a large variety, which grows even 15 foot high. This plant was formerly admitted into the London Pharmacopoeia, in the character of an anticorptic, or rather as a corrector of acrid humours, especially when manifested by cutaneous eruptions, and tumours in the lymphatic system. The best proofs of its efficacy are from Dr. Withering. A young lady was cured of a most obstinate cutaneous eruption by taking three large tea-spoonfuls of the juice twice a day; and he has repeatedly given to adults 3 or 4 ounces every morning, in similar complaints, with the greatest success. It is not nauseous, and children take it readily if mixed with milk. In the dose he has given it, it neither affects the head, the stomach, nor the bowels. This plant, therefore, if it should be eaten for water-cresses, does not seem to be very dangerous, or to require all that caution which Miller prescribes, to distinguish it from water-cresses.

Var. δ, ochræum (D. C. prod. 4. p. 104.) stems rather creeping; petioles membranous, and dilated at the base; umbels on rather longer pedicels than those of the species involucrum permanent. 2. W. H. Native of ditches and rivulets about Ludgum. Sium règens δ, D. C. fl. fr. 4. p. 300. This variety is said to be intermediate between H. nolidiform and H. rèpons.

3 H. rèpons (Koch, l. c.) stem prostrate, rooting; leaves pinnate; leaflets roundish, deeply toothed; umbels on long peduncles, opposite to the leaves; involucrem of 2-4 ovate-lan-ccolate permanent leaves. 2. W. H. Native of France, Denmark, and Germany. In Britain in boggy meadows, or on watery commons; on Bulington Green and Cowley Bottom, near Oxford; on Coldham Common, Cambridgeshire; on Goldington Green and Stevington ponds; at Fisher Row and on Guil- lon Links, near Edinburgh; and in ditches near Forfar. Sium rèpons, Lin. fil. suppl. 181. Fl. dan. 1513. Jacq. auct. 3. t. 360. Smith, engl. bot. t. 1381. Peduncles of umbels equal to the naked part of the petioles, which are in H. nolidiformum much shorter. Flowers white.

4 H. inundatum (Koch, l. c.) stems creeping; leaves pinnate; leaflets of the submersed leaves capillaceously multifid; those of the emerged ones cuneiform and deeply trifid; umbels opposite the leaves; peduncles bearing 2 rays or umbels, without an involucrum; umbellules 5-flowered. 2. W. H. Native of Europe, in marshes, bags, ditches, pools, and wet ground over-flowered in winter; plentiful in some parts of Britain. Siam inundatum, Wigger's, Holnat. p. 24. Hydrocotyle inundatum, Smith, fl. brit. 1. p. 290. Engl. bot. t. 227. Fl. dan. t. 89. Sion inundatum, Willd. Meinn inundatum, Spreng. umb. spec. 113.—Pl. arm. t. 61. f. 2. Flowers white.

6 H. Califormiæ (Hook. et Arn. in Beech. bot. p. 143.) plant procumbent? leaves pinnate, with 8-11 ovate, acute, deeply serrated leaflets; lower leaflets pinnatifid or pinnate, with few leaflets; umbels lateral and terminal; involucra and involucels of many leaves; styles dilated. 2. B. H. Native of North California, and on the low moist soils of the Columbia. The plant has a good deal the habit of H. rèpons. Douglas says the stems are 2-3 feet high, from which expression it may be inferred that the plant is not procumbent.

Califormiæ Helosciadium. Pl. 2 to 3 feet.

SECT. II. CYCLOSPERMEÆ (from κύκλος, kyklos, a circle, and σπέρμα, sperma, a seed). Lag. am. nat. 2. p. 101. D. C. prod. 4. p. 105. Both the involucra and involucels are wanting. Fruit quite glabrous.

8 H. laciniätum (D. C. mem. soc. genev. vol. 4.) plant glabrous, erect; leaves many times territorially divided: leaflets cut, oblong-linear: caulline leaves all petiolate; umbels sessile, opposite the leaves, 3-rayed, one-half shorter than the petioles. 2. H. Native of Peru and of Chili, in stony pastures. Berttero, herb. no. 101. Poccp. no. 93. p. 281. Very like H. leptophyl-ium, but differs in the leaflets being broader, and in the petioles of timble. Sison laciniátum, Lher. herb. in herb. Dumb.

Jiggled-leaved Helosciadium. Pl. 1 foot.

9 H. k. nunculiformium (D. C. prod. 4. p. 105.) plant glabrous, erect, dichotomous; lower leaves bipinnate: upper pinnate and tereate, opposite; leaflets cuneate at the base, cut into acuminate lobes; umbels rising from the forks of the branches, on short peduncles. 2. W. H. Native of Chili, on the Andes in Rio Salado, in the province of Cordova; and in the conception. H. lateriflora, Hook. et Arn. Some of the petals are entire, and some of them somewhat emarginate, from the point being bent in such a manner. Calyx obsolete. Fruit cor- datate at the base when young, more compressed, and less ribbed than in the rest.
Crownfoot-leaved Helosciadium. Pl. 1 foot.

10. **H. tenerrimum** (D. C. prod. 4. p. 105.) plant glabrous, erect; leaves bipinnate; leaflets tripartite; lobes oblate, obtuse, small; umbels opposite the leaves, sessile, 3-5-rayed; rays elongated.—Native of Nipaul on the high mountain of the Philippines. Sison? Téner, Wall. mss. Herb 6-8 inches high. Sheath of petals dilated and membranous. Fruit small, ovate, glabrous in the immature specimen. Styles very short.

**Tender Helosciadium.** Pl. ½ foot.

11. **H. Ruta** (D. C. prod. 4. p. 106.) stem multiple, diffuse; leaves biterminate; lower ones on long petioles; lobes oval, confluent a great way, obtuse; upper leaves on short petioles, with oblong lobes; umbels opposite the leaves, sessile, 3-5-rayed; rays elongated.—Native of the Cape of Good Hope. Simum foster (Rutaceae) from the axis, pedunculate, 4-5-rayed, without any involucrum.—Native of Nipaul, on the high mountain of the Philippines. Sison? Téner, Wall. mss. Herb 6-8 inches high. Sheath of petals dilated and membranous. Fruit small, ovate, glabrous in the immature specimen. Styles very short.

**Rac-leaved Helosciadium.** Pl. diffuse.

12. **H. Heyneanum** (D. C. prod. 4. p. 106.) stem nearly simple, erect; leaves on long petioles, ternate; leaflets oblanceolate, acuminate, deeply toothed; umbels on long peduncles, opposite, with 5-6 elongated rays; and the umbellules 5-8-flowered. O. H. Native of the East Indies, but in what place is unknown. Pimpinella Heyneana, Wall. mss. Mature fruit not seen. Allied to the following section, but differs in the fruit being glabrous while young.

**Heyne's Helosciadium.** Pl. 1 foot.

**Sect. III. Trachyscia'dium** (from *trachys*, trachys, rough, and *skaidion*, an umbel; in reference to the tough fruit of the species). D. C. prod. 4. p. 106. Both involucre and involucres are wanting. Fruit rough from short stiff hairs.

13. **H. trifoliatum** (D. C. prod. 4. p. 106.) stem glabrous, branched, erect; lower leaves 3-5-parted, the rest ternate; leaflets nearly sessile, ovate-lanceolate, smooth above, but scabrous from pili along the nerves beneath, deeply toothed; teeth mucronate; fruit ovate, scabrous from rigid pili.—Native of Nipaul, on the higher mountains about Gosaingtham. Pimpinella? trifoliata, Wall. mss. Umbels terminal, and opposite the leaves, 6-8-rayed. Styles very short. Fruit rather didymous.

**Trifoliata Helosciadium.** Pl.

14. **H. pubescens** (D. C. prod. 4. p. 106.) stem erect, multiple, pubescent, as well as the petioles, rays of umbel, and under side of leaves; lower leaves ternate; leaflets ovate, toothed, stalked; upper leaves on long petioles, ovate-cordate, toothed, rarely cut; fruit scabrous.—Native of Kumaon, in the East Indies. Pimpinella pubescens, Wall. mss. Very like the preceding, but differs in the pubescence and structure of the leaves. The immature fruit has only been seen.

**Pubescent Helosciadium.** Pl.

Cult. Those species belonging to the first section of the genus being aquatic perennial plants, should be grown in ponds of water; the rest being annual, the seeds of them should be sown in any warm situation.

**XLII. DISCOPLEURA** (from *δίστος*, díston, a disk, and *πλεύρα*, pleúra, a rib; the 2 lateral nerves of the fruit form a disk on both sides of the fruit). D. C. coll. mem. 5. p. 58. t. 8. 6 and 9. prod. 4. p. 106.—Amphi species of Michx. Ell. & C.

**Lin. syst.** Pentádria, Digynia. Margin of calyx obsolete. Petals elliptic, entire. Styles permanent, short. Fruit compressed from the sides, ovate; mericarps with 5 hardly prominent ribs: having one vitta in each furrow between the ribs. Seed convex on the outside, and flattish on the inside; carpophore bicipal at the apex.—Glabrous, slender, smooth, erect North American annual herbs. Stems terete. Leaves multifid; leaflets linear. Umbels pedunculate, opposite the leaves, and terminal, with few rays, destitute of involucre: rays of umbellules few and unequal; involucres short, few-leaved. Flowers small, white.

**§ 1. Fruit neither scabrous nor echinated.**

1. **L. inermis** (Nutt. in litt. ex D. C. prod. 4. p. 107.) fruit o o 2

**Fennel-leaved Psychotis.** Pl. 1 foot.

5 P. *Ajowan* (D. C. menl. soc. gen. vol. 4.) stem erect, dichotomous; leaves few, cut into multifid linear segments: upper leaves pinnatifid; umbels of 7-9 rays; leaves of the involucre linear, univalved. *O. H.* Native of the East Indies, where it is called *Jaranca, Ajowan, Ajowan or Ajowain.* Ligísticum Ajowan, Rexb. hort. beng. p. 21. Athamántha Ajowan, Wall. *Ligísticum Ajáváin,* Schultes, syst. 6. p. 556. Fleming, ind. med. in asiarch. 1. p. 170, jour. bot. 4. p. 200. *Ajava-seed,* Pereiv. ess. 1. p. 453. Very like *P. Cópicea,* but differs in the stem being less leafy, in the umbels being of fewer rays, in the rays being puberulous, and in the fruit being more ribbed, but puberulous tubercular in the same way. The fruit of this plant is prescribed in India in diseases of horses and cows.

**Ajowan Psychotis.** Pl. 1 to 2 feet.

6 P. *Roxburghiána* (D. C. prod. 4. p. 109.) stem erect, dichotomous; leaves ternate; leaflets deeply pinnatifid; lobes oblong-linear; umbels of 6-8 rays; leaves of involucre few, linear, univalved. *O. H.* Native of and cultivated in various parts of India, but particularly in Bengal, in the island of Singapure, and the mountains of Prone, &c. ex Wall. *Azipium involucratum,* Roxb. ex jour. bot. 1824. vol. 2. p. 188. Athamántha Roxburghiána, Wall. *Ligísticum* et herb.

**Roxburgh’s Psychotis.** Pl. 1 to 2 feet.

7 P. *Achilleefólia* (D. C. prod. 4. p. 109.) stem erect, a little branched; leaves bipinnate; leaflets pinnatifid; lobes linear-subulate, trifid, stiffish; umbels of 6-8 rays; leaves of involucre few, linear-lanceolate; fruit glabrous, rather munitate on the back along the ribs. *O. H.* Native of Nipaul and Kamaon. Athamántha achilleefólia, Wall. *Ligísticum* et herb. A very distinct species, but the fruit on the specimen examined not being mature, the genus to which it belongs is still rather doubtful.

**Mitfyl-leaved Psychotis.** Pl. 1 foot.

**Sect. III. Heteróptycha (from írispec, heteros, variable, and πτέρυx, ptyche, a plait; in allusion to the middle nerve of the petals being lamellate above, and varying in this respect from the rest of the sections).** D. C. prod. 4. p. 109. Universal involucre none. Teeth of calyx nearly obsolete. Petals rather emarginate, having the middle nerve lamellate above. Fruit cedinated by bristles. Styles long, diverging a little.—Perhaps a proper genus. Mature fruit unknown, and therefore also the vittæ.

8 P. *piringállla* (D. C. prod. 4. p. 109.) stem erect; leaves and rays of umbel beset with short hairs in every part. *O. H.* Native of the Levant, about Bagdad. Rays of umbel 6-9 lines long; and those of the umbellules 2 lines long.

**Puberulous Psychotis.** Pl. 1 to 2 feet.

9 P. *Barbáta* (D. C. l. c.) stems erect, and are as well as the lobes of the leaves glabrous; but with the sheath of the petiole and limb of the leaf at the origin of the leaflets bearded with soft hairs. *O. H.* Native of the Levant, between Bagdad and Kermancha. Rays of umbel 5-6 lines long, and those of the umbellules hardly 2 lines long. Perhaps only a variety of the preceding species.

**Bearded Psychotis.** Pl. 1 foot.

10 P. *Vargasaína* (D. C. l. e.) stem much branched, erect, glabrous as well as the leaves; leaves pinnate, leaflets cuneate, cut at the apex; involucre almost wanting; fruit clothed with short pubescence. *O. H.* Native of South America, about Caracas, where it was collected by Vargas. Perhaps this plant belongs to a different section of the genus.

**Vargas’s Psychotis.** Pl. 1 to 2 feet.

**Cult.** The species being natives of rather warm latitudes, their seeds will require to be sown in warm sheltered situations, or they may be reared in a hot-bed in spring, and the plants afterwards planted out in the open border in May.

**Lin. syst. Pentáduria, Gignquina.** Margin of calyx 5-toothed; the tube in the sterile flowers wanting, but those in the fertile flowers are cylindrical. Petals obovate, curved, emarginate, with a broad recess, having the terminating segment reflexed. Styles divaricate. Fruit oblong, compressed from the sides; mericarps furnished with 5, filiform, equal ribs: lateral ribs margination; carphopore free, bifid; furrows between the ribs furnished with 1 filiform vitta each. Seed tetely convex, flatish in front.—Glabrous, perennial herbs. Leaves pinnate; leaflets broad-linear, decrement, carliginato-serratæ. Umrels opposite the leaves and terminal, compound, of many rays; involucre of many leaves; involucelles somewhat dimidiate, in consequence of the inner leaves being small. Flowers white, having hermaphrodite, fertile ones, and male sterile ones in the same umbelle. This genus differs from *Sium* in the petals being curved, in the furrows of the fruit being furnished with 1 vitta each, and in the carphopore being free and bifid.

† *Species hardly known.*

3 F. *Jaya’ká* (D. C. prod. 4. p. 110.) leaves pinnate or bipinnate; leaflets ovate-oblong, deeply serrated; umbels opposite the leaves; involucre wanting; but the involucelles are of many setaceous leaves. *B. B.* Native of Java, in marshes, where it is called *Teispang* by the natives. *Sium Javanicum,* Blum. biîdr. p. 881. The furrows of the fruit are furnished with 1 vitta each, and the commissur with 2, as in the following species.

**Java Falcária.** Pl. 1 to 2 feet.

4 F. *Lacíniáta* (D. C. prod. 4. p. 110.) leaves bipinnate; leaflets pinnatifid; umbels opposite the leaves; involucre wanting; involucelles of many setaceous leaves. *B. B.* Native of Java, in the province of Bataar, in marshes. *Sium lacíniátum,* Blum. l. e. Perhaps a species of Oeválthe.

**Jagged-leaved Falcária.** Pl. 2 to 3 feet.

5 F. *Diversifólia* (D. C. l. c.) superior leaves ternate;
leaves petiolar, quite entire, some linear and others filiform. 2. H. Native of Nipaul. Sison? diversifolius, Wall. miss. Stem much branched. Herbs glabrous. Lower leaves unknown. Fruit ovate. Flowers all hemiphrapodite. Mature fruit not seen, and therefore the ovit are not well known. Both the involucru and involucres are composed of a few linear, short, acute, undivided leaves.

Diverse-leaved Falcaria. Pl. 2 feet. Cult. The two first species will grow in any soil, and under any circumstance. Those natives of Java will require to be grown in a stove.

XLVI. SISON (from sismo, Celt. a running stream; some plants formerly contained in this genus were inhabitants of running streams). Log. am. nat. 2. p. 103. Koch, umb. p. 123. D. C. prod. i. p. 110. — Sison species, Lin. and all other authors. Lin. syst. Pentandra, Digynia. Margin of calyx obsolete. Petals roundish, curved, deeply emarginate, with an inflexed point. Styles very short. Fruit compressed from the sides, ovate; mericaps with 5 filiform equal ribs; lateral ribs marginate: having one short, club-shaped vitta in each furrow between the ribs; carpophore bipartite. Seed gibbous convex, flattish in front. — Herbs pinnately branched. Leaves pinnate; lower leaflets a little lobed, toothed, or cut: upper ones linear, multifid. Both the involucres and involucres are composed of few leaves. Umbels of 4 unequal, elongated rings; and the umbellules of 4-5 short rays.

1 S. asio (Lin. spec. p. 362.) stem erect, terete, pinnately branched; leaves pinnate; lower leaflets rather lobed and toothed; upper ones linear-multifid; upper leaves ternate. 3. H. Native of Britain, France, Italy, Sicily, Greece, &c. in fields, on a dry calcareous soil; in Britain not unfrequent in rather moist spots under hedges, where the soil is marly or chalky. Jahnr. jov. vind. 3. t. 17. Haym. term. bot. t. 36. f. 10. Schkuh, handb. t. 65. Smith, engl. bot. t. 504. Sium aromaticum, Lam. dict. 1. p. 405. Seléi Anémonum, Scop. carn. ed. 2. no. 355. Centa Amomum, Crantz, anst. p. 96. Smyrnium heterophyllum, Menuch, meth. p. 97. Flowers cream-coloured. Seeds aromatic and pungent when dry and ripe; but in an early state they, like the whole herb, have a peculiar nauseous smell.

† Doubtful species.

2 S. Sieberiicum (D. C. prod. 4. p. 111.) plant glabrous, dwarf; leaves almost radical, ternate, or tripinnate; segments approximate, cuneated at the base, very blunt at the apex, cre- nately toothed, or somewhat cut; involucrum wanting. 0. ? H. Native of Camilia, on the tops of the Sphacetic mountains. Sison alpinus, Sieb. in Schultes, syst. 6. p. 414. Peucédanum Créticum, Sieb. herb. cect. 1826. Speng. nev. cect. 2. p. 148. From the immature fruit this appears to be a species of Cúrum or Brinum, the fruit being compressed from the margin, not from the back. Stem a finger in height. Umbels 4-5-rayed. Stecher's Stone-parsley. Pl. 3/4 foot.

3 S. Trinerve (Hamilt. ex D. Don. prod. fl. nep. p. 184.) stem erect, terete, dichotomous, striated, nearly naked; leaves all radical, pinnate; leaflets lanceolate, acute, quite entire, 3- nerved, glabrous; involucres 5-leaved; leaves of involucres lanceolate, awned. 2. H. Native of Nipaul, about Bassaria. The fruit is undescribed, and the genus is therefore doubtful. Three-nerved-leaved Stone-parsley. Pl. 1 foot. Cult. The seeds of the species only require to be sown in spring, in any common earth.

Lin. syst. Pentandra, Digynia. Margin of calyx obsolete. Petals elliptic, terminated by a short inflexed point. Stylopodium conical. Styles erect, rather capitate at the apex, permanent, at length diverging. Fruit cylinodically prismatic, the transverse section nearly terete; mericaps somewhat compressed from the sides, and furnished with 5 filiform, exserted ribs: the 2 lateral ribs nearly marginal: having the furrows between the ribs flat, and furnished with 1 vitta each. Carpophore undivided. Seed nearly terete. — Smooth perennial herbs. Leaves either radical, or from the lower part of the stem, bipin- nate; leaflets many-parted, decussate at the radius: segments linear, acute. Umbels terminal, on long peduncles of many rays. Both the involucra and involucres are composed of many multifid leaves; the lobes linear and acute. Flowers white, all fertile.

Lin. syst. Pentandra, Digynia. Margin of calyx obsolete. Petals obovate, emarginately 2-lobed, with an inflexed point; lobes of petals unequal, irregular, those of the outer part of the umbel usually the largest. Fruit ovate-oblong, compressed from the sides; mericaps furnished with 5 equal, filiform ribs; lateral ribs marginating: having the furrows between the ribs furnished with one vitta each; carpophore free, bipartite. Seed teretely convex on the outside, and flattish in front. — Herbs with the habit of Daucus, having fusiform roots and pinnate or many-parted leaves. Umbels compound, of many rays. Both the involucra and involucres are of many leaves; the leaves of the involucrum trifid or pinnatifid. Flowers white.

2 A. cicutefolium (Lin. spec. 319. exclusive of the syno- nyme of J. Bauh.) stem glabrous; leaves all pinnate, jagged; segments narrow-linear, acute, and a little serrated. 3. H. Native of France, at Lucon (Guett. etamp. 2. p. 433.), about Paris (Thuill. par. 137.) Andegavenny (Bast. ess. 105.) Rouen, Namastes, and in Dauphiny (Vill. dauph. 2. p. 592.), Greece, (Smith, prod. fl. grace. 1. p. 185.), Spain at Aranquez, Sicily, Liguria. This species differs from A. măjus in the characters mentioned above, and in the more branched habit and glaucous
hues. There is a monstrous variety of this species, found about Rouen, which has the 2 carpels changed into petals, besides having also the usual number of petals.

**Glaucus-leaved Bishop's-weed.** Pl. II. June, July. Cit. 1816. Pl. 2 to 3 feet.

3. *A. intermedius* (D. C. prod. 4. p. 113.) plant glabrous; leaves all decomposed, many-parted, greenish; segments cut or toothed: lower ones cuneate: upper ones linear-subulate, serrated, and ending in long tapering points. ○ H. Native of the Pyrenees, and the kingdom of Naples. *A. glaucifolium*, Lapey. fl. Paris. p. 114. An intermediate plant between *A. glaucifolium* and *A. Visnaga*. It differs from the first in the leaves being greenish, not glaucous, and in being tripartite; from the last in the lobes or leaflets of the upper leaves being much acuminate and serrated, and in the umbel spreading after flowering.

**Intermediate Bishop's-weed.** Pl. 1 to 2 feet.

4. *A. Visnaga* (Lam. dict. 1. p. 132.) stem terete, straited, glabrous; leaves decomposed; lobes or leaflets linear, cuspidate, divaricate: rays of umbel contracted after flowering, and indurated. ○ H. Native of the south of Europe, in fields; north of Africa, Caezcus near Kuby, and in plains towards the Caspian Sea, and the Levant; and also in Chili, at Mendoza and Hacienda de Vasquez, between Casa Blanca and Valparaiso. D. C. fl. fr. 4. p. 592. Dauces Visnaga, Lam. spec. 594. Jacc. hort. vnd. 3. t. 26. Visnaga daucoides, Gardn. fruct. 1. p. 92. t. 21. Visnaga, Vill. daurph. 2. p. 594. Daucus gingidium, Lin. herb. ex Smith, Gohonis, Neck. clem. no. 287.—Gardin, abr. t. 36.—Lob. icon. 726. f. 1. Umbels often not very much above the leaves. Receptacle of the rays of the umbel not much dilated. Rays crowded, very numerous, and at length they become so hard as to be used as tooth-picks, hence the name of the plant in France herbe aux eure-dents. In Spain, when they have served this purpose, they are chewed, and thus are supposed to be of service in cleaning and fastening the guns; however this may be, the leaves have a pleasant aromatic taste in the mouth. Flowers with white petals and purplle anthers.

5. *A. daucoides* (Salzm. pl. exsic. ann. 1825. ex D. C. prod. 4. p. 115.) stem terete, straited, muralcated, having a few scattered bristles at the top of the petioles and branchlets; leaves bipinnate, rather ciliated; leaflets linear, cut, acute; leaves of involucres either simple or trifid; fruit covered all over with small, obtuse tubercules. ○ H. Native about Tangiers. Habit almost of *Daucus*. Umbels nearly as in *A. Visnaga*, having the receptacle of the rays of the umbel thickened, and the rays very numerous. Fruit ribbed, as in the rest of the genus, but differs in being muralcated.

**Carrot-like Bishop's-weed.** Pl. 2 feet.

6. *A. Crinitum* (Guss. pl. rar. p. 128. t. 25. prod. 332.) stem terete, straight, glabrous, rather seose at the apex; leaves supra-decomposed; leaflets linear-setaceous, glabrous; petals biseriote; margins of the sheaths of the petals scarious; fruit glabrous, somewhat tetragonal. ○ H. Native of Calabria and Sicily, in fields. Leaves of involucrum multifid, reflexed. Flowers yellow in the dry state, as in *Daucus aures*. **Hairy Bishop's-weed.** Pl. 2 to 4 feet.

8. *A. petiolum* (D. C. prod. 4. p. 115.) stem erect, angular, leafy, glabrous; leaves bipinnate; segments or leaflets pinnatifid; lobes linear; umbels opposite the leaves, pedunculate; leaves of involucres numerous, with scarious margins, and are rather scarious, as well as the rays; some of the leaves of the involucra are trifid at the apex. ○ H. Native of Portugal, in sandy places, at the river Tavora, and elsewhere in Beira. Sisón pumilus, Brot. fl. Ins. 1. p. 695. Fruit, according to Brébner, like that of *Daucus*. Lower leaves like *A. glaucifolium*. Petals obvate, unequally obcordate. Herb a foot high, not dwarf. This is joined by Sprengel with *Psychotis cisticarii*, but it is very distinct from that plant; but from the obsolete teeth of the calyx, and from the leaves of the involucrum being sometimes trifid, it comes nearest to the present genus, although it may hereafter form a proper genus, from the fruit being much more angular?

**Dwarf Bishop's-weed.** Pl. 1 to 1¼ feet.

9. *A. Broussonetii* (D. C. prod. 4. p. 113.) stem erect, terete, leafy, glabrous, branched; lower leaves unknown; upper ones triplicate: lobes cuneate-oblong, entire or trilobulate; leaves of involucrum linear or rarely trifid; young fruit rather scarious from adpressed short hairs. ○ H. Native of Africa, probably about Mogador. Habit nearly of *A. supinus* and *A. glaucifolium*, but the involucra are very different.

**Broussonet's Bishop's-weed.** Pl. 1 to 2 feet.

10. *A. cicuta* (Willd. rel. in Schultes syst. 6. p. 531.) stem angularly-furrowed, quite glabrous, furnished with few leaves; leaves teramately tri-pinnatifid; ultimate segments lanceolate, very acute, trifid; umbels with 6-8 rays; leaves of involucrum bipinnate: having the lobes or leaflets linear, and deeply toothed. ○ H. Native of South America, but in what place is unknown. Plant small. Schlecht in litt. Petioles 3 to 4 inches long. Rays of umbel stiff, angular, shorter than the involucrum. Leaves of involucre pinnatifid or trifid. Fruit ovate, compressed from the sides, glabrous, glabrous, diverging. Ribs of mericarps rather prominent, having the furrows between the ribs furnished with 1 vitta cava, and the commissure with 2 vitae.

**Cicuta-like Bishop's-weed.** Pl. 1 foot.

* Species not sufficiently known.

11. *A.? Pyrenaicum* (Lapeyr. abr. p. 145.) stem glabrous, flexuous; leaves somewhat bipinnate; lobes or leaflets entire or cut, ultimate ones decurrent; leaves of involucres setaceous or trifid, twice the length of the umbellules. ○ H. Native of the Pyrenees, in fields about Madrres and St. Bent. The petals are said by La Peyrouse to be rounded (arrondis) which indicates that the plant does not belong to this genus.

**Pyrenean Bishop's-weed.** Pl. 1 foot.

12. *A. rubricali* (Horn. horit. lafn. 1. p. 272.) stem unknown; leaves somewhat verticillately tripinnate: leaflets capillary; leaves of involucrum compound, longer than the umbellules. ○ H. Native of North America, near Baltimore. Perhaps the same as *A. anethiifolium*.

**Red-stemmed Bishop's-weed.** Pl. 1 to 2 feet.

* Cult. The species of *Annu* are very showy while in flower; the seeds of them only require to be sown in the open ground early in spring.
distinct, conical, terminated by the long deflexed styles. Fruit compressed from the sides, ovate; mericarps with 5 filiform ribs; lateral ribs marginating; furrows between the ribs destitute of vitreous. Carpophore setaceous, forked at the apex. Seeds teretely convex on the outside, and flattened on the inside. Branching herbes, with creeping roots. Leaves binate or trinerved; upper cauline ones ternate: leaves ovate-oblong, acuminate, serrated. Umbels composed of many rays. Both the involucra and involucels are wanting. Flowers white: anthers when young purple.

1. **Æ. podagrária** (Lin. spec. p. 379.) stem furrowed; leaves binate or trinerved; leaflets oblong-serrate, unequal at the base, lower ones bilobate. 2. H. Native throughout the whole of Europe, even to Caucasus and Siberia, in hedges and orchards. Very common in some parts of Britain. Oed. fl. dan. t. 670. Smith engl. bot. t. 946. Schkuhr, hamb. t. 79. Riv. t. 47. Tragoselinum anglicum Lam. fl. fr. 3. p. 419. Pimpinêlla angelicafolia, Lam. dict. t. 1. p. 451. Ligusticum podagrária, Crantz, ann. 200. Sesel zygópodium, Scop. carn. 2. no. 329. Podagrária zygópodium Ménch. Meth. p. 90. Sison Podagrária Spreng. umb. prod. p. 35.—Lob. icon. t. 700. f. 2. The plant is called Herb Gerard, Gout-weed, Ash-weed, or Ash-weed, and Wild Masterwort, and being a great creeper, it cannot be admitted of gardens, for after it gets hold it is next to impossible to eradicate it again. Though it has the quality of most umbelliferous plants, of being aromatic, yet it is not used at all in medicine; nor has it any title to its name gout-weed, though the Germans formerly used it to assuage the pain both of the gout and piles. Lineus says it is eaten in Sweden, boiled for greens, when tender in the spring. The roots are sometimes sold for those of the true Masterwort, the *Imperinnium Ostreichanum*. Gout-weed. Fl. May, July. Britain. Pl. 2 t. 26 feet. on

2. **Æ. alpéstre** (Led. fl. Ross. alt. ill. t. 7. fl. alt. 1. p. 354.) stem smooth; lower leaves ternately pinnate; leaflets ovate, cut, lower and terminal ones somewhat tripartite; upper leaves ternate, having the leaflets pinnate at the base, but drawn out at the apex, and nearly entire. 2. H. Native of Altai, in shady places on the north sides of the mountains near Riddersk, about the fountains of the rivers Uba and Tscharayich. Root creeping. Flowers white.

**Cult.** The plants will grow under any circumstance.

L. **CARUM** (so named from Caria, in Asia Minor; originally found there) Kock, umb. 121. D. C. col. 1005. 5. p. 41. prod. 4. p. 414. Cárâm, Sison, and Búnum species of Lin. and Hoffm.—Cárum and Sium species of Spreng.

**Lin. syst.** *Pentândria Digynia*. Margin of calyx obsolete. Petals regular ovobo, emarginate, with an infused point. Stylopodium depressed; styles deflexed. Fruit contracted from the sides, ovate or oblong; mericarps furnished with 5 filiform, equal ribs; lateral ribs marginating; having the furrows between the ribs furnished with one vitta each, and the commissure, which is flat, with two vittae. Carpophore free, forked at the apex. Seed terete, convex on the back, and flatish in front. Herbs glabrous, usually perennial. Roots tuberous, edible. Leaves pinnate; segments or leaflets multiform. Both the involucra and involucels are variable. Flowers white.

**Sect. I. Cáróm** (an alteration of the generic name). D. C. prod. 4. p. 115.—Cárâm, Lin.—Cárum, Adans. fam. 2. p. 98. Involucrum wanting; involucels wanting, or of very few leaves. 1 C. **Cári** (Lin. spec. 378.) root fusiiform; leaves bipinnate; leaflets decussate, multifid; stems furrowed; involucra and involucels wanting. 2. H. Native throughout the whole of Europe, in meadows and pastures; and of Altai, in dry grassy places at the river Tscharayich. Frequent in Britain, but is only a naturalised plant. Fl. dan. 1091. Smith, engl. bot. t. 1503. Nees, off. pil. t. 17. Mart. rust. t. 55. Hayn. arzn. gel. t. 19. Woodry. med. bot. long. rust. t. 353. A. pium Cárvi, Gram. ust. Cárvi, Scop. carn. no. 361. Búnum Cárvi, Bieb. fl. taur. 1. p. 211. supp. p. 206. Legêaëa cuminumoides, Willem. ptyt. 1. p. 254, but not of Lin. Cárvi, Riv. pent. irr. with a figure. Flowers white. Leaflets of leaves in sixes, appearing rather verticillate. The caraway is called *Carum* in France, Italy, and Scotland, and Kummel in Germany. They are cultivated chiefly for the seed, which is used in confectionary and in medicine. In the spring the under leaves are sometimes put in soups; and in former times the fusiform roots were eaten as parsnips, to which Parkinson gives them the preference.

**Garden culture.**—The plant is raised from seed, of which a quarter of an ounce is sufficient for a seed-bed 4 feet by 6. Now annually, in autumn, soon after the seed is ripe: the seedlings will rise quickly, and should be thinned to a foot distance each way. In default of sowing in autumn, sow in March or April, either in drills or broad-cast; but the plants so raised will not, in general, flower till the following year. When the seed is ripe, the plant is generally pulled up in gathering, especially in field culture.

**Field culture.**—The culture and management of the caraway is the same as that of Coriander. In all probability both plants would answer if sown like clover among a crop of corn, hoed and thinned when the crop was removed, and again in the following spring. The method of culture in Essex is, about the beginning of March to plough some old pasture land; if it has been pasture for a century the better; and the soil should be very strong clayey loam. Twelve pounds of caraway-seed are mixed with ten pounds of coriander, and twelve pounds of teazle-seed; this is sufficient for an acre, and is sown directly after the plough, harrowing the land well. When the plants appear of sufficient strength to bear the hoe, which will not be until about ten weeks after sowing, it must not be omitted; and in the course of the summer the crop will require three hoeings, besides one at Michaelmas. The coriander, being annual, will be fit to cut about the beginning of July. It is left in the field after cutting, and threshed on a cloth in the same manner as rape-seed. About April following the caraway and teazle will want a good hoeing, done deep and well, and another about the beginning of June. The caraway will be fit to cut the beginning of July, and must be threshed in the same manner as the coriander. This compound crop is mostly sown on lands so strong as to require being a little exhastened to make it fit for corn. Caraway and coriander are oftenest sown without teazle; the latter being a troublesome and uncertain crop, and the produce of caraway much greater without it. The produce of caraway, on very rich old leys, in the hundreds or low lands of Essex, has often been twenty cwt. to the acre. There is always a demand for the seed in the London market. The uses of caraway-seed are the same as those of coriander, and its oil and other preparations are more used in medicine. Dr. Anderson says, both the roots and tops may be given to cattle in spring. The seeds have an aromatic smell, and warm pungent taste, and yield much essential oil. They are employed as stomachic and carminative, in flatulent colicky. The oil is used in the same way as other volatile oils.

Var. ε, *elongatum*, segments of the leaves linear, elongated.

Toothed. Petals ovate-lanceolate, quite entire, oblique or inflexed at the apex. Stylodipodium depressed, margined. Styles reflexed. Fruit ovate-oblong, compressed from the sides; mericarps solid, having 3 equal filiform ribs: the lateral ribs margined; with the furrows between the ribs furnished with 3-4 vitte each. Seed somewhat semi-terete, flattish in front; carpopodium bifid at the apex.—An herb with a fusiform root, supra-decompound or bipinnate leaves: having the segments or leaflets divided into many setaceous lobes. Scapes radical. Involucre and involucrals of many leaves. Petals yellow.

Sec. Ll. BULBOCASTANUM (from bulbus, a bulb, and castanea, a chestnut: the root is bulbous, and tastes like a chestnut.) Adams. fam. 2. p. 97, but not of Lag. Both the involucra and involucrals are many-leaved.

* Root bulbous.

Bulboestanum, or Earth-nut. Fl. May, Ju. Pl. 1 to 2 ft.

** Root fasciculate.

4 C. VERTICILLATUM (Koch, umb. p. 122.) root fasciculate, with spindle-shaped branches; stem terete, hardly branched; leaves pinnate; leaflets many-paired; segments crowded in a whorled manner, linear-filiform; leaves of both involucra and involucrals numerous, short, and deflexed. 2. H. Native of the western parts of Europe, from Corsica to Britain; plentiful in the western parts of Scotland and Wales; in Ireland, near Lane bridge, Killarney, and between Bantry Bay and the river Kenmare. Sison verticillatum, Lin. spec. 363. Smith, engl. bot. t. 396. Light. scot. 1096. t. 35. Sium verticillatum, Lam. dict. 1. p. 107. Carvi folis tenerissimis asphodelico radice, Tour. inst. 396. Carvi Lusitanicum, ð. Juss. herb. Sprengel refers to this as Æbútha fátua, Ait. hort. kew, 1. p. 355, or Meum fátum, Pers. ench. 1. p. 319, but it appears to have nothing to do with the present plant. Flowers white.

Cult. The more sandy the soil is the better the species will grow. They are increased either by dividing at the root, or by seed.

LI. CHAMESECIUM (from χίμος, chimaï, on the ground, and ἕλυσσος, skidion, an umbel; in allusion to the plant being dwarf as well as umbelliferous). Meyer, verz. pflanz. p. 122.—Buniurn species of Beib.

Lin. syst. Pentádria, Diçýnia. Margin of calyx obsolete. vol. III.
Divion. Sium viriscens, Spreng. umb. spec. 94. syst. 1. p. 906. and in Schultes, syst. 6. p. 542. Peucedanum Tauricum, hort. par. 1821. Lor et Dus. cat. pl. côté-d'or, p. 37. Peucedanum alpître. Stev. in hist. 1819. Bünium petraeum, Bieb. ex Stev. Sium Cordátûm and Sium viriscens, Lois. fl. gall. ed. 2. p. 194. Petals greenish, nearly entire, at the apex involute; section of fruit nearly terete. Vitae in the outer furrows of the fruit 3; 2 of these are incomplete; and 2 or 4 in the commissure.

Greenish-flowered Earth-nutt. Pl. 1 to 2 feet.

3 B. lutéum (Hoffin. umb. p. 108.) root nearly globose; stem terete, branched; leaves pinnate; leaflets decussate, pinnatifid: lobes linear, very fine; leaves of involucra and involucrals very short, with membranous margins; fruit linear-cylindrical. 2. H. Native of Siberia, in deserts, at the river Don, near the colony of Sarepta. Bünium luteum, Bieb. suppl. p. 297. Sium luteum, Spreng. syst. 1. p. 906. There are 3 vitae in each furrow of the fruit, according to Koch. Petals yellow. Yellow-flowered Earth-nutt. Pl. 1 to 2 feet.

Sect. II. Caroûdes (from Carum, the caraway, and idee, form; plants with the habit of Carum,) D. C. coll. mem. 5. p. 41. prod. 4. p. 116. Involucra usually of many leaves, rarely absent. Flowers white. Stylodipodium depressed: styles diverging. This section is intermediate between the genera Carum and Conopodium.

4. B. carvifolium (D. C. prod. 4. p. 116.) root fusiform, terete, elongated; leaves bipinnate; leaflets divided into many linear acute lobes; stem flexuous, erect, furnished with a few leaves; leaves of involucra and involucrals linear acute. 2. H. Native of Abruzzo, and on Mount Fuart among the Appenines; but not of Sicily, ex Guss. prod. 1. p. 359. Sisón carvifolium, Bert. in herb. Moric. Sisón prolifer, Brochi and Jan. Petals of a greenish white colour when dried. The furrows of the fruit, when immature, are furnished each with 2 or 3 vitae.

Caraway-leaved Earth-nutt. Pl. 1 to 2 feet.

5 B. Glauce’scens (D. C. prod. 4. p. 117.) bulb ovate-oblong; stem erect, straight, terete; branches alternate; leaves glaucous: radical ones bi-tri-pinnate, with multifid leaflets, and linear short lobes; cauleine leaves distant, small, multifid; leaves of involucra as well as of involucrals, 6-7 in number, linear-oblong, acute, white. 2. H. Native of Persia, in grassy valleys among the mountains about Seidkhodzî. Stem ½ foot high. Umbels 10-11-rayed. Flowers white. Glauce’scens Earth-nutt. Pl. ½ foot.

6 B. Paucifolium (D. C. prod. 4. p. 117.) bulb globose; stem erect, straight, terete; branches alternate; superior leaves tripartite, having the lobes linear and entire; upper leaves un-divided, linear; involucrum of 3-4-leaves, and the involucre of 5-6 linear white leaves. 2. H. Native of Persia, in grassy valleys of the mountains about Seidkhodzî. Herb 2 feet high. Lower leaves unknown. Flowers white. Umbels of 1-5 rays. Fruit unknown. Few-leaved Earth-nutt. Pl. 2 feet.

7 B. Apírum (Jan. herb. ex D. C. prod. 4. p. 117.) root nearly globose, thick; stem terete, erect, nearly simple; cauleine leaves striated at the sheaths, reduced to a short limb: both the involucrum and involucre are composed of 4-5 acuminate leaves. 2. H. Native of Sicily, on the Nebrodes. Herb 4 to 5 inches high. Leafless Earth-nutt. Pl. ½ foot.

9 B. Ferulaefolium (Desf. ann. mus. 11. p. 275. t. 50. cor. Tourn. 55. t. 43.) root nearly globose; stem terete, dichoto-mous; leaves all somewhat trinerved: leaflets linear; leaves of involucrum 1-3, of the involucrum 4-5, very short; fruit narrow, cylindrical. 2. H. Native of the islands of Cyprus, Canáia, and Siclo. Sium ferulaefolium, Spreng. in Schultes, syst. 6. p. 539. B. ferulaefolium, Smith. Tuberc about the size of a filbert, rufous on the outside, and white on the inside. Flowers white. Fruit not sufficiently known. The involucrum is very variable in the number of leaves.

Sect. III. Conopodium (from κονος, konos, a cone, and ποις, poïes, puts, pods, a foot; in allusion to the stalk or foot of the style, called the styloïdium or pedicel conicum) D. C. coll. mem. 5. p. 191. prod. 4. p. 117.—Conopodium, sect. 1. Koch, umb. p. 118. Involucrum wanting, or of few leaves. Stylodipodium conical, exserted. Styles short.—Perhaps a proper genus.

12 B. Denuíatum (D. C. fl. fr. 4. p. 525.) root globose; cauleine leaves nearly sessile, with short sheaths and toothed or cut leaflets; involucrals unilaterial, few-leaved. 2. H. Native of the west and south of Europe, and Caucasus, in mountain meadows and grassy pastures and among bushes, especially on a gravelly soil; plentiful in Britain. Myrrhis capitifolia, Guss. fl. sic. 1. p. 531. Myrrhis Bünium, Spreng. umb. spec. 1. p. 131. syst. 1. p. 903. exclusive of numerous synonyms. Bünium flexuosum, With. 291. Smith, fl. brit. 1301. ingl. bot. 988. Bünium bulbacastanum, Huds. angul. 132. Curt. lond. fusc. 4. t. 24. Bünium majus, Goun. ill. p. 10. This species varies much in height. Styles long, pale, short, and reddish. Fruit ovate and oblong. Involucrum wanting, or 1-5-leaved. Segments of the leaves linear and lanceolate, more or less toothed. Sprengel refers Bünium ammonoides, Link. or Myrrhis ammonoides, Spreng. in Schultes, syst. 6. p. 517. to the present plant; and probably Myrrhis tenerrima, Presl, del. prag. 131. is also referrible to it. Flowers white. There are probably numerous species confused under this name. The plant has several names in England, as earth-nutt, pig-nutt, art-nutt, hoppur-nutt, hawk-nut.
UMBELLIFERÆ. LI. BUNIUM. LI. I. CRYPTOÆNIA. LIV. PIMPINELLA.

nut, jat-nut, or yer`nut, earth chestnut, and ground-nut; in Germany it is called erdnuss; in Holland aardnoot; in Sweden jordnöt; in France sarron, terre noire; in Italy castagno di terra; in Spain castano de tierra. Root nearly globular, black, or chestnut-coloured on the outside and white inside; aromatic, sweet, and mucilaginous, with some astringency; they are frequently dug up and eaten by children. Swine are very fond of them, and will soon become fat with feeding on them. When boiled they are very pleasant and delicious, and are supposed to afford great nourishment. Thus prepared, they are said to be eaten in Holland and the Alps, and in some parts of England in soup or broth. Roasted they are even superior to chestnuts.

*Native-stemmed or Common Earth-nut.* Fl. May, June. Britain. Pl. 1 to 2 feet. 13 B. pe'mileum (Smith, fl. grece. 274. prod. 1. p. 187.) root globose; leaves bipinnate: cauleine ones petiolate, pilose; sheaths short; segment of leaves cut and acute; involucre wanting or 1-leaved; involucels many leaves. 2. H. Native of Mount Parnassus. Fruit ovate-oblong. Flowers white.

*Dwarf Earth-nut.* Pl. ½ foot. 14 B. tenuifölium (Salzs. pl. exsic. ex D. C. prod. 4. p. 118.) root unknown; cauleine leaves petiolate; sheaths elongated, glabrous; segments of leaves few, linear, very narrow, elongated, and quite entire; involucels of many leaves. 2. H. Native of Mauritania, about Morocco. Perhaps Bünium ammoids, Link, is referrible to this plant. Flowers white.

*Stiff Earth-nut.* Fl. Ju. Jul. Ch. 1787. Shrubs ½ foot. Cult. A light sandy soil suits all the species best; and they can only be increased by seeds.

LI. CRYPTOÆNIA (from κρυπτός, cryptos, hidden, and τόνια, tónia, vine; the vitre of the mericarps are hidden by a pericarp, and are invisible, unless the mericarps are cut transversely). D. C. coll. mem. 5. p. 42; prod. 4. p. 118.—Conopodium, sect. 2. Koch, umb. 119. Cyrtospermum, Rafin. in litt. 1819.—Alacospèrnum, Neck. elem. no. 276?

LIN. SYST. Pentàndria, Digynia. Margin of calyx obsolete. Petals obovate, emarginate, with an incurved point. Fruit ovate, contracted from the sides, crowned by the pulvinate stylopodium and reflexed styles, which are capitulate at the apex; mericarps with 5, equal, filiform, obtuse ribs: the 2 lateral ribs placed before the margin; vitre in furrows between the ribs numerous, covered by a somewhat corky pericarp, but closely adnate, and only visible when the carpels are cut transversely. Seed teretely convex, flattish in front. Carpinophore free, bilabed at the apex.—Perenial, glabrous, erect herbs. Roots not bulbous. Leaves ternate; leaflets ovate, crenately toothed: teeth mucronate. Umbels numerous, almost disposed in a panicle. Rays of umbels and umbellules few, very unequal. Involucre wanting; involucels few-leaved. Flowers white.

LIN. SYST. Petántradingia, Digynia. Margin of calyx obsolete. Petals obovate, emarginate, with an incurved point. Fruit ovate, contracted from the sides, crowned by the pulvinate stylopodium and reflexed styles, which are capitulate at the apex; mericarps with 5, equal, filiform ribs: lateral ribs marginaing; having the furrows between the ribs furnished with many vittae; carpinophore free, bilabed. Seed gibbously convex, flattish in front. —Herbs, for the most part natives of Europe. Roots simple. Radical leaves piniate; leaflets roundish, toothed, rarely undivided; caline leaves more finely dissected than the radical ones. Umbels and umbellules of many rays, without any involucra. Flowers usually white, rarely reddish or yellow.

p 2
2 P. Magna (Lin. mant. 217.) radical leaves pinnate; leaflets serrated and somewhat cut, ovate or oblong; the terminal one 3-lobed. 2. H. Native throughout the whole of Europe, Caucasus, and the Levant, in mountain meadows, pastures, and woods. In Britain it grows chiefly in woods and hedges, in a calcareous soil. Smith, engl. bot. t. 408. Fl. dan. 1155. Haydn. arz. gen. 7. t. 21. Jacc. auct. 4. t. 596. P. major, Mill. dict. no. 1. Gouan. ill. p. 21. P. saxifraga, Spreng. syn. 215. Tragoshelnum major, Monch. meth. 99. -Barrel. icon. t. 248. P. saxifraga, Ray. syn. 213. Petiv. brit. t. 26. f. 5. Saxifraga magna, D. p. penpt. 315. f. 1. This and the following species partake nearly of the same qualities. The root is very acrid, burning the mouth like pepper. It affords a blue oil. Its acrimony has occasioned it to be used to cure tooth-ache, and to clear the skin from freckles. It is chewed to promote the secretion of saliva, and is used in gargles to dissolve viscid mucus in the throat. In Germany it is prescribed in the asthma and dropsy. Flowers either white or reddish.

Var. β, ribens (D. C. prod. 4. p. 120.) flowers reddish. P. rubra, Hoppe, exsic.

Var. 6, orientalis (D. C. 1. c.) leaflets all pinnatifid; lobes lanceolate, acute; flowers white. P. orientalis, Gouan. ill. 15. Jacc. auct. t. 597. Plenck, icon. t. 224. P. medica, Hoffm. ex Spreng.

Var. ε, rosea (Stev. in litt. ex D. C. prod. 4. p. 120.) leaflets acutely and deeply pinnatifid; flowers rose-coloured. Native of Caucasus, at Nartiza. P. dissecta, Bieb. fl. taur. 1. p. 241.

Var. α, nigra (D. C. prod. 1. p. 120.) plant pubescent; leaflets of lower leaves ovate, serrated, somewhat lobed, rather coriace at the base; the upper leaves pinnatifid; root black. P. nigra, Willdl. spec. 1. p. 1471.—J. Bauh. hist. 3. p. 111. f. 2.

Var. γ, hircina (D. C. 1. c.) plant rather pubescent; leaflets of nearly all the leaves pinnatifid or jagged. P. hircina, Monch. sass. no. 255. P. Genevéniss, Vill. dauph. 2. p. 604.

Var. δ, dissecta; leaflets all pinnatifid, with narrow segments.

Stem erect, branched, dichotomous; branches filiform, twiggy, almost leafless. Flowers yellow, with an aromatic odour.

5 P. Aurea (D. C. prod. 4. p. 120.) lower leaves pinnate, glabrous; leaflets cuneate, 2-3-lobed at the apex; teeth large, few, mucronate; cauline leaves trïfïd or undivided and linear, few; petals ciliated, hardly emarginate. 2. H. Native of Persia, in gravelly places at Pshoi, in the province of Aderdâljan. A very distinct species, with yellow flowers, differing from P. Major in the plant being glabrous, in the form of the leaflets, and in the petals being ciliated. Fruit subglobose, dymous, compressed, furnished with many vitae in the furrows. There is a variety with smaller bipinnate leaves, also a native of Persia.

Golden-flowed Burnet-saxifrage. Pl. 2 to 3 feet.

6 P. Ramoſisima (D. C. 1. c.) plant glabrous; lower leaves pinnate; leaflets ovate-rhomboid, rather trïfïd, acuminate, quite entire at the base, deeply toothed at the apex, some of them crossed in a decussate manner; stem much branched; the leaves under the branches reduced to short ligule; umbels 5-rayed; fruct glabrous, ovate, not contracted at the commissure. 2. H. Native of Persia. Flowers unknown. Transverse section of fruit terete, as in the genus Stellâ, but without either involucrum or involucel, but with the habit of Pimpinella. Leaves like those of Tussilago farfara. Perhaps a proper genus.

Much-branched Burnet-saxifrage. Pl.

7 P. Anisoides (Brign. act. acad. neap. 1819, vol. 1. p. 1. t. 1.) plant glabrous; radical leaves bipinnate; leaflets roundish-ovate, serrated; umbels numerous; styles erect; fruit glabrous. 2. H. Native of the kingdom of Naples. It differs from P. bubonoides, ex Guss. prod. 1. p. 331., in the fruit being glabrous, in the styles not being divericate, and in the stigmas not being globose.

Aisne-like Burnet-saxifrage. Pl. 1 to 2 feet.

8 P. Depressa (D. C. prod. 4. p. 120.) stem pubescent; radical leaves pinnate; leaflets cuneate, pinnatifid, smoothish, ciliolate; lobes lanceolate, obtuse; cauline leaves pinnatifid, 1 under each branch; fruit rather puberulous from small, adpressed bristles. 2. H. Native of Candia, on the Spachiote mountains. Tragium depressum, Sieb. exsic. exsic. Spreng. in Schulz. syst. 6. p. 392. Herb 1-2 inches high. Stem terete. Root woolly. Flowers white.

9 P. Noosa (D’Ur. enum. or. p. 33.) plant glabrous; stem branched, dichotomous; leaves many-paired, with linear segments; umbels numerous; petals glabrous; fruit small, ovate, with a few adpressed hairs. 2. H. Native of the Island of Sogos, among stones, frequent, and on the old walls of cities. In the place of the stem where the involucrum ought to be, there is a thick tuberous knot, probably caused by insects.

Nodose Burnet-saxifrage. Pl. 1 foot.

10 P. Tragium (Vill. dauph. 2. p. 606.) stem canescent; radical leaves pinnate, smoothish; leaflets cuneate-obovate, deeply serrated, usually variously cleft; cauline leaves very few; petals pilose on the outside; fruit clothed with canescentomentum. 2. H. Native of the south of France, Italy, Sicily,

Var. β, glauca (D. C. prod. 4. p. 121.) plant of a canescent glaucous hue: radical leaves pinnate; leaflets roundish-ovate, somewhat 3-lobed, toothed, pubescent on both surfaces, the 3 or 4 superior lobes linear; petals and fruit clothed with adpressed villi. 2. H. Native of Sicily, on the Nebrodes. Tragium glaucum, Presl, del. frag. p. 125. Flowers white. Allied to P. Cumbre, but the leaflets are all 3-lobed, and the terminal one deeply so.

Var. γ, laevicrata (D. C. l. c.) leaflets of all the leaves dissected into narrow linear segments. 2. H. Native of Tauria. P. Tragium var. Bieb. suppl. p. 250. P. petraeæ, Beaupr., ined. Perhaps a proper species. The whole plant is clothed with woolly pubescence.

The first leaves are simple, the second ternate, but the succeeding ones are pinnate, also the lower stem ones: but the upper stem leaves are variously divided into lanceolate segments. The umbels are dropping before the expansion of the flowers. The seeds have no smell, and when first chewed have scarcely any taste, but in a short time are very acrimonious, and excite a great heat in the faucies.

Villons Burnet-saxifrage. Fl. Ju. Aug. Clt. 1817. Pl. 2 ft. 1¼. P. Cumbre (Buch. ubers. can. p. 29. and beschreib. d. can. ins. p. 152.) the whole plant is hoary from short down; radical leaves pinnate; leaflets 5-7, ovate, deeply serrated, terminal one usually 3-lobed; stem nearly leafless, branched; petals villous. 2. H. Native of Teneriffe, on the highest mountains. Tragium incanum, Chois. ined. Said to be allied to P. villosum, but differs in being more hoary, and in the leaves being simply pinnate, not doubly pinnate. Root woody, throwing out many stems at the neck.

Cumbre Burnet-saxifrage. Pl. 1 foot.
15 P. suebo-Tragium (D. C. prod. 4. p. 122.) plant glaucous and canescents; radical leaves pinnate; leaflets roundish-ovate, somewhat 3-lobed, deeply toothed, velvety-canecent on both surfaces: upper ones trifid; lower ones undivided, linear; petals rather villous on the outside; fruit very hairy. 2. H. Native of Persia, in dry exposed stony places about Seidkhodzi. This is an intermediate plant between P. tragium and P. aromácicum. The fruit is larger than in either, and the hairs on the plant are soft and spreading, not as in P. tragium, adpresso. Petals rather villous on the outside, not as in P. aromácicum very hairy.

False Tragium. Pl. 2 feet.
16 P. ? Flava (Meycr, verz. planz. p. 128.) the whole plant is canescents from minute down; radical leaves supra-decom- pond; petals cut: lobes lanceolate, mucronately acuminated; sheaths of upper cauline leaves leafless; petals yellow, canescents on the back, as well as on the germen. 2. H. Native of Caucasus, in dry stony places on the mountains of Tulshur, near Swatt, at the elevation of about 3000 feet.

Yellow-flowered Burnet-saxifrage. Pl. 1 to 2 feet?

18 P. Diversifolia (D. C. prod. 4. p. 123.) leaves ternate or bi- ternate: leaflets petiolulate, cordate, coarsely toothed, membranous, glabrous above, but puberulous along the nerves below; pericarpium wanting; involucres 3-leaved; rays of umbels and umbellules 15-20 in number, and are as well as the fruit pubescent. 2. H. Native of the East Indies, in Sirmore. Heracleum diversifolium, Wall. miss. Leaves as if they were pinnate, from the 2 lateral leaflets being undivided, and the middle one ternate. Teeth of lower leaves rounded and mucronate; of the superior leaves acute. The immature fruit has only been seen.

Diverse-leaved Burnet-saxifrage. Pl. 1 to 2 feet.
19 P. Leschenuaíth (D. C. l. c.) radical leaves petiolate, orbicular, cordate, toothed, rather coriaceous, many-nerved at the base, glabrous above, velvety from short down beneath: canescent leaves few, parted, almost reduced to the sheaths; stem a little branched, glabrous. 2. H. Native of the East Indies, on the Nellyberry Mountains, where it is called by the natives Touresson. Petals hardly emarginate. Young fruit rather puberulous, when examined under a lens, but at length becoming glabrous. Plant 1-2 feet high. Rays of umbel 5, of the umbellules 12-15. Flowers white.

Leschenuaíth's Burnet-saxifrage. Pl. 1 to 2 feet.
20 P. ? Java'na (D. C. prod. 4. p. 122.) caneline leaves petiolate, cordate, acute, cartilaginosely serrated, many-nerved at the base, velvety beneath as well as the petioles, but pubescent above; sheaths ciliated; involucrum wanting, or of 1 linear leaf; fruit hairy. 2. H. Native of Java. Herb said to be
2 feet high. Stem terete, velvety at the apex. Umbels of many rays. Fruit ovate, hairy. Styles diverging.

*Anethum* Burnet-saxifrage. Pl. 2 feet.

**Sect. III. Anisum** (the herb anise; containing plants agreeing with it). Adams, fam. 2. p. 95. Gaertn. fruct. 1. p. 102.

—Bibon species of Lag. Fruit puberulous. Annual plants.

21 P. anisum (Lin. spect. 599.) stean glabrous; radical leaves cordate-roundish, lobed, deeply serrated: middle ones pinnatifid, with cuneate-lanceolate lobes: upper ones trifid and undivided, linear; fruit bearing a few scattered hairs. O. H. Native of the Island of Scio, Egypt, and cultivated in Europe. Nees, off. plz. 12. t. 17. Hayn. arz. gew. 7. t. 22. Woodv. med. bot. t. 180. Anisum vulgare, Chls. hist. 2. p. 292. Gaertn. fruct. 1. t. 23. f. 1. Anisum officinale, Munch. medth. p. 100. Sium anisum, Spreng. in Schultes, syst. 6. p. 40. P. anisum, Trag.—Blackw. herb. t. 374.—Lob. icon. 731. Flowers of a yellowish white colour. Fruit pubescent when young. Styles short, straight. The anise is cultivated in Malta and Spain for its seeds, which are annually imported as medicinal, and for distillation and expression. In this country it is occasionally grown in the garden, to be used as a garnish, and for a seasoning like the fennel. For this last purpose, the seeds require to be sown in April, in a warm border, in a dry light soil, or raised in pots on heat, and removed to a warm place in May, where the plants will blossom and ripen their seeds in August, in favourable seasons. The plants should be thinned to 3 or 4 inches' distance.

*Anise*. Fl. June, Aug. Ch. 1551. Pl. 1 to 1 1/2 foot.

22 P. *cretica* (Poir. suppl. 1. p. 68.) plant dwarf; radical leaves roundish, 3-lobed, toothed; superior leaves small, terminally multitudinous; segments rather filiform; fruit puberulous. O. H. Native of Candia, Scio, and the Morea. A'pium Créticum minimum anisi facie, Tourn. herb. P. tenuis, Sieb. pl. exsic. Stems filiform, 4-5 inches high. Umbels spreading; with capillary rays; umbellules small. Fruit shorter than the styles, not glabrous, but puberulous, as in *P. anisum*, of which it is probably only a small variety. Flowers white.

23 P. *nichotomum* (Lin. mant. 58.) plant glabrous, dichotomously branched, erect; leaves biternate or trinerved; leaflets linear; petals winged, membranous; peduncles opposite the leaves; fruit marinated from short hairs. O. H. Native of Spain, on hills about Aranjuez. Habit of *Trinia*, but differs from that genus in the flowers not being dioecious. Petals all emarginate at the apex, from the point being incurved. Fruit nearly globose, striated. Styles reflexed. Flowers white.

*Dichotomous Anise*. Pl. 1/2 foot.

† *Species not sufficiently known."

*Fine-leaved Burnet-saxifrage*. Pl. 1 foot.

*Hairy-fruited Burnet-saxifrage*. Pl. 1 foot.

26 P. *alpica* (Host, fl. austr. 1. p. 399.) radical leaves pinnate, glabrous; leaflets of lower leaves ovate, cut; of the intermediate ones, pinnatifid, and of the upper ones linear-subulate, entire. O. H. Native of the Alps of Styria and Austria, in stony places. The petals are said to be yellowish-white. Fruit striated, probably glabrous, or villous. This is perhaps only a variety of *P. majus.*

27 P. *rupestres* (Borny, ann. gen. sec. ph. 3. 1820. p. 12.) radical leaves on long petioles, pinnate; leaflets deepely crenated, acute; stems rather dichotomous. O. H. Native of Spain, among stones, on Sierra Nevada. Plant glaucous, stiff, slender. Perhaps only a variety of *P. saxifraga.*

*Rock Burnet-saxifrage*. Pl. 1 foot.

28 P. *Capreus* (Thum. prod. p. 51. fl. cap. 2. p. 207.) stem terete, striated, glabrous; leaves ternately decomposed; leaflets lanceolate, acute, deeply pinnatifid; involucrum composed of many short leaves.—Native of the Cape of Good Hope, on the Table Mountain. Sísán Capensis, Schultes, syst. 6. p. 411. Flowers white. Fruit ovate, obtuse, striated: with the ribs obstate.

*Cape Burnet-saxifrage*. Pl. 1 foot.

*Cult.* All the species are of easy culture.—A dry sandy soil suits them best; and they are only to be increased by seeds, which ripen in abundance. Those species marked perennial are little better than biennial in the gardens.

**Sect. I. Sisarum** (altered from the Arabic name of the plant digiser; this word signifies a carrot in Persian, and *Sisarum* has small bundles of roots resembling carrots). D. C. prod. 4. p. 124.—Sisum, Koch, deutschl. fl. Lateral ribs of fruit margination, having 3-4 superficial vitta in each furrow between the ribs. Seed terete, convex on the back, and flattish in front.

1 S. *Sisarum* (Lin. spect. p. 361.) root composed of fascicles of fusiform tubers; stem terete; leaves pinnate, but the uppermost ones are ternate; leaflets ovate-lanceolate, acute, serrated: involucrum of 5 reflexed leaves; calyeine teeth almost obsolete. O. H. Native of China, Japan, Corea, Altaina, Mongol, and Cochinchina, but only cultivated in Europe. Schkuhr, handb. t. 69.—Lob. icon. t. 710. f. 1. Col. phyt. 89. with a figure.—Park. par. t. 507. f. 1. The commissure of the fruit, according to Koch, is furnished with 4 vitta. *Sisum brevicifolium* and *S. Podolicum* are probably hardly varieties of this species. Flowers white. The tubers of the root are about the size of the finger, joined together at the crown or head; they were formerly much esteemed in cookery. The Skritet is called *Chervis* in French, *Zuckerwurzel* in German, and *Siaro* in Italian; it is also cultivated in the north of Scotland, under the name of *crummock.* The tubers are boiled, and served up with butter,
and are declared by Worledge, in 1682, to be "the sweetest, whitest, and most pleasant of roots." This plant grows freely in lightish soil, moderately good. It is propagated both from seed and by offst or established roots. The better method is to raise the offst to have the roots in perfection, young, and tender.

By seeds.—"Sow between the 21st of March and the 15th of April; a fortnight later, rather than earlier, for a full crop, as plants raised forward in spring are apt to start for seed in summer. Sow on an open compartment of light ground, in small drills 8 inches apart. When the plants are 1 or 2 inches high, thin them to 5 or 6 inches asunder. They will enlarge in growth to the end of autumn; but before the roots are full grown, in August, September, or October, some may be taken up for consumption, as wanted; those left to reach maturity will continue good for use throughout winter and in spring, till the stems run.

By slips.—"Having some plants of last year's raising, furnish with root offst, slip them off; taking only the young outward slip, and not leaving any of the large older root adhering to the detached offst; which plant by diable, in rows from 6 to 9 inches asunder. They will soon strike and enlarge, and divide into offst; which, as well as the main roots, are eatable, and come in for use in proper season.

To save seed.—"Leave some old plants in the spring: they will shoot in stalks, and ripen seed in autumn."

Var. β, Ninsia; stem bulbiferous; leaves broader, rather coriaceous. Sium Ninsi, Burm. ind. t. 29. Thumb. jap. 118.

2 S. sisiroidum (D. C. prod. 4 p. 124.) stem root unknown; leaves pinnate; leaves ovate, rather coriaceous at the base, toothed; upper leaves ternate, having the leaves oblong, acuminate, and serrated; involucre of 4-5 reflexed leaves; calyceal teeth almost wanting. 2 H. Native of Persia, in the province of Aderbajdhan, about Badelan, in shaly sandy places, where it is collected by Szovits. The root is said to be creasing, but according to the specimens examined, they appear to be fasciculate like those of the common skirret. The whole plant is like S. Sisirum, and especially variety β, but differs in the stem being furred, in the leaves being broader, in the fruit being shorter, and in the fibres of the roots being cylindrical.

Skirret-like Water-parsnip. Pl. 1 to 2 feet.

3 S. Lactifolium (Bieb. suppl. p. 230.) root creasing; leaves pinnate; leaves lanceolate, equally and sharply serrated; involucre of many leaves; calyceal teeth very short. 2 H. Native of Tauria and Caucasus, in marshes and humid places; and of Altaia, at the river Irtysh. S. lactifolium, Bieb. fl. taur. 1 p. 225. exclusive of the synonymes. S. latifolium Ukrani- cenum, Fisch. cat. hort. gor. 1812. Bérla lactifolium, Bess. enum. pl. volh. p. 44. Very nearly allied to S. latifolium. The commissure of the fruit, according to Koch, is furnished with 4-6 vitae.

9 S. Thunbergii (D. C. prod. 4 p. 123.) stem fibrous, throwing out stolons from the neck; stem erect, striated; branches angular; leaves pinnate; leaves ovate, acutely, regularly and callously serrated; umbels pedunculate, opposite the leaves, and terminal; involucrum of 3-5 linear acute univalved leaves. 2 H. Native of the Cape of Good Hope, in marshes near Seekhuwali. Sium angustifolium, Thunb. prod. p. 51. Leaves approximate and regularly disposed. Plant erect.

Thunberg's Water-parsnip. Pl. 2 to 3 feet.

† Species not sufficiently known, and are therefore doubtful whether they belong to the genus.
UMBELLIFERÆ. LV. SIMU. LVI. BUPLEURUM.

10 S.? hispidum (Thunb. profl. p. 51. fl. cap. 2. p. 210.) stem branched, striated, glabrous, rather hispid at the nodi; leaves tripinnate, hispid beneath, as well as on the petioles; leaflets short, divided into many lobes; umbels opposite the leaves; involucrum of 5 leaves. 2. F. Native of the Cape of Good Hope. Anthricus capensis, Spreng. in Schultes, syst. 6. p. 526. Sium hispidum, Spreng. umb. spec. 96. Root fusiform. Fruit unknown.

hispid Water-parsnip. Pl.? 

11 S. xerophyllum (Thunb. prod. p. 51. fl. cap. 2. p. 210.) stem striated, glabrous, erect; leaves somewhat tripinnate, glabrous; leaflets multifid, lanceolate; petioles and peduncles scarious; umbels terminal; involucrum of 6 leaves.—Native of the Cape of Good Hope. Spreng. umb. spec. 96. Fruit unknown.

Xerophylius Water-parsnip. Pl. 

12 S. rugosum (Thunb. l. c.) stem erect; branches divaricate, striated; leaves tripinnate; leaflets ovate, deeply serrated, and are, as well as the petioles, ciliated with villi; umbels terminal; leaves of involucrum 6, ovate, with scarious margins.—Native of the Cape of Good Hope. Spreng. umb. spec. 97. Viilous Water-parsnip. Pl.

13 S. filiforme (Thunb. prod. p. 50. fl. cap. 2. p. 207.) stem erect, flexuous, terete; radical leaves simple, linear-form, elongated; umbels terminal; involucrum of 8 leaves, which are about equal in length to the umbel.—Native of the Cape of Good Hope. Spreng. umb. spec. 99. Fruit said to be obovate, and striated.

filiform Water-parsnip. Pl. 2 feet?

14 S. grandiflorum (Thunb. prod. p. 50. fl. cap. 2. p. 208.) stem erect, striated, branched a little; leaves glabrous, bipinnate; leaflets roundish, deeply toothed; umbels terminal; leaves of involucrum 8, ovate, acuminate. 2. G. Native of the Cape of Good Hope. Spreng. umb. spec. 89. Fruit said to be obovate, and striated.

Grandiflorum Water-parsnip. Pl. 2 feet.

15 S. ? sativum (Thunb. l. c.) stem striated, glabrous; branches divaricate; leaves bipinnate, somewhat fasciculate; leaflets linear, trifid; umbels terminal; involucrum of 6 lanceolate leaves, with scarious margins.—Native of the Cape of Good Hope. Spreng. umb. spec. 89. Spreng. umb. spec. 89. Spreading Water-parsnip. Pl. spreading.

16 S. paniculatum (Thunb. l. c.) stem terete, striated, glabrous, panicled; leaves bipinnate; leaflets deeply pinnatifid, linear, channelled; umbels terminal; involucrum of 6 lanceolate leaves, with scarious margins.—Native of the Cape of Good Hope. Spreng. umb. spec. 98. Fruit unknown. Panicled Water-parsnip. Pl. ?

17 S. japonicum (Thunb. fl. jap. p. 118.) stem erect, flexuous, branched above; leaves pinnate, glabrous; leaflets unequal, oblong-ovate, deeply toothed at the top; upper ones lanceolate, quite entire; umbels terminal.—Native of Japan. Stem terete. Superior leaves ternate. Umbels of many rays.

Japan Water-parsnip. Pl. 1 to 2 feet.

18 S. ? decumbens (Thunb. fl. jap. p. 118.) stems decumbent; leaves bipinnate, on long petioles, glabrous; leaflets trifid; umbels terminal, nearly simple. 2. H. Native of Japan. Perhaps S. Grae'num, Lour. coch. p. 179. is referrible to this species.

Decumbent Water-parsnip. Pl. decumbent.

19 S.? ? varittorum (Kit. in Schultes, fl. austr. 2. p. 495. syst. 6. p. 506.) leaves numerous, opposite, doubly pinnate; leaflets linear, acuminate, quite entire.—Native of Hungary, on the mountains.

Opposite-leaved Water-parsnip. Pl. ?

Cult. All the species of this genus do best in a moist soil, and most of them altogether in water. They are increased by separating the roots and stolons.

Petals roundish, entire, strictly involute, with a broad retuse point. Fruit compressed from the sides or somewhat didymous, crowned by the depressed stylopodium; mericarps with 5 filiform acute winged ribs, or with obsolete ones; lateral ribs marginating; furrows between the ribs either furnished with vittae or without them, smooth or granular. Seed teretely convex, flatish in front.—Quite glabrous herbs or shrubs. Leaves rarely cut, but mostly quite entire in consequence of the limbs, which are supposed to be absent, and the petioles being dilated, and changed into quite entire phyllodias, as in many species of Acacia. Umbels compound. Involucrum variable. Flowers yellow.—A very natural genus, with a distinct habit from all other umbelliferous genera, but the fruit is variable in character.

* Annual plants.

1 B. papillosum (D. C. prod. 4. p. 127.) stem erect, branched; leaves linear, acute, stiffish; umbels terminal, of 3-4 rays; involucrum of 3-4 unequal leaves; umbellules 10-flowered; involucels of 6 reflexed leaves, longer than the fruit; fruit coarsely papillose all over. (H. Native of the Levant. Allied to B. glaucum and B. tenusissimum, but the branches of the umbel are perfect; and the fruit is beset with large, obtuse, white papillose.

Papillosum-fructed Hare’s-ear. Pl. ½ to 1 foot.

UMBELLIFERÆ.

almost of B. tenuissimum, but the stems are procumbent, and the umbels are 2-5-rayed.

Procumbent Hare's-ear. Pl. procumbent.

4 B. glau'cem (Roh. et Cast. in D. C. suppl. fl. fr. p. 515.) stem branched, diffuse; leaves linear; umbels terminal, usually of 3 rays; lateral rays incomplete; involucres of 5 lanceolate cupulate denticulate leaves, exceeding the flowers and fruit; fruit without vitre, and almost without ribs, echinated with tu-

bercles. O. H. Native of Provence, Nice, Corsica, Narbonne, Spain, and Sicily, on the sea shore; and of Caucasus, on dry hills near Baku and Sallian. Rehb. icon. 2. p. 60. t. 178. Odontites glauca, Spreng. in Schultes, syst. 6. p. 383. The whole plant is very humble and glaucous.

5 B. seminoma'trum (Lin. spec. p. 342.) stem erect, branch-

ed; leaves oblance-spatalate; umbels terminal, of 3-5 rays: lateral rays incomplete; leaves of involucres lanceolate, cupulate, quite entire, 3-nerved, exceeding both the flowers and fruit; fruit without vitre, and the ribs are obliterated, and the furrows are granular. O. H. Native of the south of France, Italy, Corsica, Sardinia, Dalmatia, Istria, Algeria, Greece, &c. in cultivated fields. Gouan. ill. t. 7. f. 1. Smith, fl. græc. t. 261. Rehb. icon. 2. p. 77. t. 183. B. divaricatio B. Lam. fl. fr. Odontites ulotoca, Hoffm. umb. 299. t. 1. B. f. x. but not of Spreng.

6 B. gracile (D. C. prod. 4. p. 128.) stem erect, much branched; leaves linear, acute; umbels terminal; lateral ones somewhat 3-rayed; leaves of involucres lanceolate, shorter than the fruit-bearing umbel; fruit granular, having the ribs obliterated. O. H. Native of the south of Tauris, in gravelly saltish places; and of the plains of Caucasus, adjoining the river Terek. Odon-

tites gracilis, Bieb. suppl. p. 198. Allied to B. decumpositum, but differs in the involucres being shorter than the umbellules, not longer than them.

7 B. Ché'nse (D. C. prod. 3. p. 128.) stem with erect branches; leaves broadly linear, 5-nerved; umbels of 5-6 rays; involucra and involucres of 1-2 linear leaves, shorter than the flowers; fruit with 5 acutish ribs, having the furrows smooth. O. H. Native of China. Habit of B. tenea, but differs in the involucres being narrower and fewer, and in the pedicles being hardly equal in length to the flowers.

China Hare's-ear. Pl. 1¼ foot.

8 B. tenea (D. Don, prod. fl. nep. p. 182.) stem erect, filiform, branched; leaves 7-nerved; lower ones linear-mucronate, 5-nerved: upper and rancelae ones lanceolate; umbels of usually 4 rays; involucres of 4-5 elliptic mucronate leaves, which are about equal in length to the fruit; fruit acutely ribbed, with the furrows smooth. O. H. Native of Nipan, at Narainhetty, Kamaon, and Gosaingan. B. virgatum, Wall. cat. 555. Very like B. tenuissimum, but differs in the umbels being of 4 rays, instead of 5, and in the leaves of the involucres being elliptic, not lanceolate, &c. Umbels numerous.

Var. β, flexuös (Wall. ms.) stem much branched, flexuous; leaves having 7-9 nerves, and dotted between the nerves. O. H. Native of Nipan.

Slender Hare's-ear. Pl. 1 to 2 feet.

9 B. Gerä'di (Jacq. austr. 3. t. 256.) stem erect, branched;

leaves linear, cupulate; umbels terminal, of 5-7 rays; leaves of involucel linear, cupulate, exceeding the flowers, which are 5 or 6 in each umbel; ribs of fruit hardly elevated, and the furrows between the ribs are furnished with 5 vitre. O. H. Native of Provence, Nice, Sicily, Austria, Tauris, Caucasus, &c. in dry fields. Rehb. icon. 2. p. 56. t. 104. and t. 165. B.

Gallopov. t. 6. There are varieties of this plant with either erect or spreading branches, and with the involucres either shorter or longer than the flowers.

10 B. ju'nceum (Lin. spec. p. 343.) stem erect, paniced; leaves linear-lanceolate, cupulate; umbels terminal, of 3 rays; leaves of involucel linear-lanceolate, cupulate, shorter than the flowers, which are 3-5 in each umbel; ribs of fruit elevated, acute; having the furrows smooth, and almost without vitre. O. H. Native of south and middle Europe, even to Caucasus, in fields. Rehb. icon. 2. p. 57. t. 160. B. juncum B. Lam. fl. det. 1. p. 319. B. Gerardi, Smith, fl. græc. t. 282. B. juncum a, Spreng, in Schultes, syst. 6. p. 371.—Lob. icon. t. 243. f. 1.

Var. β, Risàndi (D. C. prod. 4. p. 128.) fruit-bearing peduncles short, axillary, hardly attaining one-half the length of the leaves.

11 B. glumaceum (Smith, prod. fl. græc. 1. p. 177. but not of Spreng.) stem erect, very slender, paniced; leaves linear, 3-

nerved; involucra and involucres of 5 lanceolate cupulate 3-

nerved leaves, which are pellucid between the nerves and veins, exceeding the umbels; furrows of fruit smooth, furnished each with one vitta, and the ribs are acute and very slender. O. H. Native of Calabria, in barren fields; chief of Scio; about Con-

st. 2. 342.)

nialis, Fl. t. 209. B. flavum, Forsk. eg. ar. suppl. p. 205. 7 B. græcium d'Urvill. enum. 30. p. 250. but not of Bieb. Nearly allied to B. odontites, but perfectly distinct, in the leaves of the involucel being diaphanous between the nerves, not reticulated.

Glumaceous Hare's-ear. Pl. 1 foot.

12 B. Oron'te's (Lin. spec. p. 342. exclusive of the syn. of Haller.) stem erect, paniced; leaves linear, 3-nerved; leaves of involucel 5, linear-lanceolate, cupulate 3-nerved, reticulately veined from the middle nerve being pinate; fruit having the fur-

rows smooth, and furnished with one vitta each, and the ribs acute and very slender. O. H. Native of Italy, Sicily, Greece, Smyrna, Montpelier, and Mauritania. Jacq. hort. vind. 3. t. 91. Reth.

nic. 256. ex ind. sem. hort. bocc. 1825. ex ind. sem. 1826. pl. rar. 112. and prod. 1. p. 312.

13 B. arista'tum (Barth. in Rehb. icon. 2. p. 70. t. 178.) stem erect, paniced; leaves lanceolate, linear, 3-nerved; leaves of involucel 3, elliptic, aristately cupulate, reticulately veined, from the middle nerve being pinate, exceeding the umbellules; fruit with smooth furrows, furnished with one vitta each, and acute very slender ribs. O. H. Native of England, France, Ba-

learic Islands, Corsica, Sardinia, Sicily, Liguria, Dalmatia, &c. in dry fields and on hills. In England on a marble rock in Devon-

shire, unquestionably wild. B. divaricatum, Lam. fl fr. p. 410. B. glumaceum, Spreng. umb. spec. 18. t. 3. f. 3. but not of Sibth. B. Odontites, Smith, engl. bot. t. 2468. Odontites lirata, Spreng. prod. 33. Schultes, syst. 6. p. 380. but not of Hoffm. By most authors this species has been confused with the preceding.

14 B. nodifórum (Sibth. and Smith, fl. græc. t. 360.) stem dichotomous or trichotomous from the base; branches spreading, forked; leaves linear; radical ones distich; umbels axi-

itary and terminal, rather capitate; leaves of involucel 5, ovate, cupulate, 3-nerved, transparent between the nerves, as well as the margins of the upper leaves; fruit with smooth furrows. O. H. Native of Candi, in corn-fields; in Syria near Baruth; and Egypt. B. nanum, Poiret. suppl. t. 750. B. Marecostium, Q q
UMBELLIFERÆ.

Delil. ined. B. proliferum, Delil. fl. egypt. p. 61. t. 22. f. 2. B. minium, Spreng. nece entd. 3. p. 163. Fruit striated, not wanted.

Variable-leaved Hare’s-ear. Fl. May, July. Clt. 1818. Pl. 1 f. 16.

Protracted Hare’s-ear. Fl. May, July. Clt. 1819. Pl. ½ to ¾ foot.

17 B. rotundifólium (Linn. spec. p. 340.) caule leaves perfoliate, roundish-ovate; umbels of 5-6 rays; involucrum wanting; involucels of 5 mucronate leaves; furrows of fruit smooth, and destitute of vitae: ribs very slender. ☞ H. Native of Europe, in fields, especially in Caucasus, south of Siberia, and Persia; in England in corn-fields, especially on a chalky soil. Smith, engl. bot. t. 99. Sturm, deutsch. fl. with a figure. Hayn. arz. gew. 7. t. 1. B. perfoliáatum, Lam. fl. fr. 3. p. 405. B. rotundifólium a, Spreng. in Schultes, syst. 6. p. 364.—Moris, hist. 3. p. 299. sect. 9. t. 12. f. 1. This plant has been reckoned among the vulnerary herbs; but its virtues, whether ever experienced or not, are recorded in old herbals only.

* * * Perennial plants.

18 B. autéreum (Fisch. in Schultes, syst. 6. p. 366.) leaves coriaceous; radical ones ovate, ovate-oblong, obovate, attenuated into the petioles at the base: caule leaves ovate, acute, stem-clasping; leaves of involucrum 3-5, elliptic, or nearly orbicular, mucronate; of the involucels 5, conforming to those of the involucrums, coloured, longer than the flowering umbels. ☞ H. Native of Siberia, on mountains beyond the Baikal; and of Altáia. B. longifólium var. Spreng, umb. spec. p. 119. Very nearly allied to B. longifólium, but differs in the involucels being yellow, obtuse with a mucrone, not acuminate.

Golden-umbelled Hare’s-ear. Fl. May, June. Clt. 1820. Pl. 1 to 2 feet.

19 B. longifólium (Linn. spec. p. 341.) leaves ovate-oblong: radical ones petiolate: caule ones stem-clasping; leaves of involucrum 9-4, ovate, somewhat acuminate; of the involucels 5. ☞ H. Native of France, Germany, Transylvania, Switzerland, Savoy, &c. on the mountains.—J. Bauh. hist. 3. p. 199. f. 1. Cam. hort. t. 38. Umbellules 7-14 flowered. With fruit with elevated, sharp, rather winged ribs: and with the furrows between the ribs smooth, and furnished with 3 vitae each, which are full of pellucid dots, ex Koch, umb. p. 117.

Long-leaved Hare’s-ear. Fl. May, July. Clt. 1713. Pl. 1 to 2 feet.

20 B. Pyrenéum (Gouan, ill. p. 8. t. 4.) radical leaves lanceolate, elongated: caule ones cordate-lanceolate, half stem-clasping, acuminate; umbels of 5, very rarely of 3 rays; involucrum of 3 broadly ovate leaves; involucels of 5 obovate distinct leaves, which are almost twice the length of the umbel.

Pyrenean Hare’s-ear. Fl. May, July. Clt. 1814. Pl. 1 ft. 22 B. stellátum (Linn. spec. p. 340.) radical leaves linear-lanceolate, elongated: caule ones almost wanting; involucrum of 3 ovate-lanceolate leaves; involucels of 8 leaves, which are joined together into an 8-eleft disk, longer than the umbel.

2. H. Native of the Alps of Switzerland, Piedmont, Dauphiny, and Savoy, in stony meadows; and of Corsica, on the mountains, and probably of the Pyrenees. D. C. fl. fr. 4. p. 346.—Hall. helv. hist. no. 771. t. 18. Ribs of fruit broadly winged; wings sharply and membranously keeled; furrows smooth, each furnished with one vitæ.

Stellate-umbelled Hare’s-ear. Fl. May, July. Clt. 1775. Pl. 1 to 1½ foot.

22 B. thyrádum (Adams, ex Fisch. in litt. ex D. C. prod. 4. p. 130.) radical leaves linear-oblong: caule ones 3, stem-clasping, oblong or ovate, hardly acute; umbels of 3 rays; involucrum of 3 obovate leaves; involucel of 7-8 obovate leaves, which are scarcely longer than the umbel.

2. H. Native of Altáia or the mountains, and at Lake Baikal. Allied to B. Pyreneum, but differs in the leaves being much less acute, in the umbels being of 3 rays, in the involucels being hardly longer than the flowers, and in the young fruit not being glaucous.

Three-rayed-umbelled Hare’s-ear. Pl. 1 foot.

23 B. multíneve (D. C. mem. soc. gen. vol. 4.) radical leaves oblong-linear, attenuated at both ends; caule ones stem-clasping, ovate, acuminate, with many parallel nerves; involucra of 5 unequal leaves, having many parallel nerves; leaves of involucel 5, ovate, acuminate, coloured, hardly longer than the umbelle.

2. H. Native of Altáia, on the mountains. Allied on the one hand to B. aéreus and B. longifólium, and on the other to B. graminifólium.

Var. β, angustáus (D. C. prod. 4. p. 130.) caule leaves narrower, more glaucous; involucrum of 2 leaves. ☞ H. Native of Dahuria.

Var. γ, minus (D. C. l. c.) involucrum of 3-4 leaves; stem nearly simple; leaves narrower. ☞ H. Native of Altáia, on the mountains.

Many-rayed-leafed Hare’s-ear. Pl. 1 foot.

24 B. graminifólium (Vahl. symb. 3. p. 48.) stem nearly naked; leaves radical, linear; involucrum of 5-5 elongated leaves, about one-half shorter than the rays of the umbel; leaves of involucel 5-8, oblong, mucronate. ☞ H. Native of the Alps of Europe and the Pyrenees. Rom. fl. eur. fase. 7. with a figure. D. C. fl. fr. 4. p. 367. Spreng. in Schultes, syst. 6. p. 368. B. petraéum, Vill. dauph. 2. p. 576. t. 14. Jacq. icon. rar. 1. t. 56. This species differs from B. ranunculóides, in the leaves being all nearly radical, in the involucels being often 7-8-leaved, in the leaves of the involucrum being more elongated. B. invernus, Bell. app. 77. t. 11. is hardly a variety of this species, unless that the leaves of the involucrum are more elongated. B. carpódium and B. petraeum of many authors are identical with this.

Var. β, bicályculátum (D. C. prod. 4. p. 131.) leaves of in

25 B. ranunculoides (Lin. spec. p. 342.) radical leaves linear-lanceolate, attenuated towards the base; cauline ones stem-clasping, oblanceolate, or ovate-cordate, striated; involucrum of 3 unequal leaves; involucels of 5 ovate or oblong nerv'd distinct mucronate leaves.  2. H. Native of the Alps, Pyrenees, Jura, Apennines, Siberia, in rough exposed places; and of North America, at Cape Muggrove, in Behring's Straits. Lam. dict. 1. p. 518. D. C. fl. fr. 4. p. 348. B. angulosum, Spreng. in Schultes, syst. 6. p. 366.—Park. theatr. 581. no. 7.—Bauh. hist. 3. p. 199. f. 2. Ribs of fruit elevated and sharp; and the furrows between the ribs smooth, and furnished with one vitta each, ex Koch, umb. p. 116. Habit of herb very variable, from a finger to a foot in height, simple or branched, bearing one or many umbels. Involucre of from 1 to 3 leaves, very variable in length, either broader or narrower than the leaves. The limits between the varieties are hardly perceptible, and to these may be referred the B. angulosum, ranunculoides, repens, obtusatum, and graminifollium, Lapere. abr. and suppl. as well as B. graminatum and Vaqinceilla, Vill. B. carici-follium and Burserlissium, Willd. B. Baldense, Hort. B. petraeum, Geners. B. angulosum L., Lin. &c.

Var. β, carici-follium (D. C. prod. 4. p. 131.) radical leaves rather convolute, linear-subulate; cauline ones hardly dilated at the base.  2. H. Native of the Apennines and the Pyrenees, in exposed rocky places. B. carici-follium of many herbaria. B. petraeum, Lin. spec. 540.  1. but the leaves of the involucel are distinct, not jointed.

Var. γ, oblongifolium (Led. fl. alt. 1. p. 348.) stem very simple; radical leaves 2, linear-oblong, 1 1/2 to 2 inches long, and 2 to 3 lines broad, acutish; cauline leaves sessile, broader than the radical ones, of different shapes: the uppermost ones coriaceous, rounded at the apex, and mucronate; involucrum of 3-5 unequal leaves; umbel of 4 unequal rays; involucels of 5-7 obovate mucronate leaves.  2. H. Native of Siberia. Crownfoot-like Hare's-ear. Fl. July, Aug. Clt. 1790. Pl. 4 1/2 ft.

26 B. Baldeense (Host, syn. 141.) stem branched; leaves stem-clasping, nearly linear, acute, nerv'd; radical ones tapering into the petioles; leaves of involucel oblong-linear, about equal in length to the fructifereous pedicles; ribs of fruit short, rounded; vitta 3 in each furrow.  2. H. Native of Mount Baldo; and of Altaia, on the rivers Tschersky, Kerly, Bucktor- mins, and near Schultbins. B. bicurc.; Helm. in act. mosq. 2. p. 106. t. 8.—Gmel. sib. 1. p. 209. no. 24. Stems numerous, erect or ascending, simple at the base, and branched at the apex. Radical leaves 2-6 inches long. Involution of 4-5 lanceolate-linear leaves, but sometimes only of one elongated decumbent leaf. Umbels of 5-13 rays. Involution of 5-9 oblanceolate acute 3-nerved leaves; umbellules of 10-20 flowers.

Var. β, multicaule (Led. fl. alt. 1. p. 530.) plant tufted; leaves rather fleshy.  2. H. Native of Altaia, in saltish deserts at the river Tschaja.

Baldo Hare's-ear. Fl. June, July. Pl. 1/2 to 1 foot.

27 B. longicaule (Wall. cat. no. 557.) stems erect, sparingly branched; leaves linear-linear-acuminate; vitta 3 in each furrow, rather membranous; umbels 2-5-rayed; involucra of 1 or 3 ovate acute leaves; umbellules 15-rayed; leaves of involucel 5, ovate, mucronate, longer than the flowers, but shorter than the fruit; fruit 3 times longer than the pedicels, acutely ribbed; vitta 3 in each furrow.  2. H. Native of Nipal, at Gossingthang, Emodi, and Kamaon. Herb 1 1/2 to 2 feet high, dividing into many stems at the neck. Leaves 3-6 inches long. Mature fruit 2 lines long.

Long-stemmed Hare's-ear. Pl. 1 to 2 feet.

28 B. Candollei (Wall. cat. no. 552.) stems rising from horizontal surculi, erect, sparingly branched; leaves lanceolate, acute, membranous, obliquely many nerv'd on both surfaces; umbels 12-15-rayed; involucel of 2-3 ovate, acute, many-nerved leaves; umbellules 12-15-rayed; involucels of 5 oval acute leaves, which exceed the fruit.  2. H. Native of Nipal, at Gossingthang and Emodi. Herb 2 feet high. Immature fruit hardly longer than the pedicels, oblong, ribbed, with the furrows smooth.

De Candolle's Hare's-ear. Pl. 2 feet.

29 B. paniculatum (Brot. fl. his. 1. p. 455.) leaves linear-narrow, many nerv'd; radical ones very long; stem erect, panicled; umbels 2-3-rayed; involucel of 2-3 small leaves; involucels of 4-5 subulate leaves, which are 3 or 4 times shorter than the umbellules; fruit oblong.  2. H. Native of Portugal, on calcareous hills. Fruit with 3 ribs on each side, usually of one mericarp from abortion. Habit of B. fruticosum, but the stems are annual.

30 B. eurynum (Ten. app. 1st cat. hort. neap. ex D. C. prod. 4. p. 131.) stems erect, simple; leaves linear, acute, narrowed at the base so much as to form petiolar, many nerv'd; umbels 5-9-rayed; involucel of 2-4 leaves; involucels of 5-7 acutish leaves; furrows of fruit smooth.  2. H. Native of the kingdom of Naples, on calcareous rocks. B. obtusifolium, Ten. prod. p. 18. Leaves acute. A very distinct species, although it has been joined by Sprengel with B. semicompitaminum. Very nearly allied to B. paniculatum.

Drooping Hare's-ear. Pl. 1 foot.

31 B. exaltatum (Bieb. tabl. casp. p. 166.) leaves all linear, many-nerved: stem one elongated; stem erect, leafy, paniculately branched; umbels 3-5-rayed; involucra and involucelles of 3-5 subulate unequal, small leaves; fruit ovate.  2. Bieb.  2. Stev. H. Native of Tauria and Caucasus, in maritime meadows, and on hills. B. Baldeense, Willd. spec. 1. p. 175. exclusive of the syn. Bieb. fl. cauc. no. 513, but not of Turr. or Host. Allied to B. falcatum, but differs in the fruit being shorter, and in the ribs being less acute.

32 B. linearifolium (D. C. prod. 4. p. 131.) stem erect, paniculately branched; leaves linear, very long, hardly acute, many nerv'd; umbels of 5-6 rays; involucra and involucelles of 4-5 small acuminate leaves; fruit linear-oblong, with rather pronounced ribs. Native of Persia, on mountains about Badaia, in the district of Khoi in the province of Aderbeijjand, where it was collected by Szovits. Very like B. exaltatum, but differs in the fruit being longer. It is perhaps, however, only a variety of it.

Linear-leaved Hare's-ear. Pl. 1 foot.

33 B. scorzonerinae-folium (Willd. enum. suppl. p. 30.) radical leaves lanceolate; cauline ones linear, all striated with 9-11 parallel nerves; stem paniculately branched; umbels 8-10-rayed; involucel of 1-2 leaves; involucels of 4-5 lanceolate apiculate leaves, which are shorter than the umbellules.  2. H. Native of Siberia, at Lake Baikal. Allied to B. falcatum, but differs in the leaves being narrower, and in the nerves being parallel and more crowded.

34 B. lancolatum (Wall. cat. no. 551.) stem erect, sparingly branched; leaves lanceolate, much acuminate, glabrous, membranous, furnished with 2 oblique nerves on each side; umbels 5-6-rayed; involucel of one small leaf; umbellules 5-8-rayed; involucels of 1-2 small leaves, rarely wanting; fruit ovate-oblong, with the ribs hardly elevated, and the furrows smooth.
L. H. Native of Nipan, on the mountains. Herb 2 feet high, quite glabrous. Leaves 4 inches long, and an inch broad. Fruit a line and a half long. Burrows of immature fruit furnished with 3 vitre each.

Lanceolate-leaved Hare’s-ear. Pl. 2 feet.

35 B. marginatum (Wall. cat. no. 556.) stems erectly ascending, sparingly branched; leaves linear, acute, stiff, 5 7-nerved; outer nerves nearly marginal; umbels 6-8-rayed; involucre of 3-5 acuminate lanceolate leaves; umbelles 10-12-rayed; involucels of 3-5 leaves, which are shorter than the pedicels; fruit oblong, ribbed, with the burrows smooth. 36. H. Native of Nipan and Kamaon. Root hard, branched, thick. Herb a foot and a half high. Lower leaves 3 inches long, and 3 lines broad, usually obtuse from some cause; nerves very prominent.

Middle-leaved Hare’s-ear. Pl. 2 feet.

36 B. tataricum (Tenore, prod. fl. neap. p. 18.) stems erect, branched; leaves lanceolate, 9-nerved; upper ones rather falcate, much shorter than the branchlets; involucrum of 3 very short linear-subulate leaves; involucels of 5 setaceous leaves, shorter than the umbelles, which are trifid. 37. H. Native of Calabria, on dry rocks. Perhaps only a var. of B. scorzoneraefolium or B. falcatum.

Trifid-leaved Hare’s-ear. Pl. 1 to 2 feet.

37 B. falcatum (Lin. spec. p. 341.) leaves oblong; lower ones oblong, petiolate; cauline ones sessile, linear-lanceolate, attenuated at both ends; leaves of involucel oblong-lanceolate, acuminate, about equal in length to the fructiferous pedicels. 38. H. Native of Middle Europe, in hedges and among bushes in dry situations; and of Siberia, on the Altai mountains; and throughout the whole of Caucasus. Jacq. auct. 2. t. 158. D. C. fl. fr. 4. p. 347.—Lob. icon. t. 456. f. 1. Ribbs of fruit elevated, narrow, and a little winged; vitre 3 in each burrow; burrows smooth, ex Koch, umb. 116.

Falcatum-leaved Hare’s-ear. Fl. May, Sept. Clt. 1739. Pl. 1 to 2 feet?

Stiff Hare’s-ear. Fl. May, July. Clt. 1830. Pl. 2 feet.

39 B. sylvicum (Ait. hort. kew. 1. p. 331.) stems dichotomous, 2-leaved; radical leaves decompound, flat, cut; involucrum of one leaf; involucels of 5 lanceolate acute leaves, which are shorter than the umbelles. 40. G. Native of the Cape of Good Hope. Flowers pale yellow. The rest unknown.

** Shrubby species. — Tenoria and Bypréstis, Spreng. l. c.

40 B. Muñow (Cham. et Schlecht. in Linneae. 1. p. 384.) shrubby, much branched; leaves linear-setaceous; umbels 2-3-rayed; involucels of 5 narrow lanceolate acute leaves, which are equal in length to the umbelles; fruit oblong, smooth. 41. G. Native of the Cape of Good Hope. Lower leaves 8 inches long. B. salicifolium 42. Africanum, Berg. cap. 76. 9 but the umbels are said to be 5-rayed, and the involucels of 5 leaves.

M north Hare’s-ear. Clt. 1726. Shrub 1 to 2 feet.

41 B. Sphenopodium (Smith, fl. gracc. t. 264. prod. 1. p. 179.) plant suffrutescent; leaves linear, rather falcate, with smooth margins; involucra usually of 5 leaves; leaves of involucel linear-lanceolate, cuspidate, shorter than the umbelles. 42. H. Native of the Morea. A specimen collected near Theben agrees very well with the character given to this; and is probably the same. Plant only frutescent at the base.

Sibirian Hare’s-ear. Shrub 1 foot.

42 B. spinosum (Lin. fil. suppl. p. 178.) shrubby, erect; floriferous branches divaricate, stiff; the deflowered ones spinose; leaves linear-subulate, many veined, quite entire; involucra of 5-5 small subulate leaves. 43. H. Native of Spain and Mauritania. Gouan. iii. p. 8. t. 2. f. 3. Desf. adl. 1. p. 233. Tenoria spinosa, Spreng. Ribbs of fruit obtuse.

43 B. frutescens (Lin. amon. 4. p. 269.) suffrutescose, erect; branches slender, elongated, erect; leaves linear-subulate, stiff, striated, 5-7-nerved; involucra of 3-5 very short subulate leaves. 44. H. Native of Mauritania, Spain, and between Perigpin and Narbonne. Cott. icon. 2. t. 106. Tenoria frutescens, Spreng. in Schultes, syst. 6. p. 376.—Barr. icon. t. 1253. Umbels small, 3-5-rayed. Ribbs of fruit obtuse.

44 B. foliosum (Salzun, pl. exsic. ex D. C. prod. 4. p. 133.) suffrutescent, erect, nearly simple; leaves sessile, half stem-clasping, linear-lanceolate, acuminated, undulated, crowded, 1-nerved, quite entire; leaves of involucra ovate. 45. F. Native of Mauritania, about Tangiers. Stem a foot high. Leaves broad and half stem-clasping at the base. Involucra of 3 leaves; involucels of 4-5 leaves. Fruit ovate, with obtuse ribbs.

Leafy Hare’s-ear. Shrub 1 foot.

45 B. elatum (Guss. prod. fl. sic. 1. p. 316.) plant suffrutescent at the base; branches elongated; leaves membranous, many veined; radical ones oblong-lanceolate, tapering into the petioles; cauline ones sessile, linear-lanceolate; umbels 8-12-cleft; involucra of 4-5 short leaves; leaves of involucels oblong, acuminate, longer than the umbelles. 46. F. Native of Sicily, on calcareous rocks. Allied to B. plantagineum, but the plant is frutescent at the base, and the leaves are acute. Ribbs of fruit smooth.

Tail Hare’s-ear. Shrub 3 to 5 feet.

46 B. casei (Schousb. mar. beob. p. 113.) shrubby, erect, branched; leaves oblong, membranous, very blunt, quite entire, sessile, with many parallel nerves; umbels 8-10-rayed; leaves of involucra oblong, obtuse, short. 47. F. Native of Mogodor. Branches of a greyish white-colour. Plant glabrous. Fruit like that of B. fruticosum. Leaves much thinner, and one-half smaller than those of B. plantagineum.

47 B. plantagineum (Desf. atl. 1. p. 233. t. 57.) shrubby, erect, branched; leaves lanceolate, mucronate; stiff, coriaceous, sessile, quite entire, many umbels; umbels 4-10-rayed; leaves of involucra elongated, subulate, acute. 48. F. Native of Mount Atlas, near Bougie. Tenoria plantaginea, Spreng. in Schultes, syst. 6. p. 376. Nerves almost diverging from the base of the leaves, not parallel.

48 B. Gibira (Lam. dict. (1784.) 1. p. 520.) shrubby, erect, branched; leaves lanceolate, attenuated at both ends, 1-nerved, coriaceous, glaucous, oblique, quite entire, sessile; leaves of involucra lanceolate. 49. F. Native of Gibraltar, on the

50 B. diffus'orme (Linn. spec. 343.) shrubby, erect, branches; leaves variable on the same branch, simple or ternate; leaflets undivided or cut; umbels terminal, 3-8-rayed; leaves of involucrum linear, acute, much shorter than the peduncules. ♀. F. Native of the Cape of Good Hope. Burm. afr. t. 71. f. 1. Cham. et Schlecht. in Linnae. 1. p. 384. Thumb. fl. cap. 248. Tenoria diffusiformis, Spreng. in Schultes, syst. 6. p. 377. Buprestis diffinis, Spreng. mag. ribs of fruit rounded and turgid, lateral ones somewhat dilated; vitte 2-3 in each furrow. This shrub sends out side branches, which in the spring have on their lower parts leaves, composed of many small flat leaflets, finely cut like those of coriander, and of a sea green colour; these leaves soon fall off, and the upper part of the branches are closely covered with long rush-like leaves, having 4 angles, coming out in clusters from each joint.

† Species not sufficiently known.

51 B. polyphyllum (Ledebe. mem. ac. se. petrop. 5. p. 528.) stem erect, striate, branch above leaves lanceolate, stem-clasping; umbels of many unequal rays; involucrum almost wanting; involucres of 6 lanceolate acuminate leaves, which exceed the fruit. ♀. H. Native of Caucasus. Flowers said to be solitary in the axils of the branches.

Many-leaved Hare's-ear. Fl. May, June. Clt. 1823. Pl. 1 ft.

52 B. oppositifolium (Lapeyr. abr. pry. p. 141.) stem naked; branches umbellate; leaves opposite, lanceolate, obtuse, nerved; involucrum almost wanting; involucres of 5 lanceolate awned leaves. ♀. H. Native of the Pyrenees, at a place called Trancade d'Ambouilla. This species is very obscure, and very doubtful whether it is an umbelliferous plant at all.

Opposite-leaved Hare's-ear. Pl. 1 foot.

 Cult. All the species grow well in any common garden soil. The leaves of the young plants only require to be sown in the open ground early in spring. The herbaceous perennial kinds are either increased by being divided at the roots, or by seeds; and the shrubby species by cuttings.

LVII. HETEROMORPHA (from ἕτερος, heteros, diverse, and μούφω, morphe, form; leaves). Cham. et Schlecht. in Linnae. 1. p. 385. 5. f. 2. D. C. coll. mem. 5. p. 43. prod. 4. p. 134.—Bupleurum species of authors.

Linn. syst. Pentândria, Digynia. Margin of calyx 5-toothed. Petals elliptic, drawn out into a long acumen, which is bent in nearly to the base. Fruit nearly terete, variable in length, crowned by the teeth of the calyx in the immature state, and by the stipulodiam and short spreading styles. Mericarps smooth, with 5 filiform ribs, lateral ones marginal; vitte large, solitary under each rib, but none in the commissure nor furrows.—Perennial herbs, natives of the Cape of Good Hope, yielding an aromatic juice. Radical leaves cut. Stems erect, hispal, naked, branched, furnished with sheathing scales or abortive leaves. Umbels of umbels compound, fertile: lateral ones often sterile. Involucra, and involucres of the short marcescent leaves. Flowers yellow? This genus from the situation of the vitte agrees alone with Melanoselinum, but the form of the fruit is very different.

Jagged-leaved Lichtensteinia. Pl. 3 to 4 feet.

Trefida Lichtensteinia. Pl. 1 to 2 feet.

UMBELLIFERÆ. 

LXXXI. LICHTENSTEINIA. 

LX. OTTOA. 

LX. GÉNANthe.

prod. p. 40. fl. cap. 262. ex Spreng.-syst. p. 4. n. 118. 
GÉNANthe Capensis, Houtt. ? Sprengel says his plant has rough leaves, and Thumb. says his is glabrous; they are, however, only the same. The plant is called GLYCH by the Hottentots, and is made by them into an inebriating liquor.

4 L. Palma'ta (D. C. prod. p. 135.) leaves pilose on both surfaces, palmate; petals broad, sheathing; lobes or leaflets 5, oblong; rather cuneate, cartilaginously serrated; stem terete, glabrous, sparingly branched; petiolate sheaths short, leafless; fruit ovate. 

Ô. 

GÉNANthe of the Cape of Good Hope.

Palmate-leaved Lichtensteinia. Pl.? 

Cult. The species of this genus require to be grown in pots so as they may easily be sheltered in the winter. Any light soil will suit them; and they may be easily increased by dividing at the root or by seeds.

Linn. syst. Pentándria, Digínia. Margin of calyx obsolete. Petals equal, with an inflexed point. Styles arcuately divaricate, capitulate at the apex. Fruit oblong; mericarps acutely 5-rilled, rather compressed at the commissure; ribs membranous.—Smooth perennial herbs. Stems simple, with few leaves. Leaves (phylloidia?) sheathing at the base, intercepted by transverse disseminules. Umbels terminal, without any involucral, in many rays. Umbellules without involucres. Flowers white, polygamous, 3-4, hermaphrodite, and 6-7 male in each umbel.

This genus is allied to GÉNANthe, but differs in the margin of the calyx being obsolete, not 5-toothed; in the petals being entire, and in the styles being divaricate.

1 GÉNANtheæides (H. B. et Kuntz, l. c.) Ô. 

GÉNANthe of Quito, between St. Vincent and Ybara. GÉNANthe Quitsônis, Spreng. syst. p. 1. 888. Herb very like Tiedemannia cetrifôlia, but the generic character is different, and the involucrum is wanting.

GÉNANthe-like Ottoa. Pl. 1 foot.

Cult. Any soil will suit this plant, and it may either be increased by seed or by dividing at the root.

Linn. syst. Pentándria, Digínia. Margin of calyx 5-toothed, permanent, somewhat acerate after flowering. Petals obvate, emarginate, with an inflexed point. Stylodes conical. Fruit cylindrically ovate, crowned by the long erect styles. Mericarps with 5 rather convex obtuse ribs; lateral ribs marginaul, and a little broader than the rest; vittae in one each furrow.

Carophorophy indendent.—Smooth usually aquatic herbs, natives of Europe and Asia. Umbels compound. Involucrum variable, usually wanting; involucres of many leaves. Flowers in the rays of the umbellules on long pedicels sterile; those in the disk on short pedicles fertile; petals white. The species of this genus are difficult to extricate, in consequence of the roots having being neglected by the authors who have described them.

§ 1. True species, natives of Europe, &c. but not of the Cape of Good Hope. 

* Plants perennial. 

Roots tuberos; tubers disposed in fascicles.

1 GÉNANthe fistulósa (Lin. spec. 365.) roots fasciculate, intermixed with oblong tubers; neck of root throwing out stolons; stems and leaves fistulátor; radical leaves bipinnate; leaflets cuneate, lobed; cauleine leaves pinnate; leaflets filiform; umbels 3-4-rayed, without any involucrum; fruit turbinate, much crowded, ribbed. Ô. 

H. Native of Europe and Caucasus, in ditches, ponds, and other watery places; plentiful in Britain. Drev. et Heyne, pl. eurip. t. 5. v. 48. Blunt. d. t. 846. Smith. engl. bot. t. 565. O. aqüatica, Bunt. pin. 162.—Bauh. hist. p. 192. f. 1.—Petiv. herb. brit. t. 25. f. 5. and 6. There is a variety of this which its roots are composed of whorles of fibres. The plant has an unpleasant smell, and a hot nauseous taste, like many other umbelliferous plants. The roots and whole herbage are said to be poisonous. Flowers pale red.

Var. β, Tabernamontani (Koch, ex D. C. prod. p. 136.) radial leaves divided into many linear segments. Ô. 

H. Native of Alsatia, in inundated places. O. Tabernamontani, Gmel. fl. bud. p. 676, exclusive of the syn. of Poll. 

Var. γ lanceolata (Spreng. ex D. C. prod. p. 136.) radical leaves pinnate or bipinnate; leaflets or segments linear-lanceolate; umbels bifid. Ô. 

2 GÉNANthe Lachenalii (Gmel. fl. bud. p. 678.) fibres of roots cylindrical, rather fleshy, in fascicles; radical leaves somewhat bipinnate; leaflets cuneiform, obtuse, tridentate at the apex; cauleine leaves pinnate; leaflets linear, entire; involucrum wanting, or of few leaves. Ô. 

Var. α, approximâta (D. C. prod. p. 137.) radical leaves pinnate; leaflets or segments trifid, obtuse, cuneate at the base. Ô. 

Var. γ, involucrâta (D. C. l. c.) involucrum of many leaves. Ô. 

H. Ô. peucedanifôlia, Schleisch. pl. exsic. Ô. Rheëna, Moricand, fl. ven. p. 149. In some specimens the involucrum is absent. Fruit ovate, striated; pedicels not thickened after flowering.

La Chenal's Water-droprrowt. Fl. June, Aug. Cl.1817. Pl. 2 to 3 feet.

3 GÉNANthe peucedanifôlia (Poll. pal. p. 1. p. 280. f. 5.) tubers of roots sessile, elliptic, ending in a fibre each at the apex; radical leaves bipinnate; cauleine ones pinnate; lobes or leaflets all linear; umbels 3-8-rayed; involucrum wanting, or of 1 leaf; fruit oblong, attenuated at the base, nearly sessile, coarctate beneath the calyx. Ô. 

H. Native of middle Europe, in meadows, ditches, and bogs; as in France, Switzerland, &c. In England, near Bury; about Bedford; on the banks of the Isis, beyond Isley; and in peat bogs, under Headington Wick Cospe, Oxfordshire. Umbellules dense, many-flowered, surrounded by the many leaves of the involucres, which are of equal length. Smith, engl. bot. t. 548. Ô. filipenduloïdes, Thunb. fl. par. p. 146. Ô. Pollichii, Gmel. fl. bud. p. 1. p. 679. Ô. peucedanoides, Roth. Ô. pânets, Meencl. —Lob. icon. 729. f. 2.—Dalech. hist. 773. f. 1.

Flowers often reddish. The roots taste like the gardenparsnip, but are probably dangerous food; yet they are not reckoned poisonous, though the roots of other species are virulent.

UMBELLIFERÆ.  L X. (ENANTHE.  303

4. G. silaioôia (Bieb. suppl. p. 232.) knobs of roots of an oblong-fusiform shape, or cylindrical, fasciculate; leaves pinnae; leaflets of the lower leaves lanceolate; of the upper ones linear; involuca almost wanting; fruit ovate, crowded, sessile, hardly longer than the involuca.  2. II. Native of Europe, common. Plentiful in Britain, in wetary places, osier holts, and about the banks of rivers. Consp. 6. t. 52. Smith. engl. bot. t. 2313. Bull. herb. t. 114. Woody. suppl. med. bot. t. 267.—Lob. icon. t. 730.—Mor. ox. sect. 9. t. 7. f. 2.—Matt. valg. p. 2. p. 290. f. 1. Leaves of involuca and involucels various in number and shape. Flowers white, tinged with purple. Plant strong. Roots abounding with an acrid, fetid, very poisonous saffron-coloured juice, such as exudes less plentifully from all parts of the herb, when wounded. Brood mores sometimes eat the root, according to Sir Thomas Franklin, and are poisoned by it. Ehret, the celebrated botanical draughtsman, experienced a giddiness from the scent of the herb. Dr. Pulney remarks, that the root is one of the most virulent poisons of all the vegetable poisons that Great Britain produces. In Westmorland the country people apply a poultice of the herb to the ulcer which forms in the fore part of the callus in the horned cattle, which is called the foul. It may be safely used externally, but internally it should be taken with caution, as is evident from the accounts given above, and others received by Mr. Howell and Sir William Watson, in the Philosophical Transactions. The former of these says that two French prisoners at Pembroke died by eating the root, that the inhabitants call it five-fingered root, and that it is much used there in cataplasmis. In the same Transactions, a case is related of eight young lads near Clonmel in Ireland, where the plant is called talons, mistaking its roots for the water-parsnip, of these they died. Mr. Miller informed Sir William Watson that a whole family were poisoned with it at Battersea. The more caution is necessary respecting this plant, because it is not uncommon in some places, its appearance and smell resemble smallage or cedry, and the roots have not any flavour disagreeable enough to deter persons from eating them.

9. G. sarmentosa (Presl, in herb. Haenk, ex D. C. prod. p. 138.) root unknown; stems branched, weak, rather scendent; leaves bipinnate; leaflets ovate, toothed: terminal ones somewhat 3-lobed; umbels opposite the leaves, of many rays; involucrum almost wanting; fruit oblong; styles very long.  2. II. Native of North America, at Nootka Sound. Leaves early as in G. apiiôia, but the umbels are those of E. phellandrum, root unknown, and therefore its proper situation among the species is doubtful.

Sarmentose Water-dropwort. Pl. sarmentose.

10. G. globulosa (Lin. spec. 365.) knobs of roots oblong, attenuated at the base, but ending in an elongated fibre each at the apex; radical leaves bipinnate; leaflets lanceolate, cut; cauline leaves pinnate, with linear leaflets; umbel 5-6-rayed, without any involucrum; fruit nearly globose, sessile (the proper pedicles being almost wanting) spongy, with thick, obtuse ribs, and small furrows.  2. H. Native of Estruria, Mauritania, Spain, Portugal, &c. in meadows. Gouan. ill. p. 18. t. 9. Spreng. umb. spec. p. 106. G. diffusa, Lag. gen. et spec. p. 19. ex Spreng. Stem compressed at the base, diffuse. Fruit larger than in any other species of the genus. Umbels on long peduncles.

11. G. prolifera (Lin. spec. 365.) knobs of roots fusiform, sessile; leaves bipinnate; leaflets cuneate, lobately toothed; umbels capitulate, without an involucrum; outer pedicles of the umbel flat, branched, proliferous; fruit turbinate, 10-ribbed; ribs thick; furrows deep.  2. H. Native of Candia, Calabria, Lycia, Dalmatia, Carniola. Jacq. Hort. vind. 3. t. 62.—P. Alp.
UMBELLIFERÆ. LX. ÓNANTHE. LXI. ANNESORHIZA.

p. 304. with a figure and p. 305. with a description.—Mor. ox. sect. 9. t. 7. f. 5. a.

* * Annual or biennial plants, with fibrous roots.

12 (E. phellandrium (Lam. fl. fr. 3. p. 432.) root fusiform, with many whorled fibres; stem furrowed, fistular, branched; leaves stalked, repeatedly pinnate, with innumerable, fine, expanded, dark green, narrow, wedge-shaped, cut, shining, acute, divaricate leaflets; umbels opposite the leaves, on short tubid peduncles, without involucre; involucels of many narrow, taper-pointed leaves; fruit ovate, with 5 broad ribs, and narrow intermediate furrows, rather shorter than the pedicels. \( \downarrow \). H. Native of Europe, Tauria, and Siberia, in rivers, ditches, and lakes; plentiful in some parts of Britain, as in ditches in Bat terssea-fields, near London; and near Edinburgh. Phellandrium aquaticum, Lin. spec. 366. Fl. dunt. t. 1154. Smith, engl. bot. t. 684. Schkuhr, handb. t. 71. Hoffm. umb. 1. p. 71. descrip. and icon. t. 1- f. 17. Hayne, arz. gew. t. 1- 40. Nees. oss. pl. 14. t. 6. Woodv. med. bot. suppl. 266. Bull. fr. t. 147. Erh. pl. off. 24. L. aquatica, Lam. dict. 4. p. 530. Ligustrum phellandrium, Crantz. hort. fasc. 3. p. 84. Cleitaría paralístris, Ger. emac. 1603. f. 1. Lob. icon. 735. f. 1. Phellandrium, Dod. pempt. 591. f. 1. Roth always writes the old name phellandrium, which agrees with an etymology hazarded by Sir James Smith, in Rees' cyclo. vol. 27. from ὑπέρ, to be treacherous, alluding to the poisonous nature of the plant; ἀλέες αὐτοκε, as Linneas has it, κορκίν, is not at all satisfactory. Linnees informs us that the horses in Sweden are seized with a kind of palsy by eating this plant; hence Withering and Sibthorpe named it horse-bane. This effect, however, is not to be ascribed to the plant, but to a coleopterous insect breeding in the stalks, which he therefore names Cercidium paraplecticum. The leaves are sometimes applied to discomatous calpens, and for this reason Boerhaave speaks highly of it. The seeds are recommended in intermittents, and are said to be diuretic, antiseptic, and expectorant. The efficacy of this plant rests chiefly on the testimony of Ernstingius and Lange, by whom various cases of its successful use are published, especially in wounds and inverteate ulcers, and even in cancers; also in phthisis, pulmonary, asthma, dyspepsia, and intermittent fevers. Dr. Woodville readily observes, that though the disorders here noticed are so dissimilar as to afford no satisfactory evidence of the medicinal qualities of these seeds, yet they appear to be well deserving of farther investigation.

Phellandrium or Fine-leaved Water-dropwort. Britain. Pl. 2 to 3 feet.

15 (E. stolonífera (Wall. cat. no. 585.) stems creeping at the base, ascending, fistular strated; leaves bipinnate; upper ones pinnate; leaflets lanceolate, acuminate at the base and apex, with a few coarse serratures; umbels opposite the leaves, exconvoluted; fruit obovate-oblong, much shorter than the pedicels. \( \downarrow \). H. Native of Silkhet, in the cast of Bengal, in rice grounds. Phellandrium stoloníferum, Roxb. hort. beng. p. 81. Teeth of calyx 5, subulate. Styles permanent. Stolonífera Water-dropwort. Pl. creeping.

14 (E. linarií (Wall. cat. no. 586.) stems throwing out roots from the nodi at the base, erect, fistular; leaves pinnate; leaflets of the lower leaves linear; stem; of the upper ones linear, elongated, toothed, or undivided; umbels opposite the leaves, without involucre; rays compressed. \( \downarrow \). H. Native of Nipaul, in rice grounds. Fruit unknown. Linear-leaved Water-dropwort. Pl. 1½ to 2 feet.

15 (E. Jayaíanca (D. C. prod. 4. p. 138.) stems terete, fistular; leaves divided into 3 parts above the sheaths of the petioles, which are bipinnate; leaflets oval-oblong, cuneated at the base, deeply toothed at the apex; umbels opposite the leaves, pedunculate; involucre of a few small leaves; leaves of involucels sessate; fruit ovate. \( \downarrow \). S. Native of Java. Siam Javanicum, Blum.

Java Water-dropwort. Pl. ?

16 (E. bu'nils (Rafin. prec. son. p. 41.) stem simple, pentagonal; leaves pinnate; leaflets of the lower leaves ovate, jagged: of the upper leaves lanceolate, entire; umbels erect, simple; flowers sessile. \( \bigcirc \). H. Native of Sicily, on the Nebro- mounes, in woods. The rest unknown. The plant is very douliful.

Humble Water-dropwort. Pl. 1 foot.

§ 2. Species, natives of the Cape of Good Hope, the greater part of which are hardly known, and all of them, most probably, belong to different genera from the present.

Filiform Water-dropwort. Pl. 1 foot.

18 (E. tenuefolia (Thumb. prod. 49. fl. cap. p. 253.) stem simple, striated; leaves bipinnate; leaflets linear-sessacaus, deeply pinnatifid; upper leaves undivided, filiform; leaves of involucre and involucels very short; ribs of fruit rather winged. \( \downarrow \). G. Native of the Cape of Good Hope. Spreng. umb. spec. p. 109.

19 (E. ferulácea (Thumb. prod. 50. fl. cap. p. 253.) root unknown; stem branched, striated; leaves decomposed; leaflets lanceolate, acute, furrowed on both sides; involucre of few leaves. \( \downarrow \). G. Native of the Cape of Good Hope. Spreng. umb. spec. p. 109.

Ferula-like Water-dropwort. Pl. 1 to 2 feet.

20 (E. interrup'ta (Thumb. prod. 50. fl. cap. p. 253.) root unknown; stem simple, terete, nearly leafless; leaves radical, petiolate, divided into 3 parts, and these parts are decomposed; leaflets oblong, sinutate pinnatifid, mucronated toothed; lower ones reflexed; involucre of 5 leaves. \( \downarrow \). G. Native of the Cape of Good Hope. Spreng. umb. spec. p. 107. Stem said by Thunberg to be villous at the base, but by Sprengel it is said to be smooth. Perhaps the same as Annesorhiza Ca-pensis.

Cult. All though all the species grow naturally in ditches, rivers, and watery places, they grow well in any kind of soil, whether dry or wet. Increased by dividing at the root, or by seeds.

LXI. ANNESORHIZA (from ayngs, agnes, chaste, and μῆκος, rhiza, a root; smell of root). Cham. et Schlecht. in Linnaea. 1. p. 398. t. 5. f. 4. D. C. prod. 4. p. 139.

LIN. SYST. Pentádria, Dígynia. Margin of calyx 5-toothed, permanent. Petals elliptic, acuminate, more or less emarginate, with an indented point. Fruit 3-angled, prismatid, crowned by the reflexed calyx and styles; mericarps convex on the back, unequal; one of them 3-winged, in consequence of the carinal and marginal ribs being winged, but the intermediate ribs are filiform; the other 4 winged, in consequence of the carinal
umbellifer.e. lxii. Sclerosciadium. lxiii. Dasylo'Ma. lxiv. cynosciadium. lxv. ethusa.

rib being filiform, and the intermediate 2 and marginal 2 being winged; vittae 1 in each furrow, and 2 in the commissure, which is flat. Carpophore bipartite.—An herb, native of the Cape of Good Hope. Root fusiform. Stem erect. Cauline leaves scale-formed. Umbels of 12-15 rays. Involutex and involucels of many leaves, having hyaline margins.

1 A. Cape'nis (Cham. et Schlecht. l. c.). 2. G. Native of the Cape of Good Hope, on the sides of mountains. The root smells of anise, hence the name of the herb at the Cape, Anonyswertel.

Cape Anise-root. Pl. 1 to 2 feet?

Cult. Any soil will suit this plant; and it will be easily increased by cuttings or by seeds.

lxii. Sclerosciadium (from σκληρός, skleros, hard, and σκίας, skiaion, an umbel; in reference to the solid fruit). Koch, diss. ined. in litt. 1828. D. C. coll. mem. 5. p. 43. t. 2. f. F. prod. 4. p. 140.

L. Syst. Pentandra, Digynia. Teeth of calyx 5, conical, permanent. Petals obcordate, with an indented point, which is bidentate or tridentate at the apex. Stylodum conicidal; styles filiform, at length diverging. Fruit ovate-globose, solid; mericarps with 5 thick, elevated, blunt, equal ribs; vittae 1 in each furrow, which are narrow, and 2 in the commissure. Carpophore distinct, univalved. Seed terete, flattish on inside.—Herb glabrous. Root fibrous. Leaves divided into linear-oblong lobes or leaflets. Umbels axillary, sessile, almost without any involucrum; rays very unequal, that is, some of the umbellules are sessile, and some are on long pedicellae in the same umbel. Involutex of 5-7 leaves, having membranous margins. This genus is allied to Cynonathu', from which it differs in the carpophore being free, in the stylodum being conical, and in the ribs of the fruit being prominent, &c. (f. 56. F.)

1 S. Hume'le (Koch. l. c. D. C. l. c.). 2. H. Native of fields, about Mogodor, and probably of Teneriffe. Cynonathu' nodifloru', Schoubs. mar. p. 120. Conium rigidum, Mert. herb. and perhaps the same as Biumum rigidu', Spreng. but neither the description nor the country agrees with the present plant.

lxiii. Dasylo'Ma (from diasys, dasys, thick, and lemma, lemma; a fringe; in reference to the ribs of the fruit). D. C. prod. 4. p. 140.

L. Syst. Pentandra, Digynia. Margin of calyx obsolete. Petals unknown. Stylodum depressed; styles short. Fruit ovate, with the transverse section terete; mericarps semi-ovate, not separating at maturity, with 5 corky, cellular ribs: the 3 dorsal ones small, and the 2 lateral ones large and blunt; vittae 1 in each furrow, which are narrow, and 2 in the middle of the commissure, which is flat. Carpophore indistinct. Seed triangular, that is, convex on the back and angular at the commissure.—Herbs with the habit of Cynonathu'. Stems fissilis. Leaves bipinnate; leaflets cuneate, few-toothed at the apex. Umbels opposite the leaves, 5-6-rayed. Umbellules crowded, many-flowered. Involutex and involucels none.

2 D. glau'cum (D. C. l. c.) umbels pedunculate. 2. H. Native of Bengal. Biforis? glauca, Wall. Differs from the preceding in the umbels being distinctly pedunculate, in the leaves vs.

being larger and glaucescent, in the dorsal ribs of the fruit being more acute, and the lateral ones smaller.

Glaucous Dasylo'ma. Pl. 1 foot?

Cult. The seeds only require to be sown in the open ground.

lxiv. Cynosciadium (from κυνός, κυνος, κυνος, a dog, and σκίας, skiaion, an umbel). D. C. coll. mem. 5. p. 44. t. 11. prod. 4. p. 140.

L. Syst. PentANDria, Digynia. Teeth of calyx 5, subulate, permanent (f. 63. c.). Petals ovate-oblong or ovate (f. 63. b.), attenuated at the apex; mericarps with 5 thick, corky ribs (f. 63. a.), 2 lateral ribs marginal; vittae nearly straight, 1 in each furrow, and 2 in the commissure. Seed sub-semicretaceous. Carpophore bipartite.—American glabrous herbs. Stems angular, fistular, branched a foot high and more, with very few leaves. Leaves pinnate or palmate; leaflets linear, elongated, entire, articulated near the base, at which places the leaflets fall off; lower and upper ones undivided, linear, and elongated. Involutex and involucels of many leaves. Flowers white.—This is an intermediate genus between Cynonathu' and Ethu'sa, but it differs from both, and from all its allies in the petals being flat and entire; it differs particularly from Ethu'sa in the calyx being 5-toothed, in the vittae of the commissure being straightish, and in the involucel and involucels being of many leaves; from Seseli in the stylodum being conical; and from Cynonathu' in the carpophore being distinct.

1 C. digita'tum (D. C. l. c. t. 11. f. A.) leaves palmate; leaflets 3, linear, quite entire; fruit ovate at the base, but attenuated at the neck.—Native of North America, on plains of the Arkansas River. Cynonathu' digitatus, Nutt. mss. Umbels few-flowered. Involutex of a few unequal leaves: leaves of involuclus subulate, very short. Rays of umbel very long.

Digita'te-leaved Cynosciadium. Pl. 1 to 1½ foot.

2 C. pinax'tum (D. C. l. c. t. 11. f. B.) leaves pinnate; leaflets distant, few pairs, linear, quite entire: terminal one very long; fruit ovate-oblong.—Native of North America, along with the preceding species. Ethu'sa pinnata, Nutt. mss. Pedicels a little longer than the leaves of the involucel. Leaves of involuclus 7-8, nearly equal, linear-subulate.

Pinnate-leaved Cynosciadium. Pl. 1 foot.

Cult. Sow the seeds in the open ground, and the plants will rise and flower and seed freely.

L. Syst. PentANDria, Digynia. Margin of calyx obsolete. Petals obovate, emarginate, with an indented point; outer ones radiating. Fruit ovate-globose; mericarps with 5 elevated, thick, acutely keeled ribs: lateral ribs marginal, and a little broader than the rest, girded by a somewhat winged keel; vittae 1 in each furrow, and with 2 arched ones in the commissure. Seed semi-globose. Carpophore bipartite.—Erect, annual, pinnate herbs. Leaves uniform, multifid. Involutex wanting Rr
or of 1 leaf; involucres of 3 or 5 spreading, or pendulous, secta-
ceous leaves, situated on the outside of the umbellules, that is,
unilateral. Flowers white. Three species of this genus are
admitted, but they are probably only varieties of one.

1 E. cynapium (Lin. spec. p. 367.) leaflets wedge-shaped,
decurrent, with lanceolate segments; rays of umbel nearly
equal; involucrum wanting; involucres of 3 leaves, which are
longer than the umbellules. O. H. Native throughout the
whole of Europe, in cultivated grounds: a common weed.

2 E. cynapioides (Bieb. fl. taur. 1. p. 227, suppl. p. 232.)
segments of the leaves oblong, acute; rays of umbel nearly
equal; involucrum wanting; involucres of 3 leaves, which are
shorter than the umbellule; vitæ in the commissure contiguous
at the base. O. H. Native of the Ukraine, in shady places.

3 E. elata (Friedlander, ex Fisch. cat. hort. gor. 1813. p.
45.) segments of the leaves oblanceolate; involucrum usually
of 1 leaf; involucres of 1-2 leaves, which are longer than the
umbellules; outer rays of umbel longest; pedicels twice the length
suppl. p. 34. Petals white, not as in E. cynapium, greenish
at the base. Styles purple after flowering. The plant is said
to be edible, and not poisonous as the others.

Cult. The seeds only require to be sown in the open ground.

LXVI. FICNICALMUL (the Latin name of the fennel, from
fenum, hay; the small of the plant resembling that of hay).
umb. p. 120. t. 1. f. 13. c. Lagen. nat. 2. p. 90. Koch.
Méum species of Spreng.

L. syl. Pentandria, Digynia. Margin of calyx tymid,
obsolete, toothless. Petals roundish, entire, inovallate,
with a rather square retuse point. Transverse section of fruit nearly
terete; mericarps with 5 prominent, bluntly keeled ribs: lateral
ribs marginal, and a little broader than the rest; vitæ 1 in each
furrow, and 2 in the commissure. Seed somewhat semi-terete.

—Bimial or perennial herbs. Roots fibrosiform. Stems terete,
striated, branched. Leaves truly pinnate, decomposed: with
linear, sectaceous leaflets. Involucrum and involucres almost wanting.
Flowers yellow.—This genus differs from Anéthum with which
it was formerly combined, by the mericarps being more turbid;
having the margin rather more compressed than the back; and
the transverse section of the fruit is therefore nearly terete, or
with the margin rather compressed.

1 F. vulgare (Ray, syn. 217. Gerdt. fruct. 1. p. 105.)
stem terete at the base; leaflets bipinnate, distich; leaflets awl-
shaped, drooping; umbels 13-20-rayed; involuera and involucres
wanting. O. H. Native of Europe, in exposed, uncul-
tivated places; in Britain, on chalky cliffs, very plentiful; and
of Caucasus, near Baku, and in the plains between Sallian
bot. t. 1208. Mill. fig. t. 13. Hayne, arz. gew. 7. t. 18. Ficn
icalmum officinale, All. pedem. no. 1359. Mém Ficnicalmum,
Ligusticum Ficnicalmum, Roth. germ. 1. p. 124. Ficnicalmum,
and aromatic flavour of this our garden fennel are well known,
and has long been an inmate of our gardens. The tender stalks
are used in salads; the leaves boiled enter into many fish sausages.
The sweet and warm seeds are a common carminative medicine
for infants. The blanched stalks of the next species, F. dulce,
called finocchio, are eaten with oil, vinegar, and pepper, as a cold
salad, and they are likewise sometimes put into soups. This
thickened part is blanched by earthing up, and is then very
tender. "Owing to the peculiar nature of this species," Mr.
Neill observes, "it is more tender than the common fennel,
and often perishes in the course of the winter. Mised by this
circumstance, several horticulturists describe it as an
annual plant, under the name of Anéthum végétum." All are
raised from seed, of which half an ounce is sufficient for a seed-
bed 4 feet by 6 feet. Sometimes also they are raised from
offsets from the old plants, where only a few are wanted.
Sow in the spring in light earth, either in drills from 6-12 inches
apart, or broad cast and raked in. When the plants are 3 or 4
inches high, thin or transplant a quantity 15 inches asunder.
As the roots of old plants divide into offsets, these may be slipped
off in spring, summer, or autumn, and planted a foot apart.
They will produce immediate leaves for present supply and in
continuance; or for immediate larger supply of leaves, you may
procure some established full roots, and plant as above; let
them be well watered. The same plants remain several years
by the root, but in the fall sends up strong stems for seed in
summer, these, or a part of them, should be cut down, to encou-
trage a production of young leaves below in succession.
It is apt to spread more than is desirable, if suffered to seed.
The swelling stems of the Finocchio or F. dulce, when of some toler-
able substance, should be earthed up on each side 5 or 6 inches
blanch them white and tender. This will be effected in 10
days or a fortnight; and by successive sowings or cutting down
plants during summer, successive crops of blanched stalks may
be had from June to December. In procuring seed, permit
some of the best flower-stems to shoot; and they will produce
large umbels of seeds in summer.

2 F. dulce (C. Bacth. pin. 147.) stem rather compressed
at the base; radical leaves rather distich; leaves all tripinnate;
with capillary elongated leaflets; umbels 6-8-rayed. O. H.
Native of Italy, and Portugal, where it is cultivated for the sake
of the blanched stalks, under the name of Finocchio. Finocchio
dulce, Targ. cors. agr. 2. p. 52. Anéthum dulce, D. C. cat.
hort. monsp. p. 78. Ficnicalmum dulce, &c. J. Baint. hist. 3.
p. 4. with a figure. It differs from the preceding species in
being hardly a foot high, in the earlier florescence, in the darker
hue, in the stalks being edible, and in the characters given
above. The use of this kind of fennel is given above with the
common fennel.

Sweet Fennel or Finocchio. Fl. May, June. Cht. Pl. 1 ft.

**LIN. SYST. PI'ENTÀDRIA, Díg'ýnia.** Margin of calyx 5-toothed, increased a little after flowering. Petals roundish, entire, involute, with a broad retuse segment: stylopodium conical; styles short, somewhat reflexed. Fruit terete, 10-furrowed; mericarps with 5 filiform, obtuse, equal ribs: lateral ribs marginal; vitae many, both in the furrows and commissure. Carpophore undivided. A glabrous perennial herb. Root fusiform. Radical leaves rarely undivided, but usually pinnate, or bipinnate; leaflets ovate or lanceolate, serrated; upper leaves ternate, and jagged. Umbels compound, terminal, of many rays. Involucra and involucels of many filiform reflexed leaves. Flowers yellow. This genus is very nearly allied to Foeniculum, but differs in the calyx being 5-toothed and permanent.

Cult,—The plant will grow in any soil, and is easily increased by dividing at the root, or by seed.

IXVIII. **DEVERRA** (a goddess worshipped by the ancients for encouraging housewifery, or rather the goddess of brooms; the plant having much the appearance of a broom.) D. C. coll. 5. p. 45. prod. 4. p. 143. Búbon species of authors.

**LIN. SYST. PI'ENTÀDRIA, Díg'ýnia.** Margin of calyx obsolete. Petals ovate, acuminate, with an inflexed point. Styles short, at length divaricate. Fruit ovate, or roundish, rather compressed from the sides, rough from scales or spreading pili; mericarps semi-terete, with obsolete ribs; vitae 1 in each furrow, and 2 in the commissure. Carpophore bipartite.—Aromatic, leafless, glaucous, stiff, broom-like shrubbery, natives of Africa. Pétioles sheathing, permanent; limbs of leaves wanting in the adult plant, or nearly so; but in young plants they are small and many-parted, with setaceously linear leaves. Umbels of few rays. Involucra of 4-6 small deciduous leaves; involucels of 4-6 ovate-lanceolate, deciduous leaves, with membranous margins. Flowers white.

**SECT. I. DÍVERRA'BIA** (an alteration from the generic name). D. C. prod. 4. p. 143. Fruit villous or hispid.

2. **Var. b. Burechellí** (D. C. prod. 4. p. 143.) young fruit beset with short, tubercul villi. 3. **G.** Native of the Cape of Good Hope. Very like the species, but the fruit is much less villous, and is therefore perhaps distinct.

**Leaffess Dverrã.** Shrub.

1. **D. TÓRTUÓSA** (D. C. prod. 4. p. 143.) stem much branched, twisted, divaricate; lower sheaths furnished with divided limbs, bearing subulate leaflets; fruit sparingly villous. 4. **F.** Native of the north of Africa.

**SECT. II. PÍTURÁNSTHOS** (from πτέρω, pteron, and αἴβος, anthos, a flower; in allusion to the fruit bearing scurf-like scales). D. C. prod. 4. p. 144. Fruit covered with scales.

**Scurfy-flowered Dverrã.** Shrub 1 to 2 feet.

Cult.—A mixture of loam, peat, and sand will suit the species of Diverrya; and they can only be increased by seeds.

IXIX. **SORÁNTHUS** (from σωρός, soros, a heap, and αἴβος, anthos, a flower; in reference to the close capitulate umbels of flowers). Led. fl. ross. alt. ill. t. 82. fl. atl. 1. p. 344. D. C. prod. 4. p. 669.

**LIN. SYST. PI'ENTÀDRIA, Díg'ýnia.** Margin of calyx obsoletely toothed. Petals broad-oval, permanent, with an inflexed point. Fruit a little compressed from the back, crowned by the divaricate styles: the transverse section elliptic; mericarps with 5 hardly prominent, equal ribs: lateral ribs marginating; vitae 1 in each furrow, and 4 in the commissure. Carpophore bipar...
suit.—An erect herb, with a habit between *Seseli* and *Géranthe*, but differs from the first in the teeth of the calyx being obsolete, in the petals being broad-ovate, not obovate, and in the ribs of the fruit being less prominent; and from the last in the shape of the petals, in the styles and in the carpophore being present.

1 S. Meyerii (Led. l.c.).  
2. H. Native of Siberia, at the river Irtysh, not far from the lake called Noor-Saian; and at the river Bekin, in sandy places. Root fusiform. Stem erect, striated, simple at the base, and usually bearing 3-4 verticillate branches at the apex; branches leafless, or furnished with membranous scales in the middle. Radical leaves 3-4, tripinnate: leaflets linear; cauline leaves 1-2. Umbels of 10-15 rays, of these 4 are longer than the rest. Involutura wanting, rarely of 1 leaf; involucels of 6-8 leaves, which are ovate-lanceolate, pilose on the outside, and ciliated, shorter than the umbellules. Flowers sessile in the umbellules: outer ones female: intermediate ones hermaphrodite: central ones male.

*Meyer’s Soranthus.* Pl. 1½ to 3 feet.

*Cult.* This plant will grow in any soil, and is easily increased by seed.

LXX. *Seseli* (Seyecytous is the Arabic name of an umbelliferous plant, but to what plant it was given is now unknown). Lin. gen. no. 560. Lag. an. nat. 2. p. 103. D. C. coll. mem. 5. p. 56. t. 3. F. R. prod. 4. p. 144.—*Seseli and Bubon species, Spreng.—Seseli species, Koch.

Linn. *Petúndria Díégia*. Margin of calyx 5-toothed; teeth short, thickish, and sometimes obliterated. Petals obovate, coarctate into an inflexed point at the apex, emarginate or nearly entire. Fruit oval or oblong (f. 55. D. a. E. u.), with the transverse section nearly terete, and crowned by the styles, which are reflexed (f. 55. D. b. E. b.); mericarps with 5 prominent filiform or elevated thick coryck ribs: lateral ribs margi

nating, and a little broader than the rest; vitte one in each furrow, but there are sometimes 2 in the outer furrows, and always 2 in the commissure, but very rarely 4. Seed somewhat semi-terete.—Usually glaucous biennial or perennial herbs. Leaves pinnate or ternately compound. Involucrum wanting or almost so; involucels of many leaves. Flowers white, very rarely yellow.

**Sect. I. Hippomária** (from *iirxe, hippe*, a horse, and *maorarh, marathron*, fennel; horse fennel). Rivin, Roehl, but not of Linn, D. C. prod. 4. p. 144. Involutura wanting. Leaves of involucels joined together nearly to the apex into a bowl-shaped cap, having a toothed margin.

1 S. Hippomária (Lin. spec. 573.) stem terete, and nearly branched at the apex, and nearly naked; leaves glaucous, bipinnate; leaflets linear, trifid, acute; petioles dilated and sheathing; fruit smoothish; involucel cup-shaped.  

**Var. br, herbárium** (D. C. prod. 4. p. 144.) fruit beset with down, even in the mature state.  
2. H. Native of Siberia. Nearly allied to *S. tomatíllus*, but the habit is more that of *S. Hippomária*, and the umbel is downy, not tongtoid.

2 S. tomentósum (Vis. daln. spec. p. 6. t. 3. f. 1.) stem simple, terete; leaves hibernate or trinate: leaflets filiform, chan

nelled; upper ones ternate; involucra wanting; involucel cup-shaped, and is, as well as the fruit, tongtoid from stellate down.  
2. H. Native of Dalmatia, on stony hills towards the sea. This species is intermediate between *S. Hippomária* and *S. lécopérnium*, nevertheless it is more nearly allied to the former than to the latter.

**Tomentose Meadow-saxifrage.** Pl. 1 to 2 feet.

**Sect. II. Hippomáraäthrogídes (agreeing with the plants in section Hippomária; hence the name).** D. C. coll. diss. 5. p. 47. prod. 4. p. 144. Involutura wanting or of few leaves. Leaves of the involucels joined to each other, particularly at the base. Flowers white.

3 S. Ledeböörii: stem a little branched; leaves glaucous, bipinnate or tripinnate; leaflets ternate, with the segments linear, upper sheaths ventricose, nearly leafless; involucrum of one lancelolate leaf; involucel cup-shaped, divided at the apex into long acuminated marcescent segments, about equal in length to the flowering umbellule; fruit prismatic, on short pedicels, pilose.  

*Ledeböör’s Meadow-saxifrage.* Pl. 1 to 1½ foot.

4 S. dicíthórum (Bieb. fl. taur. 1. p. 233. suppl. p. 245.) stem terete, erect, clothed with fine down; lower branches short: superior ones longer than the central umbel; leaves pinnate; leaflets multiform, with the segments linear; involucrum wanting; leaves of involucels joined together to about the middle, but ovate and mucronate in the free parts.  

**Dichotómous Meadow-saxifrage.** Fl. June, July. Cl. 1818. Pl. 1 to 2 feet.

5 S. **cumíme** (Smith, exot. bot. t. 120.) stem terete, thick, stiff, branched at the top, clothed with fine pubescence; leaves tripinnate, elliptic; leaflets cuneate, trifid; involucra of few leaves, rarely wanting; umbels 20-rayed; leaves of involucel joined together nearly the length of the pedicels into an expanded dish, having the free parts subulate, and exceeding the umbellules.  

**Var. críthmifólia** (D. C. prod. 4. p. 145.) stems, rays of umbels, and upper leaves rather velvety; segments of leaves elongated; central umbel surrounded by a 10-12-leaved involucrum.

**Gum-bearing Meadow-saxifrage.** Fl. July, Sept. Cl. 1804. Pl. 3 to 4 feet.

6 S. **rigidus** (Walást. et Kit. rar. hung. 2. p. 156. t. 146.) stem terete, thick, rather tomentose, stiff, sparingly branched; leaves glaucous, three or four times pinnate; leaflets linear, stiff, mucronate, rather pungent, usually trifid; involucrum none; umbel 20-rayed; leaves of involucel joined together at the base, equal in length to the umbellule; fruit tomentose.  

7 S. *cuneífolium* (Bieb. fl. taur. 1. p. 230. and suppl. 244. exclusive of the synonymes,) stem unknown; leaves several times
pinnate; leaflets broad, cuneiform, forked; superior ones oblun
tate; leaves of involucres very short, joined together at
the base; fruit villous. 2. H. Native of Eastern Caucasus, in
subalpine situations. Bäböl cunefolius, Spreng. syst. 1 p. 900.

Wedge-leaved Meadow-saxifrage. Fl. 1 foot.

8 S. Peucanadiolus (Bess. cnm. cont. p. 44.) stem terete,
sparingly branched at the apex, glaucous; leaves trinervate;
leaflets linear-lanceolate, acuminate; sheaths adpressed; in-
volute almost wanting; leaves of involucres subulate, joined
together at the base; flowers nearly sessile; fruit velvety from
flocky short down. 2. H. Native of the south of Podolia.
In Schultes, syst. 5 p. 402.? Bäböl peucanadiolus, Spreng.
syst. 1 p. 900. Involucrum sometimes of few leaves.

Cl. 1818. Fl. 1 foot.

9 S. Leucopetrum (Waldst. et Kit. pl. rar. hungr. 1 p. 92.
t. 89.) stem terete, flexuous, branched at the apex; leaves
glaucous, decompound; leaflets setaceous, linear; petioles
dilated, and sheathing; involucrum usually of one leaf; leaves
of involucres subulate, joined together at the base, and are
as well as the fruit puberulous. 2. or 3. H. Native of
Pannonia, about Buda on chalky hills. Athamantha leucop-
êrma, Poir. suppl. 1 p. 534. Very nearly allied to S. Hippo-
máratrum, but differs in the leaves of the involucres joined
only at the base, not to the apex. Umbellules dense.
Fruit with elevated corky ribs and narrow furrows, ex Koch,
emb. p. 110.

1 ½ foot.

Sect. III. Eusélêli (so called from containing what are con-
templated the true species of the genus.) D. C. prod. 4 p. 145. —
Sélêli vérâ, Koch, umb. p. 110.—Hippomáratrum, Duby, in
D. C. bot. gall. 1 p. 234. but not of Link, nor Rivín. Invo-
lucra wanting or of few leaves. Leaves of involucres distinct, or
sometimes somewhat concrete at the very base.

* Flowers yellow.

10 S. Gráçile (Waldst. et Kit. hungr. 2 p. 122. t. 117.) stem
terete; leaves trinervate; leaflets triangularly setaceous, very
thin and rather falcate; rays of umbel elongated; involucra
wanting or nearly so, very short. 2. H. Native of Pannonia
and Transylvania, on calcareous rocks. Baumg. fl. trans. 1 p.
238. Flowers yellow; petals oval-oblong, incised at the apex.
Cauldix ascending. Flowering stems erect. Sheaths of leaves
entire. Fruit elliptic and smooth, like the rest of the plant.
Umbels opposite the leaves, drooping before expansion.

Fl. 1 to 2 feet.

11 S. triéntum (Pursh, fl. amer. sept. 1 p. 197.) root
 fusiform; leaves sheathing a long way, ternate, binate, or
trinervate; leaflets or segments elongated, linear or linear-lan-
celate, quite entire, petiolulate; stem leaf at the base; umb-
els compound, with nearly equal rays; umbellules capitate;
flowers dioecious or polygamous; immature fruit oblong, some-
what cylindrical; mericarps with 5 elevated acute ribs; in-
volute and involucres wanting. 2. H. Native of North Am-
erica, about the Columbia river; common on the dry gravelly
soils near Fort Vancouver. Hook. fl. bor. amer. 1 p. 264. t.
94. This has much the habit of S. lieiodrómun. Petals invo-
lute entire. Teeth of calyx obsolete. Flowers yellow.

Trinervate-leaved Meadow-saxifrage. Fl. June, July.
Cl. 1828. Fl. 2 feet.

12 S. difívari um (Pursh, fl. amer. sept. p. 732.) stem dichó-
tomous, leafy; leaves petiolate, with short sheaths, bipinnate or
tripinnatifid; segments linear-oblong, acute, short, peduncles
lateral and terminal; rays of umbels equal; leaves of invo-
lucres linear-subulate; fruit roundish-ovate, crowned by the
calyxine teeth; mericarps rough, with 5 elevated ribs and many
vittae. 2. H. Native of North America, on the banks of the
Missouri; and about Carlton House upon the Saskatchewan.
Sims, bot. mag. 1742. Nutt. gen. amer. 1 p. 194. S. hieudim,
Fr. cat. 1813. Mârattrum, Rafin. journ. phys. 1820. Flowers
yellow. The vittae are numerous, and abound in powerfully
aromatic oil.

Difívariate Meadow-saxifrage. Fl. June, July. Cl. 1812.
Fl. 1 foot.

13 S. Lieódaru (Hook. in fl. bor. amer. 1 p. 263. t. 93.) leaves
with long sheaths, trinervate or trinervately pinnate; leaf-
lets petiolate, oblong, entire, attenuated or trifid, glaucous; stem
nearly naked; umbels compound, with the rays very unequal;
umbellules capitate; flowers dioecious or polygamous; immu-
ner fruit very smooth; involucra and involucres wanting. 2.
H. Native of the north-west coast of America; on gravelly
soils near Fort Vancouver, on the Columbia. Flowers yellowish.
Styles reflexed.

Smooth-fruited Meadow-saxifrage. Fl. ½ foot.

14 S. defoliátum (Led. fl. oss. alt. 1 p. 343.) radical
leaves early, caduceous; stem furnished with leafless sheaths;
involucra and involucres of few leaves. 2. H. Native of Si-
beria, in the Kirghisean Steppe, in sandy wet salt situations.
Plant with the habit of Fërata silva. Root perpendicular. Stems
solitary, simple at the base, divided into floriferous branches
from the middle, which are branched again. Flowers yellow,
polygamous. Carpels with 5 prominent equal filiform ribs;
vitta one in each furrow, and 2 in the commissure.

Defoliate Meadow-saxifrage. Fl. 1 foot.

** Flowers white.

15 S. Elâum (Gouan, ill. 16. t. 8.) stem rather dichoto-
mous, terete, few-leaved; leaves bipinnate; leaflets linear-fil-
iform, stellifer, involucra almost wanting; fruit ovate, tuber-
cular while young, but glabrous in the adult state, crowned by
the calyx. 2. H. Native of the south of France, Italy, &c. in
Spreng. umb. spec. 118. exclusive of the first and perhaps of the
second synonyme. S. ékhtum, Lin. spec. p. 375. is very proba-
bly a distinct plant.—Lob. icon. t. 727. f. 2. Plant glaucous.

Var. f. ligula. (D.C. prodr. 4 p. 146.) superior calicu-
lar leaves long-linear, quite entire. Native country unknown, but
is usually to be found in gardens, under the name of S. glau-
cum.

Tall Meadow-saxifrage. Fl. July, Aug. Cl. 1710. Fl. 1 to
2 feet.

16 S. varium (Trev. ind. sem. wratis. 1808. nov. act. bonn.
13 p. 168.) stem terete; branches few, erect; petioles fur-
rowed, as well as the leaves, which are triinnate; leaflets linear,
glabrous, glaucous; involucrum almost wanting; leaves of invo-
lucres short, subulate; fruit oblong, glabrous, not crowned.
2. H. Native of Caucasus and Austria. S. vérâum, Koch, emb.
p. 110. S. Tauricum, Link, in Spreng. syst. 1 p. 884. but not of
ex Trev. Diffr. from S. montânum and S. Pallâtisii, in the fruit
not being crowned by the teeth of the calyx.

Var. f. brachyphleum (Bess. in litt. 1828.) fruit shorter.
2. H. S. chaerophyllæoides, Hortul. but not of Thumb. Perhaps
a proper species.

17 S. jüneum (Sibth. et Smith, fl. grave. prod. 1 p. 200.) stem
much branched, divaricate, stiff, glabrous; leaves rather
glaucus; radial ones trinervate; leaflets keeled, trifurcate;
calicu lar petals very short, spreading; umbels solitary, few-
UMBELLIFERAE. LXX. SESELI.

flowered. 2. H. Native of Greece. Perhaps sufficiently distinct from *S. montanum.*

**Rushy Meadow-saxifrage.** Pl. 1 foot. 18 S. *montanum* (D. C. fl. fr. 4. p. 285. and suppl. p. 505.) Stem striated; leaves glaucous, bipinnate, with entire sheaths, and narrow-linear mucronulate leaflets; involucra of 1-3 leaves, and the involucres of many linear-subulate leaves; fruit elliptic, glaucous, glabrous, or clothed with fine pubescence. 2. H. Native from France to Tauria, in open mountainous places.

**var. e-, nudicaule** (D. C. prod. 4. p. 147.) Stem multiple at the base; leaves strictly adpressed. 2. H. *S. multicaule,* Retz. obs. 3. p. 27. Jacq. hort. vind. 2. t. 129.

**Mountain Meadow-saxifrage.** Fl. June, July. Ch. 1659. Pl. 2 to 3 feet.

19 S. *Pallasii* (Bess. cat. hort. crem. 1816. p. 130.) Stem terete, branched at the top; leaves bipinnate or tripinnate; leaflets trifid; segments linear, flat, acutish, glabrous, glaucous; upper leaves trifid or undivided; involucra wanting; leaves of involucres subulate, very short; fruit ovate, glabrous, crowned by the short 5-toothed calyx. 2. H. Native of Russia. D. C. mem. soc. gen. vol. 4. S. *crassifolium,* Schrad. and Hort. Umbels 10-rayed. Fruit elegantly striated with fuscous vitre. Petiolar sheaths narrow, elongated. Allied to *S. élatum,* but the fruit is not tuberced when young; to *S. lencospérum,* but the fruit is glaucous. According to Koch, it is a variety of *S. glaucum.*

20 S. *TenuiFolium* (Ledeb. fl. ross. alt. ill. t. 97. fl. alt. 1. p. 333.) Stem branched, flexuous; leaves bipinnate; leaflets linear, stiffish; involucrum almost wanting; involucres short; fruit prismatic, tubercularly warted, rather shorter than the pedicels; receptacle with a membranous margin. 2. H. Native of Altai, in dry open sterile places near Ustkmengorsk, and in the Kirghisian steppe, between the first mentioned place and Abalak. Plant glaucous. Stems many. Leaves with 5 opposite pinnae, and each pinna bearing 3 or 5, usually entire leaflets. Umbels 6-8-rayed. Involucrum usually wanting, rarely of one setaceous leaf; involucres of 7-8 small lanceolate membranous acuminate reflexed leaves. Styles and teeth of calyx reflexed on the fruit.

*Fine-leaved Meadow-saxifrage.* Pl. 1 foot.

21 S. *Coronatum* (Ledeb. fl. ross. alt. ill. 169. fl. alt. 1. p. 336.) Stem branched; leaves bipinnate; leaflets linear-oblong, decurrent, entire or tripartite; involucrum of 2 deciduous leaves; involucres of many lanceolate acute membranous reflexed leaves; fruit at length rather prismatic, wrinkled, crowned by the conical stylodium. 2. H. Native of Siberia, in the Soongarian desert. Plant glaucous. Radical leaves 8-10 inches long. Petioles dilated, and rather violaceous at the base, with white membranous margins. Umbels 6-8-rayed. Leaves of involucres indented at the points. Calyx obtusely 5-toothed. Styles reflexed.

**Crowned Meadow-saxifrage.** Fl. July, Aug. Pl. 13 to 2 ft.

22 S. *Vaginátum* (Ledeb. fl. ross. alt. ill. t. 171. fl. alt. 1. p. 336.) Plant glaucous; stem very simple; radical leaves pin-
umbellules; fruit prismatic, glabrous. \(\text{\} H\) Native at the bottoms of the Altaian mountains, frequent; as near Sogra, Loktevsk, Smegow, and elsewhere. Root fusiform. Rays of umbels 15-50, angular, roughish at the angles. Umbellules with 20-30 flowers. Mericarps with 5 prominent ribs. Stylopodium pulvinate. It differs from \(S.\) coloratum, in the leaflets of the leaves not being roughish on the margins, in the rays of the umbel not being pustulose, and in the leaves of the involucel.

Var. \(\beta\) simplex; stem simple; leaves bipinnate: leaflets 2-3 inches long, very narrow.

**Straight Meadow-saxifrage.** Fl. July. Ch. 1830. Pl. 1\(\frac{1}{2}\) ft.

28. \(S.\) purpureum (D.C. Prod. 4 p. 147.) stem striated; petioles dilated at the base; sheaths with membranous margins; leaves decomposed; leaflets few, linear, acute, glabrous; involucrum of one leaf; rays of umbels and fruit puberulous; involucels shorter than the umbellules.

29. \(S.\) tortuosum (Lin. spec. p. 373.) stem striated, stiff, much branched, divaricate; leaves bipinnate, stiffish: leaflets trifid: segments linear, short, acute, with the margins and keel rather scabrous; petioles sheathing, oblong; involucre wanting or of 1-2 leaves; umbels 5-10-rayed; leaves of involucel about equal in length to the umbellules.

30. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Puberulous Meadow-saxifrage.** Pl. 1 foot.

29. \(S.\) tortuosum (Lin. spec. p. 373.) stem striated, stiff, much branched, divaricate; leaves bipinnate, stiffish: leaflets trifid: segments linear, short, acute, with the margins and keel rather scabrous; petioles sheathing, oblong; involucre wanting or of 1-2 leaves; umbels 5-10-rayed; leaves of involucel about equal in length to the umbellules.

29. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Straight Meadow-saxifrage.** Fl. July. Ch. 1830. Pl. 1\(\frac{1}{2}\) ft.

30. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Puberulous Meadow-saxifrage.** Pl. 1 foot.

29. \(S.\) tortuosum (Lin. spec. p. 373.) stem striated, stiff, much branched, divaricate; leaves bipinnate, stiffish: leaflets trifid: segments linear, short, acute, with the margins and keel rather scabrous; petioles sheathing, oblong; involucre wanting or of 1-2 leaves; umbels 5-10-rayed; leaves of involucel about equal in length to the umbellules.

29. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Straight Meadow-saxifrage.** Fl. July. Ch. 1830. Pl. 1\(\frac{1}{2}\) ft.

30. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Puberulous Meadow-saxifrage.** Pl. 1 foot.

29. \(S.\) tortuosum (Lin. spec. p. 373.) stem striated, stiff, much branched, divaricate; leaves bipinnate, stiffish: leaflets trifid: segments linear, short, acute, with the margins and keel rather scabrous; petioles sheathing, oblong; involucre wanting or of 1-2 leaves; umbels 5-10-rayed; leaves of involucel about equal in length to the umbellules.

29. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Straight Meadow-saxifrage.** Fl. July. Ch. 1830. Pl. 1\(\frac{1}{2}\) ft.

30. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Puberulous Meadow-saxifrage.** Pl. 1 foot.

29. \(S.\) tortuosum (Lin. spec. p. 373.) stem striated, stiff, much branched, divaricate; leaves bipinnate, stiffish: leaflets trifid: segments linear, short, acute, with the margins and keel rather scabrous; petioles sheathing, oblong; involucre wanting or of 1-2 leaves; umbels 5-10-rayed; leaves of involucel about equal in length to the umbellules.

29. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Straight Meadow-saxifrage.** Fl. July. Ch. 1830. Pl. 1\(\frac{1}{2}\) ft.

30. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Puberulous Meadow-saxifrage.** Pl. 1 foot.

29. \(S.\) tortuosum (Lin. spec. p. 373.) stem striated, stiff, much branched, divaricate; leaves bipinnate, stiffish: leaflets trifid: segments linear, short, acute, with the margins and keel rather scabrous; petioles sheathing, oblong; involucre wanting or of 1-2 leaves; umbels 5-10-rayed; leaves of involucel about equal in length to the umbellules.

29. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Straight Meadow-saxifrage.** Fl. July. Ch. 1830. Pl. 1\(\frac{1}{2}\) ft.

30. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.

**Puberulous Meadow-saxifrage.** Pl. 1 foot.

29. \(S.\) tortuosum (Lin. spec. p. 373.) stem striated, stiff, much branched, divaricate; leaves bipinnate, stiffish: leaflets trifid: segments linear, short, acute, with the margins and keel rather scabrous; petioles sheathing, oblong; involucre wanting or of 1-2 leaves; umbels 5-10-rayed; leaves of involucel about equal in length to the umbellules.

29. \(S.\) subflavum (Bieb. Hist. p. 147.) stem sheaths dilated, with pale margins; petioles and styles white, or hardly reddish.

\(\sharp\). Not perhaps Selenium cativifolium. Vill. is referrible to this variety.
UMBELLIFERÆ. LXXI. LIBANOTIS.

Sect. I. Eríotis (from aper, evion, wool, and one, oes, ota, an ear; in allusion to the petals being covered with short down). D. C. coll. mem. 5. p. 17. t. 3. f. 5. prod. 4. p. 149. Petals canescent from fascicles of short down (f. 55. F. g.).

1 L. Buchtormiánus (D. C. coll. mem. 5. t. 3. f. 5. mem. soc. gen. vol. 4.) stem angular, branched; leaves stiff, bipinnate, shining: leaflets broad-ovate or oblong, serrated at the top, with the serratures mucronate; peduncles stiff; involucrum almost wanting; involucels of many leaves, which are shorter than the umbelles; fruit villous from fascicles of hairs. \( \tau. \) H. Native of Siberia, very common in dry sterile places, especially about Buchtorminsk. Bábun Buchtormiánus, Fisch, in Spreng. pag. 2. p. 55. Schultes, sst. 6. p. 496. Athamánta rigidís, Horn, Hort. haf., 2. p. 960. Athamánta cervarívulós, Schrad. med. Sésell Buchtormiánus, Koch, umb. p. 111. Habit almost of Libanotis vulgáris. Rays of umbel unequal in length. Leaves of involucel clothed with white down. Involucrum wanting, or of 2 or 3 entire or trifid or pinnatifid leaves.

2 L. gravéolens; plant clothed with hoary pubescence; stem branched; leaves pinnate; leaflets in fascicles, unequal, 2-3 times plicate pinnate: segments 2 or 3-parted: lobes linear, cuspidate; involucra variable; involucels of many distinct leaves; fruit villously pubescent. \( \tau. \) H. Native of Altâia, on rocks, but rare near the Fort called Usktamengorsok, but frequent beyond the river Irtysh. Sésell gravéolens, Led. fl. Ross. alt. ill. t. 166. fl. alt. 1. p. 340. Involucrum wanting or of one bipinnate leaf, or of many lanceolate-linear reflexed lobes. Leaves of involucel hoary, length of the umbelles. Petals pilose on the outside. The plant has a strong aromatic smell, and excudes a resinous gummy juice.

3 L. Pátrínián (D. C. prod. 4. p. 150.) stem terete, branched; leaves bipinnate, canescent; leaflets multifid: lobes short, linear-subulate; umbelles 30-flowered; fruit rather compressed. \( \tau. \) H. Native of Altâia, on a schistous arid hill at the river Irtysh, and at Usktamengorsok. The plant exudes a yellow aromatic juice. Mercarcis of fruit much compressed from the back, as in other species of Séselli and Libanotís. Involucrum of a few multifid leaves. Leaves of involucels linear, connected together a little way at the base. Perhaps the same as L. gravéolens.

Pátrínián's Stone-parsley. Pl. 1 to 2 feet.

Sect. II. Eulibanótis (this section is supposed to contain the genuine species of the genus). D. C. l. c. Petals glabrous (f. 55. F. j.).

5 L. verticíllátá (D. C. prod. 4. p. 151.) stem terete, furrowed, naked at the apex; leaves pinnate: radical ones petiolate; cut; lower lobes decussate; involucra of few leaves: adult fruit naked. \( \tau. \) H. Native of Mount Parnassus. There is a plant very similar to this grows about Bayonne, as at a place called Chambre d'Amour. Athamánta vertíccíllátá, Smith, fl. grace. t. 275. prod. 1. p. 188. The plant is very different from Pychóitís vertíccíllátá, to which it has been joined by Sprengel.

Whortled-leaved Stone-parsley. Pl. 1 to 2 feet.
Cultr. See *Sézici*, p. 311. for culture and propagation.

LXXII. CENOLOPHIFLUM *Linn. s.n.*. *Pentándria, Digýnia*. Margin of calyx obsolete. Petals of involucel leaves of involucrum, about equal size, each involucre in an inflexed point (f. 55.G. l.f.). Transverse section of fruit nearly terete; mericarps with 5 equal wings, ribs, which are hollow inside: lateral ones marginating; vitta one in each furrow, and 2 in the commissure. Seeds semi-terete. 

3 C. *Petétivíllium* (D. C. prod. 4. p. 152.) stem striated; leaves of trifid petioles: the divisions bi-tripinnate; leaflets linear-lanceolate, quite entire, or trifid; upper ones pinnate, having the segments usually undivided; umbels erect, of many rays; involucrum involucres wanting. O. H. Native country unknown. *Peccédánnum petétivíllium*, Desf. hort. par. 1821. Leaves large, with elongated segments or leaflets. Umbels 12-20-rayed. Petals greenish-white, with an inflexed point. Calyx entire.

8 L. *tenuífólia* (D. C. prod. 4. p. 151.) plant glabrous; stem terete; leaves supra-decompound: leaflets linear, divaricate; sheaths dilated; leaves of involucrum 5, about equal in length to the middle of the rays of the umbel; leaves of involucres membranous ciliated edges, length of the umbellules; fruit glabrous. O. H. Native of Altai. Athamánta tenuífólia, Pall. ex Schultes, syst. 6. p. 495. Umbels lateral. Involute of few leaves; the outer leaf the largest. Calyxes glabrous. Mature fruit unknown.

Fine-tipped Stone-parsley. Pl. 1 to 2 feet. 

9 L. *Stéphâniâna* (D. C. prod. 4. p. 151.) stem simple, fissional, glabrous, striated; leaves glabrous, pinnate; leaflets oblong or ovate, sessile; cut: uppermost leaflets rather trifid; petioles ending in a sheath at the base; lower cauline leaves larger than the radical ones, and on longer petioles; umbels dense, sheathed; sheaths, as well as the involucres and involucres, are membranous and villous; involucres of many oblong-cuneate leaves; involucres of many linear leaves. O. H. Native of Altai, in the more humid parts of the Alps, especially at the fountains of the river Tscharyshch, and elsewhere. Athamánta compácta, Led. fl. rss. alt. ill. 1. t. 31. fl. alt. 1. p. 327. Athamánta cérvarâ® Pall. itin. 2. p. 560. Athamánta monstrosâ®, Steph. ex Willd. rel. in Schultes, syst. 6. p. 495. *Ligístitum* athamánticum, Adans, miss. Petals erect, ovate-oblong, with an inflexed point. Styles equal in length or longer than the mericarps. Fruit nearly cylindrical, a little compressed from the sides, ploise, crowned by the permanent calyx and styles; mericarps with 5 filiform ribs: lateral ones marginating; vitta 2 in each furrow, and 4 in the commissure.

Var. 0. *pinnatifida*: leaves pinnate; leaflets pinnatifid; segments linear, a little cut.

*Stephan's* Stone-parsley. Pl. 1 to 1½ foot. 

10 L. *Cachóoides* (D. C. prod. 4. p. 151.) plant glabrous, glaucous; stem terete; leaves pinnate; leaflets multifold: lobes linear, entire; superior petioles dilated; involucres and involucres of many elongated acuminate leaflets. O. H. Native of Dahuria, near Nerstinski Sawod, Chárys Sibârica, Steph. ex Fisch. in cat. sem. 1823. Spreng. syst. 1. p. 892. Trev. act. soc. nat. ur. 13. p. 168. This species will probably form a proper genus, from the fruit being very much compressed from the back, in the dorsal ribs being prominent, and in the marginating ones being dilated into narrow wings. Vitta 2 in the commissure, covered, and one in each furrow. Seed flat, not involute, as in *Cinchó*, *Arcáda*, cadia, involucrul, and petals of *Libânòtis* fruit nearly of *Peccédánnum*. Ovary sometimes villous when young. Fruit glabrous. Petals glabrous. Perhaps this, with *Sézeli Patriníïnna*, will form a new genus, nearly related to *Agássizis in tribe Síriçvèë*.

*Cachyris-like* Stone-parsley. Pl. 1½ foot. 

Cult. See *Sézeli*, p. 311. for culture and propagation.

—Cultr. See *Sézeli*, p. 311. for culture and propagation.

LXXIII. CENOLOPHIFLUM *Linn. s.n.*. *Pentándria, Digýnia*. Margin of calyx obsolete. Petals of involucel leaves of involucrum, about equal size, each involucre in an inflexed point (f. 55.G. l.f.). Transverse section of fruit nearly terete; mericarps with 5 equal sharp rather winged ribs, which are hollow inside: lateral ones marginating: vitta one in each furrow, and 2 in the commissure. Seed semi-terete, inclosed in a dry pericarp, which is adnate to it when young (f. 55.G.).—Glabrous perennial herbs. Leaves bipinnate or many times ternate; leaflets divaricate, rather trifid; segments lanceolate, cuspitate, quite entire, nervcd. Involute wanting or of one leaf; involucres of many leaves (f. 56. G. c.). Flowers white. This genus is nearly allied to *Cnidium*, but differs in the seed being inclosed in a dry lower pericarp when mature.
Parsley-like Cnidium. Pl. 2 feet.

4. C. venosum (Koch, umb. p. 109.) stem terete, smooth, straight, hardly branched above; leaves pinnate; leaflets pinnatifid or bipinnatifid; segments linear, or oblong-linear, acute, quite entire or trifid; involuca wanting or of few leaves; leaves of involucels sometimes, about equal in length to the umbellules. 2. H. Native of Germany, about Halle and Witenberg; and of Caucasus and Siberia, in rather moist places. Séseli venosum, Hoffm. fl. ger. p. 144. Séseli dubium, Schkuh, handb. 1. p. 217. Schultes, syst. 6. p. 399. Séseli saxifragum, Schott. bartb. p. 397. Sélénium praténsis, Spreng. fl. hal. p. 92. t. 2. Séseli selincoudés, Besser. cat. hort. crem. p. 130. Séseli alpinum, Bib. fl. taur. no. 557. ex suppl. p. 243. Sélénium lineare, Schum. enum. pl. saland. 1. p. 95. Sheaths of leaves oblong; superior ones close. Involuca of few leaves. Leaves of involucres and involucels entire. There are varieties of this with more or less dissected leaves. Perhaps the German plant and the Siberian are the same.

5. C. anomálum (Lled. fl. ross. alt. ill. t. 311. fl. alt. 1. p. 330.) stem furrowed, glabrous, twiggy; leaves pinnate; leaflets bipinnately cut; segments cut or nearly entire, acute; leaves of involuca oblong-linear, entire, pinnatifid, or bipinnatifid. 2. H. Native of Altinâ, in fertile humid meadows, in the valleys of the rivers Tscharysch and Kotsum, near Alexandrowsk. Gmel. fl. sib. 1. p. 190. t. 42. and 43. There is also a stemless variety found on the banks of the river Tschegam. Root fusiform. Leaves pale green, glabrous. Involucres and involucels of many leaves; those of the involucres are oblong, entire, and ciliated, and about equal in length to the umbellules. Petals white. Fruit beset with glittering atoms; vittea 1-3 in each furrow, and 2 in the commissure. Stylopolium pulvinate. Calyx 5-cleft.

Anomalous Cnidium. Pl. 1½ to 2 feet or more.

6. C. cuneatum (Lled. fl. ross. alt. ill. t. 312. fl. alt. 1. p. 331.) stem furrowed, glabrous, branched; superior branches verticillate or opposite; leaves bipinnate; lower leaflets ternate; upper ones 2-3-parted, or cut, cuneate; leaves of involuca oblong-elliptic, a little toothed at the apex; leaves of involucels broad, oblong, entire, mucronate. 2. H. Native of Siberia, in meadows at the river Kelyk, but rare. Root fusiform. Leaves pale green, glabrous. Rays of umbel 12-20. Calyx with 5 minute teeth.

7. C. fontanésii (Spreng. umb. spec. p. 41.) stem striated, dichotomous at the apex; leaves ternately decumposed; leaflets rather trifid; segments linear, bluntish; leaves of involuca and involucels many, linear, acuminate. 2. H. Native of Algiers, in fields near Shibia. Lascertipus pumicadaëdis, Desf. fl. alt. 1. p. 254. t. 71. Lascar. Fontanésii, Pers. enc. 1. p. 313. Lascar. Atlánticum, Poir. suppl. 3. p. 394. Ligásticum Fontanésii, Spreng. in Schultes, syst. 6. p. 565. Perhaps the furrows of the fruit are furnished with 1 or many vitres, and therefore may be either a species of Ligásticum or Cnidium; but the habit is that of Cnidium.

Desfontaines Cnidium. Pl. 1 to 2 feet.

8. C. saufruticosum (Cham. et Schlecht. in Linnea. 1. p. 387.) stem shrubby, naked, decumbent; branches erect, leafy; leaves ternately decumposed; leaflets short, rather trifid; sheathes of leaves permanent. 2. G. Native of the Cape of Good Hope, in sand by the sea-side. Caulis saufruticosum, Berg. cap. p. 77. The habit of this plant is very different from all the other species.

Saffruticos Cnidium. Shrub decumbent.

Diffuse Cnidium. Pl. 1 foot.

10. C. carphophorum (Bieb. suppl. p. 212.) stem nearly simple; leaves pinnate; leaflets cuneiform, pinnatifid; segments linear, bluntest; involuca of 1-2 elongated, somewhat pinnatifid leaves. 2. H. Native of Caucasus. Lascertipus Caucasicum, Bieb. fl. taur. 1. p. 222. Said to be allied to Lascertipus Diacrisum, and Muun nuttellum. Leaves of involucels subulate, shorter than the umbellules. Stylopolium and styles dark purple.

11. C. meffoulium (Bieb. suppl. p. 212.) stem unknown; leaves pinnate; leaflets profusely pinnatifid; segments linear-subulate; involuca and involucels of many subulate, reflexed leaves. 2. H. Native of the Alps of Caucasus. Involucres of 6-8 leaves. Involucels longer than the flowers. Flowers of a beautiful rose colour.

Memen-leaved Cnidium. Pl. 1 to 2 feet?

12. C. canadensë (Spreng. in Schultes, syst. 6. p. 415. exclusive of many of the synonyms) stem angular, flexuous; leaves bipinnate, shining; leaflets many-parted; segments lanceolate; involuca and involucels of few leaves. 2. H. Native of North America, at the mouths of large rivers from Canada to Carolina; at the mouth of the St. Lawrence, in Canada. Selúnum Canadense, Michx. fl. bor. amer. 1. p. 155. A'pium bipinnatum, Walt. carol. p. 115. The fruit is unknown, and therefore it is a doubtful species of Cnidium. Flowers white.

Cult. See Séseli, p. 311. for culture and propagation.

Lin. syst. Pentândria, Diguîna. Calyx toothless. Petals lanceolate, entire, with an involute point. Fruit oblong, crowned by the reflexed styles; transverse section roundish-elliptic, furrowed on both sides, from the raphé being nearly central, not marginal; mericarps rather convex on the back, with 5 contiguous, thick, elevated, wingless, bluntly keeled ribs, therefore the transverse section is triangular, spongy inside; lateral ribs not broader than the rest, nor marginal. Vittea solitary in the furrows, which are narrow, and twin in the commissure. Seed adhering to the tegument, compressed, not angular.—A glabrous, green, biennial herb: with a very long, branched, thick root, which is spongy inside, and intercepted by transverse, membranous dissepiments. Stem short, nearly simple, thick, fusiform, leafy at the base, striate above, and scabrous at the strige. Leaves tripinnate; sheaths large; rachis smoothish; lobes linear, scabrous on the margins, and on the dorsal nerve, mucronate at the apex. Umbels terminal, of many rays: rays 14-33, very rough, and very unequal; central ones much the shortest. Involuca wanting, rarely of 2 leaves; involucels of from 4-12 linear-subulate, quite entire leaves, which are much shorter than the umbels. Flowers greenish. Stylopolium large.

1. P. scabra (Gay, l. c.), 2. H. Native of the Eastern Pyrenees, in the valley called d'Eynes, at a place called La Ceiulade de Nouri, among the debris of schistous rocks, at the elevation of 7200 feet, a little below the limits of perpetual snow. Selúnum scabrum, Lappre. abr. 1818. p. 147. Spreng.

Seabron's Pettita. Pl. 1/2 to 3/2 foot.

Cult. Sow the seeds in a dry situation in spring, in light earth.

**LXXV. ENDRESSIA** (in honour of M. Endress, a young botanist, who has travelled in the Pyrenees). Gay, in ann. sc. nat. 26, p. 223.

Lin. syst. Pentádria, Diégynia. Teeth of calyx at first obscure, but increase in length as the fruit comes to maturity; they are at last erect and subulate, and longer than the stylopodium. Petals without claws, quite entire, ovate-lanceolate, acuminate, and very acute, with an involucrate point. Fruit compressed a little from the sides, oblong-elliptic, crowned by the reflexed styles. Mericarps convex on the back; with 5 distant, equal, filiform ribs; lateral ribs marginating; furrows of fruit very broad; vitex 6 in the commissure, 4 in the lateral furrows, and 3 in the dorsal ones, all distinct. Seed adhering.—A perennial, smooth herb; with an oblique root, which is naked at the neck. Stem slender, quite simple, angularly striated, smooth, unless just under the umbel, where it is scabrous, a foot high, bearing 2 or 3 leaves. Leaves pinnate; leaflets sessile, decurrent, palmately 5-parted; segments palmately 3-5-crenate; lobules linear, cuneate. Umbels terminal, small, dense, when in fruit nearly globose; with short, stiff, smooth rays. Involucrum wanting, very rarely of 3-4 leaves; involucels of 1-5 linear-subulate leaves, which are about equal in length to umbellules, and sometimes much shorter. Petals white. Stylopodium small.

Carophorae bipartite.

Pyrenæa Endressia. Pl. 1 foot.

Cult. See Centélfolium, p. 513. for culture and propagation.

**LXXVI. THASPUM** (from the Isle of Thapsia, which gave the name to the Thapsia of the ancients; in allusion to its affinity with that genus). Nutt. gen. amer. 1, p. 196. exclusive of some species. D. C. prod. 4, p. 153.

Lin. syst. Pentádria, Diégynia. Margin of calyx 5-toothed. Petals elliptic, tapering into a long, inflexed point. Fruit not contracted from the sides, somewhat elliptic; mericarps convex, with 5 winged, nearly equal ribs; furrows striated, each furnished with 1 vitæ; and the commissure with 2. Seed terete.—Perennial herbs, natives of North America. Involucra wanting; involucels unilateral, of 3 leaves. This is a very distinct genus from Smyrniun and Zizia; but it is evidently allied to Cnidiun, from the fruit, but is distinguished from that genus in the calyx being 5-toothed, in the petals not being emarginate, in the involucels being 3-leaved, and in habit.

§ 1. Umbels opposite the leaves. Flowers dark purple.

1 T. atropúrupérum (Nutt. gen. amer. 1, p. 196.) radical leaves petiolate, cordate, undivided; cauline leaves pinnate, of 3-7 ovate-oblong, cartilaginosly toothed, petiolulate leaflets.

1. H. Native from Carolina to Virginia, on hills; frequent about Philadelphia. Smyrniun atropúrupérum, Lam. dict. 3, p. 567; Ell. sketch. 1, p. 306. Cnidiun atropúrupérum, Spreng. in Schultes, syst. 6, p. 418. Flowers greenish white, but at length becoming dark purple. Fruit small, with the wings exerted, and membranous.

Dark purple-flowered Thaspium. Crt. 1810. Pl. 2 feet.

§ 2. Umbels terminal. Flowers yellow.

2 T. barbinóde (Nutt. gen. amer. 1, p. 196.) lower leaves somewhat triternate: superior ones binate; leaflets ovate-cuneated, acute, unequally and deeply serrated, but entire at the base. 2. H. Native about Philadelphia, on the shady banks of the Schuykill. Ligústícum barbinóde, Mích. fl. bor. amer. 1, p. 167. Smyrniun, Muhl. cat. p. 32. Thaspia trifóliáta, Mill. dict. no. 57. Spreng. in Schultes, syst. 6, p. 615. Umbel dichotomous, terminal. Petals yellow. Fruit elliptic, with 7 wings; the alternating ones larger than the others. Stem pubescent at the joints, the rest glabrescent.

3 T. acteífoliúm (Nutt. l.c.) leaves binate; leaflets oval, equally toothed; umbels somewhat verticillate; lateral ones sterile. 2. H. Native of Canada, on the banks of the St. Lawrence, near Tadoussach; and of Virginia. Ligústícum acteífoliúm, Mích. fl. bor. amer. 1, p. 166. Herb 3 feet high. Leaves of involucels saccate. Fruit oblong-oval, with 10 rather winged ribs.

Cult. The species of this genus will grow in any common garden soil, but best in peat; and are easily increased by dividing at the root, or by seed.

Lin. syst. Pentádria, Diégynia. Margin of calyx 5-toothed. Petals on long claws, sparsely obovate, with a triangular inflexed point. Fruit a little compressed from the sides; mericarps with 5 sharp, rather winged, equal ribs; lateral ribs marginating; vitæ 6-4 in the furrows, which are broad, and 8 in the commissure. Carophorae bipartite. Seed rather semiterete.—Glabrous, perennial herbs. Radical leaf binate; leaflets large, ovate-lanceolate, unequally serrated. Stem much branched, naked at the apex. Involucra wanting, of 1 leaf; involucels of 2-5 leaves. Flowers white, those in the disk of the umbel sterile.

Cult. See Thaspium above for culture and propagation.

Lin. syst. Pentádria, Diégynia. Margin of calyx 5-toothed. Petals obovate, emarginate, or entire, with a very short unguiculate inflexed point. Fruit attenuated at the neck; transverse section nearly terete, or a little compressed from the sides; mericarps with 2 filiform, wingless, epical ribs; lateral ribs marginating; vitæ 2 or 3 in each furrow. Seed somewhat semi-terete. Carophorae unknown.—Perennial or biennial herbs, usually velvety from vili on the stem, leaves, and fruit.
UMBELLIFERÆ.

LXXVIII. Athamanta.

Leaves trinerved or pinnate; leaflets cut or multifid, involucral of 1 or few leaves; involucres of many leaves. Flowers white.

2 A. Cervariéfolia (D. C. prod. 4. p. 155.) stem suffrutescent at the base, caudex-formed; leaves glaucous, glabrous, trinerved; leaflets broad, ovate, cuspidately serrate; lateral ones somewhat bifid; terminal ones trifid; involucre of 1 or few leaves.

6 A. Sícula (Lin. spec. p. 532.) stems hoary from pubescence; leaves trinervate, rather divided; leaflets ovate, pinnatifid; segments short, bluntish; petals villous on the outside. 2. H. Native on Mount Garganus, Apulia, Sicily, and among calcareous rocks, on Mount Atlas. Desf. fl. atl. 1. p. 332. Schultes, syst. 6. p. 491. exclusive of the syn. of Bocconi. Œ. H. Native of the Levant, between Aleppo and Bagdad. Herb half a foot high, sparingly branched. Leaves of involucra and involucres ovate-oblong, apiculated. Petals some of them cleft at the apex, and others entire. Immature fruit unknown, and therefore the genus is rather doubtful.

Canescens Spignel. Pl. ½ foot.

† Species not sufficiently known, and will perhaps, when more fully examined, be removed from the genus altogether.

8 A. Depressa (D. Don, prod, fl. nep. p. 184.) leaves bipinnate, pubescent; leaflets very slender, many-parted; segments linear, mucronate; scales filiform, assurgent, velvety, exceeding the leaves; umbels simple or compound; involucrum of 5 pinnatifid leaves.

Depressa Spignel. Pl. ½ foot.

11 A. girantia (D. Don, spec. fl. nep. p. 184.) leaves supra-decompound; leaflets ovate, awned, deeply serrated, glabrous; involucre of many leaves; petals bipartite; fruit ovate, pubescent.

Grand Spignel. Pl. 3 to 4 feet.

10 A. tereus (D. Don, prod. fl. nep. p. 185.) leaves bipinnate, glabrous; leaflets pinnatifid; segments linear, acute, furrowed above; involucres of 5 short leaves; involucres of many leaves, equal in length to the rays; stem straight, terete, smooth.

2. H. Native of Siberia (ex Steph. in herb. Wild.). There are 3 specimens under this name in Willdenow's herbarium, which are very distinct from each other; one of which is Laserpitium Daucus; the second Rümia sessiloides, and the third is Rümia athamathoides. The plant is therefore doubtful.

Caraway-leaved Spignel. Pl. 1 foot.

Cult. These plants will grow in any common garden soil; and are either increased by dividing at the root, or by seed.
LXXIX. LIGUSTICUM (so named from some of the species growing abundantly in Liguria). Koch. umb. p. 104. f. 44-47. but not of Lag. D. C. prod. 4. p. 157.—Ligusticum species of authors.

Linn. syst. Petasáadia, Dígyinia. Margin of calyx 5-toothed, or obsolete. Petals obovate, acute, emarginate, with an inflexed point, on very short claws. Transverse section of fruit nearly terete, or a little compressed from the sides; mericarps with 5 sharp, rather winged, equal ribs: lateral ribs marginalizing; vitte many, both in the furrows and commissure. Seed almost semi-terete.—Herbs, for the most part perennial. Leaves decumbound, or ternately divided. Involuta various; involucels of many leaves. Flowers white.

§ 1. Margin of calyx evidently 5-toothed: teeth permanent.

1 L. Scótiu (Linn. spec. p. 530.) stem slightly branched at the upper part, striated, smooth; leaves biarticulate, opaque; leaflets rhomboid, broad, acute, smooth, serrated; involucra of unequal, partly leafy, entire leaves; leaves of involucel numerous, lanceolate, rather unequal. 2. H. Native of Lapland, Norway, &c., North America, and Siberia; Kotzebue's Sound, and Kamtchata; Scotland on the sea-coast about the Firth of Forth; also on the western coast; very abundant in rocky places; about Dunstanburgh Castle in Northumberland. Smith, engl. bot. t. 1257; Fl. dan. t. 297. Torrey, fl. un. at. 1. p. 313. Chalm. et Schlecht. in Novit. 3. p. 390. Apollo Séctica, Lam. dict. 1. p. 173. Séesi Scótiu, Riv. pert. p. 59. A. piim ternánum, Willd. herb. in Rem. et Schultes, syst. 6. p. 491. Flowers white, with a reddish tinge; anthers red. Fruit oblong, having the commissure furnished with 6 vitte. Root fusiform, warm, and pungent. The herb is eaten either crude or boiled by the natives of Scotland and its isles. The flavour is highly acid, and though aromatic, and perhaps not unwholesome, is very nauseous to those who are unaccustomed to such food. L. Scótiu, Lour. coch. p. 183. cultivated in Cochín-china, belongs probably to a distinct genus, from the circumference of the petals being entire.

§ 2. Margin of calyx minutely 5-toothed. Involuta of many leaves.

2 L. Carnólia (Host, fl. aust. 1. p. 378.) stem erect, branched, striated; radical leaves trinervate; leaflets decurrent, pinnate-parted; segments pinnaflid, mucronate; involucra of many leaves, which are toothed at the apex. 2. H. Native of Carniola, on a mountain called Groszlichenberg; and of Silézia. Fruit large, nearly 3 lines long, ovate-oblong, having the ribs short and a little winged, and with the furrows broad and furnished with 3 vitte each. Teeth of calyx very small.

Carniolian Lovage. Pl. 2 to 3 feet.

3 L. Alátum (Spreng. umb. spec. p. 125.) stem furrowed and winged; leaves supra-decompound; leaflets petiolate, ovate, decurrent, pinnaflid; segments deeply serrated, oblong; involucra of few leaves; leaves of involucels setaceous, about equal in length to the umbellules. 2. H. Native of Carnacuss, in grassy places. Rem. et Schultes, syst. 6. p. 551. Athamánta alata, Bieb. fl. nur. 1. p. 214. Cidium myrhisflórum, Bieb. suppl. p. 212. Flowers rose-coloured when young, but at length becoming white; anthers red. Margin of calyx short, 5-toothed. The commissure, according to Koch, is furnished with 4-6 vitte, and the furrows with as many, from which it differs from the genus Cidium and especially from C. apífólium, which is very like.

4 L. Verulaéum (All. pl. edn. no. 1319. f. 60. f. 1.) stem branched, striated; leaves supra-decompound; segments rather remote, linear, cuspidate; leaves of involuca pinnaflid at the apex. 2. H. Native of Dauphiny, Piedmont, and Jura, on the lower alps, in open places; and of Dauria, but not of the Pyrenees, because L. Berulaeácum of Lapeyr. is Séseli Lámnitís, Laserpitium Daúricum, Jacq. hort. vind. 3. t. 38. Ligusticum Seguérii, Vill. dauph. 2. p. 615. exclusive of the synonymes. Furrows of fruit furnished with 3-4 vitte each, and the commissure with 8 vitte. ex Koch, umb. p. 105. Stems usually spotted.

5 L. Cynaplifólium (Viv. in litt. 1820. ex D. C. prod. 4. p. 158.) stem terete, branched; leaves decumbound from the petiole being much branched; leaflets multifid: segments linear, acute; involuca and involucels of many leaves; umbel of many rays; umbellules nearly globose, many-flowered. 2. H. Native of Corsica, in the fissures of rocks. Habit almost of Cidium apióides or Ligusticum Seguérii, but is easily distinguished from them in the involuca being of many leaves; and from L. Berulaeácum it is distinguished by the stem being hardly striated, in the leaves of involucels being undivided, and in the umbellules being more crowded with flowers. Matures fruit not seen.

Fool's-parsley-leaved Lovage. Pl. 3 to 4 feet.

6 L. Consóliúm (D. C. prod. 4. p. 158.) stem terete, branched; leaves supra-decompound, glabrous; leaflets pinnaflid; lobes acutely toothed; involuca and involucels of many linear, acute, deflexed leaves, which are as well as the rays of the umbel and upper part of the stem pubescent. 2. H. Native of Nipaul, on high mountains. Laserpitium conifolium, Wall. mss. Plant tall and very showy. Radical leaves 2 feet long, with trifid petioles. Mericarps with 5 wings, and having many vitte in the furrows.

Houlaec-leaved Lovage. Pl. 4 to 6 feet.

7 L. Stiutáium (D. C. prod. 4. p. 158.) stem terete, branched; leaves bipinnate; lobes or leaflets entire, acute, rarely cut; involuca and involucels of 5-6 linear, spreadingly-deflexed leaves, which are glabrous as well as the stems and rays of the umbel. 2. H. Native of Nipaul, in the Great Valley, in rice-fields. Laserpitium striatum, Wall. mss., is but referable to the genus Ligústícum from the mericarps being furnished with 5 wings, and in the furrows being furnished with many vitte, &c.

Striped Lovage. Pl. 3 to 4 feet.

8 L. Cynaplifóliúm (Guss. pl. rar. p. 130. t. 26.) stem striated, branched; leaves shining, tripinnate; leaflets pinnaflid; segments short, cuneiform, trilobed, obtuse, awned; approximate; involuca and involucels of many linear, permanent, many leaves; fruit oval, glabrous. 2. H. Native of the kingdom of Naples, in Abruzzo, in open places of valleys. Allied to L. Pyrécúnum.

Wedge-leafletted Lovage. Pl. 1 to 2 feet.

9 L. Miscelón (Ledebe. fl. ross. alt. ill. t. 310. fl. alt. 1. p. 321.) lower leaves ternately bipinnate; lower leaflets petiolate, ternate: upper ones and segments of the lower ones oblong, pinnaflid, or cut, decurrent; involuca of many lanceolate-linear, deciduous leaves; involucels of many linear, permanent leaves. 2. H. Native of Altaia, near Riddersk, Alexandrowsk, and Belaja at the river Buchimorsk. L. Pélompréícúnum, Pall. ill. 2. p. 582. The root fusiform, supcase, perhaps biennial. Stem solitary, branched, furrowed, glabrous. Leaves pale green above, and pale glaucous beneath. Petioles of radical leaves half a foot long, ternate, and the divisions bipinnate. Rays of umbel variable in length. Calyx with 5 minute teeth. Petals white. Mericarps with 5 rather winged ribs; having the furrows furnished with 3 vitte, and the commissure with 4-6. It differs from L. Lándicuúm of Aiton, in the involuca being of many leaves.
Two-coloured-leaved Lovage. Pl. 4 to 5 feet.
10 L. canadensis (Ait. hort. kew. 1. p. 348. ed. 2. vol. 2. p. 142.) leaves supra-decompound; leaflets cuneiform, cut, glabrous; involucra of 2 rather foliaceous leaves; ribs of fruit membranous, glabrous. 2. H. Native country and the rest unknown.

§ 3. Margin of calyx obsolete. Involution wanting, or of few leaves.—Silurus species, Koch, in litt. 1828.

11 L. pyrenaicum (Goun. ill. 14. t. 7. f. 2. exclusive of the syn. of Seguier) stem branched, striated; leaves supra-decompound, shining; leaflets pinnatifid: segments linear, mucronate, short, divaricate; involucra of a few caducous leaves. 2. H. Native of the Pyrenees, in open places. D. C. fl. fr. 4. p. 309. Cudium Pyrenaicum, Spreng. umb. in Schultes, syst. 6. p. 416. L. Pyrenaicum, Koch, umb. p. 105. Sessil aristatum, Ait. hort. kew. 1. p. 359. This plant is generally confused with L. fulvicicum, but it is perfectly distinct. It is hardly to be distinguished from L. Seguieri, unless in the furrow of the fruit being furnished with many vitte, and the commissure with 6-8 vitte.

13 L. Corsicum (Gay, in ann. sc. nat. 26. p. 222.) stem nearly simple, few-leaved, striated; leaves tripinnate; leaflets palmate-pinnatifid: lobules small, linear, cuspidate; involucra wanting, or of 1 leaf; rays of umbel measured; involucres of many linear-subsalate, serrated leaves, which are about equal in length to the umbelless; teeth of calyx oblong; ribs of fruit scarious from denticulations. 2. H. Native of Corsica, on the mountains, at the elevation of 5000 or 6000 feet. Vitte in the lateral furrows 3, in the dorsal 4, also 4 in the commissure. Habit of Menna matellatum, from which it differs in the petals being emarginate, not entire.

Corsican Lovage. Pl. 1 ft. Pl. 3 to 1 ft.
14 L. Peccedanobes (Presl, in herb. Honke, ex D. C. prod. 4. p. 138.) stem branched, furrowed; leaves decumbent; leaflets linear; umbels opposite the leaves; rays angularly winged; involucra wanting, or of few leaves, which are multifid at the apex; involucres wanting, or of few leaves. 2. H. Native of Chili. The specimen is very like the rest, but varies in the involucra and involucres being sometimes wanting. Calyx oblong, somewhat wider at the base than at the apex. Petals wanting. Petals 4, alligatus, with an inclined point. Fruit ovate, roundish, with 4 or 5 stripes.

Chervil Lovage. Pl. 1 to 2 feet.
22 L. aciphylla (Spreng. in Schultes, syst. 6. p. 53.) stem strongly veined; leaves oval; leaflets linear, sinuate, entire, petiolate, punctate; leaflets wanting, or of few leaves. 2. H. Native of New Zealand. Aciphylia squarrosum, Forst. gen. p. 42. t. 21. Involucra and involucres of 6 lanceolate-subulate leaves. Calyx 5-toothed, entire. Petals wanting, with an inclined point. Fruit ovate, roundish, with 8 stripes.

Pental-leaved Lovage. Pl. 1 foot.
23 L. du'rum (H. B. et Ktch, nov. gen. amer. 5. p. 19.) stem branched, terete, striated, firm; leaves ternately decumbent, rather hairy beneath; leaflets sessile, ovate-oblong, rather crenate-serrate, emarginate at the base. 2. H. Native of New Spain, in humid places. Flowers white. Fruit un-
known. According to Kunth, this is perhaps a species of He-
ricium.

Doubtful Lavage. Pl. 1 foot.

31 L. Græcum (D. C. prod. 4. p. 159.) stem erect, branched; leaves all bipinnate. *G.* H. Native of Greece. Ligusticium Graecum folio-apii, Tourn. cor. p. 23. According to the fruit, which is preserved in the herbarium of the museum of Paris, it is a true species of *Ligusticum*. Siam Graecum, Lour. and S. Graecum, Linn. are very different plants from this.

Greek Lavage. Pl. 25

25 L. Cape'nse (D. C. prod. 4. p. 159.) stem erect, branched; leaves bipinnate; leaflets short, thick; involucre and involucels of 3-5 leaves; fruit ovate; calyx obsolete. *G.* G. Native of the Cape of Good Hope. Athamānta Capensis, Burm. fl. cap. p. 7. In Burmann's herbarium there are specimens of several plants fastened on the same sheet of paper, under the name of *Athamānta Capensis*, therefore the one which he meant to go under this name is doubtful.

Cape Lavage. Pl. 2 feet.

Cult. See Athamānta, p. 316. for culture and propagation.

Lin. syst. Pentandria, Dicygina. Margin of calyx obsolete. Petals obovate-oblong, narrowed into an inferred point, entire, or rather emarginate, appendiculate at the base, or sessile and truncate. Transverse section of fruit, nearly terete. Mericarps with 5 sharp, rather winged equal ribs: lateral ribs marginating; vitta many in each furrow, and so close together as to appear like a single broad one; and 4-6 in the commissure. Seed somewhat semi-terete. — Glabrous, perennial herbs. Leaves cut into many parts; leaflets linear. Involucre wanting, or of few leaves: involucels of many leaves. Flowers cream-coloured or greenish. This genus is very nearly allied to *Ligusticum*.

1 S. pratensis (Bess. unum. pl. vohl. p. 43. no. 1367.) stem angular; leaves supra-decompound; leaflets pinnate-parted; segments rather remote, lanceolate, nerved, a little channelled, cuspidate; involucre obsolete; or of 1-2 leaves. G. H. Native of humid meadows, from Europe to Tauria; and Siberia; in Britain, in rather moist meadows and pastures. Peucedanum Silaüs, Lin. spec. 354. Smith, engl. bot. 2142. Mart. rast. t. 128. Jacq. aust. t. 15. Hayne, arzg. gew. t. 7. 5. Crithmum Silaüs, Spreng. umb. prod. 40. Schultzes, syst. t. 6. p. 416. Silaüs Silaüs, Roth, fl. germ. 1. p. 129. Sēsēi pratensis. Riv. pot. irr. t. 58. Cramt, ausdr. 3. p. 209. t. 6. f. 1. Sēsēi selinoides. Jacq. enum. vind. 227. Ligusticum Silaüs, Duby, in D. C. bot. gall. 1. p. 230. — Mor. hist. 3. sect. 9. t. 6. f. 10. — Lob. icon. 738. f. 5. — Petiv. herb. brit. t. 28. f. 5. Root spindle-shaped. Herb smooth, dark green. Leaves bipinnate; leaflets elliptic lanceolate, entire; either undivided or separated almost to the base into 2 or 3 segments of the same shape and magnitude. Umbels of several unequal rays. Involucra of from 1-3 linear, white-edged leaves, but most frequently none at all. Involucels of several linear leaves. Flowers yellow or greenish white. Fruit roundish-ovate. The whole plant, when being fed, with this root, is subjected in some parts of Norfolk to give a bad flavour to milk and butter; but cattle certainly do not eat it; except accidentally, or in small quantities, sufficient perhaps to have the effect in question. Where this herb abounds in pastures, it may be found partially cropped, though generally left almost entire.

2 S. tenuifolius (D. C. mem. soc. gen. vol. 4.) stem terete, striated; leaves 3 or 4 times pinnate; leaflets pinnatifid or trifid; segments linear, cuspidate, somewhat divaricate; involucrum wanting; fruit cylindrical. *G.* H. Native of Hungary and Tenerife! Peucedanum tenuifolium, Desf. hort. par. 181. f. 238. — T. Poir. dicr. 5. p. 228. but not of Thumb. Peu-
cedanum serotinum, Pers. exch. 1. p. 310. Peucedanum Mathioli, Spreng. in Schultzes, syst. t. 6. p. 559. Silaüs Mathioli, Koch, umb. p. 106. Spreng. pag. 2. p. 56. umb. spec. p. 113. This plant is usually to be found in gardens under the name of *Méum Sibiricum*.

3 S. alpestreis (Bess. enum. pl. voll. p. 43. no. 1405.) stem striated; leaves bipinnate or tripinnate, with the ramifications spreading; leaflets pinnate; lower segments 3 or 4-parted: upper ones entire: lobes all entire, linear, cuspidate; involucre almost wanting; leaves of involucels setaceous; fruit ovate-oblong. *G.* H. Native of the south of Podolia, in open fields; and of Altai, near Schumilin, at the river Irtysch. Peu-

4 S. longifolius (Led. fl. ross. alt. t. 1. p. 323.) leaves supra-
decomposed, with the ramifications rather divaricate; leaflets somewhat tripartite: segments lanceolate or linear, cuspidate; involucre almost wanting; leaves of involucels setaceous. *G.* H. Native of Siberia, in meadows, about the rivers Irtysch and Borchorminsk. Ligusticium longifolium, Willd. spec. t. 1. p. 1428. Athamānta demudāta, Fisch. Angulis Fischeri, Spreng. in Schultzes, syst. t. 6. p. 605. Crithmum Mediterrānium, Bibl. fl. taur. 3. p. 215. Ligusticum Fischeri, Link, enum. t. 1. p. 276. Cnidium Fischeri, Spreng. syst. t. 1. p. 890.—Gmel. sib. 1. p. 188. no. 4. t. 41. The Alpian plant differs from the one collected on the banks of the Volga, in the leaves being more profoundly divided, nearly ternate; in the segments being linear, not 3-5-parted; in the lobes being lanceolate; and in the involucre being usually of 1 leaf. Furrows of fruit furnished with 1 vitae each, but sometimes the outer ones have 2. Tar. b. deiricatum: segments of leaves longer.

2 H. Cnidium divaricatum, Led. ind. sem. hort. jlorp.

5 S. carvifolius (Meyer, pflanz. p. 125.) root fusiform; stem furrowed and striated, branched; leaves bipinnate; leaflets of the radical leaves decussate: of the cauline linear, divaricate; involucre and involucels composed of short setaceous leaves; rays of umbel very unequal. *G.* H. Native of Caucasus, on the higher mountains. Bünium peucedanoides, Bibl. fl. taur. 1. p. 208. suppl. 211. D. C. prod. 4. p. 116. Sium peucedanoides, Spreng. umb. spec. 41. no. 5. Peu-
cedanum carvifolii, Bibl. Pets. pale yellow. Vitae solitary in the furrows, according to Besser: but there are 2-3 vitae in nearly all the furrows, rarely solitary.

6 S.? peucedanoides (D. C. prod. 4. p. 161.) root turnip-

formed; stem striated, fuscular, somewhat trichomatic at the apex; leaves nearly ternate; segments linear, acute, entire, with revolute margins; involucre of 1 leaf; involucels wanting; umbels of 4-5 rays; umbellules 8-10-flowered. O.? H. Native of South America, on temperate mountains about Popayan. Cnidium peucedanoides, H. B. et Kunth, nov. gen. amer. 5. p.
UMBELLIFERÆ. LXXXI. WALLROTHIA. LXXXII. MEUM. LXXXIII. GAYA.

15. Peucedanum juncceum, Willd. mss. in Schultes, syst. 6. p. 576. From the yellow entire petals, it comes nearer Silius than Cañorum, but the involucre is wanting.

Untouched-wort-like Pepper-saxifrage. Pl. 2 feet?
Cult. See Athamanta, p. 116. for culture and propagation.

Lin. syst. Pentândria, Diggînia. Margin of calyx obsolete. Petals entire, elliptic, acute at the base and apex. Transverse section of fruit nearly terete. Mericarps with 5 prominent, acutely keeled, equal ribs: lateral ribs margining; vitae many in the furrows, and 6-8 in the commissure. Seed nearly semi-terete. —Glabrous, perennial herbs. Stems nearly simple, terete, striated. Leaves supra-decompound, or pinnate; leaflets multiform; segments slender, linear, acute. Involuta almost wanting; involucels of many leaves. Flowers white or purple. This genus is distinguished from Ligusticum in the calyx being without teeth and in the petals being entire.

Lin. syst. Pentândria, Diggînia. Margin of calyx obsolete. Petals obovate, more or less emarginate, with a broad inflexed point. Fruit oval, rather compressed; mericarps with 5 elongated, wing-formed ribs, which are contiguous at the base, obtuse: outer ones marginal. Vitæ none. Carphophore bipartite. Seed nearly semi-terete, easily separated from the covering. —Perennial mountain herbs. Leaves all radical, pinnate; leaflets bipinnatifid; lobes linear. Stems naked, simple. Umbel compound. Involuta of a few leaves. Flowers equal, fertile, white. This species differs from Mèum in the petals being emarginate, not entire; in the furrows of the fruit being without vitæ, and in the fruit being rather bladdery.

Pyrenæca Gaya. Pl. 2/ foot.

Cult. These plants should be grown in pots, in a mixture of peat and loam, and placed among other alpine plants. They are increased by seeds.

3. Physalis. Dig.Digita. Margin of calyx obsolete. Petals obovate or ovo-vate, with an inflexed point. Styles at length diverging, reflexed. Fruit rather compressed from the back, or convex: mericarps with 5 winged ribs; the lateral ribs twice the breadth of the others, and marginal; vitice unequal, 3 than the lateral furrows, but usually 2 in the dorsal ones, and 4-8 in the commissure. Carpophore bipartite. Seed flat on one side—Glabrous, biennial herbs. Stems branched, fistular. Leaves bipinnate; leaflets pinnate-parts; segments oblong-linear. Umbels terminal, of many rays. involucrata wanting, or of few leaves. Involucels of 5-7 linear-subulate leaves, which are about equal in length to the umbellules, or longer. This is an ambiguous genus, intermediate between the tribe Peucedanide and Seselideae; with the first it agrees in the mericarps being winged, and with the last in the mericarps being convex on the back. Flowers white.

1 C. Fischi... (Wimm. et Grab. ex flora 1828. p. 215.).

3. H. Native of Siberia, Tartary, Ingriz, Silesia, and Savoy, on the mountains; North America between the Coppermine and Mackenzie rivers; Labrador; Straits of De Fuca, on the north-west coast; Kotzebea's Sound, C. Tatariacum, Hoffm. l. c. Perhaps C. Iongicum or C. neglectum, Fisch. in litt. is not distinct from this. Perhaps Ligusticum Gmelini, Cham. et Schlecht. in Linne. 1. p. 391. and Gmel. sib. 1. p. 195. t. 44. appertains also to this plant. Perhaps all these different names belong to different species, or probably to the same, but they are so much confused that it is impossible to extricate them.

Fischer's Conioselnum. Pl. 1 to 2 feet. Cult. This plant is only to be increased by seed, which should be sown in the open ground early in spring. A light soil suits it best.

LIN. Syst. Pentандрия, Dijijüna. Margin of calyx obsolete. Petals roundish, entire, inovolute, ending in an obovate segment. Transverse section of fruit nearly terete; mericarps with 5 elevated, sharp, rather winged ribs; lateral ribs a little broader than the rest, and marginating; pericarp spongy, with large cells. Seed semi-terete, constituting a free nucleus, which is covered with copious vitice in every part.—A suffruticose, glabrous, fleshy herb. Petioles saccating at the base. Leaves bipinnate; leaflets oblong-linear. Umbels compound. Involucra and involucels of many leaves. Flowers white. This genus differs from all others in the present tribe as the genus Archangelica does from the rest of the genera in tribe Angie-lieae, in the seed being a free nucleus, covered with copious vitice.

1 C. Maritimum (Lin. spec. 554.). 2. H. Native of rocky sea-shores and cliffs; as along the Black Sea, in Tauria; and along the Mediterranean Sea; and of Europe along the shores of the Western Ocean from Spain to Britain; and of the Canary Islands; in Britain, on the rocky sea-shore and cliffs. Smith. engl. bot. 819. Jacq. hort. vind. 2. t. 87. Cachrys maritima, Spreng. in Schultes. syst. 6. p. 442. Crétchamsus, Cord. hist. 201. f. 1. Sæmpire, Petiv. hort. brit. t. 24. f. 8.—Lob. icon. 392. f. 1.—Bauh. hist. 3. p. 2. 194. f. 1. Moris. hist. 3. p. 289. sect. 9. t. 7. f. 1. Root branched, creeping extensively. Herb greenish-glaucescent, salt, and pungently aromatic in flouvoir. Stems ascending. Leaves alternate; leaflets uniform, lanceolate, tapering at the base. Leaves of involucra and involucels ovate, acute, spreading, rather short. Flowers white, with yellowish anthers. Samphire is called types-pierre and Saint-pierre of which our English name appears to be a corruption) in French; Meerwurz in German; and Finschio marina in Italian. The herb makes an old-fashioned English pickle, as those know who read Shakespeare's King Lear. It is sold in the London shops; but there are many plants preferred for the same purpose, as Salixviera herbs and Judia crithmifolia, &c., and is a frequent addition in salads. In taste it is crisp and aromatic, and constitutes a light and wholesome condiment. It is generally gathered in places where it is found wild; and the allusion to the practice by Shakespeare, in his description of Dover Cliffs, is well known. The plant is also used medicinally.

Far. B. Canariaca (Cav. anal. scient. nat. 1801. vol. 3. p. 35.) leaves more sheathing (ex Cav.), but the difference between the Canary Island plant and the European is hardly discernible. Sea-side or Common Samphire. Fl. Ang. Brit. Pl. 1 ft. Cult. Samphire is propagated by parting the roots, or by sowing the seeds in April; but is rather difficult of cultivation. Marshall says it "is a cool situation; but yet prefers a sandy or a gravelly soil, and plenty of water. Some," he adds, "have found it to do best in pots, set for the morning sun only." J. Braddock placed it in a sheltered dry situation, screened from the morning sun, protected it by litter during winter, and in spring sprinkled the soil with a little powdered barilla. "This I do," he says "to furnish the plant with a supply of soda, since, in its native place of growth, it possesses the power of decomposing sea water, from which it takes the fossil alkali, and rejects the muriatic acid. With this treatment it has continued to flourish at Thames Ditton for some years, producing an ample supply of shoots, which are cut twice in the season, for pickling or to be used in salads.

Tribe VI.

ANGELICEAE (this tribe contains plants agreeing in important characters with the genus Angeliceum or Orthospermum paneczygáte tetrapéréa, Koeh. umb. p. 98. D. C. prod. 4. p. 164. Fruit compressed from the back, girdled by a double dilated winged margin, from the raphie being central or nearly so, hence the fruit is furnished with 2 wings on both sides. Mericarps with 5 ribs; dorsal 3 fíliform or winged: lateral 2 always expanded into wings, and always broader than the dorsal ones, even if they rest upon the back. Seeds rather convex on the back, and flatish in front.—A strong, perennial, glabrous, smooth herb. Stems terete. Leaves ternately decomposed; leaflets obovate-cuneate, deeply toothed, rather coriaceous. Involucra and involucels of many leaves. Flowers yellow.

odour of this plant is strong and peculiar; its taste is warm and aromatic. It abounds with a yellowish, gummy, resinous juice, very much resembling Opópanax. Its qualities are supposed to be similar to those of Angelica and Masterwort in expelling flatulences, and exciting perspiration; therefore chiefly used in hysterical disorders and uterine obstructions. The leaves, eaten as salad, are accounted as emmenagogue. The root, which is not so ungrateful as the leaves, is said to possess similar virtues, and may be employed in powder.

Cult. This plant will grow in any soil; and is easily increased by dividing at the root.

Lin. Syst. Pentádrinia, Digínia. Margin of calyx obsolete. Petals obovate, emarginate. Fruit compressed from the back, furnished with 2 wings on each side from the raphe being central; mericarps with 5 membranous, winged ribs; wings of the lateral ribs twice the breadth of the others; vitive 1 in each furrow, but there are often 2 in the outer furrows, and always 2 in the commissure. Carphophage bipartite. Glabrous perennials. Leaves ternately decimated or tripartite; leaflets pinnatifid. Umbels compound. Involuture of few leaves; involucres of many leaves. Flowers white.

2 S. Caudóli (D. C. prod. 4. p. 165.) stem terete; rays of umbel pubescent; petals obovate, having the middle nerve crested above. 2. H. Native of Nepal, on the mountains at Komon. Angelica? Caudóli, Wall. mas. Leaves ternately decimated; leaflets slender, multifid. Umbels terminal, of many rays. Involuture of many or of few leaves, or wanting, or soon falling off. Petals nearly as in the genus Pychódis. Fruit as in S. carvifólia, but larger, and more ovate. Seed furrowed on the back.

De Candolle's Milk-parsley. Pl. 2 feet.

3 S. Terébínthum (Hook. fl. bor. amer. 1. p. 266. t. 95.) plant glabrous in every part; leaves tripiniate, stiff, glaucous; segments pinnatifid; lobes short, linear, acute; peduncles elongated; involucru wanting; leaves of involucres linear, short; mericarps with 5 broad, undulating ribs. 2. H. Native of the north-west coast of America, common on the sandy grounds of Wallalawah river. Root fusiform. Rays of umbel very unequal. Fruit rather large, ovate, compressed. The genus to which this plant belongs is truly doubtful. The fruit not corresponding to which any described genus.

Turpentine Milk-parsley. Pl. 1 ft. foot.

4 S. Stellátum (B. Don, prod. fl. nep. p. 185.) leaves pin-
Umbelliferæ. LXXXIX. Angelica. XC. Archangelica. 323

Mountain Angelica. Fl. July. Clt. 1818. Pl. 3 feet. 3 A sylvatris (Lin. spec. 361.) stem polished, striated, with wide spreading branches, pubescent at the apex, as well as the peduncles; leaves bipinnate or tripinnate, rather glabrous; leaflets ovate or ovate-lanceolate, acute, unequal and sharply serrated, never deciduous at the base; involucra of 1-2 leaves. 2 H. Native of Europe, Siberia, and Caucasus, in watery places, alder, and along the banks of rivers, common; plentiful in like situations in Britain. Smith, engl. bot. t. 1128. Woodl. suppl. t. 265. Ger. enac. 999, f. 1. Dodon, pempt. 318, f. 1. Camer. epit. 900, f. 1. Lob. icon. 699. Angelica palustris, Riv. pent. t. 17. Hayne, arz. gew. 7. t. 9. Water Angelica, Petiv. herb. brit. t. 24, t. 10. Imperatoria sylvatris, D. C. fl. fr. 4, p. 286. Selinum sylvatris, Crantz, auct. 177. Selinum anglici, Roth, germ. 1, p. 133. Selinum pubescens, Mooneh, math. p. 80. Umbels convex, with numerous general and partial downy rays. Flowers white, but more generally flesh-coloured. Points of petals erectish. Vitae in the commissure superficial. The flowers are more bitter, and less grateful than the Archangelica, but the virtues of both are similar. The herb dyes a good yellow.

Wild Angelica. Fl. July. Britain. Pl. 4 to 6 feet. 4 A. lucida (Lin. spec. 360.) stem terete, glabrous; leaves bipinnate; leaflets equal, ovate, deeply serrated; sheaths dilated; involucra and involucels of 5 leaves each. 2 H. Native of North America, from Canada to Pennsylvania, in moist shady places. Pursh, fl. amer. sept. 1, p. 193. Jaccq. herb. vind. 3, t. 24. — Moris, hist. sect. 9, t. 5, f. 5. Ang. lobata, Walt. car. p. 115. ex Torr. The petals are said to be elliptic, pale green, with an indented point. By Jaccqin the flowers are said to be whitish, or of a pale yellow-colour.

Sect. II. Pseudangelica (this section is supposed to contain false species of the genus; hence the name). D. C. prod. 4, p. 168. — Angelica species, Spreng. Koch. — Selinum species, Gounan. — Sæeli species, Lin. Petals elliptic, acuminated or mucronated. The fruit is like that of the last section, but differs in there being usually 4 vitae in the commissure. Rays of umbels very unequal, the central ones very short.

7 A. integrifolia (Walt. car. p. 115.) leaflets entire, petiolate. 2 H. Native of Carolina. The rest unknown. Entire-leafletted Angelica. Pl. ?

8 A. bracteata (Roxb. in Beav. triv. voy. append. p. 297.) stem flatular; leaves unequally pinnate; leaflets rather cordate, 5-7-nerved, finely jagged, serrated; bracteas or sheaths broad, nearly orbicular at the base of the petioles, and between the segments; involucra and involucels of 6-10 broad lanceolate leaves each. 2 H. Native of the Island of St. Helena, where it is called by the inhabitants common angelica. Petals white, oval-oblong, incurved. Umbellules glabrose. Fruit unknown. Perhaps a species of Archangelica.

Bracteate Angelica. Pl. 3 to 4 feet. Cult. Any soil will suit the species of Angelica, and they are easily increased by seeds.

Lan. syst. Pentändria, Dipsáceae. Margin of calyx with 5 short teeth. Petals elliptic, entire, acuminate, with an incurved point. Fruit rather compressed from the back, furnished with 2 wings on each side, from the rhiphe being nearly central. Mericarps with 5 thickish keeled ribs, the 3 dorsal ribs elevated, and the 2 lateral ones dilated into wings, which are twice the breadth of the others. Seed not adhering to its tegument, but distinct from it, and covered by copious vittae all over. Carpophore bipartite. — Perennial or biennial herbs. Leaves pinnate; leaflets broadly ovate, acute, coarsely toothed; terminal one lobed. Petioles large, sheathing, and rather bladdery. Involucra wanting or nearly so; involucels dimidiate, of many leaves. Flowers white or greenish.

1 A. officinalis (Hoffin. and Koch, l. c.) stem polished, striated, a little glaucous, branched in the upper part; leaves ternate, then pinnate; leaflets ovate-lanceolate or subcordate, cut, and sharply serrated, partly decurrent; the odd one deeply 3-lobed; petioles dilated and tumin at the base; involucra of a very few linear leaves, or wanting altogether; leaves of involucels linear-lanceolate. 2 H. Native of Europe, on mountains by river sides, particularly in Lapland, Sweden, Norway, Germany, Carpathian mountains; and from Unalaska to the Bay of Esschelzolts, and now cultivated everywhere for the sake of its stalks. In Britain in watery places, rare, apparently a naturalized plant; as about the Tower of London, and on the banks of streams frequent; in marshes among reeds by the side of the t t 2
UMBELLIFERÆ. XC. Archangelica. XCI. Opopanax.

Thames, between Woolwich and Plumstead, very abundantly; in the county of Durham; and at Broadnare, about 7 miles north-west from Birmingham. Angelica Archangelica, Lin. spec. 360. Oed. fl. dan. t. 396. Nees, off. pl. 9. t. 14. Haym. arr. gen. 7. t. 8. Smith, engl. bot. 2561. Woody. bot. t. 60. Angelica officinalis, Mönch, meth. p. 81. Angel. sativa. Mill. dict. no. 1. Riv. pent. t. 15. Petiv. herb. brit. t. 24. f. 9. Camer. ep. 999. f. 1.—Ger. enac. 1000. Flowers greenish. The plant delights in moist situations, or the bank of running water; but will grow freely in any soil or exposure. The plants are raised from seed, and for a bed 4½ feet by 6, sown in drills a foot apart, to be transplanted; half an ounce of seed will be requisite. "Sow in August, or as soon as the seed is ripe, as the plants will come up earlier and stronger than from sowing in the spring. When the plants are advanced from 4 to 6 inches high, transplant them into rows 2 feet apart. They will soon strike root, and advance quickly in strong growth. In the second year these strong erect branchy stalks will be several feet high, producing large umbels of flowers and seed, ripening in autumn, which, as well as the leaves of the plant, are used in medicine. But for candying, the young shoots of the stem and stalks of the leaves are the useful parts; being cut while green and tender in May and June, they are made by the confectioners into the sweet-meat called angelica. In the second year, if seed is not wanted, cut the plants down in May, and the stock will send out side shoots; by repeating this practice every year, the same plant may be long continued."—Aberrickie.

2 A. ATROPURPUREA (Hoffm. umb. 169.) stem polished, purplish, with a glaucous bloom, branched at the top; leaves ternate, then pinnate; leaflets ovate, acute, deeply serrated, and somewhat lobed: the terminal ones confluent; petioles dilated, and turbid at the base; branches and umbels pubescent; involucre wanting; the involucres of many narrow leaves. 3 H. Native from Canada to Virginia, in moist meadows. Angelica atropurpurea, Lin. spec. 360. Lam. dict. 1. p. 173. Torr. fl. un. stat. 1. p. 316. Angelica triquitata, Bigel. fl. post. p. 68. ex Torr. —Corn. cam. 169, with a bad figure.—Moris, hist. sect. 9. t. 3. f. 9. bon. Petals rusty purplish or white. The plant may be used in the same way as A. officinalis.

3 A. DECIÆRÆS (Leed. fl. ross. alt. illt. t. 166. fl. alt. 1. p. 316.) stem striated, with a glaucous bloom, furnished with leaves and axillary branches at the base; leaves pinnate or bipinnate; lower leaflets pinnate, upper ones pinnatifid; segments oblong, or ovate-oblong, acuminate, decurrent; odd one 3-lobed; involucra of many narrow leaves. 2 H. Native of Altaias, everywhere on the margin of rivulets. Flowers like those of A. officinalis, but varying more to yellow. Habit of A. officinalis, but differs in the leaves being more acuminate, those on the secondary branches of the petiole running down it a great way, and serrated their whole length. Fruit exalting a heavy smell when rubbed.

Decurcent-leafletted Archangelica. Fl. year. Pl. 6 to 8 ft.

4 A. LITTORALIS (Agardh, in litt. ex D. C. prod. 4. p. 170.) stem glabrous, terete, striated, hard; leaves bipinnate; leaflets ovate, acute, serrated: odd one 3-lobed; sheaths large; leaves of involucres rather scabrous, one-half shorter than the umbel-lules. 2 H. Native of the north of Europe, on the sea shore. Archangelica spuria or A. littoralis, Walh. carp. p. 84. Major, Lag. gen. nov. et spec. p. 13.?—Dodon. pempt. 318. f. 1? Flowers whish. Stem hard and acrid, not edible.

Sea-shore Archangelica. Pl. 4 to 6 ft.

5 A. GELMINIS (D. C. prod. 4. p. 170.) stem glabrous, terete, striated; leaves ternate; leaflets tripartite: lobes ovate, serrated, cuneated at the base; sheaths middle-sized; leaves of involucres about equal in length to the umbel-lules. 2 H. Native of Kamtschatka and Kotzebue's Sound. Angelica Gelminis, Worrnsh. ex Fisch. in litt. A pium ternatum, Tall. in Spreng. syst. 1. p. 890. The plant is used for culinary purposes by the Russians in Kamtschatka. Fruit like those of A. officinalis, but more oblong, and the vitve are fewer. There is a dwarfer variety of this found in Kotzebue's Sound.

Gelminis's Archangelica. Pl. 1½ foot.

Cult. The species are of easy cultivation; and are only to be increased by seed.

Tribe VII.

PEUCEDANEE (so named from the plants agreeing with the genus Peruciadaum in many points), or Orthospermæ paucijugata dipræe.—SCLEREE, Koch, umb. p. 88. Fruit flatly or lenticularly compressed from the back, girded by an entire dilated smooth winged flattened or rather convex margin. Mericarps with 5 filiform ribs, which are rarely winged; lateral ones contiguous to the margin, or running into it; raphe marginal, hence the fruit is only furnished with one wing on each side, not as in tribe Angeliceæ, furnished with 2 wings on each side from the raphe being central. Seed flattened or convex on the back.

XCI. OPOPANAX (from οποπανακτιανα in many points) Færula scopoletinæ, Spreg. Lax. spec. Pentandria, Digynia. Margin of calyx obsolete. Petals roundish, entire, involute, with a acutish point. Stylodium broad, thick. Styles very short. Fruit flatly compressed from the back, girded by a dilated convex margin. Mericarps with 3 dorsal filiform slender ribs; the lateral ones absent or not distinct from the margins; vitve 3 in each furrow, and 6-10 in the commissure. Seed flat.—A perennial herb. Root thick. Stamens 3. Leaves bipinnate; leaflets unequally crenate, crenated, obtuse. Umbels composed of many rays. Inflorescence and involucres of few leaves. Flowers yellow.

O. CHIRONIUM (Koch, 1. c.) 2 H. Native of the south of France, in open situations; also of Italy, Sicily, Croatia, and Greece. Nees, off. pl. 17. t. 11. Guld. bot. 288. Woodv. med. bot. t. 113. Seinum Opopanax, Crantz, austral. pl. p. 61. Færula Opopanax, Spreng. spec. 77. Schultes, syst. 6. p. 597. Pastinaca alissima, Lam. fl. fr. p. 465. Lob. icon. 702.—Moris, hist. 3. p. 315. sect. 9. t. 17. f. 2. Sheaths at the flowering branches spathaceous, and sometimes destitute of leaves. Leaves hairy, especially beneath. Although the plant is native of the south of Europe, the gum-resin, which is said to be obtained by wounding the stalks, is brought from the Levant and the East Indies, sometimes in round drops or tears, but more commonly in irregular lumps, of a reddish yellow-colour on the outside, with specks of white;
inwardly of a paler colour, and frequently variegated with large white pieces. It is supposed to be an emmenagogue, but is seldom used.

Chiron’s or Common Opopanax. Fl. June, July. Ct. 1640. Pl. 6 feet.

Cult. This is a plant of easy culture; and may be increased either by seeds or dividing at the root.

Lin. Syst. Pentadactyla, Digynia. Margin of calyx with 5 short teeth. Petals ovate, entire, acuminate, with the points ascending or incurved. Fruit thinly compressed from the back, girded by a flattened dilated margin. Mericarps with 3 dorsal filiform ribs, and 2 lateral obsolete ones, which are lost in the dilated margin. Vitae 3 or more in the dorsal furrows, and 4 or more in the commissure. Seed flat. Carpophore bipartite. Herbs, with thick roots, tall stems, and supra-decompound leaves: leaves usually cleft into linear segments. Umbels of many rays: lateral ones usually opposite or verticillate. Involuta variable. Flowers yellow. Stems in many of the larger species filled with medulla, interspersed with fibres, as the stems of monocotyledonous plants.

Sect. I. Ferula’ago (an alteration from the generic name). Koch, umb. 97. Dorast and commissurall vita numerous, from 50 to 60. Involuta constantly of 4-5 leaves. Stems usually striated or angular.

1 F. sylvatica (Bess. cont. enum. pl. vohl. et pod. p. 44. no. 193.) stem striate, straited, rather angular; leaves pinnate, with 10-20 pairs of opposite bipinnate-parted leaves; lobes or segments linear, cuspitate; leaves of involucra ovate-lanceolate, deflexed. 2. H. Native of Volhynia, Caucasus, Podolia, and at the river Don, in woods and meadows. Peuce-danum officinale, Bess. prim. fl. galic. et cat. hort. erem. 1816. Ferula nodiflora, Rochel. F. myriophylla, Bieb. miss. Ferulago sylvatica, Rchh. inc. bot. 4. p. 371. Leaves a foot or a foot and a half long.

Wood Giant-fennel. Pl. 6 feet.

2 F. rauclisaca (D. C. prod. 4. p. 171.) stem striated, angular; leaves pinnate, with 4-5 pairs of opposite leaflets; leaflets bipinnatifid; lobes or segments linear; involucra of 2-5 erect leaves, which are cuspitate at the apex, and membranously dilated at the base. 3. H. Native of Persia, at the foot of the mountains about Badala, where it was gathered by Szovits. Allied to F. sylvestri, but differs in the stem being more angular, and in the leaves being 3-4 inches long, and in the leaflets being only 4-5 pairs. Umbel terminal, of 12-14 very unequal rays. Herb glabrous, a foot and a half high.

Few-paired-leaved Giant-fennel. Pl. 1 1/2 foot.

3 F. Ferulago (Lin. spec. p. 356.) stem terete, striated; leaves supra-decompound; leaflets pinnatifid, divaricate; segments linear, cuspitate; leaves of involucra numerous, oblong-lanceolate, reflexed. 4. H. Native on hills and exposed places in the islands of the Mediterranean, and the adjacent region; and of Transylvania and Galicia. Spreng. umb. prod. p. 82. F. nodiflora, Jacq. asst. append. t. 3, and probably of all other authors.—F. latifolium, Moris, ox. sect. 9. t. 15. Lb. inc. t. 779. Dodon. pempt. t. 321. f. 2.

Ferulago or Broad-leaved Giant-fennel. Fl. June, July. Pl. 6 to 8 feet.

4 F. geniculata (Guss. prod. fl. sic. 1. p. 366.) stem terete, a little striated, gibbous at the nodi; leaves supra-decompound; leaflets decussate: segments linear, flat, acute, stiff, rather awned; floriferous branches alternate; leaves of involucra and involucels ovate-lanceolate, short; fruit oblong-elliptic, with acute prominent ribs. 5. H. Native of Sicily and the kingdom of Naples, on dry calcareous hills. F. rigidis, Tenore, fl. neap. append. 4. p. 15. exclusive of the synonyms. Bubon rigidos, Ucria ex Guss.—Bocc. mus. 2. t. 76.?

Geniculate-leaved Giant-fennel. Pl. 2 to 3 feet.

5 F. thyrsiflora (Sibth and Smith, fl. graece. t. 289. prod. no. 664.) stem angular and furrowed at the top; floriferous branches terminal, aggregate, compound; leaves supra-decompound; leaflets linear, elongated, roughish; leaves of involucra 4-6, linear-lanceolate. 6. H. Native of Candia, on rocks. Ferulago thyrsiflora, Koch, umb. p. 98. Vitae above 30 in the commissure, according to Koch, but in a specimen examined there are only from 20 to 25.

6 F. sylviola (Deuf. atl. 1. p. 352. t. 67.) stem angular and furrowed; leaves supra-decompound; leaflets pinnatifid; lobes linear, acuminate; leaves of involucra many, oblong-linear, reflexed. 7. H. Native of Italy, Naples, Sicily, Mauritania, and Portugal, on hills. F. nodiflora, Spreng. umb. spec. p. 84. but the figure of F. nodiflora in fl. graece. is destitute of involucra, and therefore does not belong to this plant; therefore the plant of Linnaeus is truly doubtful. F. Barrelieri, Tenore, in herb. Merat. Ferulago nodiflora, Koch, umb. p. 98. Ligusticum luteum, Poir. voy. barb. 2. p. 136. ex Poir. suppl. 3. p. 481. Peuce-danum Lucanisium and repliceto, Willd. herb. ex Spreng. syst. 1. p. 914. Vitae 60 in the commissure, ex Koch.

Var. B. campéstris (Bess. in litt. ex Spreng. syst. 1. p. 914.) segments of leaves linear-elongated.

7 F. stricta (Spreng. in Schultes, syst. 6. p. 592.) stem straight, stiff, furrowed; leaves ternately supra-decompound, straight; leaflets trinerved, triquetrous, filiform, glabrous; leaves of involucra ovate-oblong. 8. G. Native of the Cape of Good Hope.

Sect. II. Ferula’la (an alteration from the generic name). D. C. prod. 4. p. 172.—Ferula, Koch, umb. 96. Vitae 3 in each of the dorsal furrows, and 4 in the commissure. Involuta wanting. Stems terete.

*Stem leafy.

8 F. communis (Lin. spec. p. 355.) stem terete, branched; leaves supra-decompound, green; leaflets linear-setaceous, flaccid; central umbel nearly sessile; lateral ones male, pedunculate; involucre wanting; sheaths of upper leaves very large. 9. H. Native on hills in the region of the Mediterranean, from Portugal to Greece, and of Mauritania. D. C. fl. fr. 3. p. 343. F. nodiflora, Lin. spec. 356? Smith, fl. graece. t. 279.—Dodon. pempt. p. 321. f. 1. Lb. inc. t. 778. f. 2.—F. fennica, Plunt. Tourn. Moris, umb. 35. t. 2. hist. 3. p. 309. sect. 9. t. 15. f. 3. Lateral umbels usually opposite, rising from the axils of the sheathing petals under the central umbel. Fruit 5 lines long, and 3 lines broad. There issues from the stem when cut a yellowish feitid juice, which hardens on the surface of the wound. The dry dead stem is full of white pith, which easily takes fire, and the Sicilians use it for tinder. Hence the name of Prometheus. In Apulia, where the plant grows in great plenty, it is grateful to buffaloes, which form the chief part of the subsistence of many farmers there.

F. glauca (Lin. spec. p. 356.) stem terete, branched; leaves supra-decompost, glaucous beneath; leaflets linear, elongated, flat; involucra wanting; petioles of upper leaves dilated; central umbel pedunculate; lateral ones male, on longer peduncles. 2. H. Native of the south of France, at Merival, near Montpelier in the spot mentioned by Lobel; also of Provence, Italy, Sicily, Greece, &c. F. folio glauco, Bauh. hist. 3. p. 2. p. 45 with a figure. Fcrula et Ferulago, Lob. adv. p. 348. F. commünis, Gouan. hort. monsp. p. 140. F. glauca, D. C. fl. fr. suppl. p. 514. Schultes, syst. 6. p. 588. Leaves of involucra many, linear-setaceous, caducous, ex Spreng. but in the plants examined there has been no involucra from this; therefore Sprengel's plant is probably distinct from this.

10 F. bigdula (D. C. prod. 4. p. 173.) stem terete, branched, and is, as well as the petioles, quite glabrous; leaves bipinnate; leaflets pinnatifid; lobes short, few, acute, channelled, stiffish, hardly puberulous; umbels rather panicked, without any involucra. 2. H. Native of Persia, on rocks among the mountains about Seidkhozd. Very like F. Cásperca in the in florescence and fruit, but differs in the primary pairs of leaves being an inch and a half distance from each other, and the secondary pairs are more elongated; leaflets fewer; lobes fewer, stiffer, and rather fleshy. Sheaths larger, and rather glaucous.

Stiffish Giant-fennel. Pl. 3 feet.

11 F. Cásperca (Bieb. fl. taur. suppl. no. 551.) stem terete, branched; leaves triplicate pinnate; leaflets pinnatifid, soft, approximate; segments very short; umbels somewhat panicked; the peduncles of the lateral umbels furnished each with a subulate ligula at the base; involucra none. 2. H. Native of arid fields from Odessa to Sarepta; and of Caucasus, near Kishiar. Spreng. umb. spec. p. 81. F. carchoides, Fisch. in litt. 1822. There are varieties of this with either glabrous or pubescent leaves, according to Bieb. The habit is like that of Cachrys Odontálgica. Sheaths ciliate; upper ones almost destitute of leaves. Fruit oval, glabrous, 3 lines long, 1/3 line broad. Commissure furnished with 4 vitte. Umbel-bearing branches alternate; lower ones often opposite, and upper ones in whorles. Perhaps a species of Peucedanum, according to Boesser.

Caupian Giant-fennel. Fl. June, July. C1t. 1819. Pl. 2 to 3 feet.

12 F. orientalis (Lin. spec. p. 356.) stem terete, branched; leaves 5 times pinnate; leaflets multifid, setaceous, apparently puberulous when examined by a lens; sheaths large, ciliate; involucra wanting. 2. H. Native of Asia Minor, Greece, Caucasus on Mount Beschcharmak, and perhaps of Numidia. Lam. dict. 2. p. 456. Spreng. umb. spec. p. 89? Tourn. trav. 2. t. 379. Branches of root thick. Leaves a foot and a half long. Upper two-thirds of it are sheaths, and an inch broad. Sprengel refers to this the Fashbook of Jackson's account of Morocco. t. 7. Steven says it is the same as F. peucedanifolia, Willd. herb., but Pallis's figure, which is cited for it, is very different from our plant.

13 F. Pérsica (Willd. spec. 1. p. 1413.) stem terete, glauca; leaves ternately supra-decompost; leaflets rather remote or decurrently pinnate; segments linear-lanceolate, dilated, and cut at the apex; primordial umbel sessile; involucra and involucra wanting. 2. H. Native of Persia, and of Caucasus, on hills near Baku. Andr. bot. reg. 558. Sims. bot. mag. 2006. F. asafsátida, Mart. in Mill. dict. no. 9. exclusive of the synonyme of Kémf. Woodv. med. bot. 22. t. 8. Plench. icon. t. 202. Assa-fesátida, Hoppe, in phill. trans. 1785. p. 36. t. 3 and 4. The plant smells very strong of asafoetida, and there is a yellow gummy juice very like it flows from the plant, which in all probability has the same virtues as that of the true asafoetida, F. asafsátida. Plant of a yellowish hue.

Persian Asafoetida. Fl. June, July. C1t. 1782. Pl. 3 to 6 feet.

14 F. Tintozána (Lin. spec. p. 355.) stem terete, branched; leaves supra-decompost, shining; leaflets or segments oblanceolate, deeply toothed; upper petioles large, sheathing; terminal umbels on short peduncles; lateral umbels few, male, on longer peduncles; involucra none. 2. H. Native of Spain and Barbary, and in fields about Tangiers. Rivin. pentap. 3. t. 10. Herrn. par. t. 165. Moris. ox. sect. 9. t. 15. last figure. Desf. fl. atl. 1. p. 231. Fruit 6 lines long, and 3 lines broad. This plant is easily distinguished from the rest, in the leaflets being broader, and shining.

Tanger Giant-fennel. Fl. June, July. C1t. 1680. Pl. 2 to 8 feet.

16 F. Tolucce-inus (H. B. et Kunth, nov. gen. et spec. 5. p. 12. t. 418.) stem terete, fistular; leaves quadripinnate; leaflets or segments linear, acute, flat; involuca of one leaf; involucro of 3-7 linear leaves, which exceed the fruit. 2. F. Native of Mexico, in cold places near the town of Tolulco. Herb glabrous, a foot high, a little more. Rays of umbel unequal. Leaf of involueruma linear, shorter than the rays of the umbel. Leaves of involucro 5-6, very unequal, the longer ones exceeding the umbelulas. Flowers many, abortive. Vitte 4 in the commissure, and 3 in the furrows. Tolulco Giant-fennel. Pl. 1/2 foot.

17 F. petiolarius (D. C. prod. 4. p. 173.) plant quite glabrous; stems terete, branched, leafy at the base; petioles alternate, having the ultimate divisions very long, and cylindrically conical, acute, bearing no foliacium segments; upper sheaths small, undivided, acuminate; involucra and involucro none. 2. H. Native of Persia, among stones on the tops of the mountains about Seidkhozd, where it was collected by Szovits. The species is very remarkable in the absence of foliacia leaflets, and therefore the leaves are reduced to the naked petioles. Ultimate lobes of petioles 7-8 inches long, usually knotted at the third part of their length, as in Juncus articulatus, the knave indicating the places of the abortive branches. Umbels few-flowered. Young fruit oblong, glaucous.

Petiodar Giant-fennel. Pl. 2 to 4 feet.

18 F. seseloides (Meyer, planz. p. 126.) glabrous, glaucous cent; stem rather angular, leafy, branched; lower leaves bipinnate; leaflets pinnatifid; lobes linear; sheaths narrow: upper sheaths less, acuminate; umbels all fertile, pedunculate; involucro almost wanting; leaves of involucro sessile; vitte 1-3 in the furrows. 2. H. Native of Caucasus, on Mount Beschcharmak. Leaves of Seseli montanum; but the petals are yellow like other species of Férula. Margin of calyx obsolete. Fruit nearly like Peucedanum.

Seseli-like Giant-fennel. Pl. 2 to 3 feet.

** Stecus almost naked.

19 F. Assa-fesátida (Lin. mat. med. 79.) stem terete, simple, furnished with leafless sheaths; radical leaves pinnate, having 1 or 2 pinnatifidly cinated leaflets on each side; lobes oblong, obtuse; involucro wanting. 2. H. Native of Persia, in the provinces of Khorassan, Laar, and Fars. Assa-fesátida, Kémf. amun. p. 535. p. 536. with a figure. Stein
Asafoetida is well known by its peculiar nauseous fetid smell, the strength of which is the surest test of its goodness. This odour is extremely volatile, and of course the drug loses much of its efficacy in keeping. It comes in large irregular masses, composed of various shining little lumps or grains, partly whitish, partly brownish or reddish, and partly of a violet hue; those are accounted the best which are clear, of a pale reddish-colour, and variegated with many fine white tears. It is a gummy resin, but has the gum in largest quantity. It is the most efficacious of the fetid gums, and is commonly used in hysteria hypochondriasis, some symptoms of dyspepsia, amenorrhoea and chlorosis, flatulent cholics, and most diseases termed nervous; it is thought to be the most powerful remedy we possess for those peculiar convulsive and spasmodic affections, which often recur in hysterics. It is recommended as an emmenagogue, anthemimetic, expectorant, antiasmatic, and anodyne. Its action is quick and penetrating.

Asafoetida. Fl. July, Aug. Pl. 6 to 7 feet.

20 F. Szovitsian’s (D. C. prod. 4. p. 173.) stem terete, nearly naked, branched, glabrous; leaves tripinnate, clothed with velvety pubescence; leaflets deeply toothed, obtuse; umbels somewhat panicked, without involucra; fruit oval-obovate, flat, longer than the pedicels. 2. H. Native of Persia, at Seidkhozdji, in gravelly and stony places, where it was collected by Szovits. Neck of root appearing hairy from numerous erect fibres. Petioles of leaves trifid. Umbels terminal, on short peduncles. Fruit the size of F. communis.

Szovits’s Giant-fennel. Pl. 5 to 6 feet.

21 F. Pune’cens (Pall. ex Willd. rel. in Schultes, syst. 6. p. 598.) stem pubescent, panicked, nearly leafless; radical leaves clothed with hoary pubescence, ternately tripinnate; leaflets jagged: lobes linear, tripartite, obtuse; sheaths opposite, small; involucra and involucelles minute and caducous. 2. H. Native of Siberia.

22 F. Pumila (Pall. ex Willd. rel. in Schultes, syst. 6. p. 598.) stem smooth, panicked, leafless; sheaths naked; radical leaves pubescent, ternately tripinnate; leaflets pinnatifid; lobes decussate, bluntnish. 2. H. Native of Siberia.

Dwarf Giant-fennel. Pl. 1 foot.

23 F. Armena (D. C. prod. 4. p. 174.) glabrous; petioles ternate at the base, having the divisions bipinnate; leaflets short, divided into thick, oblong, obtuse, aggregate, somewhat whorled lobes; stem naked, terete; leaves of involucra and involucelles short, oblong; fruit elliptic. 2. H. Native of Armenia. Oreoselinum Armenii Sesseleos Massiliensis folio, Tourn. herb. Upper leaves reduced to short leafless sheaths.

Armenian Giant-fennel. Pl.? + Little known species.

24 F. brevifolia (Link, in Schultes, syst. 6. p. 592.) stem terete, glabrous; leaves supra-decompound; leaflets linear, channelled, divaricate, aciculiform, ciliate, elongated; involucra wanting; primordial umbels sessile. 2. H. Native of Portugal.

Short-leaved Giant-fennel. Pl.?

25 F. capillaris (Link, in Spreng. umb. spec. 85.) stem terete, glabrous; leaves trinervate; leaflets filiform, capillary, loose; sheaths of petioles almost wanting; umbels axillary; involucra of a few sessile leaves. 2. H. Native of Portugal. Narthecium, Dalech. lundg. p. 754. Ferula teniouri-folia, Mor. ox. sect. 9. t. 15.

26 F. necedantifolia (Wildl. herb. in Schultes, syst. 6. p. 592.) stem kheed, branched, leafy; leaves tri-nervate, stiff; leaflets trifidly pinnatifid, linear-subulate, elongated; involucra wanting; umbellules rather capitae. 2. H. Native of Siberia, at the Volga. F. nodiflora, Pall. ilin. app. p. 39. t. N. ed. gall. t. 56. F. Sibirica, Willd. spec. 1. p. 1411. Leaflets very long, nearly terete. Fruit unknown. The herbarium of Wildenow is said not to contain this plant.

Sulphur-mort-leaved Giant-fennel. Pl. 5 to 6 feet.

27 F. nudicaulis (Spreng. neu endt. 2. p. 149. but not of Nutt.) stem naked, furrowed, glabrous; radical leaves bipinnate; leaflets deeply serrated, mucronate; sheaths of upper leaves abortive; leaves of involucrum linear-baccate. 2. H. Native of Sicily, on the Nebrodos, in the higher pastures. Lasertipium resinosum, Presi, sic. p. 156. Leguminosum resinosum, Guss. ind. sem. 1826. prod. 1. p. 396. Fruit glaucous, compressed, marginated.

Naked-stemmed Giant-fennel. Pl. 2 to 3 feet.

28 F. fennicaeira (Nutt. gen. amer. 1. p. 183.) plant pubescent; stem short, naked, furrowed, glabrous; radical leaves pubescent, supra-decompound; leaflets linear, very narrow, acute, short: ultimate ones trifid; involucra wanting; involucelles univalent, digitate, with linear segments. 2. H. Native of North America, on the plains of the Missouri; and on the north-west coast near Fort Vancouver, and barren sandy grounds on the Columbia river; low hills near the source of the Wallawalla river, and on the Saskatchewan at Carlson House. Pastinaca fennica, Spreng. in Schult. PI. coreae, syst. 6. p. 587. Flowers yellow. Herbs smelling of fennel. Fruit furnished with 5 stripes, 3 of which are conspicuous. Umbel solitary, terminal. Sprengel refers to this Lomatium villosum, Rafin, in journ. phys. 1819. aug. 1. p. 101. and the flowers are said to be white by the author, but according to Nuttall they are yellow; and it is therefore also the Cosgweilá villósa, Schultes, syst. 6. p. 588.

29 F. Canadeïsis (Lin. spec. p. 356.) segments of leaves branched, shining, linear.—Native of Canada. Lin. horst. ups. p. 61. Gron. virg. p. 147. This is a very obscure plant, and probably the same as Angélica bicida.

Canadian Giant-fennel. Pl. 2 feet.

30 F. nuttallii (D. C. prod. 4. p. 174.) plant small, almost stemless, glabrous; leaves supra-decompound; leaflets linear, short, acute; scapes radical; rays of umbel elongated; involucra wanting; involucelles univalent, digitate, with linear segments. 2. H. Native of North America, on the plains of the Columbia; banks of streams among stones at the Great Falls of the same river. F. nudicaulis, Nutt. gen. amer. 1. p. 183. but not of Spreng. Smyrnium nudicaule, Pursh, fl. bor. amer. 1. p. 196.
Pastinaca medicaeae, Sprung. in Schultes, syst. 6. p. 587. Root fustiform. Plant having the odour of fennel, but more aromatic. This plant differs from the genera Férula, Pastinaca, and Smyrnium, in the flowers being white, not yellow, as in those genera.

*Nutallii* Giant-fennel. Fl. July, Aug. CIt. 1817. Pl. 12 to 2 feet?

31 F. ? *Palme'lla* (Hook. in fl. amer. bor. amer. 1. p. 268,) plant glabrous, nearly stemless; leaves bipinnatifid, on longish petioles, glaucous; leaflets linear, bluish; lower ones often again pinnatifid; peduncles rather shorter than the leaves; involucrum none; involucre unilateral, dimidiate, palmate, with the disk floriferous. 2. H. Native of North America, about Carlton House on the Saskatchewan. Root long, thick, rather fusiform. The involucres are very remarkable; truly palmate, gradually tapering into the broad petiole or ray, and bearing a small umbellule of white flowers on the disk.

*Palmella* Giant-fennel. Pl. 7/ foot.

32 F. *Aff'inis* (Bess. cat. hort. crem. 1816. p. 57.) Native near Odessa. This species is not described.

*Allied* Giant-fennel. Pl. 2 to 3 feet.

Cult. Any common garden soil answers the species of *Férula*; and they are only to be increased by seeds.

**XCHI. DOREM'A** (from *dorēma*, dorēma, a gift or benefit; not that the plant is considered pre-emminently deserving that title, but that the name is also agreeable to the ear). D. Don, in Lin. trans. vol. 16. p. 601.

LIN. SYST. *Pendudria, Digyinia*. Flowers sessile, immersed in wool. Margin of calyx 5-toothed. Petals ovate, with an inflexed point. Disk epigynous, cup-shaped, fleshy; with a plicate, rather lobulate margin. Style connate, recurved at the apex. Stigmas truncate. Fruit elliptic, much compressed from the back, girded by a complains broad margin; raphe very narrow, usually closed. Mericarps 5-ribbed; the 2 intermediate ribs distinct, filiform, at equal distances; lateral 2 confluent with the margins; vitreous prominent, one in each furrow, and 4 in the commissure, which is flat. Carpophore bipartite, filiform. Seed flat.—A robust, greenish, glaucous, Persian herb, with a perennial root, and clothed with glandular down, almost with the habit of *Opóqueuax Chiróium*. Leaves large, petiolate, somewhat bipinnate, 2 feet long; pinnae usually 3 pairs, each pair rather remote; lower leaflets distinct; superior ones confluent, deeply pinnatifid; segments oblong, mucronate, quite entire, or rarely a little loded, coriaceous, veined beneath, 1-5 inches long, and half an inch to 2 inches broad. Petioles and rachis terete, ribbed, pubescent, very much dilated at the base, and sheathing a little, with the upper margin winged and stipulate. Umbels profuse, racemose; umbellules globose, on short peduncles, usually disposed in a spicate manner. Peduncles terete, woolly, involucra and involucres wanting. Petals white. Stamens and styles yellow. *Ovarium* densely woolly. Fruit naked.

1. D. *AMon'ium* (D. Don, L. c.) 2. H. Native of the south of Persia, in the vicinity of Jezid Kast, a town of Irak El Ajam, the ancient Parthia, about 42 miles south of Isphahan. To discriminate and characterize those plants which more immediately administer to the wants and comforts of man, is one of the chief objects of practical botany; but it is a task replete with difficulties; the countries whence many of the substances are derived, particularly those belonging to the Materia Medica, being generally remote, and often inaccessible to travellers. Although the gnm Ammoniacum has held a place in the Materia Medica from a very early period, yet the plant from which it is obtained has hitherto remained almost totally unknown; and the same may be said of the analogous gun Galbanum, and many other articles derived from the vegetable kingdom, enumerated in the *Pharmacopoeia*. It is true Dioscorides and Pliny mention the plant which yields the gun Ammoniacum, the former under the name *delphinii* of Agasialis, and the latter under that of *Metopium*, and give Libya as its native country; but if the gun was ancienly imported thence, it must have been the produce of a different plant than ours; and probably identical with the species of *Férula*, represented by Jackson in his account of Morocco, as the gun now comes to Europe by way of the Levant and India. Dioscorides, whose opinion is adopted by all subsequent writers, derives the name Ammoniacum from Ammon or Hammon, the Jupiter of the Lybians, whose temple was situated in the desert of Cyrene, near to which the plant was said to grow. But it appears that Dioscorides was altogether mistaken as to its native country; and that the name Ammoniacum or Armoniacum, as it is indifferently written, is really a corruption of Armenianum; for it is now ascertained beyond all doubt, that the plant is a native of Persia, and that the gun must have been ancienly brought to Europe by way of Armenia; and we sometimes find the name of the apricot written Malum Amnoniacum. Willdenow, having seen some seeds picked from the gun-Ammoniacum, a species of Heracleum came up, which he called Heracleum gummarifum, but this appears to be identical with Heracleum Pyrenaeicum; but as the plant possesses no smell analogous to Ammoniacum, and affords no gummy substance whatever, it is probable it was only an accidental weed.

The materials from which the description was drawn were procured by Lieut.-Colonel Wright, of the royal engineers, in the district where the gun Ammoniacum was collected, which is given above, and presented by him along with other dried plants to the Linnaean Society. Every part of the specimen is covered with drops of a gum possessing all the properties of Ammoniacum; and this circumstance alone, independent of any other evidence, would seem sufficient to remove all doubt on the subject; besides the specimen has been compared with the portions of inflorescence and fruit, which are found abundantly intermixed with the gum in the shops, and they are found to agree in every particular. The name applied to the plant by Dioscorides is already pre-occupied by another genus of *Um belllelfer*, and that of Pliny is scarcely unexceptionable, as originating in a mistake, Metopium having been used by some ancient authors to denote the *Galbanum*, and by others the gum-Arabic tree; but most writers seem to agree in considering it the appellation of an ointment, or some oleaginous substance, rather than of a plant. The name *Dorema* has been given to avoid confusion.

The first volume of the *Dictionnaire Universel de Matière Médicale*, by Merat and De Lens, published at Paris in 1829, contains some valuable notices on the Ammoniacum plant, from which it appears that the plant was already known to Mr. Brown, and had been determined by him to constitute a new genus. We also learn from the same work that M. Fontanier, a geologist sent into the Levant by the French government, had visited the district where the plant grows spontaneously, and transmitted a drawing, together with specimens of the herb and gum, to the museum of natural history at Paris. M. Fontanier was informed that the plant grows likewise in Khorassan.

In the appendix to the first volume of the transactions of the Medical Society of Calcutta, p. 369, is an extract of a letter addressed to Dr. Wallich by Lieut.-Colonel Kennett, accompanied by a rude figure of the plant, which yields the gum-Ammoniacum, of which the following is a copy: "I have the pleasure to forward you a drawing and description of Oslane, a Persian plant that produces the gum Ammoniacum. It was procured by Capt. Hart, of the 5th battalion Bombay native regiment, whilst on sick certificate in Persia; and understanding it was a desideratum in botany, he has requested me to send it to you in his name. It is to be regretted that Capt. Hart did not know enough of botany to give a particular description of the plant,
umbelliferæ. xcli. dorema.

flower, and seed; but he brought away a root, with a piece of the stem, and some dry leaves attached; and which I have forwarded in a box to your address. You will observe the account of the plant was dated in July, 1822, though I only received it a short time ago.

"Description of the Oshak or gum-ammoniac plant, by Capt. Hart."

"It having been intimated to me while at Bushire by the Resident, Capt. Bruce, that the plant which produces the gum-ammoniac, called by the Persians Oshak, would be acceptable to botanists, as it was but imperfectly known, I procured the accompanying piece of stem, leaf, and flower, and took a drawing of one of the finest plants. Its height was 7 feet 2 inches, and the circumference of the lower part of the stem 4 inches. It grows principally on the plains between Yerdekanst and Kumisha, in the province of Irak, without cultivation. The gum is so abundant, that upon the slightest puncture being made, it instantly cozes forth, even at the ends of the leaves. When the plant has attained perfection, innumerable beetles, armed with an anterior and posterior probe of half an inch in length, pierce it in all directions; it soon becomes dry, and is then picked off, and sent via Bushire to India and various parts of the world; and is an article of considerable export. I am of opinion it might be cultivated with success in many parts of Kattywar, and the experiment might be worth the consideration of government. The gum might easily be procured by artificial means, which would answer the purpose equally well.

"From the part of the stem attached to the roots of the specimen I sent you, a considerable portion of the gum will be seen exuded, in which respect it resembles the Asafoetida plant, which mountains abounds in the south of Persia, particularly in the province of Pars."

The gum is collected about the middle of June; a tenth is remitted as tribute to the government; the rest is sent to Bushire on the Persian Gulf. Part of that imported to this country comes from the Levant; but the largest quantity and the best comes by way of India.

According to Major Willcock, who has visited the districts where the plant grows wild, the Ooshak or gum-ammoniac plant grows in great abundance over the arid plains in the vicinity of the town of Jezd Khāst, on the borders of the provinces of Fars and Irak, a district appertaining to the government of Ispahan. The white juice which forms the gum pervades the whole plant, but exudes chiefly from the principal stem. It either remains on them in lumps, or, falling to the ground, is gathered by the villagers in the autumn, and is sold by them. The Ooshak plant is to be met with nowhere but in the province of Irak, growing in very dry plains, gravelly soils, and exposed to an ardent sun.

Ammoniac has a nauseous taste, followed by a bitter one; and a peculiar smell, somewhat like that of Galbanum, but more grateful; it softens in the mouth, and acquires a white colour upon being chewed. It softens by heat, but is not fusible; when thrown upon live coals it burns away in flame. Such tears as are large, dry, free from small stones, seeds or other impurities, should be picked out, and preferred for internal use; the coarser kind is purified in solution, colature, and careful inspiration; but unless this be artfully managed, the gum will lose a considerable deal of its more volatile parts. These are often vended in the shops under the name of stained gum-ammoniacum, a composition of ingredients much inferior in virtue.

The general action of gum-Ammoniac is stimulant. On many occasions, in doses of 10-30 grains, it proves a valuable antispasmodic, deobstruent or expectorant. In large doses it purges gently, excites perspiration, and increases the flow of urine. It is used with advantage to promote expectoration in some pulmonary diseases, especially asthma and chronic catarrh; in dropsical affection to augment the flow of urine, and to support the salivation in small pox. In long and obstinate cholices, proceeding from viscid matter lodged in the intestines, this gummy resin has produced good effects, after purges and the common carminatives had been used in vain. Externally it is supposed to soften and ripen hard tumours, is often applied as dissolvent in white swellings of the knee, and other indolent tumours. A solution of it in vinegar has been recommended by some for resolving even schirrous swellings. It is exhibited internally combined with vinegar, vinegar of squills, assafetida &c. and in pills, with bitter extracts, myrrh, assafetida; externally, dissolved in vinegar, combined with turpentine, common plaster, &c.

xcv. eriosynaph. xcv. palimbia.

Erioseynaph (from ουρον, erion, wool, and σύνην, synaph, connection; in reference to the commissure, which is the connection of the two mericarps that compose the fruit, and which is clothed with wool-like down in the hollows between the nerves). D. C. coll. mem. 5. p. 50. t. 1. f. 9. prod. 4v. 175. —Ferula species, Fisch.

L. n. s. t. Pentándria, Digynia. Limb of calyx with 5 short blunt teeth. Petals ovate, entire, acuminate; points short, incurved. Fruit compressed from the back, girdled by a thickish margin. Mericarps with 3 dorsal filiform ribs, but the 2 lateral ones are lost in the thickish margin, which is spongy inside; furrows between the ribs broad, and furnished with 2-3 striae, and bearing 2-3 small vitæ; commissure without vitæ, marked by a middle nerve and 2 marginal ones, tomentose, and rather concave between the nerves. Seed complanate.—A perennial glabrous herb, with the habit of Ferula. Leaves decomposed: leaflets long, linear. Involucre and involucels none. Flowers yellow. This genus is very nearly allied to Ferula, but the singularity of the commissure of the fruit distinguishes it from all other umbelliferous genera.

L. n. s. t. Pentándria, Digynia. Margin of calyx obsolete. Petals elliptic, with an inflexed acute point. Fruit oblong or oval: the transverse section elliptic. Mericarps compressed from the back, having 5 filiform blunter ribs: the 2 marginal ones rather the broadest; furrows between the ribs furnished with 3-5 veins each; commissure bearing 2 broad markings. Seed oblong, with many stripes free from the pericarp.—Glabrous perennial herbs. Leaves tripinnate; leaflets mottilud. Stem terete, branched. Involucre of few leaves or wanting. Flowers cream-coloured. This genus differs from Peneclandum, in the furrows of the fruit being furnished with 3 vitre each, instead of one.

1 P. sala (Bess. enum. pl. vohl. 56. no. 1484.) stem terete, branched, naked; radical leaves tripinnate; leaflets many-

uu

2 P. Ramossisina (D. C. prod. 4. p. 176.) stem terete, much branched, sparingly leafy; leaves alternate: leaflets few, oblong, acutely cut; involucrum wanting; involucels of few leaves, fruit oblong. 2. F. Native of the East Indies, on the Pampa mountains on the confines of the province of Silhet. Selinum ramosissimum, Wall. mus. Root long, cylindrical, simple. Stem 2 feet high. Upper leaves reduced to the petioles. Fruit much flattened from the back; furrows furnished each with 2-3 obscure vittae; commissure covered with a pelliele, and therefore appearing without vittae at first sight.

Much-branched Palumbia. Pl. 2 to 3 feet?

Cult. See Peucedanum, p. 355. for culture and propagation.

XCVI. PEUCEADANUM (πυκνόεσχενος of Theophrastus and Dioscorides; said to be from πυκνό, peuké, a pinch, and δαννός, parched; the plant was so called on account of its strong smell, which resembles resin). Koch, umb. 92. f. 28. and f. 29. D. C. prod. 4. p. 176.—Peucedanum, Selinum, and Fétula, &c. of authors.—Orosesium and Thysellum, Hoffm. umb. p. 153. and 154.—Orosesium and Peucedanum, Lag. am. nat. 2. p. 90. Lin. syst. Pentádria, Digníga. Margin of calyx 5-toothed. Petals obvate, emarginate or entire, with an infelexed point. Fruit flattened from the back or lenticularly compressed, scariosus, pappus decurrent. Petals or involucra and involucels of many leaves. Peucedanum, having the ribs at equal distances, the 3 intermediate ones filiform, but the 2 lateral ones are more obsolete, and contiguous to the dilated margins, or lost in it. Vittae one in each furrow, but sometimes 2, and usually 2 in the commissure. Cardophora bipartite. Seed flat in front. Usually glabrous perennial herb. Leaves simply pinnate, or many times pinnate, or ternately divided. Umbels compound, terminal. Involucrata variable; involucels of many leaves. Flowers white or yellow or greenish yellow. According to Besser, the species with obcordate petals narrowed at the base are distinguished from the species with ovate petals, which are broadest at the base, and entire or a little emarginate at the apex. The first constitutes Orosesium, and the second the true species of Peucedanum.

Sect. I. Eupéuceadum (from eu, well, and Peucedanum; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 176.—Peucedanum legitíma, Koch, f. c.—Peucedanum, Gertrn. fr. 1. t. 21. Spreng. syst. 1. p. 1082. Margin of mericarps narrow. Vittae 2-4 in the commissure. Dorsal ribs of mericarps 5, the outer 3 more remote than the rest. Involucrata usually wanting or of few leaves, rarely of 5-8 leaves.

*flowers yellow.*

1 P. paniculátum (Lois. fl. gall. p. 722.) stem terete, striated, branched at the top; leaves 5 times ternate or trichotomous; segments linear; leaves of involucra 1-2, setaceous, caducous; involucels of many leaves. 2. H. Native of Corsica. D. C. fl. fr. 5. p. 513. Schultz, syst. 6. p. 565. Umbels numerous, disposed in a panicle. Flowers yellow. Fruit unknown. This is a different plant from the Selinum paniculatum of Shoreham.

Panicled Sulphur-wort. Fl. May, June. Cult. 1818. Pl. 3 to 4 feet.

2 P. officinális (Lin. spec. p. 553.) stem terete, branched; leaves 5 times tripartite: segments linear, acute, flaccid; involucre of 3 setaceous leaves, deciduous; pedicels much longer than the fruit. 2. H. Native of Europe, in humid meadows and shady places. In Britain in salt marshes, very rare; as in ditches near Shoreham, Sussex; and at Walton near Harwich, Essex. About a quarter of a mile below Faversham, by the river side. Smith, engl. bot. t. 1767. Hayne, arz. gew. 7. t. 4. P. altissínum, Desf. cat. hort. par. p. 119. P. Alsaléiicum, Poir. dict. 5. p. 227. Selinum Peucedanum, Sowerby, engl. bot. t. 1767. P. majus Hátracum, Bauh. pin. 143. Moris, oxeon. sect. 9. t. 15. f. 1.—Bauh. hist. 3. p. 26. f. 1.—Trag. hist, p. 880. p. 851. Hóg's-fennel, Petiv. herb. brit. t. 24. f. 7. Herb smooth, with a resinous juice, and a strong sulphureous smell. In England, Gerarde says, it is called Horestrange and Horestrong (or Horestrang, from the German Haarstrang), Sour-fennel or Hóg's-fennel, Sulphur-wort, and Brinstein-wort. The root wounded in spring yields a considerable quantity of a yellow juice, which dries into a gummy resin, and retains the strong scent of the root. Many stimulating qualities have been attributed to the root, but it should seem to be rather dangerous for internal use.

Var. β, Italicum (Mill. dict. no. 2.) segments of leaves or leaflets very narrow, filiform. 2. H. Native of the south of Europe. Lob. icon. t. 781. Leaves of involucra 3-4, as in the species. Leaves almost like those of P. longifóllum. Perhaps a proper species or a variety of P. longifóllum or P. Morisónum, but very distinct from P. Parisiense. It grows on low mountains, and also in valleys by the sides of rivers in Italy. It is altogether a larger plant than the species.

3 P. Leodebœrìi; stem terete, branched; leaves 5 times tripartite; segments linear, with roughish cartilaginously serrated margins; involucels of few leaves, caducous; pedicels exceeding the fruit. 2. H. Native of Siberia, every where in open situ-
atons, particularly on rocks. P. officinalis, Ledeb. fl. alt. 1, p. 304. Bieb. fl. taur. 1. p. 215. In a note, 2. p. 214. no. 338. Segments of leaves covered with copious pellucid dots. Involucra for the most part of 3 leaves: of these 2 is lanceolate, the other lanceolate-linear, and the third filiform, 2 are caducous, and the third permanent. This species differs from P. officinalis in the margins of the leaves being cartilagineously serrated, and in the fruit being smaller. 3. Var. ß: leaves biternate; leaflets 5-6 inches long; rays of umbel and umbellules elongated and divaricatured.

Ledebour's Sulphur-wort. Fl. June, July. Pl. 3 to 4 feet.

4 P. elatum (Led. fl. ross. alt. illt. t. 305.) stem terete; leaves glabrous, 3 or 4 times pinnate; pinnae pinnatifid or cut or entire: lobes linear, acuminate, with smooth margins; primordial umbel nearly sessile; involucrum wanting; involucres short. 2. H. Native of Altai, every where in exposed places on the declivities of mountains. Primary and secondary ramifications of the leaves opposite, but the pinnae are alternate. Petals deep yellow: those of the male flowers ovate-oblong, attenuated: those of the hermaphrodite flowers obovate, all having inflexed points. Vitex almost the length of the mericarpars, 1 in each furrow, and 2 in the commissure.

Tall Sulphur-wort. Fl. May, June. Pl. 5 feet.

5 P. longifolium (Waldst. et KIT. pl. rar. hung. 3. t. 251.) stem terete, branchet a little; leaves 5 times tripartite; leaflets triquetrously setaceous, channelled, elongated; involucra wanting or of one leaf; fruit with very narrow wings. 2. H. Native of Hungary, on calcareous rocks. Schultes, syst. 6. p. 567. Host, fl. austr. 1. p. 366. Petioles of radical leaves terete. Flowers yellow. Fruit with 5 ribs, and 4 vitex on the back; and the commissure with 2 vitex.

Long-leaved Sulphur-wort. Fl. June, July. Cl. 1833. Pl. 4 to 5 feet.

6 P. ruthenicum (Bieb. fl. taur. and suppl. no. 539.) stem terete; leaves triquarteternately divided: segments or leaflets acute, 1-terminated, very long; involucre nearly wanting; pedicels long of fruit. 2. H. Native of Caucasus, Tauria, and the south of Russia. P. Tauficicum, Spreng. umb. spec. p. 53. Fërula Ruthenica, Spreng. umb. prod. 14. pug. 1. p. 27. This species differs from P. officinalis in the leaves being less divided, in the segments or leaflets being longer, and in the pedicels being one-half shorter. 3. Var. ß, Tauficicum (Bieb. fl. taur. p. 540.) leaves 5 times tripartite; segments or leaflets linear, acute, short. 2. H. Native of Tauria and Caucasus, in mountain meadows.

Russian Sulphur-wort. Fl. May, June. Cl. 1818. Pl. 3 to 4 feet.

7 P. Morsinii (Bess. in Schultes, syst. 6. p. 567, in a note,) stem unknown; leaves triquarternately divided: leaflets linear, acute, long, stiff, 3-5-nerved; involucra wanting; pedicels of many setaceous leaves. 2. H. Native of Siberia. Ligusticum longifolium, Willd. spec. 1. p. 1428. Peucedanum, Mor. oxon. 3. sect. 9. t. 15. f. 1. Vitex 2 in the commissure, but usually 4, ex Koch, umb. 93.

Moxib's Sulphur-wort. Fl. 3 to 4 feet.

8 P. Besseriænæ (D.C. prod. 4. p. 177.) stem terete, a little branched; leaves triquarternate; leaflets linear, nerved, divaricate; involucrum nearly wanting; involucres of a few very short leaves. 2. H. Native on hills about Odesa. Fërula Besseriæna, Spreng. in litt. Peucedanum species, Bess. in litt. Herb and leaves nearly as in P. Parisiæense, but the flowers are yellow, and commissure is furnished with 4, not with 2 vitex. Teeth of calyx short, not as in P. officinale subulate. Rays of umbel nearly equal. Fructiferous pedicels 3-6 lines long, not as in P. officinale an inch long.

Beiser's Sulphur-wort. Pl. 3 to 4 feet.

9 P. arenarium (Waldst. et Kit. pl. rar. hung. 1. t. 20.) stem terete, striated, branched; leaves tripinnate; leaflets linear, obtuse, stiltish, short; involucre nearly wanting; rays of umbel few, unequal; leaves of involucres linear-subulate. 2. H. Native of Hungary, in sandy places; and of Transylvania, in calcareous places; and of the south of Podolia. Spreng. umb. spec. 51. Schultes, syst. 6. p. 368. Bess. cont. p. 43. Allied to Petelium Chabrotiâ. Vitex one in each furrow, and 4 in the commissure, ex Koch, umb. 93.

Sund Sulphur-wort. Fl. June, July, Cl. 1816. Pl. 2 to 3 ft.

10 P. Sibericum (Wald. spec. 1. p. 1496. Koch, umb. p. 93.) stems terete, almost without leaves; canale sheets large, proximally glabrous; radical leaves on long petioles, triply ninate, stiff, shining; leaflets linear, cuneate, with serrated margins; involucrum almost wanting; central umbel sessile: lateral ones pedunculate. 2. H. Native of Croatia, Bessarabia, Caucasus, and Siberia. Fërula Tatariëca, Fisch. in litt. Spreng. umb. prod. 14. exclusive of the synonyms. Bess. suppl. p. 219. Fërula Siberica, Spreng. in Schultes, syst. 6. p. 592. Vitex 1 in each furrow, but sometimes 2 in the lateral furrows, and always 4 in the commissure; lateral vitex usually incomplete, and sometimes wanting in the same specimen. Habit and flowers like P. arenarium. The plant from Croatia is probably different from that of Siberia.

Siberian Sulphur-wort. Fl. June, July. Cl. 1804. Pl. 3 to 4 feet.

11 P. dissectum (Led. fl. ross. alt. illt. t. 181. fl. alt. 1. p. 306.) stem terete, leafy; superior branches in whorls; sheaths spreading; leaves pubescent, 4 times pinnate; pinnule opposite, petiolate, pinate; leaflets pinnatifid or entire; segments obtuse, that bident; primordials umbels nearly sessile; involucra and involucres very minute. 2. H. Native of Altai, on hills at the river Talovka, near Buchtominsko. Involucrum of one or few minute setaceous leaves. Petals golden yellow, ovate, acute, inflexed. Ribs of fruit filiform. Vitex 1 in furrow, and 2 in the commissure.

Dissected-leaved Sulphur-wort. Fl. June, Pl. 4 feet.

12 P. canescens (Led. fl. ross. alt. illt. t. 105. fl. alt. 1. p. 307.) stem terete, leafy; intermediate branches opposite and tern; sheaths closely adpressed; leaves clothed with hoary pubescence, 3 times pinnate; pinnule opposite, petiolate, pinate; lower segments pinnatifid: upper ones confluent: leaves broad-ovate, triolinate or entire, acute; involucrum wanting or of one leaf; involucres of many short leaves. 2. H. Native of Altai, on rocks on Mount Arkaul. Leaves of involucres many, lanceolate, acute, with a yellow keel, and white margins. Flowers deep yellow. Petals ovate, acuminate, inflexed. Fruit not seen.

Caucasian Sulphur-wort. Fl. May, June. Pl. 1 to 2 feet.

13 P. graciles (Ledeb. fl. ross. alt. illt. t. 306. fl. alt. 1. p. 308.) stem leafless, branched; branches scattered; radical leaves clothed with hoary pubescence, but at length becoming glabrous, bipinate; pinnule opposite, pinate; leaflets nearly opposite, rather trifid; sheaths leafless, stem-clasping, chartaceous, permanent. 2. H. Native of Altai, in dry saltish open places in the Kirghiz-scan teppe, between Buchtominsko and the lake called Noor-Saisan. Root thick. Involucra and involucres wanting, or of one or two leaves, which are formed from the pedicels becoming abortive and leaf-like. Flowers polygamous, those in the terminal umbels hermaphroditic and fertile; and those in the lateral umbels male. Vitex 1 in each furrow, and 4 in the commissure. Petals golden yellow, obovate, acute, inflexed. Habit of a species of Fërula, and probably the same as Fërula pimilis, Pall. ex Schultes, syst. 6. p. 508.

Var. ß, microödrys (D.C. prod. 4. p. 309.) seed one-half smaller than in the species.
UMBELLIFERÆ. XCVI. PEADEANUM.

Sulphur-wort. Fl. May. Pl. 1 to 2 feet.
14 P. dumum (Led. fl. alt. 1. p. 310.) stem leafless, branched; branches scattered; upper branches nearly opposite; leaves unknown; sheaths leafless, stem-clasping, chartaceous, permanent; fruit orbicular-elliptic. 2. II. Native of Altai, exposed to sterile places, at the river Tschunga. Habit more robust than that of the preceding species, and the stems more branched and more flexuous. Umbels polygamous. Involucra and involucels wanting, unless they are caducous. Vitex 1 in each furrow, and 4 in the commissure.

Double Sulphur-wort. Pl. 2 to 3 feet.
15 P. Soongariæ; stem leafless from the base to the apex, slender; upper branches disposed in whorls; radical leaves clothed with hoary pubescence, 4 or 5 times pinnate; pinnule opposite, pinnate-parted; segments ovate-cordate, cut; lobes acuate; involucels very minute. 2. II. Native of the Soongarian desert, between the river Iryshe and the mountains of Dolen-Kara, in saltish places. P. paniculatum, Led. fl. Ross. alt. ill. t. 199, fl. alt. 1. p. 311. Involucrum wanting, unless it be caducous. Umbels usually prolificous, hermaphrodite and male on the same stem. Involucels wanting to the hermaphrodite umbelules, unless they are caducous; but usually of many lanceolate-linear acuate leaves to the male umbelules. Flowers yellow; petals ovate-oblong. Vitex 1 in each furrow, and 4 in the commissure. Perhaps the same as Fétula Soongárica, Pall. ex Schultes, syst. 6. p. 598. The stem yields a gum which has a taste between gum-Ammoniac and parsley. Habit exactly of Fétula Soongarian Sulphur-wort. Fl. May, June. Pl. 3 to 4 feet.

17 P. capillaceum (ThUMB. prod. p. 50. fl. cap. p. 257.) stem terete, striated, naked, nearly simple; radical leaves 5 times trichotomous; segments subulate, furrowed above, stiff; involucra and involucells of 5-6 lanceolate-subulate leaves. 4. F. Native of the Cape of Good Hope, on the mountains. Sibth. pl. exsic. no. 212. Flowers yellow, according to Thumberg. Fruit ovate, compressed, marginately winged, having 3 elevated ribs on each side, ex Thumb.

Capillary-leaved Sulphur-wort. Pl. 1 foot.
18 P. tenellifolium (ThUMB. prod. p. 50. fl. cap. p. 257.) but not of Poir.) stem striated, terete, a little branched; leaflets pinnatifid; segments lanceolate and alternate, marginated; sheaths broad, stipula-formed at the base of the petioles; involucra and involucells of sterile leaves. 4. F. Native of the Cape of Good Hope, on the mountains. Spreng. umb. spec. p. 59. Fruit ovate, marginating, winged on the back, with 5 ribs, ex Thumb.

Fine-leaved Sulphur-wort. Pl. 2 to 3 feet.
19 P. virgatum (Cham. et Schlecht. in Linnaea. 1. p. 392.) stem terete, shrubby; leaves stiff, pinnate; leaflets lanceolate, quite entire, mucronate, with revolute margins; involucra and involucells of many short leaves. 4. G. Native of the Cape of Good Hope, on the mountains. Burchell, cat. pl. afr. austr. no. 2869. The whole plant is quite globulous and coriaceous. Petals ovate, yellow, entire at the apex, or hardly marginated. Fruit said to be ellipitic, with 5 ribs on the back, having a complanate margin.

Twiggly Sulphur-wort. Shrub.

** Flowers cream-coloured.
20 P. schottii (Bess. in litt. ex D. C. prod. 4. p. 178.) stem terete, a little branched; leaves pinnate-parted; segments linear, acute, entire or divided; involucra and involucells none. 2. II. Native of Volynia and Podolia. Imperatoria Chabréb', Bess. fl. gall. Very like Palumbia Chabréb', but differs in the lobes of the leaves being more diverging, in the rays of the umbels being quite smooth, in the involucels being wanting, and in the furrows being furnished with one vitæ each.

Schott's Sulphur-wort. Pl. 2 to 3 feet.
21 P. orientale; stem terete, branched, fistular; leaves pinnate; leaflets bipinnatifid; lobes linear-oblong, acute; involucrum wanting; involucells of a few leaves. 2. II. Native of Nipaul, in the Himalayas at Gomashtang. P. disséctum, D. C. prod. 4. p. 178. but not of Led. Selinium ? dissécutum, Wall. mss. Habit of Ethusa or Thyselium. Fruit nearly orbicular, with a narrow margin. Vitæ all evident, solitary in the furrows, and twin in the commissure. Flowers cream-coloured or greenish, according to the dried specimen.

Eastern Sulphur-wort. Pl. 1 to 2 feet.

** Flowers white.

Parison Sulphur-wort. Fl. May, July. Cit. 1809. Pl. 4 to 5 feet.

23 P. Galacum (D. C. prod. 4. p. 179.) stem terete, branched; leaves bipinnate; leaflets broad-linear, elongated, attenuated, with a few anned serratures; involucra and involucells wanting; fruit with membraneous wings. 2. II. Native of Nipaul, and at Debra-Dhoon. Selinium? glaicum, Wall. mss. Flowers white, but rose coloured in a dried state. The fruit is nearly like that of section 4, but the involucra are wanting. Commissure furnished with 2 curved vitæ.

Glacca Sulphur-wort. Pl. 2 to 3 feet.
24 P. vaginalum (Led. fl. Ross. alt. ill. t. 808. fl. alt. 1. p. 312.) root creeping; stem simple; leaves pinnate; pinna opposite, pinnate; leaflets alternate, pinnate-parted, or triplicate, or entire; segments linear, acute; sheaths membranous; involucrum wanting; leaves of involucels linear, length of umbelules. 2. II. Native of Altaiia, in meadows at the rivers Iryshe, and Koksun. Flowers white; petals tapering into an infelexed point. Vitæ 2 in each furrow, and 4 in the commissure. Stylodium and styles purple. Margin of mericarps broad.

Var. β. pumilum (Led. fl. alt. l. c.) differs from the species in the stems being only 3 inches high, furnished with leaves at the root; mericarps nearly one-half smaller.

Sheathed Sulphur-wort. Pl. ½ to 1 foot.

UMBELLIFERÆ.

26 P. Baical'ense (Koch, umb. p. 94.) stem furrowed at the top, much branched; leaves pinnate; leaflets pinnatifid: segments linear, acute; leaves of involucre many, rather toothed; leaves of involucels cohering at the base, exceeding the umbelules. 2. H. Native of Siberia, about Lake Baical; and of Hungary. P. terebinthináceum, Fisch. in litt. Selinium terebinthináceum, Trev. nov. act. soc. nat. cur. 13. p. 166. S. col- linum, Kit. in Wildl. herb. The Hungarian plant is the same as the Siberian one.

Var. β, latifórum (Viv. ital. fragm. 1. p. 18. t. 22.) leaves broader and less glaucous. 2. H. Native in rather boggy places.

29 P. cervar'iéfolium (Meyer, verr. pflanze. p. 126.) plant glabrous, glaucescent; stem fistulare, terete; leaves bipinnate and tripinnate; leaflets membranous, ovate, or a little cordate, cut, mucronately toothed; petioles nearly terete, fistular; sheaths narrow; leaves of both involucre and involucels setaceous; mericarps puberulous, with narrow margins; the 3 dorsal ribs sharp. 2. H. Native of Caucasus, on the Tafus mountains. Allied to P. Alsatíceus, P. cérvariá, and Imperátoria Caucásica, but sufficiently distinct from all. Flowers greenish or dirty red.

Cerarea-leaved Sulphur-wort. Pl. 3 to 5 feet.

31 P. Aèstr'a'ricum (Koch, umb. p. 94.) stem sulcate; striated; leaves tripinnate; leaflets ovate, cuneated at the base, coarsely toothed, pinnatifid: teeth bluntish, mucronate; leaves of involucre linear. 2. H. Native of Austria, Pannonia, Upper Italy, and probably of France. Selinium Austriáicum, Jacq. aust. t. 71. vind. 49. Selinium argértaceum, Craizt, austr. 174. t. 4. f. 2. Selinium nigrum, Lam. fl. fr. 3. p. 420. Oreoselinium Austriáicum, Hoffm. umb. p. 155. Vitae usually 4 in the commence, and often 2 in the outer furrows, ex Koch, in litt. P. montánun, involucrátum, and Reblésse, are probably only varieties of this species. Besser makes P. Aèstr'a'ricum and montánun one species and P. involucrátum and Reblésse another. The petioles of the radical leaves are divided into 3 branches.

32 P. Mont'n'um (Koch, umb. 94.) stem deeply furrowed, branched, and corymbose in the upper part, smooth, hollow; leaves thrice pinnate; leaflets pinnatifid, with elliptic-lanceolate segments; leaves of involucrum lanceolate, pointed, dependent,

**Mountain Milk-parsley or Sulphur-wort.** Fl. July. Britain. Pl. 4 to 5 feet.

33 P. ALPESTRÉ (Lin. spec. 353.) stem terete, furrowed, branched; leaves thrice or 4-times ternate; leaflets linear, acute; involucrum of many reflexed leaves; umbels of many rays; involucels of many linear, acute leaves, rather shorter than the umbelles. [2] H. Native country unknown. P. alpinum, Desé Hort. par. cat. 119. Horn. Hort. hafn. 1. p. 276. P. minus, Poir. suppl. 5. p. 228? but not of others. The leaves agree with those of *P. montanum*. Flowers yellow.

**Alp Sulphur-wort.** Fl. June, July. Ch. 1738. Pl. 2 to 3 ft.

34 P. WALLICHIÉNIUM (D. C. prod. 4. p. 181.) stem terete, branched; leaves supra-decompound; leaflets linear, cuspidate, smooth; involucra and involucelles composed of cut leaves; ribs of fruit elevated; vitte in the commissure 4. [2] H. Native of the East Indies, at Sirinagur; and of Nipal at Kamaon and Gossingthtan. Selinum tenuisulphum, Wall. mss. Leaves, habit, and involucrum like those of *P. involucratum*. Ribs of fruit more elevated than in the rest of the species of the present genus, and nearly as in *Selinum* exsertum, but the commissure is broad, as in the other species of the genus.

**Wallich’s Sulphur-wort.** Pl. 2 to 3 feet.

**Involucrated Sulphur-wort.** Fl. July, Aug. Ch. 1810. Pl. 2 to 3 feet.

**Broad-leaved Sulphur-wort.** Fl. July, Aug. Ch. 1816. Pl. 2 feet.

**Selinum-like Sulphur-wort.** Pl. 2 to 3 feet.

39 P. POLYPHYLLUM (Ledebl. fl. ross. alt. ill. t. 309. fl. alt. 1. p. 314.) stem sulcately striated, branched; radical leaves numerous, bipinnate; leaflets pinnatifid, trifid, or entire; segments oblong or linear, acute, with smooth margins; leaves of involucre lanceolate, with membranous margins, deciduous. [2] H. Native of Altaia, on dry rocks at the rivers Tscharysch and Keryly, near Riddlers, Lektwsk, and elsewhere; on sandy hills, about Schuhbins at the river Irtysch. Involucels of many leaves, like those of the involucrum. Flowers white; outer petals deeply margined, with an inflexed point. Mericarps with rather prominent ribs, girded by a broad margin. Vitte 2 in the commissure, and 1 in each furrow; the outer ones as broad as the furrows.

**Tar. a, pubécosus (Ledd. fl. alt. 1. p. 315) segments of leaflets short, oblong, crowded, covered with fine down or thick short hairs; stem at most 2 feet high. [2] H. Native on dry rocks, at the rivers Tscharysch, and Keryly.

**Tar. β, glabrum (Ledd. 1. c.) segments of leaflets longer, oblong-linear, more remote, glabrous; stem 3 feet high, or more. [2] H. Native in sandy places, near Schuhbins and Lektwsk.**

**Var. γ, ligneare (Ledd. 1. c.) segments of leaflets elongated, linear, rather falcate, remote, glabrous; stem about 2 feet high. [2] H. On rocks about Riddlers.**

**Many-leaved Sulphur-wort.** Fl. June. Pl. 2 to 3 feet.

**Whorled-branched Sulphur-wort.** Fl. July. Ch. 1883. Pl. 4 to 6 feet.

† *Species not sufficiently known.*

41 P. LÉTÉNÉE (Spreng. umb. spec. p. 57, and in Schultes, syst. 6. p. 569.) stem angular, much branched; leaves ternately decompound; leaflets trifid and pinnatifid; segments lanceolate, cuspidate, veiny; umbels axillary; involucra and involucelles of
many leaves. 2. H. Native of Siberia, on the mountains.—
Gmel. sib. 1. p. 190. t. 42. Root thick, fusiform. Habit of
*Trinia*. Flowers cream-coloured. Fruit oval, a little winged.

This species probably appertains to sect. *Thyselium*.

42 P. *Cresinctum* (Lin. spec. 354.) stem terete, knotted at the
origin of the leaves; leaves glaucous, pinnate; leaflets multifid:
segments linear; umbel of 8-10 rays; involucra of many short,
reflexed leaves; fruit oblong, glabrous. 2. H. Native of
Cherkesia (near Caucasus) and in Asia Minor. 209. Tourn. cor. ex herb. Juss. The **cut in Buh. hist. 3. p. 2.**
57 and 58. f. 1. agrees well with this plant, but the figure of
P. Alp. exot. p. 328. cited by Linnaeus, is very different from it.

*Cretan* Sulphur-wort. Pl. ?

43 P. *Microphyllum* (Smith, in Rees' cyclo. no. 11.) leaves
tripinnate; leaflets 3-lobed, fleshy; involucrum hardly any. 2. H.
Native of Siberia, in salt deserts about the Volga.

*Peucedanum* salvinum, Pall. in Spreng. syst. 1. p. 910. 
Atámanáth tenuifólia, Willd. herb. ex Spreng. Involuturum of 1
seolate leaf, which is also sometimes absent. Fruit unknown. A
doubtful species.

*Small-leaved* Sulphur-wort. Pl. 2 to 3 feet?

44 P. *Japonicum* (Thunb. fl. jasp. p. 117.) stem terete, flex-
umbrance; leaves tuberous; leaflets cuneiform, trifid; petioles
broad, shining. 2. H. Native of Japan, on the shore.

*S. Alp. plant*., Koch, umb. 95. Nées off. pfl. t. 7. Imperatoria, 
Rivin. pent. irrig. t. 7. Ger. emac. 1001. f. 1. Mor. oxon. 3.
278. sect. 9. f. 1. f. 1. I. major, Buh. pin. p. 156. Caudal
prop. t. 55. Laspiértium Germánicum, Fuchs. hist. 763. with a
figure. Astrántia, Dod. pempt. 320, with a figure. Clus.
hist. vol. 2. p. 194, with a figure. Smyrnium, Trag. hist. 433.
with a figure. Flowers white or pale flesh-coloured. Root
fleshy, tuberous, somewhat creeping, of an aromatic and acidic
quality; long supposed a sovereign counter-poison, and cele-
brated as a powerful external as well as internal remedy in nu-
merous disorders. It is said to be a sudorific, diuretic, and
sialogogue; recommended in dropsy and debilities of the sto-
mach and bowels; an infusion of it in wine is said to have
cured quarts that have resisted the bark. When chewed it ex-
itates a copious flow of saliva, with a warm and not disagree-
able sensation in the gums, and frequently cures the rheumatic
toothache. The mericarps are broadly winged. The plant is
cultivated in several places for the London market.

*Var. p. tritermita*; leaflets 3-parted, or nearly ternate. 2. H.
Native in the region of the Mediterranean. Imperatoria triter-
mata, Viv. in lit.

*Sparrer or Common, or Great Masterwort.* Fl. Ju. July, 
Britain. Pl. 1 to 2 feet.

2 I. *Angustifolia* (Bell. in Horn. Hort. hafn. 1. p. 286.) leaves
termate; leaflets oblong, attenuated at the base, acuminate
at all leaves, cordate at the apex; pedicels shortly and bluntly
attached at the base; umbels pedunculate, of 2-3 rays; involucrum
of 2-3 leaves; umbellae many-flowered; petals inflexed cor-
date at the apex. 2. H. Native of New Zealand. Bowlæia
geniculata, Spreng. umb. spec. 14. t. 5. f. 11. But it certainly
is not a species of *Bowlæia*, from the calyx being without teeth.

*Kneed* Sulphur-wort. Pl. prostrate.

49 P. *Sprengelii* (D. C. prod. 4. p. 182.) stem terete,
branchte; leaves bipinnate, lanceolate; leaflets pinnatifid, ses-
sile: segments lanceolate, mucronate, veiny, with serrately
searous margins; floriferous branches pinnate. 2. H. Na-
p. 50. syst. 1. p. 999. Flowers yellow. Fruit with 3-winged
mericarps, having the ribs obsolete, and the furrows convex.

*Sprengel's* Sulphur-wort. Pl. 2 to 3 feet?
UMBELLIFERæ. XVII. Imperatoria. XVIII. Callisace. XCIX. Bubon. C. Anethum.

plant has the appearance of a species of Ligústicum. Fruit winged, as in Peucedánium, sect. iv., but the calycine teeth are obsolete, and the involucre is wanting, as in the other species of Imperatoria.

Caucasan Masterwort. Pl. 1 to 2 feet.
1. I. Mexicanæ (Hort. Chelsea). 2. H. Native of Mexico. A broad-leaved species, received by Mr. Anderson, of the Chelsea Botanic Garden, from Mr. Otto, of the Botanic Garden at Berlin, in the year 1818, but it has not yet flowered. It may prove hereafter to belong to a distinct genus.

Mexican Masterwort. Cl. 1818. Pl. 3 to 4 feet.

Cult. Plants of easy culture; and may be either increased by dividing the roots or by seed.

LIN. SYST. Pentádria, Digynia. Margin of calyx somewhat 5-toothed or nearly obsolete. Petals oval, acuminate, uncurved. Fruit compressed on the back, winged on the margin, nearly orbicular, marginal at the base. Mericarps with 3 blunt, dorsal, nerve-formed ribs; the 2 lateral ribs expanded into wings, which cover the whole surface of the fruit. Vitte 1 in each dorsal furrow, which are narrow, and 1 on each side of the commissure at the margins. Parts of carpophore adnate to the mericarps. Seed complanate. — A perennial herb, with the habit of Angelica or Ostricereum. Sheaths of leaves large: upper ones leafless. Umbels pubescent, of many rays. Involucra none, or of few leaves. Umbels dense, many-flowered. Involucels of many setaceous leaves. Flowers white. This is an intermediate genus between Angelica and Imperatoria.

1. C. Damérica (Fisch. in litt. D. C. prod. 4. p. 184.). 2. H. Native of Dahuria, near Nertschinski-Savoy. Thyselium Dahuricum, Spreng. syst. 1. p. 894. Habit of Ostricereum pratensis, but more branched, finer, and thicker in the stem. Habit also of Angelica Ruzoillsis, but the leaves are more deeply serrated, the sheaths larger and inflated, and the involucrums composed of one or two leaves.

XCIX. Bubon (from böbbon, böbbon, the grain, or a tumour in that part, or elsewhere, which this herb was supposed to cure). Koch, umb. 95. D. C. prod. 4. p. 184. but not of Spreng.—Bubon species, Spreng. in Schultes, syst.—Agasylis species, Spreng. prod.—Galbanóphora, Neck. civil. no. 292.

LIN. SYST. Pentádria, Digynia. Margin of calyx obsolete. Petals ovate-oblong, entire, with a slight acute point. Fruit lenticularly compressed from the back, girdled by a dilated complanate margin. Mericarps with 3 ribs at equal distances: the 3 intermediate ones filiform; and the 2 lateral ones lost in the complanate margins. Vitte covering the whole seed, 4 on the back and 2 in the commissure. Carpoaphore bipartite. Seed rather convex, flatish in front. Quite smooth shrubs, natives of the Cape of Good Hope, abounding in a gummy, resinous, sweet-scented juice. Stems terete. Leaves biennial, glaucous, stiffish; leaflets toothed or pinnatifid; petals sheathing. Umbels compound, of many rays. Involucra and involucels of many linear leaves. Flowers greenish yellow.

1 B. Galbanum (Lin. spec. 364.) leaflets cuneate, rhomboid, deeply toothed at the apex; terminal ones 3-lobed. 2 G. Native of the Cape of Good Hope, on hills. Jacq. vind. 3. t. 39. Thunb. fl. cap. 233. Berg. cap. 77. Woodv. med. bot. 34. t. 12. Sims. bot. mag. 2489. Selinum Galbanum, Spreng, in Schultes, syst. 6. p. 563. Agasylis Galbanum, Spreng. prod. 22. Pluk. alm. t. 12. f. 2. Herrn. par. 163. with a figure. Dorsal vitte of fruit under a thick pericarp. Stem with purplish bark, covered with whitish powder. This was formerly supposed to be the plant which yielded the drug called gum galbanum; but it has lately been discovered to be the produce of quite a different plant, a native of Persia, now called Galbanum officinale.

2 B. Gumimum (Lin. spec. 564.) leaflets cuneate at the base, pinnatifid: segments lanceolate, acute. 5 G. Native of the south of Africa. Selinum gumimum, Spreng. in Schultes, syst. 6. p. 564.—Comm. hort. amst. 2. p. 115. t. 58. Like the preceding, but differs in the leaves being more finely divided. Dorsal vitte of fruit superficial.

Cult. A mixture of loam, peat, and sand is a good soil for these shrubs; but they can only be propagated by seed.

LIN. SYST. Pentádria, Digynia. Margin of calyx obsolete. Petals roundish, entire, involute, with a somewhat quadratic reteuse point. Fruit lenticularly compressed from the back, girdled by a complanate margin. Ribs of mericarps filiform, at equal distances: the 3 intermediate ones acutely keeled: and the 2 lateral ones more obsolete, and running into the flattened margin. Vitte broad, solitary in the furrows, and filling them, but with linear in the commissure. Seed rather convex, flatish in front.

—Annual, crect, glabrous herbs. Leaves decomposed, with linear-setaceous lobes. Involucra and involucels wanting. Flowers yellow, nearly like those of Pastinaca.

2 A. graveolens (Lin. spec. 377.) fruit elliptic, girdled by a flat, dilated margin. Q H. Native of the south of Europe, and about Astrachan, in corn-fields; and in meadows towards the Caspin sea, between Sallian and Lenkeran; also of the Cape of Good Hope and the Island of Timor; of South America, about Buenos Ayres. Fl. dam. 1572. Brot. fl. lus. 1. p. 464. Hayn. arz. gew. 7. t. 17. Woodv. med. bot. 159. Plench. icon. 215. Blackw. 545. Pastináca Anethum, Spreng. in Schultes, syst. 6. p. 587. Anethum minus, Goan. ill. p. 29. Selinum Anethum, Roth. fl. germ. 1. p. 113. Fenicíllium vulgáre, Hook. in Beech. bot.—Rev. pent. t. 13.—Mor. umb. t. 1. f. 22.—Fuchs, hist. p. 30. Lob. icon. 776. The common dill is a plant of upright growth, somewhat similar to fennel,
but smaller and more glaucous; it has finely divided leaves, and a slender single stem. The whole plant is powerfully aromatic. The leaves are used to heighten the relish of some vegetable pickles, particularly cucumbers; and also occasionally in soups and sauces. The whole herb is also used in medicinal preparations. Dill is raised from seed, of which half an ounce is sufficient for a bed 3 feet by 4 feet. Sow annually in February, March, or April, or occasionally in autumn, as soon as the seed is ripe, to come up stronger in the spring, in any open compartment, either in drills, 6 or 12 inches apart, or broad-cast thinly, and raked in evenly. The plants should remain where raised, and may be thinned moderately, should they rise too thick. They will shoot up in stalks, with leaves and seed umbels in summer and autumn, for use in proper season. Leave some plants when raised for seed; they will furnish plenty in the autumn. The bruised herb is anodyne and resolvent. The seeds are aromatic, and contain an ethecal oil, and useful, therefore, in flatulencies; the essential oil is also good in the colic. A distilled water, drawn off to the quantity of a gallon to a pound of seeds, was ordered in the London Pharmacopoeia, and occasionally made the basis of carminative draughts, and juleps; its flavour is more agreeable than that of the seeds in substance. Along with the water arises a considerable quantity of essential oil, which is given from 1 to 3 or 4 doses, or more, as a carminative. This, however, is now altogether disused.

3 A. Soua (Roxb. hort. Beng. p. 22,) fruit oblong, nearly destitute of a membranous margin. O. H. Native of the East Indies, where it is called Soua, and where it is cultivated for its use in medicine. Fleming, ind. med. in soc. asiat. 11. p. 156. ex. Schultes, syst. 6, p. 628. Herb very like the preceding. Rays of umbel 5-16. Fruit flat, 3-ribbed, almost wingless.

† Species not sufficiently known.

4 A. Cyseroca*rpen (D. C. prod. 4. p. 186,) fruit elliptic, puberulous on the outside, when examined by a lens, with a very narrow margin. O. H. Native of Persia, about Seidkhodzi, where it was collected by Szowits. Plant small, glabrous. Root slender, simple. Leaves many-parted: lobes linear. Umbels pedunculate, opposite the leaves, 3-6-rayed, without involucra. Umbeluhle 6-7-flowered, surrounded by an involucel. Flowers unknown, but probably yellow, as the other species. Fruit appearing turgid at first sight, ellipsoid, but empty inside, from the mericarps being thin and concave. Carpophore filiform, bipartite. Mericarps of the same structure as the other species of the genus.

Boat-fruited Dill. Pl. 1 foot.

5 A. Erythr*um (D. C. prod. 4. p. 186,) fruit elliptic, glabrous, hardly marginate; mericarps flattish; involucra and involucels of 4 or 5 leaves. O. H? H. Native of Persia, in gravelly places, at the foot of Mount Avrin, in the district of Khoi, in the province of Aderbeijan, where it was collected by Szowits. Herb glabrous. Stem terete, purplish. Leaves small, multifid, with small obtuse lobes. Umbels on long peduncles, 7-12-rayed. Invovlula of 5-7 leaves. Umbeluhles 12-13-flowered; involucels of 5-7 short leaves. Petals white, ovate, acute. Mericarps sometimes flat, and sometimes rather concave, fuscous on the outside, and purplish inside. Very like A. Segetum.

Red-stemmed Dill. Pl. 1 foot.

Cult. All the species grow very well in the open border, where the seeds should be sown.

UMBELLIFER.E. C. Anethum. CI. Cortia. CII. Capsophyllum. CIII. Tiedemannia. 337

CI. CORTIA (in honour of Bonav. Corti, who was the first to discover the motion of molecules in the cells of plants). D. C. prod. 4. p. 186.—Schultzia species, Wall.

Lin. syst. Pentändria, Digynia. Teeth of calyx elongated, acute. Petals lanceolate, acuminate, entire. Stylodium conical; styles diverging. Fruit elliptic, rather retuse at both ends; mericarps flattish, 5-ribbed; ribs winged: lateral ribs the broadest; vittae 1 in each furrow, and 2 in the commissure, which is broad and flat. Seed flattish.—A nearly stemless herb. Leaves petiolate, pinnate; leaflets divided into short, capillary segments. Scapes, some of them thick and stem-formed, bearing an involucrem, composed of 2-3 multifid leaves; others are elongated, and bearing an umbel, which is usually of few rays. Involucels of 5-7 linear, entire, or 2-3-cleft acute leaves. This genus differs from Schultzia in the calyx being 3-toothed, and in the fruit being compressed from the back, not from the sides, evidently 5-winged.

Lindley's Cortia. Pl. 1 foot?

Cult. Sow the seeds in the open border in spring, in a warm sheltered situation.

CII. CAPNOPHYLLUM (from κατάνοε, kaptos, the Greek name for fumitory, and φυλλον, phyllon, a leaf; resemblance in leaves to those of fumitory). Gaern. fruct. 2. p. 32. t. 85.

Koch, umb. p. 95. no. 24. in add.—Cönum species, Auct.—Rümia, Link, but not of Gaern.

Lin. syst. Pentändria, Digynia. Margin of calyx obsolete. Petals oblong, somewhat emarginate, tapering into an inflexed point. Fruit lenticularly compressed, girded by a complicane, dilated margin. Mericarps having the 3 intermediate ribs thickish, keeled, rather flexuous or tubercled; the lateral ribs lost in the dilated margins. Vitre solitary in the furrows, and twin in the commissure. Seed rather convex, but flat in front.—Annual herbs, natives of the Cape of Good Hope, with leaves almost like those of fumitory, whence the name. Leaves hoary, multifidly decomposed, with linear, cuneate segments. Umbels opposite the leaves, or nearly terminal. Involucera and involucels composed of 3-6 leaves, with membranous edges. Flowers white.

African Capnophyllum. Pl. 1 foot.

Cult. Sow the seeds in a warm sheltered situation in spring.

CIII. TIEDEMANNIA (in honour of Professor Tiedemann, of Heidelberg, a vegetable physiologist.) D. C. coll. dist. 5. p. 51. t. 12. prod. 4. p. 187.

Lin. syst. Pentändria, Digynia. Margin of calyx 5-toothed (f. 64. a). Petals acuminate, reflexed (Ell.); anthers erect, adnate to the sides of the filaments (Ell.). Fruit fahy com-

X
pressed (f. 64. c.) from the back. Mericarps with 5 filiform, rather keeled ribs, at equal distances, approximate; lateral ribs dilated into a membranous margin (f. 64. c.), broader than the fruit. Vitae solitary in the furrows, and filling them, and twin in the commissure. Carpophore bipartite. Seed flat.—Gla-
brous herbs, natives of North America, in marshes. Stems te-
rete. Leaves reduced to the petioles, which are terete, acute, 
fusiform, and jointed, without any leaflets. Involucra and in-
volution of 4-5 subulate leaves. Flowers white.—Habit of *Sium, 
*Campanula, and *Otosia, but the fruit is that of *Anémone, and the 
authors are very different from those of all other umbelliferous 
plants.

1 T. *TERETIFOLIA* (D. C. prod. 4. p. 187.). — H. Na-
tive of Carolina. *Campanula umbellata*, Walt. var. p. 113. but not 
354. (fig. 64.)

*Terefe-leaved Tiedemannia.* Pl. 1 foot.

*Cult.* Sow the seeds of this plant in a pot filled with peat, 
and place a pan of water under it.

**CIV. ARCHEMANOA** (from Archemorus, in mythology, 
son of Lycurgus, slain by an adder; in reference to the poison-
ous quality of the plants). D. C. coll. diss. 5. p. 52. prod. 4. 
p. 188.

**LIN. SYST.** *Penandria, Digyga.* Margin of calyx 5-toothed. 
Petals obcordate, with an indented apex. Fruit compressed 
from the back, flat, oval, or obovate. Mericarps with 5 filiform, 
rather keeled ribs at equal distances, approximate; lateral ones 
dilated into a membranous margin, which is almost broader than 
the seeds. Vitae solitary in the furrows, and filling them; but 
twin in the commissure. Carpophore bipartite. Seed flat.— 
Marsh herbs, natives of North America. Leaves pinnate. In-
volution wanting, or of few leaves; involucres of many leaves. 
Flowers white. Habit of *Campanula or Sium.* Fruit of *Pastinaca.*

1 A. *AMBIGUA* (D. C. prod. 4. p. 188.) stem smooth; leaves 
pinnate: with 3-5 pairs of linear, sessile, undivided, acute 
leaves; involucrum wanting: involucres of 3-5 subulate leaves; 
fruit oval. 2. B. H. Native of New Jersey, and about Phi-
longifolium*, Pursh, fl. amer. sept. 1. p. 194. Habit almost of 
*Campanula puccinellii*, ex Nutt. Hardly distinct from the 
following. This is a truly poisonous herb.

*Ambiguous Archemamoa.* Pl. 6 to 10 feet.

2 A. *DIGITA* (D. C. prod. 4. p. 188.) stem striated; leaves 
pinnate; leaflet sessile, oblong-lanceolate, marginate, almost 
entire; involucrum wanting: involucres of 8-8 subulate leaves; 
fruit oval. 2. B. H. Native of New Jersey, Pennsylvania, 
Maryland, and Carolina, in bogs and marshes. *Sium rigidum*, 
st. 1. p. 514. This plant is very poisonous, according to Bar-
ton, comp. fl. phil. 1. p. 142.

*Stiff Archemamoa.* Fl. July, Aug. Cite. 1774. Pl. 5 to 3 ft.

3 A. *TRICUSPIDATA* (D. C. prod. 4. p. 188.) leaves pinnate; 
lower leaflets lanceolate; upper ones ovate, tridentate; in-
volute caducous. 2. B. H. Native of Carolina, in humid 
rigidum*, Walt. car. 114. According to Elliot, this is very like 
the preceding species.

**Tricuspidata-leaffletted Archemamoa.** Pl. 2 feet?

4 A. *DENTICULATA* (D. C. prod. 4. p. 188.) leaves pinnate; 
with usually 3 pairs of oval, denticulated, acute leaflets; in-
volvera of 2 leaves, rarely wanting. 2. B. H. Native of 
Georgia, in humid places, and along the sides of water. Stem 
3-4 feet high.

*Denticulated-leaved Archemamoa.* Pl. 3 to 4 feet.

*Cult.* The species of *Archemamoa* grow best in peat earth, 
in a moist situation; and they will be easily increased by divid-
ing at the root.

**CV. PASTINACA** (from *pastinum*, a dibble; in reference 
and 27. *D. C. prod. 4.* p. 188.—*Pastinaca* and *Malabalia*, 

**LIN. SYST.** *Penandria, Digyga.* Margin of calyx obsolete, 
or minutely denticulated. Petals roundish, entire, involute: 
with a broad, retuse point. Fruit compressed from the back, 
girded by a dilated, complanate margin. Ribs of mericarps very 
slender: the 3 dorsal ones at equal distances; and the 2 lateral 
ones contiguous to the dilated margin. Vitae linear, acute, 
hardy shorter than the ribs, solitary in the furrows, but twin or 
more in the commissure. Carpophore bipartite. Seed flat.— 
Herbs with fusiform, usually flabby roots. Leaves pinnate; 
leaflets toothed, cut, or lobed. Umbels compound. Involucra 
and involucres none, or of very few leaves. Flowers yellow.

1 P. *SATIVA* (Lin. spec. 376.) stem furrowed; leaves pinnate, 
downy beneath; leaflets ovate, serrated, and cut: the ter-
tinal one 3-lobed; involucra and involucres generally wanting, 
but there is occasionally a solitary leaf under the general as 
well as partial umbels; teeth of calyx obsolete; fruit oval; com-
misium of fruit furnished with 2 vitae. 2. H. Native of Eu-
rope, even to Caucasus, in meadows. In Britain, about the 
boundaries of fields, on hillocks and dry banks in a chalky soil. 
North America, on the banks of the Saskatchewan and Red 
123. t. 1 f. 11. *Hayna. arz. géw. 7.* t. 16. *Smith, engl. bot. 
t. 566. Mart. fl. rust. 83. *Lam.* ill. t. 206. *Selenium Pasti-
Riv. pent. irr. t. 6. *Sicer sylvéstris*, Fuchs, hist. 753. with a 
figure. Root spindle-shaped, white, aromatic, mucilaginous, 
sweet, with a degree of acrimony, which it loses by cul-
tivation, becoming var. *β*, the eatable garden parsnip. *Pastinaca* 
flowers yellow: the innermost ones of the umbel frequently abortive. The leaves are sometimes downy on both surfaces.

**Var. β, colada** (D. C. prod. 4. p. 189.) leaves glabrous on 
both surfaces, shining above; root thick, fleshy. 2. H. *P. 
709. *Blackw. 379.* Cam. épit. 507. with a figure. P. sativa, 
Mill. dict. no. 2.

The garden parsnip, is called *Parnis*, in French, *Pastinaca* 
in German, and *Pastinaca* in Italian. It has smooth leaves, of 
a light yellowish green colour, in which it differs from the wild 
plant, the leaves of which are downy and dark green; the roots 
also are thick and fleshy; and have a milder taste; it does not 
differ so much from the native plant, as the cultivated does from 
the native carrot.

*Ucri.—The parsnip has long been an inmate of the garden, 
and was formerly much used.* In Catholic times it was a famous
Lent root, being eaten with salted fish. "In the north of Scotland," Mr. Neill observes, "parsnips are often beat up with potatoes and a little butter; of this excellent mess the children of the peasantry are very fond, and they do not fail to thrive upon it. In the north of Ireland a pleasant table beverage is prepared from the roots, brewed along with hops. Parsnip wine is also made in some places; and they afford an excellent ardent spirit known as parsnip after a similar preparatory process to that bestowed on potatoes, destined for that purpose." The following are the varieties:

1. **Common parsnip,** *scleris parsnip,* *swelling parsnip.*—The leaves are long; roots generally from 20-30 inches long, and from 3-4 in diameter.

2. **Guernsey parsnip,** *Jersey parsnip,* *panais long* of the French, *panais coqine* of Guernsey.—The leaves are somewhat stronger and taller than those of the common sort. The roots are also larger and more perfect, about 3 or 4 feet long.

3. **Hollow-crowned parsnip,** *hollow-headed parsnip,* *panais Lisboana* of Guernsey.—In this variety the leaves are shorter and not so numerous as in the common parsnip; the roots are oblong, about 18 inches long, more swollen at the top, and not tapering generally, but ending rather abruptly, about 4 inches in diameter at the shoulder.

4. **Turnip-rooted parsnip,* *panais ront,* *Siam parsnip.*—The leaves of this sort are few, and do not exceed 12 or 13 inches; the roots are from 4-6 inches in diameter, funnel-shaped, tapering very abruptly, with a strong tap-root, the whole being from 12-15 inches long. The shoulder is broad, and grows above the surface of the soil. The flavour of this parsnip is superior, and when dressed is of a yellower colour than the other varieties.

5. **Soil.—** The soil most proper for the parsnip should be light, free from stones, and deep. It should be dug or trenched before sowing, at least 2 spits deep; and the manure should either be perfectly decomposed, or if recent, deposited at the bottom of the trench.

6. **Seed estimate and sowing.—** Sow in the end of February, or in March, but not later than April, and for a seed-bed 5 feet by 20, the plants to remain thinned to 8 inches’ distance, half an ounce of seed is the usual proportion. Having prepared either beds 4 or 5 feet wide, or one continued plot, sow broadcast, moderately thin, and rake the seed well into the ground.

7. **Culture.—** When the plants are about 1-2 or 3 inches high, in May or June, let them be thinned and cleared from weeds, either by hand or by small hoeing, thinning them from 8 to 12 inches’ distance. Keep them afterwards clean from weeds, till the leaves cover the ground, after which no further culture will be required. The roots will be pretty large by the end of September, from which time a few may be drawn for present use: but the parsnip is far best at full maturity, about the close of October, indicated by the decay of the leaf. The root will remain good for use till April and May following.

8. **Preserving during winter.—** The parsnip is not so liable as the carrot to be hurt by frost if left in the ground. But it would be proper in the beginning of November, when the leaves decay, to dig up a portion of the roots, and to cut the tops off close, laying them in sand, under cover, ready for use in hard frosty weather. The rest will keep good in the ground till they begin to shoot in the spring: then in February or March dig them up; cut the tops off; and, preserved in sand, the roots will remain sound until the end of April.

9. **To save seed.**—Transplant some of the best roots in February, 2 feet asunder, inserted over the crowns; they will shoot up in strong stalks, and produce large umbels of seeds, ripening in autumn.

10. **Field culture of the parsnip.**—The parsnip has been partially introduced of late years as a field plant, and is nearly equal to the carrot in its product of nutritive and saccharine matter. Its culture as a field plant has chiefly been confined to the island of Jersey, where it attains a large size, and is much esteemed for fattening cattle and pigs. It is considered rather more hardy than the carrot, and its produce is said to be greater. It may be sown either in autumn or spring, and its seeds admit of drilling by machinery. The plants, when they come up, are more easily recognised than carrots, and therefore their culture is on the whole more simple, but equally so to herminal labour and therefore more suited to farming. For the rest their culture is the same as that of the carrot. The variety best suited for the field is the *Large Jersey,* the seed of which should be procured from the island, as that of the garden parsnip sold by seedsmen never attains the same size. The quantity of seed required for sowing in drills is from 4 to 5 lbs. per acre, and for broadcast 6 or 8 lbs. It must always be new, as two year old seed does not come up freely. It may or may not be prepared by steeping, but it requires no earth or sand intermixed with it, as it passes freely through the same drill that will sow tares or peas. The time of sowing is generally about the middle of February; but some sow in September, in which case the seeds are not to be planted till early in spring. This last method is obviously against the culture of the soil, which must thus remain a year in a consolidated state. The manner of sowing is generally in drills 15 or 18 inches distant; but some sow broad-cast and harrow in the seed; and in Jersey, parsnips and beans are generally cultivated together. The beans are first dibbled in, and afterwards the parsnip seed scattered over the surface and harrowed. It is acknowledged that a good crop of both plants is never obtained; and therefore, though this mode may be found to answer in the mild climate of Jersey, it is not to be imitated in other places. Drills or broadcast, without any intermixture of plants, are the only advisable modes. The after culture of the parsnip is the same as that for the carrot, with this difference, that the parsnip, when sown broad-cast, is generally thinned out to 12 inches at an average, plant from plant, and when in rows 18 inches apart, to 9 inches in the row. The produce of the parsnip is said to be greater than that of the carrot, and the economical application the same. In the fattening of cattle it is found equal if not superior, performing the business with as much expedition, and affording meat of exquisite flavour, and a highly juicy quality. The animals eat it with much greediness. It is reckoned that thirty perches, where the crop is good, will be sufficient to fatten an ox 3 or 4 years old, when perfectly lean, in the course of 3 months. They are given in the proportion of about 30 pounds weight morning, noon, and night; the large ones being split in 3 or 4 pieces, and a little hay supplied in the intervals of those periods. And when given to milch cows with a little hay in the winter season, the butter is found to be of as fine a colour and as excellent a flavour as when feeding in the best pastures. Indeed, the result of experiment has shown that not only in neat cattle, but in the fattening of hogs and poultry, the animals become fat much sooner, and are more bulky than when fed with any other root or vegetable; and that, besides, the meat is much sweeter and delicious. The parsnip leaves being more bulky than those of carrots may be mown off before taking up the roots, and given to cows, oxen, or horses, by whom they will be greedily eaten. Their produce in nutritive matter is 99 parts in 1000, of which 9 are mucilage and 90 sugar. Gerarde says, that a very good bread was made from them in his time. They afford as much spirit as the carrot. The parsnip being more hardy and luxuriant than the carrot, is less liable to the mildew and worms; but equally so to become forked if the soil be not deep and well pulverised, and if the manure be not minutely divided and equally distributed. 

X X 2
Cultivated or Garden Parsnip. Fl. Jul. Brit. Pl. 3 to 4 ft. 2 P. latifolia (D. C. mem. soc. vol. 4. prod. 4. p. 189.) stem terete, striated, pubescent, as well as the petioles and leaves on the under surface; leaves pinnate; leaflets of the lower leaves large, and dilated at the base, and rather cut; of the cauline leaves ovate; involuca and involucels wanting; teeth of calyx obsolete; fruit oval: having the commissure furnished with 2 vitae. 2. H. Native of Corsica, where it was gathered by Solerio. It differs from P. sativa in the stem being terete, not furrowed; and from P. diversifolia in the fruit being oval, not orbicular, in the commissure being furnished with 2 vitae, not with 4-6; and from other species in the leaves of the radical leaves being large.

Var. b. glabrata (D. C. prod. 4. p. 189.) leaves glabrous above, hardly pubescent beneath. 2. H. Native country unknown, but cultivated in the botanic garden at Geneva.

Broad-leaved Parsnip. Fl. Ju. Jul. Chlt. 1820. Sh. 3 to 4 ft. 3 P. Divaricata (Desf. cat. hort. par. 1815. p. 139.) stem terete, striated; leaves pinnate, clothed with short pubescence on both surfaces; radical leaves with 9-11 leaflets: cauline ones with 3-5; leaflets ovate, cuneated at the base, or cordate, undivided, sharply serrated; teeth mucronate; terminal leaflet larger and somewhat 3-lobed; involuca and involucels wanting; fruit nearly orbicular. 2. H. Native of Corsica, at Bastia. P. gravéolens, Salzm. excis. Koch, umb. 91. but not of Bleib. P. sativa, Thom. excis. P. velutina, Koch, in litt. P. Köchii, var. Duby, in bot. gall. 1. p. 230. Vitte 4-6 in the commissure, usually interrupted, 2 of which are generally larger than the rest.

Divaricate Parsnip. Pl. 3 to 4 ft.

4 P. Lucida (Lim. mant. 58.) stem furrowed, much branched; leaves glabrous, stiff, crenated, reticulated beneath: radical ones cordate, usually lobed; cauline leaves termate or quinate; leaflets attenuated at the base; upper ones ovate-rhomboid; umbels numerous, rather panicked; involuca of 1 leaf; fruit orbicular. 2. H. Native of Balearic Islands. Gounl. ill. 19. t. 11, 12. Jacq. hort. vind. t. 199. Root thick, milky. Stem when cut yielding a whitish, feid, rue-like, tenacious gum.

Flowers yellow.

5 P. Umbrosa (Stev. in litt. ex D. C. prod. 4. p. 189.) stem furrowed, angular; leaves pinnate, pubescent on the nerves and petioles; leaflets oval-oblong, serrate-toothed; terminal leaflet somewhat 3-lobed; umbels numerous, rather panicked; involucels dimidiate; fruit oval. 2. H. Native of Tauria. This species was formerly confused with P. gravéolens, but is truly distinct from it.

Shady Parsnip. Pl. 2 to 3 feet.

6 P. Stenocardia (D. C. prod. 4. p. 189.) stem striated, glabrous; leaves smoothish, pinnate; leaflets deciduous, oblong-linear, cut, and toothed; involuca wanting; involucels of few leaves; fruit oblong.—Native of Siberia. Umbels and umbellules of many rays. Fruit 3 lines long and a line broad, quite glabrous; lateral ribs not expanded into wings, but all filiform, as well as the vittae. Vittae twin in the commissure, solitary in the dorsal furrows, and often wanting in the lateral furrows.

Narrow-fruited Parsnip. Pl. 2 to 3 feet?

Strong-sequested Parsnip. Fl. Jul. Aug. Chlt. 1817. Pl. 2 ft. 8 P. Sekakul (Russ. besch. aep. p. 157.) stem terete, downy, branched; leaves pinnate, puberulous; leaflets piliform, cut, bluntly and unequally toothed; peduncles villous; involuca none; involucels of 1-2 leaves; fruit ovate-ornibicular. 2. H. Native of Syria, about Aleppo; and of Egypt, near Alexandria. Heracleum pinnatum, Viv. in litt. Tordylum suvèolens, Delille, ill. fl. aegypt. no. 323. Pastinaca dissécta, Vent. cels. t. 78. Sécacul, Rauw. reis. 1. p. 746. ex Vent. J. B. Barth. hist. 3. p. 66, with a figure.—Moris, oxon. sect. 9. t. 4. ultimate figure, and therefore the Tordylum Sékakul, Mill. dict. no. 5. Root grey on the outside and white inside, edible. According to Olivier this species of parsnip is cultivated in the Levant under the name of Sebkakul.

Sékakul Parsnip. Pl. 1 to 2 feet.

9 P. Pimpinelloides (Bieb. fl. taur. 1. p. 237. suppl. 247.) stem angular, branched; leaves pinnate, pubescent; leaflets rather trifid, cut: segments cuneated, deeply serrated: lower ones reflexed: upper ones linear-lanceolate; involuca of 1-3 leaves; involucels of 4-5 leaves, dimidiate, deciduous; fruit orbicular. 2. H. Native of Caucasus and Iberia, in grassy places; and of Persia, near Seidkhodzhi, in sandy places. Buxh. cent. 3. t. 27. Mill. fig. t. 266. Malabula pimpinelloides, Hoffm. umb. 126 and 209. t. 1. f. 6. a. b. Heracleum pimpinellifolium, Spreng. tent. 12.

Obteuse-leaved Parsnip. Pl. 1 to 2 feet.

Cult. The species are only to be increased by seed, which should be sown in spring in the open ground.

CVII. LEIOTULUS (from λείως, λειέων, smooth, and ους, ους, ους, oons, an ear; in allusion to the smooth dilated margin of the fruit). Ehrenb. in Linnaea. 1829. p. 390. D. C. prod. 4. p. 669.

Petals red or maroon, entire, involute, with a broad retuse segment. Fruit finely compressed, having a smooth thickened dilated margin: and 3 intermediate approximate ribs, and 2 very remote lateral ones; vittae filiform, solitary in the furrows, and distant in the commissure.—Herb a span high. Leaves bipinnatifid. Involucels wanting. Invocules of a few very fine entire leaves, but often wanting altogether. Flowers yellow.

1 L. Alexandrienus (Ehrenb. l. c.)—Native of Egypt, near Alexandria, on hills towards Rosetta.

Alexandriam Leiotulus. Pl. 1 1/2 to 2 1/2 foot.

Cult. Sow the seeds in a warm sheltered situation in the open ground.

CVIII. ASTYĐAMIA (a mythological name, daughter of Oceanus; the plant grows on the borders of the ocean, in the Canary Islands). D. C. coll. diss. 5. p. 53. t. 1. f. D. prod. 4. p. 190.

Lin. syst. Pentétria, Digynia. Margin of calyx 6-toothed. Petals obovate, entire, with an inflexed acumen. Stylodium thick; styles very short. Fruit compressed from the back, girded by a thick, dilated margin; mericarps rather spongy, furnished with 3 crested, approximate, short ribs on the back:
UMBELLIFERÆ. VII. ASTYDAMIÆ.

the 2 lateral ribs lost in the margin. Dorsal vittae very few, and the commissural ones are either wanting or covered. Seed unknown.—A smooth, fleshy subshrub. Leaves pinnate; leaflets cuneate, deeply toothed at the apex: ultimate ones confluent. Umbels compound. Involuta and involucres of many leaves. Flowers yellow. It differs from *Crichtium* and *Bupleurum* in the fruit being compressed from the back, and in the calyx being 5-toothed; and from *Heracleum* in the vittae not being club-shaped, and in the petals being entire; and from *Laserpitium* in the ribs being hardly elevated, and in the petals being entire; and from *Pastinacea*, to which it is most nearly allied, in the fruit being rather fleshy and a little crested, with the margins hardly flattened.

Canary-island Astydamia. Fl. Jul. C1t. 1730. Sh. 1½ ft. Cult. This plant will require the same treatment as it is recommended for *Crichtium*, p. 321.; but it will require shelter in winter.

CVIII. SYMPHYLOMA (from σύμφυόν, συμφύον, to glue together, and λυμα, luma, a fringe; the margins of the mericarps are closely joined together). Meyer, ver. pl. 127.

Lin. syst. *Pentadactria Digynia*. Margin of calyx obsolete. Petals equal, emarginate, with an inflexed point. Stylodipodium without a margin. Styles reflexed. Fruit elliptic, compressed from the back, flat, with rounded margins; mericarps closely joined together at the margins; with 5 filiform ribs: the 3 dorsal ones at equal distances: and the lateral ones more remote and almost marginating. Vittae wanting or obsolete. Seed complanate. Carpophore wanting.—A humble herb. Leaves with 3-5, nearly orbicular leaflets. Involuta none. Petals red. Fruit very singular in its structure, by the mericarps being closely joined at the margins.

Lin. syst. *Pentadactria, Digynia*. Calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: outer ones usually radiating and bifid. Fruit flatly compressed from the back, girded by a flat, dilated margin. Mericarps with slender ribs: the 3 dorsal ones at equal distances: and the 2 lateral ones remote from the others, contiguous to the dilated margin. Vittae solitary in the furrows, and usually twin in the commissure, all flat: dorsal ones 4.—Strong, coarse, robust herbs, with broad, pinnate, ternate, or lobed leaves; petioles large and sheathing. Umbels of many rays. Involuta caducous, usually of few, intricate, and difficult to define.

CVIII. SYMPHYLOMA. CIX. HERACLEUM.

1 H. NEPALE'NSIS (D. Don, prod. fl. nep. p. 185.) stem furrowed, rather hairy; lower leaves having the petioles twice trifold, binate; with tripartite leaflets; upper leaves ternate: with rather 3-lobed leaflets; leaflets all ovate, acute, and equally serrated, rather hairy above, and pubescent along the nerves beneath; fruit elliptic; commissure furnished with 4 vittae. &. H. Native of Nipal. Flowers equal, yellowish. Knees of stems bearded with white wool.

Nipal Cow-parsnip. Pl. 3 to 4 feet.

2 H. oer'sesifo'lium (Wall. miss. ex D. C. prod. 4. p. 191.) stem striated, pubescent; leaves ternate or 3-lobed, roundish-cordate; leaflets or lobes obtuse, with a few coarse teeth, rather hairy above, and beset with whitish pubescence beneath; umbels of many rays; fruit obovate; commissure furnished with 4 vittae. &. H. Native of Nipal. Dorsal vittae linear. Flowers not radiating, cream-coloured.

Oblance-leaved Cow-parsnip. Pl. 3 to 4 feet.

3 H. ru'gens (Wall. miss. ex D. C. prod. 4. p. 191.) stem striated, pubescent; leaves ternate, with the petioles rather hairy; leaflets petiolate, orbicular, rather cordate at the base, toothed, scabrous from hairs above, pubescent beneath; upper leaves bluntly trifold; fruit obovate-elliptic; commissure furnished with 4 vittae. &. H. Native of the East Indies. *Conium rigens*, Heyne, ex Wall. Leaves of involucres lanceolate, striated, puberulous on the outside. Flowers not radiating, cream-coloured. Dorsal vittae of fruit linear.

Stiff Cow-parsnip. Pl. 2 to 4 feet.

Sect. II. Ehe'racl'eum (from eu, well, and *Heracleum*; this section contains what are considered the true species of the genus). D. C. prod. 4. p. 191.—Heracleum, Hoffm. umb. p. 141. D. C. prod. 4. p. 191. Commissure of fruit furnished with 2 vittae. Umbels equal or radiating. Petals greenish-yellow.

4 H. flave'scens (Baumg. fl. trans. 1. p. 214.) leaves pinnate, rough from hairs; leaflets ovate or oblong; flowers yellowish, not radiating; commissure furnished with 2 vittae. &. H. Native from Dauphany to Siberia, in the grassy parts of mountains. Jacq. aust. t. 173.

Var. a. latifo'lium (D. C. prod. 4. p. 191.) leaflets lobed or palmately parted, unequally crenate-serrate; flowers uniform, not radiating; fruit orbicularly oval; glabrous, emarginate at the apex. &. H. Native of Tauria, Caucasus, Siberia, Dauphany, and many other parts of Russia, in rather humid meadows. H. Sibiricum, Lin. mant. 354. Bieb. fl. taur. and suppl. no. 558. Hoffm. umb. 143. t. 1. f. 1. Schult. syst. 6. p. 475. H. Austriacium, Pall. ind. taur. Spondylion conformite, Meench, meth. p. 83.—Gmel. syl. 1. t. 50. From this plant a spirit is drawn at Kantschatka, called raka, as related in Cook's voy. 3. p. 387. where the process of making the spirit is described. It is used also as food.

Var. b. angustifo'lium (D. C. prod. 4. p. 191.) leaflets oblong, lanceolate, or linear, sinutately toothed, ultimate ones confluent. &. H. Native of Dauphany, Valáis, Austria, Russia, &c. in waste, grassy fields. H. angustifolium, Lin. mant. 36. Jacq. fl. aust. t. 173. H. Sibiricum of Lin. has been raised from the seeds of *H. angustifolium*.

5 H. Ors'su (Guss. pl. rar. p. 133. t. 27.) stem furrowed, muricate, almost simple; leaves simple, cordate, glabrous on both surfaces, rather coriaceous, obscurely lobed, and tripartite,
UMBELLIFERæ

crenate-serrate; lobes acuminated; flowers rather radiating; involucre almost woody; leaves of involucels linear; fruit ovate. 2. H. Native of Abruzzo, in gravelly parts of mountains. Habit of *H. alpinum*, but the flowers are greenish. Commissure of fruit furnished with 2 vittæ.

*Orsia* Cow-parsnip. Pl. 2 to 3 feet.

6 H. *Achærum* (Sibth. and Smith, fl. grece. t. 282; prod. 1. p. 192.) stem much branched; leaves pinnate; leaflets lobed, cut, pubescent; of the radical ones roundish; umbels usually of 3 rays; flowers radiating; fruit orbicular; involucræ and involucels almost wanting; vittæ semi-circular. 3. H. Native on Mount Parnassus. Habit of *Pastinaca sativa*; but the petals are obcordate, with an infixed mucrone. Flowers golden yellow. Vitæ linear.

*Golden-flowered Cow-parsnip*. Pl. 1 to 2 feet.

Sect. III. *Spondylium* (σπόνδυλος, spondylus, vertebra; resemblance in the articulations of the stem). Hoffm. umb. p. 129.

7 H. *Longirostum* (Jacq. austr. t. 174.) leaves scabrous, pinnate, or pinnatifid from the coalition of the leaflets; leaflets or lobes elongated, deeply crenate; leaves of involucels linear-sagittaceous; fruit glabrous, cucumiform. 2. H. Native of Austria, in alpine meadows. Host. fl. austral. 1. p. 574. An intermedium species between *H. flavescens* and *Spondylium*. Petals at first green, but at length becoming white, obcordate; outer ones radiating a little. Fruit larger and much more cuneate than in the above-mentioned species.

8 H. *Palmatæfolium* (D. C. prod. 4. p. 192.) upper cauline leaves 5-parted from the top of the sheath, or 3-parted; outer lobes bipartite, all elongated, coarsely toothed, glabrous above, but roughish beneath; leaves of involucels linear-sagittaceous; fruit glabrous in all states, ovate. 2. H. Native country unknown. Flowers white, radiating a little. It differs from *H. Spondylium* in the leaves being palmate-parted, not pinnate-parted, less rough, and in the fruit being more obvate. Probably *H. elegans* of many authors is the same as this species.

Palmate-lobed Cow-parsnip. Pl. 4 to 5 feet.

9 H. *Sesnonia* (Linn. spec. 1. p. 353.) leaves ternate, pinnate, or pinnatifid from the coalition of the leaflets, scabrous; leaflets pinnatifid, cut, and serrated; leaves of involucels lanceolate, membranous, finely fringed, with long taper points; fruit orbicular, glabrous. 3. H. Native of Europe, and probably of Siberia, in hedges, the borders of fields, and rather moist meadows, very common; plentiful in some parts of Britain. Smith, engl. bot. t. 939. Hayn. arz. gew. 7. t. 10. H. protiforme, Cronitz, austral. 3. p. 11. H. bránea ursina, All. pedem. no. 1291. Spondylium Rall, syn. 305. Ger. emac. 1609. with a figure. Camer. epít. 548. with a figure. Riv. pent. irrit. t. 4. and of many other old authors. Spondylium bránea, Scop. carn. no. 335. Spondylium bránea ursina, Hoffm. umb. 132. t. 1. f. 11.—Acantis Germánica, Fuchs, hist. 53. with a figure. Cow-parsnip. Petiv. herb. brit. t. 54. f. 1. Root taper-shaped, white, aromatic, sweetish, and rather mucilaginous. Stem red, with white hairs. Flowers more or less radiate, white or reddish. The whole plant is wholesome and nourishing food for cattle; and is gathered in Sussex for fattening hogs, being known by the name of *hog-weed*. The seeds are strong-scented, and are accounted diuretic and stomachic. Linnaeus says the plant is used in Scania against dysentery. Gnehn says that the inhabitants of Kamtschatka, about the beginning of July, collect the footstalks of the radical leaves, and after peeling off the rind (which is very acrid) dry them separately in the sun, and then tying them in bundles, lay them up carefully in the shade in bags; in this state they are covered with a yellow saecharine efflorescence, tasting like liquorice; this being shaken off is eaten as a great delicacy. The Russians distil an ardent spirit from the stalks thus prepared, by first fermenting them in water, with the greater bilberries (*Vaccinium uliginosum*), which Gnehn says is more agreeable to the taste than spirits made from corn.

Var. *b*, *angustifolium* (Smith, fl. brit. 307.) leaves deeply pinnatifid; the 2 lowest lobes elongated, and spreading in a radiating manner. 3. H. Native of Yorkshire. Mr. Woodward has found this variety growing on the same root with the common kind.

Var. *y*, *elegans* (Jacq. austr. t. 175.) leaflets deciduous, narrow, toothed. 3. H. Native of Austria, Piedmont, &c.

Var. *t*, *laciniatum* (Desf. hort. par. ex D. C. prod. 4. p. 192.) leaflets cuneate, ovate, coarsely and deeply serrated. 3. H. Native country unknown.

Var. *r*, *subaequascens* (D. C. prod. 4. p. 192.) leaves canescen beneath. 3. H. Native of France. This variety differs from *H. Pyrenœca* in the ovaries being glabrous.

10 H. *Cæruleum* (Hortul. ex D. C. prod. 4. p. 192.) leaves pinnate, scabrous; leaflets elongated, cut, and toothed, acuminate; leaves of involucrum linear, broader at the base; leaves of involucels setaceous, ciliated on both sides with long villi; fruit ovoblate, glabrous in all stages. 2. H. Native about the Caspian Sea. This species is sufficiently distinct from any of the varieties of *H. Spondylium*.

11 H. *Canadensis* (Wall. diss. ex D. C. prod. 4. p. 192.) leaves ternate, clothed with hoary tomentum beneath, as well as on the stems and petioles, but smoothish above; leaflets petiolate, cuneate at the base, trifid or pinnatifid: lobes irregularly toothed; leaves of involucels linear, acuminate, about equal in length to the rays; fruit ovoblate-oblong; vitæ linear. 2. H. Native of the north of India, at Deyroodoo and Kamaoon.

Whitened Cow-parsnip. Pl. 4 to 5 feet.

12 H. *Lana'tum* (Med. fl. bor. amer. 1. p. 166.) leaves ternate, petiolate, tomentose beneath; upper ones 3-lobe; leaflets petiolar, broad-ovate, roundish-cordate, lobed; leaves of involucels small, subulate; fruit broadly obcordate, ovate. 3. H. Native of Virginia, Pennsylvania, and Canada, as far as the Mackenzie river; moist banks of streams in north-west America, in humid pastures. Pursh, fl. amer. sept. 1. p. 181. Begel. fl. bot. p. 67. Torr. fl. bor. amer. 1. p. 313. H. Spondy- lium, Cham. et Schlecht. in Linnaeo. 1. p. 39. Petsal said to be oblong. The plant is said to be very nearly allied to *H. Spondylium*, but very distinct. The roots and stems of this plant are eaten by the Chenoek Indians; and by the Cree Indians, under the name of Penpouo antic; i.e. flute stem; and the young stems are used by them as a pot-herb.

13 H. *Coratatum* (Presl. del. præg. p. 135.) leaves ternate; leaflets cordate-ovate, petiolate, lobately pinnatifid, minutely toothed, hispid beneath, as well as the petioles and stem, which is furrowed; leaves of involucels linear; involucre wanting; fruit glabrous, obvurate, somewhat emarginate at the apex. 2. H. Native of Sicily, in humid groves on the Nebrodes. Root black, sweet-scented, and is called *Angélica* by the Sicilians, and is used for the same purposes as *H. Spondylium* and H. Páneas Ucrica, ex Guss. prod. fl. sic. 1. p. 364.

*Cordate*-leafed Cow-parsnip. Pl. 4 to 6 feet? 1

14 H. *Pyrenaææum* (Lam. dict. 1. p. 403.) leaves very large, pinnatifid, hoary from tomentum beneath; leaflets lanceolate, toothed or ternate; involucra of few leaves; young fruit covered with long hairs; adult ones glabrous, nearly orbicular.
UMBELLIFERÆ. CIX. HERACLEUM.

343

Pyrenean Cow-parsnip. Fl. June, July. Ch. 1798. Pl. 4 to 6 feet.

15 H. PANÄCES (Lin. spec. p. 338.) leaves pinate, canescent beneath; leaflets on long petioles, cordate, usually 3-lobed, toothed; leaves of involucres linear-setaceous; young fruit bearing a few scattered hairs. ζ. H. Native of the southern Alps of Europe. Lob. icon. t. 701. f. 2. Mor. ox. sect. 9. t. 17. f. 3. H. setosum, Lapeyr. a. p. 153?

16 H. ASPERUM (Bieb. fl. taur. suppl. p. 224.) stem rough from stigae; leaves deeply lobed, serrated, acute, scabrous above, pubescent beneath; umbels of 40 rays; leaves of involucra setaceous; fruit orbicular elliptically; when young rather scabrous. ζ. H. Native of the north of Caucasus, on Mount Beschatu; and according to Koch also of the Alps of Bavaria and Tyrol. Spondylium asperum, Hoffm. umb. p. 154. Dorsal vittae 2 longer than the lateral ones; all filiform; those in the commissure evidently clavate. In the cultivated plant the fruit is nearly glabrous even when young.

Rough Cow-parsnip. Fl. June, July. Ch. 1818. Pl. 6 to 8 ft.

17 H. villosum (Fisch. in Schults, syst. 6. p. 579.) leaves sinuately pinnatifid, sharply serrated, acuminate, clothed with hoary tomentum beneath; leaves of involucres and involucres setaceous, deflexed; umbels sparingly radiate; fruit elliptic, ciliated, woolly on the back. ζ. H. Native of Caucasus, in gravelly places on the margins of rivulets. Stev. obs. 1828. p. 72. H. Pyrenäicum, Bieb. fl. et suppl. no. 559, but not of Lam. H. decipiens and H. marginatum, Hoffm. umb. p. 134, and 135, and probably H. giganteum, Horn. hort. hafn. ex Presc. Leaves as in H. Pyrenäicum hoary beneath, but differs in the young fruit being tomentose, and in the adult ones being rather ciliated. Vittae broad; the dorsal ones drawn out beyond the middle, and filling the furrows; the commissural ones short, rarely somewhat branched. There are varieties with larger and smaller fruit.

Var. β. subellüïfium (Hoffm. umb. gen.) fruit covered by scattered rather loose hairs; leaves less canescent beneath. Filious Cow-parsnip. Fl. July. Ch. 1836. Pl. 4 to 6 ft.

18 H. PUBESCENS (Bieb. suppl. p. 225.) leaves pubescent beneath; cauline leaves ternate; leaflets somewhat palmately pinnatifid, toothed; segments and recesses acute; umbels of many rays; involucra of 1-2 leaves; involucres short, caducous, of few leaves; fruit elliptic, having the disk rather villous. ζ. H. Native of the south of Tauria, in shady places; and of Eastern Caucasus, in alpine places. Spondylium pubescens, Hoffm. umb. p. 134. H. speciosum, Ledeb. hort. dorp. 77. H. Panäces, Steven. mem. moss. 3. p. 259! To this species is probably referrible the H. gumüferous, Wild. enum. p. 312. hort. berol. 1. p. 53. t. 53. and t. 54. It differs, however, from H. Pyrenäicum and H. Panäces, in the young fruit being clothed with short down, not with long spreading down. Fruit glabrous in the adult state; having the dorsal vittae slender, and drawn out beyond the middle, and being suddenly dilated into a club-shaped form at the apex. The young shoots are filled with a sweet aromatic juice, which is called Baldergan by the natives of Cau- casus, and is eaten by them in a crude state.

Pubescent Cow-parsnip. Fl. July. Ch. 1823. Pl. 4 to 5 feet.

19 H. BARBA'TUM (Ledeb. fl. ross. alt. ill. t. 303.) leaves pinnate, with 2 pairs of leaflets; lower leaflets and terminal one sinuately pinnate-parted, petiolate; lobes acuminate, serrated; serratures ovate, acuminate; umbels radiant; fruit elliptic, beset with a few pili, somewhat emarginate at the apex; vittae in the commissure parallel. ζ. H. Native of Altaia, in mountain meadows. Stem furrowed like the rest, beset with rigid pili, which rise from a callos or blackish point, and which are usually retrograde on the lower part of the stem; bearded with numerous pili at the knees. Petioles hispid, bearded at the insertion of the petioles. Leaves pubescent beneath, but green and furnished with a few stiff hairs beneath at the veins. Involute in one or a few leaves, caducous; involucres of a few linear permanent leaves. To this plant may be referred the one in Gmel. fl. sib. 1. p. 213. no. 29, which Linnaeus has cited for his H. Panäces. It is called Stadtkajatrasca, i. e. a sweet herb, by the natives of Siberia, a name given by them to many other plants, as to Liquorice and Milk-vetch, &c.

Bearded Cow-parsnip. Pl. 4 feet.

20 H. nisečëcës (Ledeb. fl. ross. alt. ill. t. 304. fl. alt. 1. p. 301.) leaves ternate; leaflets petiolulate; lateral leaflets pinnate-parted; terminal one palamate-parted; segments cut or pinnatifid, oblong, acuminate, serrated; umbels radiant; mericarps orbicularly elliptic, at length glabrous; commissural vittae diverging. ζ. H. Native of Altaia, in meadows, near Tschetschulcha, and the metal mines at Riddersk; and elsewhere. H. laciniatum, Fisch. in litt.? Stem deeply furrowed, sparingly pilose, hispid at the joints, villous towards the top. Leaves hispid above from a few thick hairs, but paler and pubescent beneath. Involution wanted; involucres of a few linear leaves, which are variable in length. Flowers white.

Dissected-leaved Cow-parsnip. Fl. July. Pl. 3 feet.

21 H. douglasia (B. D. C. prod. 4. p. 193.) leaves scabrous beneath, and on the petioles, glabrous above, ternate; leaflets petiolulate, cordate, 3-5-lobed, acuminate, toothed; leaves of involucra numerous, subulate at the apex; fruit obovate, glabrous; dorsal vittae elongated, rather club-shaped; commissural vittae 2, short, rather club-shaped, and 2 other small, nearly abortive ones. ζ. H. Native of the north-west coast of America. This may prove nothing but a variety of H. lanatæm. Douglas's Cow-parsnip. Pl. 3 to 4 feet.

22 H. cuenœföëm (B. D. C. prod. 4. p. 194.) leaves hispid beneath, as well as the petioles, glabrous above, pinnate; leaflets 3-5-petiolate, cordate, lobed; lobes toothed, hardly acuminate; leaves of involucra many subulate; fruit ovovate-cuneated, glabrous; dorsal vittæ filiform; commissural vittæ 2, rather clavate. ζ. H. Native country unknown, but probably of Siberia.

Cuneiform-fruited Cow-parsnip. Pl. 4 feet?

23 H. ligusticiföëm (Bieb. & suppl. no. 560.) leaves decumbent, ternate or quinately pinnate, smoothish; leaflets cuneated, obtuse, deeply serrated; fruit villous; vittæ filiform, acute. ζ. H. Native of Tauria, on stony hills; and of Caucasus, in subalpine places above Nikita, ex Stev. obs. 1825. p. 71. H. montanum, Georgii in Wild. herb. ex Stev. Stem angular, pubescent, as well as the young leaves. Flowers white, radiant. Commissural vittæ equal in length to the dorsal ones. Looeage-leaved Cow-parsnip. Fl. June, July. Ch. 1816. Pl. 2 feet.

24 H. caæcæcæcæ (Stev. mem. soc. hist. nat. moss. 3. p. 259.) leaves ternate; leaflets on long petioles, toothed, glabrous above, pubescently scabrous beneath; intermediate one 3-lobed. ζ. H. Native of Caucasus, on the mountains, at the river Ju- charibasch. Flowers white, rather radiant. A plant like this from Iberia has the upper leaves ovate and 3-lobed, on long petioles, and the young fruit bristly.

25. H. MÜHLE (Sibth. et Smith, ß. græc. prod. 1. p. 193.) leaves rather bipinnate, cut, pubescent; stem nearly simple; umbels 4-5-rayed; fruit orbicular, smoothish. H. H. Native of Greece, on Mount Olympus. Umbels large. Stems hardly a hand high. Vittae of fruit 4, red, oblong; the dorsal ones attaining the length of the middle. *Humble Cow-parsnip.* Pl. ½ to ¾ foot.

**Sect. IV. CARMELA** (from Mount Carmelo, the habitation of the species). D. C. prod. 4. p. 194. Fruit ornamented with thick adpressed stiff bristles. Vittae not sufficiently known, but there are probably 4 dorsal ones, and 2 filiform hardly elevate commissural ones. Petals hispid; exterior ones radiant. Perhaps a proper genus, or perhaps only a species of *Zozimia* or *Pastinaca.*

26. H. CARMEI (Labiill. syr. dec. 5. p. 3. t. 1.) leaves pinnate, scabrous from adpressed down beneath; leaflets ovate-oblong, deeply toothed: extreme one rather cordate, 3-lobed; rays of umbel 5, very unequal, contracted after flowering. H. Native of Syria, on Mount Carmel. Involuta and involucres composed of erect permanent setaceous leaves. Bristles on the stem and branches retrograde.

**Carmelo Cow-parsnip.** Pl. 2 to 3 feet?

27. H. ALPINUM (Lin. spec. p. 329.) leaves cordate-roundish, smooth, palatom 5-cleft: lobes bluntish, crenate toothed, rarely cut; leaves of involucres setaceous; fruit orbicular-ovulac.

**Alpine Cow-parsnip.** Fl. June, July. Cl. 1750. Pl. 1 to 2 ft.

29. H. AUSTRICUM (Jacq. austr. t. 61.) leaves pinnate, with 3-5 pairs of leaflets, scabrous from scattered hairs on both surfaces; leaflets ovate-lanceolate, doubly serrated; terminal one somewhat 3-lobed. H. H. Native of Austria, Carniola, and Transylvania, in alpine meadows. Crantz, austr. 153. t. 1. Spondylium Austriacum, Scop. carn. ed. 2. vol. 1. p. 204. t. 1. To this Sprengel refers Tordilium stilifolium, Scop. carn. no. 318. t. 8. but it differs in the petals being red, and in the fruit being hispid from vil."
Z. absinthifolia (D. C. prod. 4. p. 195.) stem furrowed; leaves supra-decompound, hoary and pilose; leaflets lanceolate, rather remote, and somewhat trifid, cuneate at the base, short.  

2 Z. anethifolia (D. C. prod. 4. p. 196.) stem terete; leaves supra-decompound, glabrous, glaucous; leaflets linear, acute.  

H. Native of Persia, between Teheran and Isplian. Habit of the first species. Involute small, glabrous. Fruit more of an orbicular form than in H. absinthifolium, and best with scattered down over the whole disk, but when young rather pilose.

Fennel-leaved Zozima. Pl. 2 feet.

Cult. The seeds of these plants should be sown in the open ground in spring. A light soil suits them best.

CXL. POLYPROPHEA (from πυλος, poly, many, and ραγίον, ταινία, vitta; the mericarps are furnished with many vittae.) D. C. Coll. mem. v. p. 53 t. 13. prod. 4. p. 197.

Flowers yellowish in the dried state. This genus is allied on the one hand to Zozima, and on the other to Tordylium.

1 P. Nuttallii (D. C. 1. c.) Native of North America, in the Arkansas territory. Tordylium Americanimum, Nutt. miss. Stem nearly terete. Leaflets trifid, eneuated at the base; lobes lanceolate, toothed at the apex. 

Nuttall's Polytrichum. Pl. 1 foot.

Cult. See Zozima above for culture and propagation.

CXLII. JOHRENA (in honour of Mart. Dan. Johreni, who was the first to introduce the dichotomous method in botany.) D. C. Coll. mem. v. p. 54 t. 1. F. C. prod. 4. p. 196.

Lin. syst. Pentadandria, Digynia. Teeth of calyx obsolete, very blunt. Petals unknown. Stylodium short, conical, a little furrowed; styles short, diverging, at length deciduous. Fruit oval, lenticularly compressed from the back, quite glabrous, rather spongy and suberose, with a tumid smooth margin, and a flat rather coloured dorsal area. Mericarps with 3 dorsal filiform ribs, which at length become brownish, and therefore probably contain vittae; the 2 lateral ribs usually indistinct in the dilated margin: but sometimes rufous, and of the form of vittæ. Commissoory spongy, without any vittæ, but furnished with 2 lines. Carpophore bipartite. Seed complanate.—A quite glabrous herb, native of the Levant. Stem terete, dichotomous. Lower leaves bipinnate; leaflets opposite, 2 pairs and an odd one, distant, divided into 2-5 linear acute lobes, which are con- 

fluent at the base; superior leaves parted into 3 linear elongated, quite entire lobes; upper ones reduced to a narrow elongated sheath. Umbels of 6-8 rays. Involution wanting or of one leaf; involucres of 4-5 linear-setaceous leaves.

1 J. dichotomy (D. C. 1. c.)—Native of the East, at Mount Lebanon. Hippomarathrum eritthus folio flore inaevo, Vaill. herb. Dichotomous Johrenia. Pl. 1 to 2 feet?

Cult. See Zozima above for culture and propagation.

Tribe VIII.

TORDYLIUM (plants agreeing with Tordylium in important characters), or Orthopteremum paucijugum annulatum, Koch, umb. p. 55. D. C. prod. 4. p. 196. Fruit longitudinally or flately compressed from the back, girded by a thick dilated thickened knobbed or plicate margin. Mericarps with 5 very slender or obsolete ribs; lateral ribs contiguous to the dilated margin, or forming the same. Seed flat. This tribe differs from tribe Peucedanum, in the margin of the fruit being ribbed or plicate, not smooth, and quite entire.

Lin. sysv. Pentadandria, Digynia. Margin of calyx 5-toothed. Petals obvolute, emarginated with an inflexed point; outer ones radiant, bifid. Fruit round the rays of the umbels flately compressed, with a somewhat thickened accessory winged margin, which is hardly tubeicularly wrinkled; those of the disk dissimilar, having one of the mericarps contracted into a hemispherical urceolus around the other, which is abortive. Mericarps with very slender ribs, the 3 dorsal ones at equal distances, and the 2 lateral ones contiguous to the thickened margin, or covered by it. Vittæ filiform, one in each furrow, and 2 in the commissure. Carpophore bipartite. Seed flattened. This genus hardly differs from Tordylium unless in the unequal mericarps of the fruit, and in their margins being hardly wrinkled, and quite smooth in the disk on both sides, as in Heracleum.

1 H. egyptiacum (Lin. amon. 4. p. 270. exclusive of the synonymes,) stem hispid; leaves scabrous, pinnate; leaflets pinnaflid; segments bluntly lobed; involucre and involucres small, setaceous. O. H. Native of Egypt and of Syria, on the sea shore. Jacq. hort. vind. t. 87. Tordylium Egyptianum, Lam. ill. t. 193. f. 2. Poir. dict. 7. p. 711. Flowers white. In this species the flowers sometimes have 5-4 styles. Carposphere green. Styles white, erect.

2 H. cordata (Lin. fil. suppl. p. 179.) plant pubescent; lower leaves ternate; leaflets ovate, rather cordate; superior leaves simple, cordate, toothed; leaves of involucres and involucres numerous, setaceous, reflexed. O. H. Native of the Levant. Jacq. hort. vind. 2. t. 193. Tordylium cordatum, Poir. dict. 7. p. 712. Rays of umbels hispid. Leaves of involucres subulate, longer than the umbellules. Flowers white. Fruit as in most of the species of Tordylium few, but unequal, as in Hasselquisitia.

Cult. The species being natives of warm climates, the plants are difficult to preserve through the winter. The surest way to procure good seed is to sow in autumn, and preserve the plants in a frame or green-house till spring, when they should be planted out in a warm sheltered situation.

CXIV. TORDYLIUM (τορδκλιομ of Dioscorides; said to

Y y

**Lin. syst. Pentádria Diganja.** Margin of calyx 5-toothed. Petals obovate, connate, with an inflexed point; outer ones radiating and bident. Fruit fiddle pressed from the back, girded by a rugged tubercular thick accessory margin. Mericarps with very slender slender: the 3 dorsal ribs at equal distances, and the 2 lateral ones contiguous to the thickened margin, or covered by it. Vitae filiform, one or more in the furrows, and 2 or more in the commissure. Carpospore bipartite. Seed complanate.—Herbs, with pinnate leaves; leaflets ovate, deeply toothed. Involuta of many leaves. Flowers white. The two sections differ from each other in the number of vitae.

**Sect. I. Eutordylium** (from eu, well, and *tordylium*; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 197.—Tordylium, Hoffm. umb. 1. p. 198. t. 3. f. 3-4. A. Koch, umb. 87. f. 24, 25. Vitae solitary in the furrows, and twin in the commissure.

1 T. Syriacum (Lin. spec. p. 342.) plant pubescent; leaves pinnate; leaflets roundish, repandly toothed; terminal one ovate; involucra and involucelles longer than the umbels. **O. II.** Native of Syria, Caria, Asia Minor, and Greece. Jacq. Hort. vind. t. 1. t. 51. Riv. pent. t. 3. Barrel. icon. t. 349.—Mor. ex. sect. 9. t. 16. f. 7. There is a variety of this with a simple erect stem; and another with diffuse procumbent stems.

**Syrian Hart-wort.** Fl. July. Clt. 1597. Pl. 1 foot high or procumbent.

2 T. Maximium (Lin. spec. 345.) stem scarious or hispid from retrograde bristles; leaves pinnate; leaflets lanceolate, deeply serrate and toothed; terminal one elongated; leaves of involucra and involucelles lanceo-triangular, shorter than the umbels. **O. H.** Native of middle and south Europe, Caucasus, and the Levant, in cornfields. In England on banks and waste ground, but rare; about London; under a hedge on the north side of the parks, Oxford; in a hedge about half a mile from Eton. Smith, Engl. bot. 1173. Jacq. anat. t. 142.—Mor. ex. sect. 9. p. 316. sect. 9. t. 16. f. 1.—Riv. pent. tir. t. 1.—Lob. icon. 737. Hercules-Tordylium, Spreng. spec. umb. 49. T. mágnum, Broth. and T. Lusitanicum, Willd. does not differ from this species according to Link. Stem erect, branched, hollow. Leaves densely clothed with close close bristy hairs, all directed towards the point; leaflets oblong-lanceolate, the lower ones ovate. Umbels dense, bristy. Flowers reddish, the outermost petal with equal lobes, the two next with unequal unequal ones.

**Great Hart-wort.** Fl. June, July. Britain. Pl. 3 to 4 feet.

**Sect. II. Condylócaras** (from *condylo*, *kondýlos*, a finger joint, and *karpos*, *karpos*, a fruit). Hoffm. umb. 1. p. 292. Koch, umb. p. 86. but not of Desf. D. C. prod. 4. p. 198. Vitae numerous both in the furrows and commissure. In the commissure there are 4 in T. Hasselquistia, and therefore is an intermediate plant between the two sections, as there are 8-10 in the commissure of the other species.

3 T. Hasselquistia (D. C. prod. 4. p. 198.) plant pubescent; leaves pinnate; leaflets roundish, repandly toothed: the terminal one in the lower leaves is reniformly cordate; leaves of involucra and involucelles narrower, shorter than the umbels: of the involucelles similar, but longer than the umbelles. **O. H.** Native of the Levant. Like Hasselquistia cordata, but the character of the fruit is the same as that of Tordylium. Habit of T. officinale. Vitae in the commissure 4, 2 curved and 2 straight.

**Hasselquistia’s Hart-wort.** Pl. 1 foot.

4 T. Officinale (Lin. spec. p. 345.) stem generally branchéd, furrowed, clothed with soft deflexed hairs; leaves pinnate, rough, hairy; leaflets ovate, cut, erect, the odd one the longest, leaves of involucre and involucelles lanceolate, acute; those of the latter about equal in length to the umbelles; radiant petals in pairs, with very unequal lobes. **O. H.** Native of Portugal, south of France, Italy, Dalmatia, and Greece, in cultivated fields; possibly never seen at all in England, the T. máximum having been confounded with it; however, it is said to have been found by Mr. Doody about Isleworth, Ray, and about London. Petivier. Smith, Engl. bot. 44. f. grae. 3. t. 237.—Colum. ephr. t. 124. f. 1.—Mor. ex. sect. 9. t. 16. f. 6.—Dodd. pemp. p. 313. f. 314. Lob. icon. 736.—Baub. hist. 3. p. 84. f. 2. Small Hart-wort, Petiv. herb. brit. t. 24. f. 6. T. michéspérmum, Ten. add. 1827. Condylócaras officinale, Koch, l. c. Leaflets roundish or ovate, erect, and variably cut. The radius of the umbelles formed of the very unequal outer petals of the flowers of the circumference, the large lobes of 2 flowers coming together, and resembling a single petal. These lobes are sometimes reddish. Fruit hairy on the disk, known with scarcely any ribs or veins; the border greatly elevated, tufted, nearly crenate transversely. T. Apulum is readily distinguished from this species by having in each marginal flower only one radiant petal, with 2 equal lobes.

**Official Hart-wort.** Fl. June, July. Britain. Pl. 1 to 1½ ft. 5 T. Apulum (Riv. pent. t. 2.) plant erect, villous below; leaves pinnate; leaflets of the lower leaves roundish, eneuated at the base, lobately crenated: of the upper ones pinna-tidif, linear, acute; leaves of involucra and involucelles setaceous: those of the latter shorter than the umbelles. **O. H.** Native of Apulia and Greece, in cultivated fields. Lin. spec. 345. exclusive of the synonyms.—Jacq. Hort. vind. t. 53. T. grandiflórum, Mench, mch. p. 78. Condylócaras Apulum, Hoffm. umb. p. 293. T. insulare, Clark in Spreng. nec encl. 8. p. 165. There is a variety of this which is almost glabrous below. Stem hairy at the joints.

**Cult.** The seeds only require to be sown in the open border in spring. A light soil will suit the species best.

**CXV. TORDYLOPSIS** (from *tordylium* and *övel, opsis*, appearance; plant resembling *Tordylium*). D. C. prod. 4. p. 199.—Tordyloides, Wall. ms.

**Lin. syst. Pentádria Diganja.** Margin of calyx 5-toothed: teeth acute; outer teeth the largest, dilated at the base, and cuspidate at the apex. Outer petals of umbels large and obedately 2-lobed; the rest smaller, ovate, and cuspidate, entire, rarely a little 2-lobed. Stylodum conical; styles 2, erect, elongated. Fruit hairy when young. The rest unknown.—Herb a foot high, more or less hairy. Stem terecate, straited, erect, nearly simple. Petioles sheathing at the base. Leaves with 1-2 pairs of ovate cut toothed leaflets, and an odd one. Umbels terminal, 6-8-rayed. Involuta of 5-6 lanceolate linear acuminated leaves, which are almost longer than the rays. Umbelles crowded, 15-18-flowered. Leaves of involucra conforming to the leaves of the involucra, exceeding the flowers.—Habit almost of Herácleum, but the involucra are of many leaves. It agrees also with *Tordylium* in the hairiness, and in the corollas. The genus is very doubtful, the perfect fruit being unknown.
UMBELLIFERÆ. CXVI. Krubera. CXVII. Pachypleurum. CXVIII. Agasyllis. CXIX. Stenocælum, &c.

1 T. Brunonis (Wall. hist. ex D. C. prod. 4. p. 199.) Τ. F. Native of Nipaul, in Kamaon, towards Émodi. Brown's Tordyliopsis. Pl. 1 foot. Cult. This plant should be grown in a pot, so that it may be placed under shelter in winter.

Tribe IX.

SILÉRINEÆ (this section contains plants agreeing with Siler in important characters, or Orthospermæ mutagünptae lenticulares, Koch, umb. 84. D. C. prod. 4. p. 199. Fruit lenticularly compressed from the back. Mericarps with 5 primary ribs, having the lateral ones of these marginating; and 4 secondary less prominent ones; these last are rarely wanting; all filiform and wingless. Seed flattish in front.

Lin. syst. Pentándria, Digynia. Margin of calyx obsolete. Petals lancelolate, incurved. Fruit oval, compressed from the back; mericarps with 5 primary obtuse ribs; the 2 lateral ones of these more humble than the rest, and placed in front of the short accessory margin: the secondary ones sometimes absent. Seed a free nucleus, which is flat on one side, and rather convex on the other, covered with many vitres, 8-10 on the back, and 5-6 in the commissure. — A perennial herb, with the habit of Câchrys. Stem succulent. Leaves pubescent, ternately decumbent; leaflets deciduous, lancelolate, serrated, a little lobed. Involucre wanting. Umbels of many rays. Leaves of involucres numerous, sessile. Flowers white.

CXIX. STENOCAELUM (from στενή, stenos, narrow, and κοίλος, koilos, hollow; in reference to the narrow furrows of the fruit). Ledeb. fl. ross. alt. ill. t. 175. fl. alt. 1. p. 298.

Lin. syst. Pentándria, Digynia. Margin of calyx 5-toothed. Petals obovate-ornicular, somewhat emarginate, with an inflexed point. Fruit compressed from the back. Mericarps with 5 elevated roundish thick equal ribs; the lateral ribs marginaing. Vitce one in each furrow, and 2 in the commissure. Seed flat in front. Involucre and involucres of many lancelolate-linear leaves, with membranous margins. — A perennial herb, having a fuscescent root, nearly a foot long. Stem solitary, 2-3 inches high, leafy at top; but with numerous axillary elongated branches, which are furnished with leaves beneath the middle. Petals dilated into sheaths. Leaves pinnate; leaflets pinnatifid. Cauline leaves tripinnate; leaflets oblong, acute, entire or bifid. Umbels of many rays. Umbellules when bearing the fruit nearly globose. Flowers white. The whole plant is pubescent, and powdery towards the apex. Stems, petioles, peduncles, and rays of umbels violaceous.

lentically compressed from the back;—mericarps with elevated obtuse filiform ribs, having 5 primary ones: the lateral ones of these marginating; and 4 less prominent secondary ones. Vitae one in each furrow, under the secondary ribs. Seed flattish in front.—Perennial glabrous herbs. Leaves trinate; petioles trifid, sheathing at the base; branches of petioles bearing 3 roundish, coarsely and bluntly crenated, or bluntly 3-lobed leaflets. Umbels large, of many rays. Involvea wanting or of few leaves, caducous. Flowers white.

1 S. TULBRUM (Scop. carn. 1. p. 217.) L. H. Native of Europe and Asia, from Spain to Kamschatka; but the habitats given are doubtful, the plant being often confused with Las

Cult. See Lasenpintum. p. 351. for culture and propagation.

CXXI. GALBANUM (gallh or galban, in Celtic, means fat, oily; in reference to the gum). D. Don, in Lin. trans. 16. p. 603.

Lin. syst. Pentandra, Dijigia. Fruit compressed from the back, elliptic, unguncular; raphe narrow, open, not closed. Mericarps with 5 elevated compressed bluntly keeled ribs, not winged: lateral ones distinct, marginal; furrows broadish, concave, without any vitae. Commissure flat, dilated, furnished with 2 vitae; vitae broad, a little arched. The seeds from which the foregoing description has been drawn were picked from the gum. The rest of the plant remains unknown.

1 G. officina/a (D. Don, l. c.) L. H. The plant, according to Dioscorides, is a native of Syria; but it must be in some remote inaccessible part of it, as it has not been observed by any of the numerous travellers who have visited that country. As the gum-galanbun is partly imported from Smyrna and partly from India, it is very probable that the plant is also a native of Persia. The Böun Galbanum of Linnaeus possesses neither the smell nor the taste of Galbanum, but in these particulars agrees best with Fennel, and the fruit has no resemblance whatever to that found in the gum. How a plant differing so essentially from Galbanum could yet have retained so long in the Pharmacopoeia may well be subject of surprise, especially as the Böun Galbanum, being so frequent in gardens, afforded abundant opportunities of settling the question.

Galbanum agrees in virtue with gum-aromoniae, but is generally accounted less proper in asthma, and more so in hysterical complaints. It is exhibited in the form of pills or emulsions, to the extent of about a drachm. Applied externally, it is supposed to resolve and discuss tumours, and to promote suppuration. The best sort of galbanum consists of pale coloured pieces, about the size of a hazel nut, which, on being broken, appear to be composed of clear white tears, of a bitterish acid taste, and a strong peculiar smell. But it most commonly occurs in agglutinated masses, composed of yellowish or reddish, and clear white tears, which may be easily torn asunder, of the consistence of firm wax, softening by heat, and becoming brittle by cold, mixed with seeds and leaves. Galbanum is generally obtained by cutting the plant across some inches above the root. The juice which flows from the wound soon hardens, and is the galbanum brought to us from Syria and the Levant.

Official Galbanum. Pl. 4 to 5 feet.

Cult. See Thapsia, p. 350, for culture and propagation.

Tribe X.

CUMNEAE (this tribe contains plants agreeing with Cum-
num in important characters), or Orthospermae multijugata contractae, Koch, umb. 51. D. C. prod. 4. p. 200. Fruit contracted from the sides. Mericarps with 5 primary filiform ribs: the lateral ones of these marginating, and 4 secondary more prominent ones; all wingless. Seed straight, flattish in front.

Lin. syst. Pentandra, Dijigia. Teeth of calyx 5, lanceolate, setaceous, unequal, permanent. Perals oblong, cruminate, with an inflexed point, erectly spreading. Fruit contracted from the sides. Mericarps with 5 wingless ribs: the 5 primary ones filiform, and minutely muculurated, the lateral ones of these marginating: the 4 secondary ones more prominent and prickly. Vitae one in each furrow, under the secondary ribs. Carpophore bipartite. Seed rather concave in front and convex on the back.—Herbs, with multifid leaves; linear setaceous leaflets. Involvule of 2-4 simple or divided leaves; involvules dimidiate, of 2-4 leaves, which are at length reflexed. Flowers white or reddish.

1 C. Hisa/uncum (Merat, herb. D. C. prod. 4. p. 201.) segments of leaves linear-setaceous, acute; umbels bilabif; umbel
lules bearing 3-4 fruit; involucre about equal in length to the fruit, which are bearded by bristles. O. H. Native of Spain, in corn-fields in Vallez de la Manca. Habit of C. Cuminum, but differs in the fruit not being glabrous or puberulous, but bearded by long stiff spreading pili. Flowers reddish.

Spanish Cumin. Pl. 1 foot.

2 C. Minu/ten (D'Urv. enum. 32. t. 272.) segments of leaves linear, obtuse; involucre about equal in length to the fruit, which is glabrous. O. H. Native of the island of Cos, in shady places frequent. Stem slender, branched, hardly 2-3 inches high. Every part of the plant is smaller than in the other species. In the specimens received from D'Urville, the segments of the leaves are acute, and the involucres are rather shorter than the fruit.

Minute Cumin. Pl. 2 to 3 inches.

3 C. Cymnum (Lin. spec. p. 365.) segments of leaves linear-setaceous, acute; umbels 3-5 cleft; involucre exceeding the fruit, which is pubescent. O. H. Native of Upper Egypt, and Æthiopia. Cuminum, Riv. pent. t. 40. Cam. epit. 518. Schkuhr, handb. no. 714. t. 80. Woody. med. bot. t. 196. Nees, off. pl. 13. t. 7. Hayn. arz. gew. 7. t. 11. Plessch. icon. 192. Cav. icon. 4. t. 360.—Mor. hist. p. 271. sect. 9. t. 2. There are varieties of Cumin with white, red, or purple flowers. Coat of fruit aromatic; albumen insipid. The plant is cultivated in the south of Europe and all Lesser Asia. In the islands of Malta and Sicily, where it is much cultivated for sale, it is called Cumino aigro or hot cumin, to distinguish it from Cumino dolic, sweet cumin. Cumin seeds have a bitterish warm taste, accompanied with an aromatic flavour, not of the most agreeable kind, residing in a volatile oil.

Var. a, sceldridum (D. C. prod. 4. p. 201.) fruit clothed with short down; but roughish on the ribs. O. H. C. Ægyptia

cum, Merat, in herb. This is the wild plant.

Var. ß, glabridum (D. C. l. c.) fruit glabrous. O. H. C. Cuminum, Merat, in herb. This is the cultivated plant.

Cult. The seed should be sown in spring in a warm sheltered situation, where the plants will flower in summer, and produce seed in autumn.

CXXIII. TREPOCARPUS (from τρεπόντω, trepo, to turn, and
UMBELLIFERÆ. CXXIII. TREPOCARPUS. CXXIV. THAPSI.

1 T. Gargarica (Lin. var. 57.) stem terete, glabrous; leaves bi-tripinnate, shining; segments linear, acute, elongated, quite entire along the margins, decurrent or confluent; involucra of few leaves; fruit cordate at the base, with a very open recess. 2. H. Native of Calabria, Mauritania, Greece, Sicily, Sardinia, Spain, &c. in open places and on hills. Mag. nat. monsp. p. 286 with a bad figure.—Gouan. obs. p. 18, t. 10. Desf. alt. p. 268. Sibth., et Smith, fl. grece. t. 287. There are varieties of this with glabrous or hairy petioles. To this the Férula Neapolitana, Ten. fl. med. p. 316, append. 4th. p. 12., is referred by Sprengel, which is said by the author to be nearly allied to Eglane. The bruised root is said to be good for resolving tumours.

2 T. Silphium (Viv. fl. lyb. p. 17.) stem terete, furrowed, glabrous; leaves pinnate; leaflets many-parted; segments simple or trifid, all linear, elongated, hairy on both surfaces, with red veins. Wings and fruits are at the base, hairy and furrowed, with spongy tissue constructed. 2. H. Native of the north of Africa, on the mountains of Cyrenaica. This is supposed to be the plant which yielded the juice called silphium, a medicine held in such high estimation among the ancients, as to have imparted to the region where it grew (the vicinity of Cyrene, now included in the pashal of Tripoli,) the appellation of "Silphifera!" Silphium Deadly-carrot. Fl. July, Aug. Ct. 1824. Pl. 2 to 4 feet.

3 T. Villorosa (Lin. spec. p. 375.) stem terete, glabrous; leaves tripinnate, and are, as well as the petioles, villous; leaflets oblong, minutely pinnatifid; lower ones deflexed; involucra and involucres almost wanting. 2. H. Native of Portugal, Spain, south of France, and Mauritania, on hills and in bushy places. Lam. ill. t. 206. D. C. fl. fr. 4. p. 342.—Moris. exsct. 9. t. 18. f. 3. Plench. 219. Perkins. 878. t. 877. f. 2. Ger. mer. 1030. Flowers yellow, as in the rest of the species. Aspect of plant hoary. Root carrot-shaped, black on the outside. Villorosa Deadly-carrot. Fl. June, July. Ct. 1710. Pl. 3 to 4 feet.

4 T. Asclepium (Lin. spec. p. 375.) stem terete, glabrous; leaves tripinnate; leaflets digitately multifid, capillary, short; petioles glabrous; involucra and involucres wanting. 2. H. Native of Apulia, Sicily, Rhodes, and about Constantinople. Sibth. fl. grece. t. 286. ex Smith, prod. t. p. 201. Guss. prod. fl. sic. 1. p. 370. T. Apulia, Mill. dict. no. 4.—Col. ephr. t. 86. Mor. hist. 3. p. 319. sect. 9. t. 18. f. 9. Fruit one-half smaller than those of T. Gargarica, having the wings rather truncate at both ends. Habitat of Elaeosinum macedus. The root is about the thickness of a man's thumb; the bark is yellow and wrinkled; the inside white, abounding in a bitter milky juice. Swallow-wort Deadly-carrot. Fl. July, Aug. Ct. 2 to 3 feet.

5 T. Fétida (Lin. spec. p. 375.) stem terete, petioles villous; leaves tripinnate; leaflets much spreading, pinnatifid, attenuated at the base; segments short, lanceolate, toothed; involucral wanting. 2. H. Native of Spain, Zante, Cyprus, &c. Blackw. t. 708. ex Smith. Moris. hist. sect. 9. t. 18. f. 7. ex Lin. Lobel's figure is more probably referable to Laeseriptum gammaicum. T. tenuifolia, Lag. gen. ct spec. 12. is referable to the figure of Morison, but differs in the stem being glabrous. It is probably only a variety of this species. The leaves are rough and hairy. Fétida Deadly-carrot. Fl. July, Aug. Ct. 1596. Pl. 2 to 3 ft.
UMBELLIFERÆ. CXXV. Thapsia. CXXV. Cymopterus. CXXVI. Laserpitium.

** Involucra of 5-7 leaves.

6. T. polygama (Desf. fl. atl. 1. p. 261. t. 75.) stem terete; glabrous; sparingly branched; leaves glabrous, bipinnate; leaflets multifid: lobes linear, acute, divaricately trifid; involucra of 5-7 leaves; central flowers male. *H. Native of Mauritania, about Bone, Lacaille, and Tangiers. Spreng. in Schultes, syst. 6. p. 614. exclusive of the synonyme of Lam. and therefore the description. Flowers pale yellow. Stylodium thick. Styles diverging, at length reflexed.—Barrel. icon. 336. appears to be intended for this plant, but the flowers are said to be white.

* Polygamous. Deadly-carrot. Pl. 1 to 2 feet.

† Species not sufficiently known.

7. T. prealta (D'Uvry, enum. p. 32.) stem branched above; radical leaves quadrifidly decompounds, shining; leaflets oblong, cut, almost pinnatifid; umbels numerous; central one much the shortest: lateral ones on peduncles, which are furnished each with a lanceolate twin bractea at the base. *H. Native of the island of Cos, among broken rocks at the height of 900 feet. Stem 6-8 feet high. Fruit unknown.

Tall Deadly-carrot. Pl. 6 to 8 feet.

Transtanga Deadly-carrot. Pl. 2 to 4 feet.

9. T. maxima (Mill. dict. no. 2.) leaves pinnate; leaflets very broad, pinnatifid, villous beneath; petioles decurrent. *H. Native of Spain, all over Old Castile quite to the Pyrenees. Perhaps not different from T. villosa. Root said to be of a dark colour on the outside, and the leaves very thick.

Largest Deadly-carrot. Fl. June, July. Clt. Pl. 4 to 5 ft. 10. T. altissima (Mill. dict. no. 6.) leaves decompound; leaflets large, shining; umbels large. *H. Native of Apulia. Perhaps the same as T. praecita.

Tallest Deadly-carrot. Pl. 8 feet.

Cult. The species of Thaspia will grow in any common garden soil. They are only to be increased by seeds, which should be sown in autumn as soon as ripe.

CXXV. Cymopterus (from κυμα, κυμα, a wave, and πτερον, πτερον, a wing; in allusion to the undulated wings of the mericarps). Rafin. journ. phys. 1819. aug. p. 100. but not of Schultes, syst. 6. p. 34.—Thaspia, Nutt. gen. amer. 1. p. 181.

Lin. syst. Pentádria. Digydia. Calyx minutely 5-toothed. Petals roundish-oval, with an inflected point. Fruit nearly elliptic; compressed, 7-8-winged: the perfect mericarps are therefore 4-winged, and the imperfect ones 3-winged: wings undulate; furrows of fruit flat, 1-nerved; commissure naked, but with 5 stripes. Carpophore not separable from the mericarp.—A smooth humble herb, with tuberous roots, rather decumbent, nearly naked stems; binate leaves: with short obtuse decussate lobes, and long petioles. Umbels 4-6-rayed; involucra wanting; involucres 5-7-parted, dimidiate. Flowers polygamous; female ones nearly sessile and white; central ones male, pedicellate.—This genus is truly distinct from Thaspia, but perhaps may be joined with Laserpitium.

Glomerate-flowered Cymopterus. Pl. decumbent.

Cult. See Thaspia above for culture and propagation.

Lin. syst. Pentádria, Digydia. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the back, or nearly terete, 8-winged; the 5 primary nerves of the mericarps being filiform: and the 4 secondary ones being winged. Vitte in 1 each furrow, under the secondary ribs. Carpophore free, bipartite.—Herbs with bipinnate or tripinnate leaves; leaflets entire, toothed or cut. Umbels showy, of many rays. Involucre and involucres of many leaves. Flowers white, rarely yellow. This genus is easily distinguished from the others by the 8 wings to the fruit.

* Fruit glabrous, or the primary ribs are clothed with adpressed, very short down.

Rough Lasarwort. Pl. 1 to 2 feet.

2 L. glabrum (Cranz, austr. 3. p. 54.) leaves bipinnate, quite glabrous in every part, and shining; leaflets obliquely cordate, mucronately toothed: but those of the superior leaves are quite entire; leaves of involucra setaceous; wings of fruit equal, rather curved. *H. Native of Europe, on the mountains, in dry and stony places. D. C. fl. fr. suppl. p. 509. L. latifolium, Lin. spec. 356. Jacq. fl. aust. t. 146. Sclhkuhr. handb. t. 67. Fl. dan. t. 1313. L. Libanotis, Lam. dict. 3. p. 423.—Dodd. pempt. 312. f. 2. Chus. hist. 2. p. 149. f. 2.—Riv. pent. t. 21.—Plench. icon. 179.—Mor. hist. sect. 9. t. 17.—Mor. hist. 3. p. 320. t. 19. f. 1-6. Stem and under side of leaves rather glaucous. Flowers white. In the Alps this plant is only a foot or 2 feet in height, while in cultivation it grows much larger. The plant is acid and aromatic, with something of bitterness, and somewhat pungent, and to merit a place amongst the aromatic stimulants, emmenagogues, and apotropaics. It is used by the peasants for themselves, and by farriers for horses, in some countries. The root is the hottest part of the plant.

4 L. acanthus (Moretti, in Com. (1824.) fl. com. no. 344. and in bot. ital. (1825.) no. 3. p. 35.) leaves somewhat tripinnate: leaflets rounded 2-5-lobed, acutely and deeply serrated.
upper cauline ones tripartite; lobes linear-lanceolate; involucra and involucells of few leaves; wings of fruit flat, unequal: the dorsal ones a little smaller than the lateral ones. 2. H. Native of Switzerland and Italy, in subalpine places. L. latifolium, Gaudin, f. helv. 2. (1828) p. 948. L. trilobum, Sut. fl. helv. but not of Lin.—Hall. hist. no. 352. exclusive of the synonyme. Allied to L. aquilegifolium and L. glutinum, but differs from them in the flowers being yellow.

**Gaudin's Laserwort.** Pl. 3 to 4 feet.

5 L. marginatum (Waldst. et Kit. pl. rar. hort. 2. p. 210. t. 192.) leaves biternate, shining, and are as well as the stems glabrous; petioles and nerves of leaves rather pilose beneath; leaflets ovate, sessile, somewhat 3-lobed, serrated; upper stem leaves reduced to the petioles; involucra and involucells of 2-5 linear-lanceolate leaves; wings of fruit unequal: the 2 lateral ones the broadest. 2. H. Native of Croatia, in woods. Petals incurvally obovate at the apex, greenish yellow, margined with purple.

6 L. siculum (Spreng. sys. 1. p. 918.) stem terete, branched, few-leaved; leaves bipinnate; leaflets elliptic or obovate, glaucous, mucronate, veiny; involucra and involucells of many awned leaves, wings of fruit coloured, emarginate. 2. H. Native of Sicily, among rocks, on the Nebrode mountains. Guss. prod. f. sie. 1. p. 317. L. Nebrodense, Jan. herb. 260. spec. 15. Allied to L. Silzer, but the wings of the fruit are very different.

**Sicilian Laserwort.** Pl. 3 to 4 feet.

**Whitby or Mountain Laserwort.** Fl. May, July. Clt. 1640. Pl. 1 to 6 feet.

8 L. gallicium (C. Bauh. pin. 156. Lin. spec. p. 357.) leaves supra-decomposing, glabrous, shining; leaflets cuneate, 3-5-cleft, mucronate; leaves of involucra linear-lanceolate, acuminate; wings of fruit equal, flat. 2. H. Native of the south of France; and of Upper Italy. D. C. fl. fr. 4. p. 312. Spreng. in Schluchtes, sys. 6. p. 624. Gaud. aix. t. 58. Park. theat. 928. f. 1. L. trifurcatum, Lam. fl. fr. 3. p. 415. L. cuneatum, Moench. meth. 79. There is a variety with broader segments (in Mor. hist. sect. 9. t. 19 f. 8.) and with the lobes very much divaricate and short (Pluk. alm. t. 199. f. 1. L. formosum, Willd. spec. 1. p. 1518.) segments of leaves ob-long-linear (Mor. hist. sect. 9. t. 19 f. 9. and therefore L. angustifolium, Lin. spec. p. 357.) segments of leaves very narrow (J. Bauh. hist. 3. p. 137. and therefore L. angustifolium, Willd. l. c.) segments of leaves cut into many lobes (L. Gallicum laciniatum, Hertel, &c.) The most of the varieties have glabrous stems; very few have them hispid from scattered bristles. L. tenifolium, Riv. pent. irr. 22. is also a variety of this species. Flowers white.

9 L. peucedanoides (Lin. spec. p. 358.) leaves trinerved, quite glabrous; leaflets quite entire, oblong, mucronate; leaves of involucra, and involucells setaceous; pistils elongated; wings of fruit unequal, flatish. 2. H. Native of Carniola, Croatia, and Upper Italy, in mountain woods. There are varieties of this with oval-oblong leaflets (Hoppe, fl. exsiccat.) oblong leaflets (Jacq. icon. rar. 2. t. 250.) oblong-linear leaflets (Seg. var. 3. p. 227. t. 7.) and linear leaflets (Pluk. alm. t. 198. f. 4.) but all these varieties differ from any of those of L. Gallicum in the segments of the leaves not being cuneated nor lobed. Flowers white.

**Salphur-wort-like Laserwort.** Fl. June. Clt. 1816. Pl. 1 to 3 feet.

10 L. gummi-ferum (Desf. fl. atl. 1. p. 254. t. 72.) leaves ternately decomposing, glabrous; leaflets pinnatifid; lobes lanceolate, short, acute, stiffish; involucra and involucells of few leaves. 2. H. Native of Portugal, Spain, and Mauritania, in sandy and barren fields. L. thapsioiderne, Brot. phyt. ins. p. 77. t. 35. L. polygonum, Lam. dict. 3. p. 425. Thapsia gummi-fera, Spreng. umb. spec. p. 31. Flowers white. Petals in- flexely emarginate. Fruit 8-winged (ex Brot.) and therefore this plant if referrible to Laserpitium and not to Thapsia. Lobes of leaves, when dry, usually channelled. Petioles sometimes pilose, usually glabrous as well as the lobes.

**Gum-bearing Laserwort.** Pl. 2 to 3 feet.

11 L. hispam (Lam. fl. fr. 3. p. 618.) leaves supra-decomposing, hairy; leaflets narrow, pinnatifid; lobes short, linear, cuspidate; leaves of involucra and involucells membranous, rather tristif at the apex, ciliolate; wings of fruit thin, flat. 2. H. Native of France, Switzerland, Piedmont, on the Alps, in meadows; and of Kotzebue's Sound. D. C. fl. fr. 4. p. 313. L. Paniax, Gouan. ill. 13. L. Halleri, All. pedem. no. 1315. —Hall. helv. no. 795. t. 19. exclusive of the synonyme of Gmel. and Seg.—Mor. hist. sect. 9. t. 15. f. 16. Flowers white.

**Hair Laserwort.** Fl. June. Clt. 1759. Pl. 1 to 2 feet.

12 L. scabrum (Cav. icon. 2. p. 72. t. 190.) leaves bipinnate, scabrous; leaflets oblong, cut, acute, and are as well as the stems glaucescent; leaves of involucra and involucells lanceolate, tapering into a bristle; fruit tormentose while young; adult ones 8-winged. 2. H. Native of Spain, near Cat and Valeriemes, on dry exposed hills. Referrible to L. hispam, but truly distinct. Petals white, with a violaceous border, villous beneath. Stem scabrous.

13 L. nitidum (Zanted. comm. brix. 1813. exc Poll. fl. ver. p. 311.) leaves bipinnate, beset with setose bristles, as well as on the stem and petioles; sheaths of petioles glabrous; leaflets ovate, serrated; ultimate ones confluent; leaves of involucra and involucells lanceolate, with membranous margins, deeply serrated at the apex; wings of fruit nearly equal. 2. H. Native of Upper Italy, among rocks on the mountains. L. pilosum, Com. fl. comp. p. 53. but not of Willd. Fruit glabrous. Flowers white.

**Nitis-leaved Laserwort.** Pl. 2 to 3 feet.

14 L. Archangelica (Jacq. icon. rar. 1. t. 58. Wulf. in Jacq. coll. 1. p. 214.) leaves ternately divided; stem and petioles hispid; leaflets ovate, cuneated at the base, serrate, extreme one 3-lobed; and the lateral ones 2-lobed; leaves of involucra and involucells linear-lanceolate, hairy, 2-3-cleft at the apex; wings of fruit flat, broader than the mericarps. 2. H. Native of Carniola, Croatia, Silisia, Carpathian mountains, among rocks. L. Chirionium, Seop. earm. no. 324. Archangelica,
UMBELLIFERÆ. CXXXVI. LÆSÆRÆTUM. CXXXVII. LOPHSOCDIUM. CXXXVIII. MELANOSELUM.

Clus. hist. 2. p. 195. Lob. icon. 701. Petioles large, saccate, very villous. Stem 5 feet high, furrowed. Flowers white, purplish when young. Fruit glabrous, or clothed with adpressed pubescence according to Koch.

* * Primary ribs of fruit hispid from spreading bristles.

15 L. Hispidum (Bieb. fl. taur. 1. p. 221. suppl. p. 222.) leaves ternately bipinnate; petioles, nerves on the under sides of the leaves, stem and umbels hispid; leaflets cuneiform-ovate, deeply serrated; stem terete, furrowed: leaves of involucre and involucels oblong, acuminated at the apex, or cut; wings of fruit unequal; 2 lateral ones the largest. 2. H. Native of Tauria and Caucasus, in gravelly places. L. pilosum, Willd. enum. p. 310. L. Archangelica, Hort. but not of Jacq. Cañéalhispid, Desf. Hort. par. Petioles white.

16 L. Prutenicum (Lin. spec. p. 357.) leaves decumbent, rather hairy on the nerves and petioles; leaflets ovate-lanceolate, pinnatifid; lobes lanceolate-cuspidate; outer ones confluent; stem angular, beset with retrograde bristles; leaves of involucra and involucels linear, with entire hyaline margins: wings of fruit unequal; 2 lateral ones the largest. 8. H. Native of Hungary, Carniola, Germany, Switzerland, east of France, on hills. Jacq. fl. aust. t. 152. L. selinoides, Crantz, aust. 182. L. Gallicum, Scop. carp. 321. Jacq. vind. 48.—Breyen. cent. t. 84.—Riv. pent. irr. 23. Flowers white.

Far. b, glabratum (D. C. prod. 4. p. 206.) leaves and stems glabrous. 8. H. Native of Piedmont, Pyrenees, &c. L. daucoides, Dufour, in litt. L. Prutenicum, Lapeyr. suppl. p. 48. Balb. fl. taur. 49. Fruit pilose on the primary ribs, as in var. a. The wings of the fruit are very unequal: the 2 lateral ones are large; and the 2 dorsal ones very small, or nearly wanting, hence this species falls in almost to Thapsia, but differs in the petals being emarginate.

17 L. Athamantia (Spreng. in Schultes. syst. 6. p. 624.) plant hispid; stem furrowed, much branched; leaves ternately decumbent, rough on both surfaces, stiffish; leaflets oblong, pinnatifid; segments broadly lanceolate, mucronate; leaves of involucra and involucels oblong, reflexed. 8. H. Native of Siberia. Perhaps the same as L. hispidum or a variety of L. Prutenicum.

† Species not sufficiently known.

18 L. Cape'ske (Thunb. prod. p. 50. fl. cap. 2. p. 201.) stem terete, glabrous; leaves bipinnate; leaflets oval, mucronate, margined, quite entire; sheaths large, petiolar.—Native of the Cape of Good Hope. Fruit ovate, striated, and therefore the genus is doubtful.

Cape Laserwort. Pl. 1 to 1½ foot.

19 L. Aureum (Wild. spec. 1146.) stem terete, nearly simple; leaves ternately decumbent; leaflets ovate-lanceolate, pinnatifid; segments lanceolate, bluntish, mucronate; leaves of involucra and involucels filiform. 8. H. Native of the Levant. Spreng. in Schultes. syst. 6. p. 626.—Buxb. cent. 1. t. 43. ex Spreng. but the description hardly agrees with it. L. elegans, Clark, in Spreng. nov. endit. 3. p. 160, is related to it according to Spreng. syst. 1. p. 918. Flowers golden yellow. Fruit unknown. Perhaps a species of Thapsia.

20 L. Ferulaceum (Lapeyr. abr. pyt. p. 152. but not of Lin.) stem naked, simple, furrowed; leaves decumbent: leaflets capillary, simple in the lower part, and more decumbent at the apex; mericarps of fruit 4-winged. 8. H. Native of the Pyrenees, in a place called Pic du Gard. This is a very obscure species.

Fenestral-like Laserwort. Pl. 2 to 3 feet?

Cult. All the species grow well in common soil, but it must be rather dry. They are only to be increased by seed, which should be sown in the autumn or spring.

CXXXVII. LOPHSOCSIUM (Λοφος, lophos, a crest; and σκία, skiaion, an umbel; in reference to the crested nature of the mericarps). D. C. coll. mem. 5. p. 57. t. 3. f. 6. prod. 4. p. 207.

LIN. SYST. Pentandria, Digynia. Margin of calyx 5-toothed. Petals elliptic, entire, acuminated, somewhat involute at the apex. Fruit compressed from the back. The primary ribs of the mericarps are unknown; but the 4 secondary ones are winged: the 2 lateral of which are expanded into a somewhat serrated wing each; and the 2 dorsal ones are expanded into interrupted wings, which at first sight appear like retrograde scales. Seed unknown.—Herb glabrous. Stem terete, erect. Lower leaves like those of Achillea millefolium, pinnate; leaflets short, innumerable, divided into linear-subulate lobes; upper leaves somewhat pinnate from the base, usually rising from the axis of the sheaths. Umbels compound, sometimes proliferous. Leaves of involucra 5-7, ovate-lanceolate, cuspidate; of the involucels 5-7, but narrower, and about equal in length to the umbellules. Flowers yellow. Allied to Thapsia, but differs in the ribs of the fruit being sealy; but the fruit examined being immature and incomplete, it is therefore doubtful in what part of the order the genus should be placed. Perhaps it should have been placed near Cächstg.

Cult. See Laserpitium above for culture and propagation.

LIN. SYST. Pentandria, Digynia. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit flatly compressed from the back. Mericarps with 5 filiform, primary ribs: the 3 intermediate ones on the back; and the 2 lateral ones placed in the commissure, which is flat; and 4 secondary ones: the inner ones of these filiform and very slender, but the outer 2 are expanded into membranous serrated wings; under all the ribs there are oleiferous canals. Carophoriparite. Seed flat.—A shrub with a terete simple stem, which is naked below. Leaves tripinnate; leaflets ovate, acuminate, serrated; ultimate ones usually confluent; petioles sheathing. Umbels composed of many rays. Involuta of many cut leaves; and the involucels of many entire leaves. Flowers white.

plant is called by gardeners Rubus Cali•bars, to which it is very similar in habit, hence it has the name of decipiens.

Cult. Any light soil will suit this plant; and it is only to be increased by seed.

Tribe II.

DAUCINEAE (this section contains plants agreeing with Daucus in important characters) or Orthosperme Multi-
A fruit lenticularly compressed from the back, or the transverse section is nearly terete. Mericarps with 5 primary, filiform, bristly ribs; the lateral ones placed in the commissure, which is flat, as in Thapsiaceae; and with 4 secondary ones, which are more prominent and prickly than the primary ones: the prickles free, or joined into a wing. Seed complanate or somewhat semi-terately convex, flattish in front.

Lin. syst. Pentändria, Digînia. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point; those in the outer ray of the umbels with unequal lobes: the outer lobe very large. Fruit compressed from the back. Mericarps with 5 primary, filiform ribs the 3 intermediate dorsal, and the 9 lateral ones placed in the commissure; and 4 secondary ribs: the 2 inner ones of these filiform: and the 2 outer ones winged; the wings deeply and sinuately lobed. Carpo-
ephore bipartite. Vitae none. Seed flat.—An annual, glabrous herb. Leaves, as well as those of the involuera and involucelles divided into linear lobes. Umbels compound. Flowers white. Herb with the habit of Nigella Damascenâ: and the inflores-
cence like that of Orlaya grandiflora.

1 A. squamata (Lin. spec. p. 347). C. H. Native of the Levant, on Mount Lebanon (Lin.); between Bagdad and Kermanshah (Olivier), on the banks of the Euphrates (C. Ros-
tan); in Syria and Asia Minor (Schr.). in the Morea, and Lycia (Smith); Cyprus (Smith), Gtélidium Rauñâfâ, Cam. hort. 16, but not of Dioscorides, ex Sibth. and Smith, fl. grece. 268. Thâpia orientâla, Tourn. cor. 22. 1 Mor. ox. sect. 9. t. 18. f. 11. Flowers white. There is a pencil-like brown brush in the centre of the umbels. Cotyledons long, linear. Compare D. C. mem. umb. t. 19. t. 7.

Cult. The seeds should be sown as soon as they are ripe, in a warm border, as if sown in spring, the plant rarely pro-
duces seed.

Z. 2
UMBELLIFERÆ. CXXXI. DAUCUS.

1 D. MURICATUS (Lin. ment. p. 392.) plant hispid; leaves pinnate; leaflets multifid cut; leaves of involucrum 5-7, many of which, or all, are trifid or pinnatifid; prickles of fruit longer than the breadth of the seed, peltately glochidiate at the apex. ♂. H. Native of Mauritania, Numidia, Calabria, and China, in fields.—Mor. hist. sect. 9. t. 14. f. 4. Herm. par. 111. Artèdã muricatus, Lin. spec. ed. 1. p. 242. D. muricatus, Desf. atl. 1. p. 243. Spreng. in Schultes, syst. 6. p. 477. exclusive of the synonymy of Poir. Platyspermum muricatum, Hoffm. and Koch, l. c. and perhaps Caucalis Mauritaniae is referrible to this. The hairs on the lower part of the stem are best bent.—Col. espl. 1. p. 96. t. 94. Flowers pink.

2 D. LITTORALIS (Sibth. and Smith, fl. gracc. t. 272. prod. 1. p. 185.) stem decumbent, hispid from deflexed hairs; leaves bipinnate, hispid; leaflets short, multifid, cuneiform; leaves of involucrum 3-clfed, shorter than the umbel; fruit ovate, beset with glochidiate prickles. ♂. H. Native of the island of Cyprus, by the sea-side; and of Spain. Leaves of the involucre usually 5; of the involucres membranous. Flowers white. Fruit angular, beset with strong prickles. Sea-shore Carrot. Fl. Ju. Jul. Clt. 1829. Pl. dec.

4 D. BESARRAECUS (D. C. prod. 4. p. 210.) glabrous; leaves ternately supra-decompound; segments linear-setaceous; umbels of many rays; involucre wanting; prickles of fruit length of seeds, when young subcarpous. ♂. H. Native on the shores of the Black sea, about Odessa; Bessarabia. Caucalis littorialis, Bieb. fl. taur. 1. p. 208. Cauchy littorialis, Spreng. umb. prod. 20. no. 5. Platypermum littorialis, Koch, l. c. This is very different from Daucus littorialis of Sibth., but it nearly agrees with D. pulchermissus, especially in the leaves of the involucres being ciliate, but differs from it in the segments of the leaves being fewer and longer; in the rays of the umbels and umbellules being fewer; and in the prickles of the fruit being shorter. Flowers white.

Bessarabian Carrot. Fl. May, June, Clt. 1819. Pl. 1 ft.

5 D. LASERPITTOIDES (D. C. prod. 4. p. 210.) plant glabrous; leaves pinnate and bipinnate; with linear, elongated segments; umbels of 6-8 rays; leaves of involucrum 5-6, linear, undivided; prickles of fruit joined at the base, neither scabrous nor glochidiate. ♂. H. Native of Mauritania, in sand by the sea-side, near Bone. Laserpitum daucóides, Desf. fl. atl. 1. p. 253. t. 70. Caucalis virgátæ, Poir. voy. 2. p. 133. suppl. 2. p. 136.

Lasewor-like Carrot. Pl. 2 to 3 feet.

6 D. PUBESCENS (Koch, umb. p. 77.) stem rough, branched; leaves pinnate, rather hispid; leaflets pinnatifid, with linear or trifid segments; leaves of involucre usually trifid or undivided; prickles glochidiate at the apex, longer than the breadth of the fruit, which is oblong. ♂. H. Native of Egypt, at Alexandria. Caucalis glabra, Forsk. descript. p. 206. Delije, fl. argent. 64. t. 28. f. 2 and 3.

Var. a; smaller, sea-side plant; stems humble, diffuse. Delije, l. c. f. 2.

Var. β; a larger plant, native of sandy places, with taller, erect stems, and more slender and more acutely divided leaves.

Pubescent Carrot. Fl. May, Ju. Clt. 1820. Pl. 3 to 1 ft.

7 D. SETULOSU (Guss. act. soc. bot. ex D. C. prod. 4. p. 211.) stem branched, bristy; leaves pinnate; leaflets multifid; segments linear; leaves of involucrum multifid; prickles of fruit longer than broad, glochidiate capitate at the apex. ♂. H. Native of Calabria, and at Naples. D. sebosus, Bert, ex Guss.

Bristy-stemmed Carrot. Pl. 1 to 2 feet.

Sect. II. CAROTA (from car, celt. red; colour of root). D. C. prod. 4. p. 211. Prickles of secondary ribs slender, separate, even to the base. Rays of umbel nearly equal, or gradually shorter to the centre.

8 D. PARVIFLÓRUS (Desf. fl. atl. 1. p. 241. f. 60.) stem tubercular, rather hairy; leaves bipinnate; leaflets of lower leaves ovate-oblong; of the superior ones linear-lanccolate, cut; leaves of involucrum trifid, subulate, short; of the involucres simple; flowers equal, small; prickles shorter than the breadth of the fruit, which is ovate, peltately glochidiate at the apex. ♂. H. Native of Mauritania, about Arzéau (Desf.). Flowers yellowish, according to the dried specimens.

9 D. INVOLUCRÁTUS (Sibth. and Smith, fl. gracc. t. 271. Smith, prod. 1. p. 184.) stem hispid from spreading hairs; leaves bipinnate; leaflets multifid; leaves of involucrum pinnatifid, longer than the umbel; umbellules few-flowered, uniform; leaves of involucres narrow. ♂. H. Native of Cyprus, by the sea-side. Perhaps the same as D. Créceius, Mill. dict. no. 5. Fruit small, scabrous from silvery prickles, which are hooked and glochidiate at the apex.

10 D. CAROTA (Lin. spec. 348.) stem hispid; leaves bipinnate, and tripinnate; leaflets pinnatifid, with linear-lanceolate acute segments; umbels with a solitary, coloured, abortive flower; when in seed concave; bristles of fruit slender; leaves of involucrum pinnatifid, not so long as the umbels; umbellules few-flowered, equal; leaves of involucres undivided or trifid. ♂. H. Native of Europe, Tauria, Caucasus, and now introduced to South America, China, Cochin-china, &c. in pastures and the borders of fields, in a gravelly soil; common in Britain, in like situations. Smith, engl. bot. 1174. Mart. rust. t. 82. Fl. dam. 723. Plench. off. t. 176. Hayn. arz. gew. t. 7. D. vulgaris, Neck. D. polygammus, Jacq. vind. 3. p. 43. t. 78. Caucalis Caróta, Crantz. Huds. ang. p. 114. Stephanus, Riv. pentap. irr. t. 28. Pastinacea sylvéstris, Math. valgr. vol. 2. p. 107. f. 1.—Ger. enac. 1928.—Fuchs, hist. p. 684. Root slender, aromatic, and sweetish, resembling the garden carrot, which is only a cultivated variety. Leaves rather hairy. Umbels white, except the one central neutral flower, which is blood red. Seeds small, protected by the incuration of all the flower-stalks, by which the umbels are rendered hollow, like a bird's nest. There are several varieties of the wild carrot, besides the cultivated kinds.

Var. β, sativa (D. C. prod. 4. p. 211.) root spindle-shaped, thick, succulent. This is the cultivated carrot, of which there are varieties with white, red, but usually yellow or copper-coloured roots.

The root of the plant, in its wild state, is small, dry, sticky, of a white colour, and strongly flavoured; but the root of the
UMBELLIFER.E.

cultivated variety is large, succulent, and of a red, yellow, or pale straw colour.

Use.—It is used in soups and stews, and as a vegetable dish. Parkinson informs us that, in his day, ladies wore carrot leaves instead of feathers. In winter, an elegant chimney ornament is sometimes formed by cutting off a section from the head or thick end of a carrot, containing the bud, and placing it in a shallow vessel with water. Young and delicate leaves unfold themselves, forming a radiated tuft, of a very handsome appearance, and heightened by contrast with the season of the year.

Varieties.—Those in common cultivation are:

1. Large red or field carrot, grows to a large size, and is chiefly cultivated in fields, and in farmers' gardens, for colouring butter.

2. Orange carrot. The root is long and large, of an orange colour, and is the best sort for the main crop.

3. Early horn. Root short, smaller. It is the best kind for a small, early crop; also for shallow soils.

4. Late horn. With the same characteristics as the preceding, but suited for a late crop.

William Christie enumerates the following sorts of horn carrots:

—Early red, common early, long horn. Of large carrots:

White, yellow, long yellow, long orange, long red, and the Alpine, or superb, originally from Cheshire.

The carrot requires a light mellow soil, mixed with sand, which should be dug or trenched one or two spades deep, breaking well all the lumpy parts, so as to form a porous bed, and an even surface. The orange and red sorts, on account of their longer roots, require a soil proportionally deeper than the horns.

Seed estimate and sowing.—The seeds have numerous forked hairs on their ribs, by which they adhere together, and therefore should, previously to sowing, be rubbed between the hands, and mixed with dry sand, in order to separate them as much as possible. They are also very light, and therefore a calm day must be chosen for sowing; and the seeds should be disseminated equally, and trod in before raking. Previously to sowing, if convenient, the seed should be proven, by sowing a few in a pot, and placing it in a hot-bed, or hot-house; as it is more frequently bad than most garden seeds. For a bed 4½ feet by 50, one ounce will be requisite, and the same for 150 feet of drill rows.

Times of sowing.—To have early summer carrots, sow on a warm border in the beginning of February, or, to have them still more forward, sow in a moderate hot-bed, giving copious admission of air. In the open garden, begin with the early horn, in the last fortnight of February, or first week of March, as dry, fine, and open weather may occur. The first sown beds should be assigned a favourable situation, and covered for a time with haulm. Follow with the orange, in the first fortnight of March, and make successive sowings thence to the 20th of April for main crops. Add smaller sowings twice in May, for plants to draw young late in summer; also sow a few at the commencement of July, for a later succession of young carrots in summer and autumn. Lastly, in the beginning of August, two separate small sowings may be made for plants to stand the winter, and afford young roots early in spring, March and April.

Insects.—Carrots, when they come up, are apt to be attacked by insects, like the turnip; the most approved remedies for which are thick sowing, in order to afford both a supply for the insects and the crop; and late sowing, especially in light soils, thus permitting the grubs to attain their fly state before the seed comes up.

Culture.—When the plants are up 2 or 3 inches in growth, in May and June, they will require thinning and clearing from weeds, either by hand or small hoeing. To 3 from 5 or inches' distance, such as are designed for drawing in young and middling growth. But the main crop, intended for larger and full-sized roots, thin to 6 or 8 inches' distance. Keep the whole clean from weeds in their advancing young growth. Some of small and middling growth will be fit for drawing in June and July; large sizeable roots, in August and September; and those of full growth, by the end of October.

Preserving in winter.—Carrots are taken up at the approach of winter, cleaned, and stored among sand. They may be built very firm, by laying them heads and tails alternately, and packing with sand. In this way, if frost be excluded from the store-house, they keep perfectly well till March or April of the following year. Some persons insist that the tops should be entirely cut off at the time of storing, so as effectually to prevent their growing; while others wish to preserve the capability of vegetation, though certainly not to encourage the tendency to grow.

To save seed.—Plant some of the largest best roots in October, November, or the last fortnight of February, 2 feet apart; insert them a few inches over the crowns. They will yield ripe seed in autumn, of which gather only from the principal umbel, which is likely not only to afford the ripest and largest seed, but the most vigorous plants. A considerable quantity of carrot-seed, for the supply of the London seedsmen, is raised near Weatherfield in Essex; and much is imported from Holland.

Field culture of the carrot.—It is observed, by a judicious writer, that the carrot has been too much neglected on lands, where it would have yielded a more valuable product in agriculture perhaps than any bulbous or tap-rooted plant whatever. Several contradictory experiments in its culture have been detailed in a number of publications, from which the practical husbandman will be at a loss to draw any definite conclusion. But in a communication to the board of agriculture from Robert Burrows, an intelligent Norfolk farmer, who has cultivated carrots on a large scale, and with great success, for several years, so accurate an account is presented of the culture, application, and extraordinary value of this root, that carrots will probably soon enter more largely into the rotation of crops on suitable soils.

Varieties.—The only sort adapted for field culture is the long red or field carrot. New seed is most essential, as it will not vegetate the second year.

The best soil for the carrot is a deep rich sandy loam; such a soil ought at least to be a foot deep, and all equally good from top to bottom; on any other the field culture of the carrot will not answer.

In preparing the soil for the carrot, it is essential to plough it before winter, that it may be pulverized by frost, and to work it well in the spring to at least the depth of a foot. This deep tillage may be perfectly accomplished by means of the trench plough, following the common one, or even by the common one alone with a good strength of team; but the former method is to be preferred, wherever the lands are inclined to be stiff or heavy. Three ploughings are mostly found sufficient when the land has been previously in a state of tillage, but more may in other cases be necessary. As soon as the last ploughing has been made in March, the land should be harrowed, and the surface made as fine as possible. In Suffolk the farmers sow carrots after turnips, barley, and peas, set upon a rye-grass ley; the crops upon the first have generally been most productive; next to that they prefer the latter. In the first place, they feed off the turnips by the beginning of February, and then lay the land up in small bulks or furrows, in which state it remains till the second week in March, when it is harrowed down, double furrowed to the depth of about a foot, and the seed sown.

The climate most suitable to the carrot is the same as for the turnip; but they will thrive better than the turnip in a dry and
UMBELLIFERÆ.  CXXXI. DATUCS.

warm climate, and are consequently of better growth in the south of England and France, in proportion to their size in moist climates, as Holland and Ireland, than the turnip.

Manure, according to some, should not be given to carrots the year they are sown, as it is alleged when the roots meet with it they become forked and wormy. This, however, is only applicable to cases in which recent unfermented manure has been given, or where other manure has not been properly broken in pieces, and spread over the soil, or in the drills. The Suffolk and Norfolk farmers, who are the best carrot growers, always use dung; a suitable proportion of well-rotted farm-yard dung being constantly turned into the soil at the last ploughing in March, as it has been fully shown by various trials detailed in the Annals of Agriculture, and other books on husbandry, that though good crops of carrots may be occasionally grown without the aid of manure, it is only by the liberal application of that substance that the greatest produce possibly can be obtained, as they are in general found to bear a relative proportion to the quantity that may have been employed. Mr. Burrows prepared the land with a good dressing of about 16 cart loads per acre of rotten farm-yard manure, or cottagers' ashes,—the load about as much as three horses can draw. He usually sows wheat stubbles after clover, ploughing the first time in autumn, and once more in the early part of the month of February, if the weather permits; setting on the manure at the time of sowing, which is about the last week in March, or sometimes as late as the second week in April. In Suffolk, when carrots are intended to be sown after peas, they usually plough the stubble as soon as the harvest is over, in order that the land may clear itself of weeds; in December, it is laid up in small balks to receive the benefit of the frosts; in February, it is harrowed down, and manured at the rate of 10 loads per acre; the manure ploughed in to the depth of about 4 inches, and in the month of March the land is double-burrowed, and the seed sown. By pursuing this method, they say, the manure lies in the centre of the soil, and not only affords nourishment and support to the carrot in its peripendicular progress, but renders it easy to be turned up by a single ploughing, and greatly promotes the growth of the succeeding crop of barley. In Norfolk, it is the practice to sow carrots after a crop of turnips. The manure, after being put on the land in the beginning of March, is first ploughed in with a common plough, and afterwards trench ploughed about 14 or 15 inches deep; it is then harrowed very fine, and the seed sown about the beginning of March.

The season for sowing the carrot, preferred by Mr. Burrows, is the last week in March or first of April; but he prefers the first period, having generally found early crops the most productive.

The usual preparation of the seed for sowing, is by mixing it with earth or sand, to cause it to separate more freely; but Burrows adds water, turns over the mixture of seeds and moist earth several times, and thus brings it to a point of vegetation before he sows it. "Having then weighed the quantity of seed to be sown, and collected sand or fine mould in the proportion of 2 bushels to an acre, I mix the seed with the sand or mould and 8 or 10 pounds to every 2 bushels, and this is done about a fortnight or 3 weeks before the time I intend sowing; taking care to have the heaps turned over every day, sprinkling the outside of them with water each time of turning over, that every part of the sand heaps may be equally moist, and that vegetation may take place alike throughout. I have great advantage in preparing the seed so long beforehand; it is by this means in a state of forward vegetation, therefore lies but a short time in the ground, and by quickly appearing above ground, is more able to contend with those numerous tribes of weeds in the soil, whose seeds are of quicker vegetation." Suppl. &c.

The quantity of seed, when carrots are sown in rows, is 2 pounds per acre, and for broad-cast sowing 5 pounds. Burrows sows 10 pounds per acre in the broad-cast manner.

The usual mode of sowing the carrot is broad-cast, but perhaps the better mode would be to sow them in rows at 12 or 14 inches asunder; drawing the drills, and hoeing the intervals by any suitable hoe. The most common practice, however, where carrots are best cultivated, is the hand or broad-cast method, the seed being dispersed as evenly as possible over the land, after the surface has been reduced to a very fine state of pulverization by harrowing, in order to provide a suitable bed for it to vegetate in, being then covered in by means of a light harrow. As the seed is not of a nature to be deposited with much regularity by the drill, and as the young plants can be easily set out to proper distances in the operation of hoeing, this is probably the most appropriate method of putting such sort of seed into the ground. And an additional proof of it is indeed found in its being that which is almost universally adopted in those districts where carrot-husbandry is practised to the greatest extent. The drill method, however, would save much hand labour. The seed may either be deposited by the drill-machine, or by furrows made with a hoe or other implements, burying the seed about an inch in depth, and harrowing once.

The after culture given to the carrot consists entirely of hoeing and weeding. In Suffolk they are hoed generally 3 times in the season. The first time, as soon as the plants can be distinguished from the weeds, which should be done with a 3-inch hoe. It is an operation that requires to be performed with great attention, as it is extremely difficult to distinguish the young carrots from the weeds. The second hoeing should be given in 8 or 4 weeks afterwards, according to the forwardness of the crop; it may be performed with common hoes, care being taken to set out the plants at proper distances. From 8 to 15 inches each way is the common distance, at which they are allowed to stand; and it has been proved by experience, that carrots which grow at such distances always prove a more abundant crop than when the plants are allowed to stand closer together. The third hoeing is commonly made about the middle or end of June, and in this, besides destroying the weeds, another material circumstance to be attended to, is to set the carrots at proper distances, and also wherever any have been left double at the former hoeings, to take the worst of the two plants away.

Carrots sown according to the plan of Burrows, are ready to hoe within about 5 or 6 weeks. He hoes 3, and sometimes 4 times, or until the crop is perfectly clean. The first hoeing is with hoes 4 inches long, and 2½ inches wide. The second hoeing invariably takes place as soon as first is completed, and is performed with 6-inch hoes, by 2½ inches wide. By this time the plants are set; the first time of hoeing nothing was cut but the weeds. He leaves the plants 9 inches apart from each other, sometimes they will be a foot or even farther asunder.

Carrots are generally taken up in the last week of October. The operation is performed by 3-pronged forks. "I take up in autumn a sufficient quantity to have a store to last me out any considerable frost or snow that may happen in the winter months. The rest of the crop I leave in the ground, preferring them fresh out of the earth for both horses and bullocks. The carrots keep best in the ground, nor can the severest frosts do them any material injury; the first week in March it is necessary to have the remaining part of the crop taken up, and the land cleared for barley; the carrots can either be laid in a heap, with a small quantity of straw covered over them, or they may be laid into some empty outhouse or barn, in heaps of many hundred bushels, provided they are put together dry. This latter circumstance it is indispensable to attend to; for if laid together in large heaps when wet, they will certainly sustain
UMBELLIFERÆ. 357

Much injury. Such as I want to keep for the use of my horses until the months of May and June, in drawing over the heaps (which is necessary to be done the latter end of April, when the carrots begin to sprout at the crown very fast,) I throw aside healthy and most perfect roots, and have their crown cut completely off, and laid by themselves; by this means carrots may be kept the month of June out in a high state of perfection."—Burrows' Communications to the Board of Agriculture, vol. vii. p. 72.

The storing of the whole crop of carrots, may be a desirable practice when winter wheat is to follow them, in which case the same mode may be adopted as for turnips or potatoes, but with fewer precautions against the frost, as the carrot if perfectly dry is very little injured by that description of weather.

The produce of an acre of carrots in Suffolk, according to Arthur Young, is at an average 350 bushels; but Burrows' crop averaged upwards of 800 bushels per acre, which considerably exceeds the largest crop of potatoes.

The uses to which the carrot is applied in Suffolk are various. Large quantities are sent to the London markets, and also used as food to different kinds of five stock. Horses are remarkably fond of carrots, and it is even said when oats and carrots are given together, the horses leave the oats and eat the carrots. The ordinary allowance is about 40 or 50 pounds a day to each horse. Carrots, when mixed with chaff, that is, cut straw, and in a little hay, keep horses in excellent condition for performing all kinds of ordinary labour. The farmers begin to feed their horses with carrots in December, and continue to give them chiefly that kind of provender till the beginning or middle of May; to which period, with proper care, carrots may be preserved. As many of the farmers in that country are of opinion, that carrots are not so good for horses in winter as in spring, they give only half the above allowance of carrots at first, and add a little corn for a few weeks after they begin to use carrots.

The application of the carrot to the feeding of working cattle and hogs, is thus detailed by Burrows: "I begin to take up the carrot crop in the last week of October, as at that time I generally finish soil ing my horses with lucern, and now solely depend upon my carrots, with a proper allowance of hay, as winter food for my horses, until about the first week of June following, when the lucern is again ready for soil ing. By reducing this practice to a system, I have been enabled to feed 10 cart horses throughout the winter months for these last 6 years, without giving them any corn whatever, and have at the same time effected a considerable saving in hay. I give them to my cart-horses in the proportion of 70 pounds weight of carrots a horse per day, upon an average, not allowing them quite so many in the very short days, and sometimes more than that quantity in the spring months, or to the amount I withheld in the short winter days. The men who tend the horses slice some of the carrots in the cut chaff of hay, and barn door refuse; the rest of the carrots they give whole to the horses at night, with a small quantity of hay in their racks, and with this food my horses generally enjoy uninterrupted health. I mention this, as I believe that some persons think that carrots only, given as food to horses, are injurious to their constitutions; but most of the prejudices of mankind have no better foundation, and are taken up at random, or inherited from their forefathers. So successful have I been with carrots, as a winter food for horses, that with the assistance of lucern for soiling in summer, I have been enabled to prove by experiments, conducted under my own personal inspection, that an able Norfolk team-horse, fully worked two journeys a day, winter and summer, may be kept the entire year round upon the produce of one statute acre of land. I have likewise applied carrots with great profit to the feeding of hogs in winter, and by that means have made my straw into a most excellent manure, without the aid of neat cattle. The hogs so fed are sold on Norfolk-hill to the London dealers as porkers." The profits of carrots so applied, he shows in a subsequent statement, together with an experiment of feeding four Galloway bullocks with carrots, against four others fed in the common way with turnips and hay.—Burrows' Communications, &c.

In comparing the carrot with the potatoe, an additional circumstance greatly in favour of the former is, that it does not require to be steamed or boiled, and it is not more difficult to wash than the potatoe. These, and other circumstances considered, it appears to be the most valuable of all roots for working horses.

The use of the carrot in domestic economy is well known. Their produce of nutritive matter, as ascertained by Sir H. Davy, is 98 parts in 1000, of which 3 are starch, and 95 sugar. They are used in the dairy in winter and spring to give colour and flavour to butter. In the distillery, owing to the great proportion of sugar in their composition, they yield more spirit than the potatoe; the usual quantity is 12 gallons per ton. They are excellent in soups, stews, and haricots, and boiled whole with salt beef.

Medical qualities.—The seeds, especially of the wild variety, have a moderately warm pungent taste, and an agreeable smell. They are carminative, and are said to be diuretic. The roots, especially of the cultivated variety, contain much mucilaginous and sacchariform matter, and are therefore highly nutritious and emollient. When beaten to a pulp, they form an excellent application to catarrhalous and ill-conditioned ulcers, allaying the pain, checking the suppuration and fetid smell, and softening the callous edges.

11 D. maritimum (Lam. dict. 1. p. 634. but not of Wich.) stem elongated, smooth, and glabrous at the base, but scabrous from tubercles above; leaves glabrous: lower ones bipinnate; leaflets jagged: segments linear, acuminate; leaves of involucre pinnatifid, linear, acute; of the involucres univalved; prickles about equal in length to the diameter of the fruit, which is ovate. 2. H. Native of France, in sand, along the sea-shore; as well as along the shores of the Mediterranean Sea, where it is generally mixed with D. Carota, but from which it is easily distinguished. D. C. fl. fr. 4. p. 329 bot gall. 1. p. 215.

12 D. glabraebrum (Desf. fl. atl. 1. p. 244. t. 61.) stem glabrous, or rather scabrous from small down; leaves pinnate; leaflets cuneated, bluntly 3-5-lobed, glabrous; leaves of involucres pinnatifid, acute, one half longer than the umbels; involucres trifid or simple; prickles about equal in length to the breadth of the fruit, which is ovate. 3. H. Native of the north of Africa, near Tozer, in woods of palm trees. Flowers small, white.

Quite-glabrums Carrot. Pl. 1 to 2 feet.

13 D. Gasciiumi (Lin. spec. 345.) stem and petioles scabrous from scattered bristles; leaves bipinnate; leaflets deeply toothed, ovate: segments obtuse, mucronate; leaves of involucre striated, pinnatifid, about equal in length to the umbels: prickles bristle-formed, equal in length to the breadth of the fruit, capitately glochidiate at the apex. 3. H. Native of Corsica, on rocks by the sea-side, and probably of Sicily. D. Mauritianicus, Salzim, exsic. —Ginigodium, Math. ed. Valgr. 373. f. 1. D. liceus, Lin. fil. suppl. 179. ex Smith, in Lin. trans. 9. p. 133.—Bocc. mus. t. 20. Habit of D. Hispaliensis, but differs in the fruit. Τυγγενός, is a name employed by D. Dorskides for an umbelliferous plant, but what plant is now unknown.

UMBELLIFERÆ.

CXXXI. DAUCUS.

15 D. pectinatus (D. C. prod. 4. p. 212.) stem smoothish, striated, rather scabrous at the apex; leaves bipinnate, glabrous; leaflets ovate-lanceolate, pinnatifid: segments ovato-lanceolate, acute; leaves of involucra pinnatifid, about equal in length to the umbels, which are many-rayed; prickles simple, regularly pinnatifid, shorter than the breadth of the fruit, which is ovate. § H. Native country unknown. This species differs from all the rest in the fruit.

16 D. Mauritánicus (All. pedem. no. 1381. t. 61. f. 1.) stem scabrous from retrograde bristles; leaves bipinnate, glabrous; leaflets of the lower leaves lanceolate, deeply toothed: of the superior leaves linear, acute; leaves of involucra striated, pinnatifid, shorter than the umbels; prickles simple, acute, exceeding the breadth of the fruit, which is ovate. § H. Native in fields about Nice, and in the south of France, and of Mauritania. D. C. fl. fr. 5. p. 512. and probably of Lin. spec. 248.

Var. β. pterocéleus (D. C. prod. 4. p. 212.) leaves of the involucres variable, some of them undivided; and some, as the outer ones, pinnatifid. § H. Native of Tauria, on the banks of rivers.

17 D. Mâximus (Desf. fl. Atl. 1. p. 241.) stem scabrous, striated; leaves bipinnate or tripinnate; leaflets of the lower leaves ovate, equally cut, with obtuse mucronate segments: of the upper leaves linear, acute; leaves of involucra pinnatifid, about equal in length to the umbels; prickles glochidate at the apex, equal in length to the breadth of the fruit, which is ovate. § H. Native of Mauritania, Sardinia, south of France, on the borders of fields. Umbels large, radiating: having the central flower abortive.

Largest Carrot. Pl. 2 to 4 feet.

18 D. cuttâtus (Sibth. et Smith, fl. grœc. t. 269. Smith, prod. 1. p. 184.) stem hairy from spreading pili; leaves bipinnate; lower leaflets cuneated, pinnatifid, mucronate: superior ones lanceolate, finely serrulately: involucra shorter than the umbels; leaves of involucres membranous; central flowers of umbels abortive, and of a different colour from the rest. § H. Native of the Grecian islands, and of Asia Minor.

Spotted Carrot. Pl. 1 foot.

19 D. pâlygâmus (Gouan. ill. p. 9.) stem terete, nearly scabrous; leaves bipinnate, smoothish, but pilose beneath on the nerves, as well as on the petioles; leaflets pinnatifid: segments lanceolate-linear, acute; leaves of involucra triod or pinnatifid: outer flowers of umbel abortive; prickles acute, about equal in length to the fruit, which is ovate. § H. Native of Spain, and probably of Sicily, if the figure in Bocc. sic. t. 40. f. 3. appertain to this species. D. Carôtâ β, Pers. exch. exclusive of the synonyme of Jacq. Fruit larger than those of D. Carótâ, and the prickles are twice the length. Perhaps sufficiently distinct from D. Carótâ.

21 D. grandiflorus (Desf. fl. Atl. 1. p. 240. t. 59.) stem pilose; leaves tripinnate and quadripinnate; leaflets trifid, linear, cuspitate; leaves of involucra pinnatifid, with subulate segments, about equal in length to the radiating umbels; prickles peltately glochidiate at the apex, exceeding the breadth of the fruit, which is ovate. § H. Native of Algiers, among corn. Flowers like those of Orléâna grandiflora, and the leaves like those of D. Mauritánicus, but differs in the prickles of the fruit being glochidiate at the apex.

Great-flowered Carrot. Pl. 2 to 3 feet.

22 D. pusillius (Michel. fl. bor. amer. 1. p. 164.) stem hispid from retrograde pili at the base, and rather scabrous at top; leaves bipinnate, rather scabrous; leaflets cut into linear segments; leaves of involucra pinnatifid, about equal in length to the umbels, which are small; prickles distinctly glochidiate at the apex, about equal in length to the breadth of the fruit, which is ovate. § H. Native of Carolina, at St. John's and Savannah, in dry places (Bibl. sketch. 1. p. 340); at the Red River (Nutt. in litt.); in Pennsylvania, at Reading (Herb. Koch.). Truly distinct from D. Carótâ.

Small Carrot. Pl. 1 foot.

23 D. microphyllus (Presl. in herb. Henke, ex D. C. prod. 4. p. 213.) stem villons from soft retrograde hairs, especially at the bottom; leaves bipinnate, villous; leaflets cut into linear segments; leaves of involucra pinnatifid, about equal in length to the umbels, which are small and crowded; prickles distinctly glochidiate at the apex, about equal in length to the breadth of the fruit, which is ovate. § H. Native of the northwest coast of America, at Nootka Sound; Straits of De Fuca; Rocky places of the Grand Rapids of the Columbia; and on the plains of the Multnomah River. Very nearly allied to D. pusillius, but the hairs on the stem are more numerous, longer, soft, and not tubercular at the base; and the fruit is a little larger.

Small-leaved Carrot. Pl. 1 foot.

24 D. setösus (Desf. fl. Atl. 1. p. 244. t. 65.) stem smooth, erect; leaves decomposed, pubescent; leaflets many-parted, opposite, somewhat verticillate: segments elongated, filiform, very narrow; leaves of involucra multifid; fruit cylindric, pubescent, ciliately echinated at the angles; prickles short. § H. Native of Mauritania, near Mascar, on uncultivated hills. Central flowers abortive. Perhaps the same as D. verticillatus, Horn. bot. hafn. 1. p. 272.

Bristle-leaved Carrot. Pl. 3 feet.

25 D. âurêus (Desf. fl. Atl. 1. p. 242. t. 61.) stem hispid from spreading pili; leaves glabrous, supra-decomposed; leaflets multifid: segments linear-lanceolate, acute, with rather revolute edges; leaves of involucra and involucres decomposed, reflexed; prickles stiff, peltately glochidiate at the apex, longer than the diameter of the fruit, which is oblong. § H. Native of Mauritania, in corn-fields near Mascar; and of Sicily and Calabria, in argillaceous soil; and of Lycia. Flowers white,
but becoming yellowish on drying. Umbels of many rays. Fruit yellow.

26 D. cinerea (Desf. fl. atl. 1. p. 242. t. 62.) stem rather roughish from small, retrograde down; leaves glabrous, pinnate; leaflets multifid, somewhat verticillate: segments setaceous, stillish; leaves of involucre many-parted at the apex; prickles bristle-formed, acute, and a little cleft at the apex, double the length of the diameter of the fruit. 2. H. Native of Mauritania, near Tangiers, Mascarin, Themens, and on Mount Atlas. Bristles of fruit purplish in Desfontaines’s specimens, but yellowish in those of Salzmann. Torilis crinita, Spreng. umb. spec. 141. D. meifolius, Broth. phyt. t. 36. is not distinct from the present species.

27 D. hispida (Sibth. and Smith, fl. græco. t. 269. prod. 1. p. 184.) stem hairy from spreading pile; leaves bipinnate; leaflets lanceolate, finely serrulated; leaves of involucre entire, trilobed, or pinnatifid, shorter than the umbels; prickles of fruit elongated, glabrous, and coloured. ©. H. Native in the islands of the Archipelago and Asia Minor, frequent. Spreng. umb. 143. Leaves of involucres membranous. Flowers white; central ones abortive. Prickles of fruit golden yellow.

28 D. bicolor (Sibth. et Smith, fl. græco. t. 276. prod. 1. p. 184.) stem beset with spreading hairs; leaves puberulous, bipinnate; leaflets multifid, with linear lobes; leaves of involucre trilobed, longer than the umbels; involucres membranous, on one side; central flower discoloured. ©. H. Native of Asia Minor.

Two-coloured-flowered Carrot. Pl. 1 to 1 1/2 foot.

Sect. III. Anisactis (from anisos, unequal, and actis, a ray; in allusion to the unequal rays of umbels). D. C. prod. 4. p. 214. Carphophore undivided, or hardly bipinnate at the very top. Rays of umbels very unequal.

29 D. Brachyles (Sieb. exsic. nov. holl. no. 115.) stem glabrous; leaves bipinnate, smooth; leaflets divided into linear lobes; leaves of involucre multifid, much shorter than the rays of the umbel, which are unequal; leaves of involucres simple, much shorter than the pedicels; prickles glabrous at the apex, about equal in length to the breadth of the fruit, which is oblong. ©. ? H. Native of New Holland. Stem 2 or 3 from the same root, about a foot high. Rays of umbels diverging much.

Brachiate-umbellled Carrot. Pl. 1 foot.
30 D. toriloides (D. C. prod. 4. p. 214.) stem hispid from deflexed hairs; leaves bipinnate, scabrous; leaflets divided into linear lobes; leaves of involucre multifid, much shorter than the rays of the umbels, which are unequal and scabrous from bristles; leaves of involucre simple, much shorter than the pedicels; prickles stellately hooked at the apex, about equal in length to the breadth of the fruit, which is oval-oblong. —Native of Peru, on the mountains; and of Mexico to Tohmebo, and the Cordilleras de Guichlaque; and probably of Chili and Caraccas. D. montanus, Willd. rel. in Schultes, syst. 6. p. 482. ? Torilis Peruvian, Presl. in herb. Hænke. Habit of Torilis; but differs from that genus in the albumen not being involuted. Rays of umbels shorter and less diverging than in the preceding species.

Torilis-like Carrot. Pl. 1 foot.
31 D. Monthevidæsis (Hort. berol. ex Bernh. in herb. Balb. D. C. prod. 4. p. 214.) stem, petioles, and under side of leaves hispid from long, soft villi; leaves bipinnatifid; segments divided into linear-subulate lobes; terminal umbels 5-7-rayed; axillary ones 3-5-rayed; rays unequal; prickles of fruit glabrous at the apex. ©. H. Native of Monte Video. Leaves of involucre multifid, about equal in length to the umbel. Petals obcordate.

32 D. australis (Papprig. pl. exsic. no. 97. diar. no. 330.) stem simple, hispid; hairs on the lower part of the stem deflexed; leaves bipinnate, hispid; leaflets multifid, with short acute lobes; leaves of involucre multifid, almost exceeding the umbels, which are crowded, and composed of few rays; prickles of fruit glabrous at the apex. ©. H. Native of Chili. Flowers small, golden yellow in the dried state. The whole herb yellowish.

Southern Carrot. Pl. 1 to 2 feet?

† Species not sufficiently known.

33 D. cuminoïdes (Lam. ill. t. 192. f. 2. Poir. suppl. 2. p. 118.) stem glabrous, flexuous; leaves tripartite; segments linear, very long, glabrous; leaves of involucre ternate, shorter than the umbel, which is composed of few rays; prickles shorter than the breadth of the fruit, which is oblong. —Native country unknown. Perhaps a species of Anthiscus.

Cuming-like Carrot. Pl. 1/2 foot.
34 D. Strobus (Tineo, pug. sic. 1. p. 6.) stem erect, striated, hispid; leaves pinnate; leaflets ovate, deeply toothed; teeth obsolete, mucronate; petals hairy; leaves of involucre pinnatifid, larger than the umbel. ©. H. Native of Sicily. Schultes, syst. 6. p. 623. Schrank, in fl. 1819, p. 383. Outer flowers of umbels yellow; inner ones reddish. Fruit unknown.

Sicilian Carrot. Pl. 1 to 2 feet.
35 D. frölicheri (Presl, del. prag. 130.) stem erect, rather dichotomous, furrowed, covered with retrograde hairs; leaves bipinnate; leaflets cordate, pinnatifid, toothed; leaves of involucre entire, or deeply toothed; primary umbel proliferous; pedicels and fruit very hairy. ©. H. Native country unknown, according to Gussone, prod. fl. sic. 1. p. 324.; but according to Presl, it is a native of Sicily, between Syracuse and Catania, in sand by the sea-side. Perhaps the same as D. Siculus.

Proliferous-umbellled Carrot. Pl. 1 to 2 feet.
36 D. alatus (Poir, suppl. 2. p. 118.) stem erect, furrowed, hairy; leaves glabrous, somewhat pinnate; leaflets broadly cut: segments bluntish; petals pilose; leaves of involucre pinnatifid at the apex, with linear segments; rays of umbel crowded, hispid; ribs of fruit membranously winged, spiny-toothed. ©. H. Native of Barbary, in uncultivated stony places by the sea-side.

Winged-furrowed Carrot. Pl. 2 feet?
38 D. rioides (Hort. par.) These 2 species have not D. macercoprus (Hort. erf.) been described.

Cult. All the species grow well in any common garden soil. The seeds of them should be sown in spring.

Suborder II. Camptolepeæ (from kamptos, curved, and pepon, sperma, a seed). D. C. prod. 4. p. 215. Albumen involuted, or marked by a longitudinal furrow or channel on the inner side.

Tribe XIII.

ELEOSELÆNÆ (this tribe contains plants agreeing with the genus Eleocharis in important characters) or Camptolepeæ multijuga'te atalne. Koch, in lit. D. C. prod. 4. p. 215. Fruit cylindrical, more compressed from the back than from the sides. Mercicarp with 5 filiform, primary ribs; and 4 secondary ribs: the 2 dorsal ones of these last nerve-formed:
and the 2 lateral ones expanded into wings; having the margins nerve or wing-formed. Seed involute, semi-lunar.

**CXXXII. ELÆOSELÉNINUM** (from *Ælonia, elæion, an olive tree, and *ælion, *ælion, parsley). Koch, in litt. *D. C. precd. 4.* p. 215.—Laserpitium species, Desf. Thapsia species, Guss. *Lin. syst. Pentádiæ, Digeán. Margin of calyx, hardly 5-toothed. Petals obvolute, entire, with an inflexed point. Fruit somewhat compressed from the back, nearly terete, 4-winged. Mericarps with 5 filiform primary ribs; the 3 intermediate ones dorsal, and the 2 lateral ones placed within the wings and the nerve-formed margins; and 4 secondary ribs, the inner ones of these last obtuse, and the 2 outer ones expanded into membranous wings. Vittae under all the ribs abounding in oil, those under the primary ribs slenderer and narrower than those under the secondary ones; and 4 in the commissure. Seed involute.—Perennial herbs. Stems terete, glabrous. Leaves decumposant from the branched petioles. Umbels and umbellules of many rays. involucral and involucres of many linear-unifoliate leaves. Flowers yellow. Carpopody unidiected in *E. meoideas,* but bipartite in *E. thapsoides.*

**Metho-like Olive-parsley.** *Fl. July, Aug. Cl. 1815. Pl. 2 to 3 feet.*

2 H. thapsoides (D. C. prec. 4. p. 215.) leaves pinnate, hardly velvety on the petioles and nerves; leaflets pinnate-parted, cuneated at the base; lobes obovate-oval, toothed—ultimate one trifid. *2. H. Native of Mexico, about St. Angela. Herb 6-7 feet high, with the habit of Thapsia Gargantua. Teeth of calyx nearly obsolete. Fruit a little smaller than in *E. meoideas,* but the rest of the plant is similar.

Cult. The plants will grow in any common garden soil; and are only to be increased by seed.

**Tribe XIV.**

**CAULALINEÆ (this tribe contains plants agreeing with *Caulaxis in important characters),** or Campyloterpes, multifoli-atate arrandie, Koch, umb. p. 79. *D. C. prec. 4.* p. 216. Fruit contracted from the sides or nearly terete. Mericarps with 5 filiform primary bristly or prickly ribs; the lateral ones placed in the commissure, which is flat; and 4 secondary more prominent, prickly ribs, or they are obliterated from the coincisus prickles covering the whole furrow. Seed involute or inflexed on the margin. *Caulaxis* is allied on one hand to *Daucus,* and on the other to *Scandix.*

**Lin. syst. Pentádiæ, Digeán.** Teeth of calyx 5, ovate-lanceolate. Petals obvolute, emarginate, with an inflexed point: outer ones radiating, profoundly bilab. Fruit somewhat compressed from the sides. Mericarps with 5 filiform primary bristly or prickly ribs: the 3 intermediate ones on the back and the 2 lateral ones placed in the commissure, which is flat; and 4 secondary more prominent ones, which are deeply cleft into a simple series of prickles. Vittae one in each furrow, under the secondary ribs, and 2 in the commissure, which is flat. Carpo-

*phore stiff, cleft at the apex. Seed involute or inflexed on the margin.—Herbs, with multifid leaves. Involucrum wanting, or of 1 or 2 leaves. Leaves of involucres 3-5, lanceolate, spreading. Flowers white; those in the disk of the umbels male and sterile.

2 C. leptophylla (Lin. spec. p. 347.) stem glabrous or rough from scattered retrograde hairs; leaves decumbent, with linear-lanceolate acute segments; umbels 2-3-cleft; involucrum wanting; prickles of fruit scabrous, hooked at the apex. *O. H. Native of Middle and South Europe, and of Mauritania and the Levant, as well as of Caucasus. C. himal., Jacq. hort. vind. 2. t. 185. C. parvifolia, Lam. dict. 1. p. 657. Involucres of 5 leaves. Petalikes stiff. Flowers pinkish.

3 C. glochidiata (Poir. suppl. 2. p. 137.) stem glabrous above, but rough from retrograde bristles at the base; leaves pilose, decumbent, with short linear segments; involucres of 2 leaves; rays of umbel unequal, few; prickles of fruit glochidiate at the apex. *O. H. Native of Van Diemen's Land. Scândix glochidiata, Labill. nov. holl. l. 1. p. 75. t. 102. Cåulis glochidiata, Spreng. umb. prod. p. 24. Schultes, syst. 6. p. 471. Fruit ovate. The petals are said to be pilose on the outside.

**Glochidiate-prickled Bur-parsley.** Pl. 1 foot.

4 C. tenuifolia (Delli. fl. eg. p. 58. t. 21. f. 3.) stem hispid from adpressed retrograde hairs; leaves decumbent, hispid, with linear-subulate setaceous-acute segments; umbels 5-7-rayed; involucra wanting or of one large prickles shorter than the length of the fruit, which is oblong; fruits of fruit smooth. *O. H. Native about Alexandria, in stony places.

**Slender Bur-parsley.** Pl. 1 foot.

† Species not sufficiently known.

5 C. Mauritania (Lin. spec. p. 347.) stem stiff, rough, spreadingly branched; leaves bipinnatifid, with linear-lanceolate strigose segments; peduncles bilab; involucrum wanting; involucres usually of 3 leaves; umbellules 6-flowered. *O. H. Native of Mauritania. Spreng. umb. spec. 143. Fruit somewhat prismatic, having the 3 dorsal ribs prickly. The fruit under this name in Wildl. herb. does not differ from that of *Daucus marciatus,* but the description given by Linnæus does not agree with that plant.

**Mauritania Bur-parsley.** *Fl. June, July. Cl. 1818. Pl. 3 ft.*

6 C. strigosã (Russ. beschr. aple. ex Schultes, syst. 6. p. 473.) leaves pinnate, cut, pilose; umbel of many rays; leaves of involucra and involucres membranous; fruit glabrous, and the bristles are lanceolate-subulate. *O. H. Native about Aleppo.

**Sirigosa Bur-parsley.** Pl. 1 foot?

7 C. angustifolia (Forsk, ægypt. descr. suppl. p. 206.)
leaves multifid, narrow; involucra and involucels hispid, as well as the fruit.—Native of Arabia, at Hadie.

Narrow-leaved Bur-parsley. Pl. ?

Cult. The seeds may be sown either in autumn or spring.

LIN. SYST. Pentadria, digyna. Teeth of calyx 5, setaceous. Petals obovate, emarginate, with an inflexed point: outer ones radiating, bifid. Fruit contracted from the sides, rather dilated. Mericarps with 5 primary ribs, and 4 secondary ones: the lateral primary ones placed in the commissure, which is flat, furnished with a simple series of muricar or prickles; not as in the rest of the ribs, which are furnished with 2 or 3 rows of prickles each; prickles all equal. Furrows under the secondary ribs 1-vittate from both sides of the raphé. Carpophage setaceous, bifid. Seed involucrated. —Erect scabrous herbs. Leaves pinnae; leaflets oblong, toothed. Umbels of few rays. Leaves of involucra and involucels 3-5, ovate, concave, equal, with membranous margins. Flowers white or rose coloured; those in the disk of the umbellules male and sterile.

1 T. latifolia (Hoffin. l. c.) leaves pinnae; leaflets deeply pinnatifid or strongly serrated, the upper ones decurrent; umbels of 2-4, but usually of 3 long firm rays; umbellules having the flowers in the circumference alone fertile; ribs of fruit beset, with double rows of straight purplish bristles; the ribs in the commissure bear acute tubercles, not bristles. O. H. Native of Middle and South Europe, Mauritania, Greece, Caucasus, and Persia, in corn fields. In England in fields on a chalky soil, but rare; in Cambridgeshire not uncommon. Caicalis latifolia, Lin. syst. nat. ed. 12. vol. 2. p. 276. Smith, engl. bot. t. 198. Jacq. hort. vindi. t. 128. —Mill. fig. t. 85. Card. prov. t. 22. Tordylum latifolium, Lin. spec. 345. Reich. spec. 1. p. 696.—Colun. cephr. 98. t. 97. f. 1. Broad Bur-parsley, Petiv. herb. brit. t. 27. f. 6. Broad-jagged Bur-parsley, Petiv. herb. brit. t. 27. f. 7. Herbage rough, rather glaucous. Stem beset with minute ascending prickles. Teeth of calyx broad, short, spreading. Petals bright pink; those in the circumference of the umbellules twice as large as the rest. The plant varies much in nature, in the leaves, and in the colour of the flowers, which are sometimes white. This is one of the most striking and handsome of our native umbelliferous plants.

Broad-leaved Turgenia. Fl. July. Britain. Pl. 2 to 3 feet.

2 T. multiflora (D. C. prod. 4. p. 218.) leaves ternate above the sheath; leaflets pinnatifid; umbels of 4 or 5 rays; ribs of fruit in the commissure bearing true prickles. O. H. Native of fields about Constantinople. Fruit more ovate than in the preceding species, 6-8, not 2-3 in each umbellule; and all parts of the plant are much more robust.

Many-flowered Turgenia. Fl. July. Pl. 3 feet.

3 T. heterotheca (D. C. prod. 4. p. 218.) leaves pinnate; leaflets oblong, deeply toothed; umbels of 6-10 rays; mericarps of fruit dissimilar, having the secondary ribs in both toothless. O. H. Native of Persia, in the district of Khoï, in corn fields; and of the Levant, between Bagdad and Kermancha. Habit and flowers very similar to those of T. latifolia. Outer mericarp of fruit having the 3 dorsal primary ribs ornamented with 2-4 broad prickles each, and the lateral ribs filiform and toothless; the secondary ones hardly distinct, or a little toothed; the inner mericarp has the primary ribs all toothless, but the dorsal 3 are larger than the lateral ones; and the secondary ribs are hardly distinct. Alburnum involuto

Variable-fruited Turgenia. Pl. 2 to 3 feet.

Cult. See Caicalis above for culture and propagation.

LIN. SYST. Pentadria, digyna. Teeth of calyx 5, triangular-lanceolate, acute, permanent. Petals obovate, emarginate, with an inflexed point: outer ones of the umbellules larger than the central ones and bifid. Fruit contracted from the sides. Mericarps with 5 brisly primary ribs: the 3 intermediate ones on the back, and the 2 lateral ones placed in the commissure, which is flat; the secondary ribs beset with cypisous prickles, which occupy the whole furrows, having one vitta under each secondary rib below the prickles. Carpophage setaceous, bifid. Seed with an inflexed margin.—Herbs, with multifid leaves, beset with short adpressed hairs, which are retrograde on the stems, and erect on the rays of the umbels. Umbels opposite the leaves. Involucra of 1-5 leaves, involucels of 5-8 lanceolate ciliate leaves. Flowers white, those in the dish of the umbellules male and sterile. Prickles of fruit hair-formed, usually hooked at the apex.

SECT. I. ECTORILIS (from ev, ev, well, and Torilis; this section is considered to contain the true species of the genus). D. C. prod. 4. p. 218. Fruit covered with stiff prickles, which are usually hooked at the apex.

1 T. microcarpa (Bess. cont. enum. no. 1562.) stem branched; leaflets linear-cut, outer ones not elongated; umbels on long peduncles, 7-10-rayed; leaves of involucra and involucels setaceous; fruit ovate; prickles much shorter than the fruit, incurved. O. H. Native of the Ukraine and the south of Podolia. Torilis Ukrajina, Spreng. in Schultes, syst. 6. p. 485. Involucra as in T. Anthiscus, equal in length to the umbellules.

Small-fruited Hedge-parsley. Pl. 2 to 3 feet.

2 T. Anthiscus (Gmel. fl. b. 1. p. 613.) umbels on long peduncles of 5 to 10 closely rayed; leaves of involucra and involucels several, awl-shaped; fruit covered with incurved bristles. O. H. Native of Europe and Caucasus, and hedges and on the borders of fields, very common; plentiful in Britain in like situations. Caicalis Anthiscus, Spreng. fl. cern. no. 311. Huds. angl. t. p. 114. Smith, engl. bot. t. 987. Fl. dan. t. 919. Curt. lond. fasc. 6. t. 32. Tordylum Anthiscus, Lin. spec. 346. Jacq. fl. austr. t. 261. Torilis rubella, Mæchn, math. p. 103. Caicalis aspera, Lam. quot. 1. p. 636.—Riv. pent. irr. t. 32. Bauh. pin. 153. prod. 80. with a figure. Stem rough from deflexed hairs. Leaves bipinnate, pinnatifid, and sharply cut, rather than soft, but harsh to the touch; the lowermost one much more compound than the others. Flowers small, either white or flesh-coloured; the exterior ones only a little irregular or radiant.

3 T. neolécta (Schultes, syst. 6. p. 484.) stem and branches erect; leaflets ovate-lanceolate, cut; the terminal one hardly longer than the rest; umbels on long peduncles of from 7 to 10 rays; involucrum wanting. O. H. Native of Sardinia, Germany, &c. in fields and on the margins of woods. Scândix infestá, Jacq. fl. austr. t. 46. Caicalis infestá, Vest. ech. p. 493. ex Schultes. Peduncles longer and the fruit larger than in T. infestá. Flowers white.

4 T. inteésta (Hoffin. umb. p. 89. Spreng. prod. 24.) stem erect, much branched; leaflets pinnatifid, deeply cut, and sometimes almost bipinnate: the terminal leaflets elongated; umbels 3 A
UMBELLIFERÆ.

Var. a, diaphorá (D. C. prod. 4. p. 219.) stem branched, divericate. O. H.

Var. β, anthriscádes (D. C. prod. 4. p. 219.) stem sparingly branched, or almost simple; tall; branches erect. O. H. This appears to be a variety intermediate between T. infesta and T. anthróicus, and is probably the T. Anthriscus, Spreng; exclusive of the synonyms.

Var. β, purpéræ (D. C. l. c.) leaflets hardly elongated. O. H. Native of the south of Europe. Torilis purpéræ, Ten. append. 4. p. 12. Guss. prod. fl. sic. 1. p. 325. In the specimens examined of this variety, the flowers are white, and the prickles of the fruit are more or less coloured. Perhaps a proper species.

Troublesone or Spreading Hedge-parsley. Fl. July. Britain. Pl. ½ to 1½ foot.

5 T. heterophylla (Guss. prod. flor. sic. 1. p. 326.) stem erect, sparingly branched: segments of leaves linear-lanceolate, cut; outer or terminal one not elongated: upper ones linear, entire; umbels on long peduncles of 2-3 mm.; involucrum almost wanting; prickles equal in length to the breadth of the fruit. O. H. Native of Sicily, Corsica, and south of France. Caúcalis linearifólia, Requien, in litt. 1815. The fruit in this species is very variable in form and size, as in T. nodosa.

African Hedge-parsley. Pl. 1½ foot.

7 T. rufóchórus (Spreng. syst. 6. p. 889.) stem branched, rather puberulous; leaves bipinnate; leaflets or segments lanceolate, pinnafiddly serrated; umbels on long peduncles, 7-8-rayed; involucrum usually of only one leaf; bristles coloured, rather soft, scabrous, glabiate at the apex, rather longer than the diameter of the fruit. O. H. Native of the Canary Islands.

Green-fruited Hedge-parsley. Pl. 1 to 2 feet.

8 T.nodocá (Garrn. fruct. 1. p. 82. t. 20. f. 6.) umbels nearly sessile, glomerate, lateral, simple; stems prostrate; involucre of several linear hairy leaves; the outer mericarps of each external fruit thickly clothed with long, straight, pale, rough bristles, minutely hooked at the tops; the inner, as well as the interior fruits covered with dense, whitish, shining, tubercular granulations. O. H. Native of Europe and the Levant, on banks, and about the borders of fields; most plentiful in a gravelly or chalky soil; plentiful in Britain. The plant is also to be met with in Chili and Peru, but has probably been transported thither. Caúcalis nodocá, Huds. augl. bot. t. 199. but not of All. Tordiúm nodocus, Lin. spec. 346. Jaccq. aut. append. t. 24. Caúcalis nodóifóra, Lam. dict. 1. p.

656.—Riv. pent. irr. t. 36.—Mor. oxon. sect. 9. t. 14. f. 10. Stem rough from reflexed bristles. Leaves a deep glaucous green, hairy, bipinnate, and sharply cut, with very narrow tolerably uniform segments. Petals white or reddish, hardly at all radiating or unequal. This plant is very different from Ockerophyllum nodocá, of which it is said to be a synonyme by Sprengel in Schultes, syst. 6. p. 485. The Caúcalis Hispánica, Lam. 1. p. 658. appears to be referrible to this from the description; and Caúcalis lappuláceus, Poppig. diar. no. 356. pl. excis. p. 96. does not differ from this.

9 T. Japonóica (D. C. prod. 4. p. 219.) stem smoothish, terete; branched; leaves pubescent, bipinnate; leaflets oblong, pinnafiddly; umbels pedunculate, axillary, and terminal, 5-7-rayed; involucrum and involucres of a few short subulate leaves; mericarps oblong; bristles of fruit stiff, hooked at the apex. O. H. Native of Japan. Caúcalis Japonica, Houtt. pl. syst. 8. p. 42. t. 45. f. 1. Upper branches and rays of umbel angular, beset with upright hairs.

Japan Hedge-parsley. Pl. 1 to 2 feet.

10 T. scabra (D. C. prod. 4. p. 219.) stem smoothish, terete; branched; leaves pubescent, pinnate; leaflets oblong, pinnafiddly, much acuminated; umbels terminal, and opposite the leaves, 5-7-rayed, sometimes without an involucrum; leaves of involucres subulate; mericarps oblong, covered with stiff bristles, which are hooked at the apex.—Native of Japan. Chaerophyllum scabrum, Thumb. fl. jap. 119.

Scarbourous Hedge-parsley. Pl. 1 to 2 feet.

11 T. tuberculátà (Spreng. in Schultes, syst. 6. p. 486.) plant glabrous; branches twiggy; leaves pinnate; leaflets linear, quite entire; involucre and involucres wanting; hairs of fruit hardly hooked.—Native of Syria. Caúcalis tuberculáta, Poir. suppl. 2. p. 137. Styles tubercular at the base; hence the name. Fruit the size of that of T. micrócarpa.

12 T. elátà; hispid, erect, branched; involucre of many leaves; fruit ovate, very hispid from stiff bristles; leaves supra-decompound; leaflets lanceolate, deeply pinnafiddly; outer ones elongated. O. H. Native of Nipal, on the mountains. Caúcalis élata, D. Don. prod. flor. nep. p. 183. Caúcalis conífolia, Wall. cat. miss. Umbels of 8-10 rays. Involucres of 6-8 linear-subulate leaves.

Tall Hedge-parsley. Pl. 2 to 3 feet.

Sect. II. Trechosóre's (from θρόχος, thríschis, a hair, and κορός, korós, a fruit; in allusion to the fruit being covered with long soft hairs). D. C. prod. 4. p. 220. Fruit covered with very long, soft, setaceous, crowded, spreading, coloured hairs, which are not hooked at the apex.

13 T. thičosóre's (Spreng. umb. spec. 142.) stem nearly erect; branches smoothish; leaves bipinnate, rough from adpressed hairs; leaflets pinnafiddly, acute; umbels on long peduncles, 3-6-rayed; involucre wanting; involucres of 2-3-subulate leaves. O. H. Native of Egypt, ex Lin.; and of Syria, at Tripoli. Scándix trichóspérma, Lin. mant. 57. Chaerophyllum trichóspérma, Lam. dict. 1. p. 685. but not of Schultes. Anthriscus trichóspérma, Pers. euch. 1. p. 685. but not of Schultes. Bristles of fruit painted with rufous or violet colour.

Cult. Sow the seeds in the open ground.

Tribe XV.

SCANDICITAE (this tribe contains plants agreeing with

Lin. syst. Pennádría, Bigýnia. Margin of calyx oblong, or somewhat 5-toothed. Petals ovate, truncate or emarginate, usually furnished with an inflexed point. Fruit somewhat compressed from the sides, having a very long beak; mericarps with 5 blunt equal ribs; lateral ribs marginating; furrows without vittae, or with obsolete ones. Carpophore undivided, or forked at the apex. Seed teretely convex, with a deep furrow in front. Annual herbs, with terete, rather striated stems, and bi-pinnate leaves, having the leaflets divided into linear lobes. Umbels of few rays. Involutula wanting, or of one leaf. Umbellules of few rays; involucels of 3-7 leaves. Flowers white.

Common Shepherd's-needle, 'Toun's-comb, or Needle Chervil. Fl. June, Sept. Britain. Pl. 1 foot. 3 S. BRACHYCEPA (Guss. ind. sem. 1825. prod. sic. 1. p. 320.) involucrum wanting; leaves of involucels entire; umbels of few rays; fruit glabrous in the seminiferous part; beak hardly twice the length of the seed. C. H. Native of Sicily, on the Nebrodes; and of Syria. This is an intermediate plant between the two sections of the genus from habit; but the beak of the fruit is compressed from the back, not from the sides. Leaves terminally decumbent, glabrous; lobes short. Stem hardly a hand high. Fruit 10 lines long. Short-fruited Shepherd's-needle. Pl. ½ to ⅔ foot.

5 S. FALCATA (Lond. jour. must. 1. p. 87. t. 5. ex Hoffm.) leaves of involucels obvate, bluntly bidentate, ciliated, with membranous margins; radiate petals obolate, somewhat emarginate; fruit rather falcate, scabrous from bristles; stem and petioles pilose; umbels glabrous. C. H. Native of Tauria, frequent. S. australis β., Bieb. suppl. 424. Wylia rágians, Schultes, syst. 6. p. 504.?

6 S. APICULÁTA (D.C. prod. 4. p. 221.) leaves of involucels ovate, acutely mucronate or bidentate, with membranous ciliated margins; radiant petals oblong-ovate, entire or bifid, with an acute recess; fruit scabrous from bristles; stem and petioles pilose; umbels glabrous. C. H. Native of the Levant. Very S. falcóta, but differs in the involucels being mucronate and acute; in the styles being long, and at length diverging; in the lower leaves being on longer petioles, and in the plant being smaller.

7 S. GRANDIFLÓRA (Linn. spec. 369.) leaves of involucels ovate, obtuse, somewhat denticulated, with membranous ciliated margins; radiant petals somewhat obcordate, with an obtuse recess; fruit bristly; stem and leaves hairy. C. H. Native of Greece, Tauria, and Iberia, in fields; also of Dalmatia, if S. hirsúta of Bissoletto, collected at Lassín-Piccólo, be the same. Scándix orientalis flore maximo, Tourn. cor. p. 23. Cherophyllum grandifórum, Lam. dict. 1. p. 686. Wylia grandifóra, Hoffm. umb. 1. p. 15. t. 2. f. 3. Far. β., glabriáta (D. C. prod. 4. p. 222.) stem and leaves glabrous. C. H. Native of the Levant, about Bagdad. Rays of umbel forming almost a straight angle: lateral ones bearing 12-15 fruit, and the terminal ones 5-6, the rest abortive. Involucels spreadingly deflexed, rather ciliated. Perhaps a proper species, or a variety of S. falcóta.

8 S. IREƒÍCA (Bieb. fl. taur. 1. p. 230.) leaves of involucels ovate, somewhat bidentate, with rather membranous ciliated margins; radiate petals obcordate, with an acute recess; fruit 3 a 2.
umbels. Fruit the umbels of 5 deflexed leaves, with ciliate margins. Flowers either white or red.

4 A. *stylifera* (Hoffm. umb. 40-46, t. 1. f. 19. p. 216. t. 1. B. f. 17.) stem branched, striated, the lower part downy; leaves tripinnate; leaflets ovate, pinnatifid, rough-edged: extreme ones elongated; umbels smooth, terminal; involucels of 5 ovate fringed deflexed leaves: styles short, hardly diverging; fruit lanceolate, with a deep channel on each side, smooth.

2. H. Native throughout the whole of Europe, even to Cauca-

Cicuta, in hedges and the borders of pastures and fields, in a rather fertile soil, very common; plentiful in Britain. *Chere-

4. Cult. Sow the seeds in the open ground.

404. *UMBELLIFERÆ.*

9 S. *Gila* (S. G. Gmel. t. n. 3. p. 304. t. 31. f. 2.) stems branched, striated; fruit smooth.—Native of the north of Persia. Gmel. syst. veg. 486.

*Gilan Shepherd’s-needle.* Pl. 1 ft.

5. *H.* Fruit outer brous or glabrous, deflexed, or glabrous; leaves terminal, opposite; the leaves of involucels deflexed, lanceolate, acuminate, ciliate; umbels terminal; rays glabrous; outer petals radiant; fruit shining, girded by a series of small bristles at the base. 2. H. Native of the Alps of Provence and Piedmont. *Chereophyllum torquatum,* D. C. fl. fr. suppl. 505. *Myrhis fulvus,* All. pedem. no. 1373. exclusive of the synonymes. *Myrhis torquata,* Schultes, syst. p. 6. 511.

2. A. *Scilla* (D. C. prod. 4. p. 223.) stems glabrous, striated; leaves ternately decumbent; sheaths and involucera ciliate; leaflets ovate, pinnatifid; lobes oblong, deeply toothed, bluntish; fruit oblong, smooth, girded, by a series of bristles or hairs at the base. 2. H. Native of Sicily, in woods and shady groves. *Chereophyllum Scilum,* Guss. prod. 1. p. 352.

*Var. β, scabra* (D. C. l. c.) fruit scabrous from tubercles, particularly on one side. 2. H. Native of Sicily.

*Scillan* Rough Chervil. Pl. 2 to 3 feet.

3. A. *Cicutaria* (Duby, in D. C. bot. gall. 1. p. 239.) plant smoothish; leaves ternate, then pinnate; leaflets pinnatifid, unequal at the base; segments lanceolate, bluntish toothed; umbels opposite the leaves and terminal; rays numerous, glabrous; petals hardly emarginate, outer ones radiant; fruit ovate-oblong, smooth, naked at the base. 2. H. Native of the Alps of Dauphiny and Switzerland, &c, in humid places; also of Vol-

milis, Bess. enum. p. 13. no. 358. *Chereophyllum daucifölium,* Desf. cat. hort. par. 1828. Leaves membranous, glabrous; leaflets broad. Involucels of 5 deflexed leaves, with ciliate margins. Flowers either white or red.

4. Cult. Sow the seeds in the open ground.

357. *UMBELLIFERÆ.*

2. *H.* native of the south of Europe. In Britain, near Worecester; in great

Far. β, trichespérama (Koch, in litt. ex D. C. prod. 4. p. 224.) stem weak, glabrous; leaves ternately decomposed or triply pinnate; leaflets coarsely 5-7-toothed; segments blunt; umbels opposite the leaves, pedunculate; rays few, glabrous; fruit oblong-linear, mucronated from short down; styles short, erect.

O. H. Native of Panama. Chérophyllum trichespérama, Schultz, eastr. fl. 2. 1. p. 504. but not of Lam. Anthdráceae trichespérama, Schultz, syst. 6. p. 522. but not of Pers. Chérophyllum trichespérama, Bass. in litt. Allied to A. celerófilum, but very different from Torids trichespérama. Perhaps a variety of Scândix celerófilum, with scabrous fruit, ex Jaqc. and Biebr, and therefore Chérophyllum nemorósum, Jaqc. appertains to this plant.

7 A. fumárioides (Spreng. umb. prod. 27.) plant quite glabrous; stem striated, branched; leaves ternately supra-decompound; leaflets pinnatifid; segments linear, remote, cut, ciliated; umbels terminal; leaves of involucres reflexed, not ciliated; fruit oblong-linear, scabrous. 3.-H. Native of Croatia, on limestone mountains. Schultz, syst. 6. p. 322. Scândix fumárioides, Waldst. et Kit. pl. rar. hong. 3. p. 349. t. 224. Petals white, oblong, cuneate. Fruit oblong, echinated with stiff short hairs. Styles short, parallel, erect. Perhaps the same as Chérophyllum divaricátum, Poir. suppl. 4. p. 343. and Chérophyllum tubérculósum, Poir. suppl. 4. p. 342. or Anthródrus tubérculátus, Schultz, syst. 6. p. 557.

Common Beaked-parsley. Fl. May, Britain. Pl. 2 to 3 feet. Cult. All the species are of the most easy culture, and will grow in any soil and situation.

Sect. I. Physocalais (from φυσκα, phýska, a bladder, and καλλις, kalliς, a stem; in allusion to the stems being tumid at the joints.) D. C. coll. diss. 5. p. 59. prod. 4. p. 225. Fruit subpyramidical, somewhat attenuated at the apex, covered by stiff, compressed, angular bristles: having the ribs obtuse and much depressed. Styles short, straight.—Annual.

Far. β, Basée (D. C. prod. 4. p. 225.) stem rather hairy, erectish; leaves tripinnate; leaflets pinnatifid; segments short, bluntish; umbels of 2-3 rays. 3.-H. Native of Carolina. Stem a foot or a foot and a half high, contracted at the nodi in the dried state. Invólucra of 1 or 2 multifid leaves; involucres of 5 ovate entire leaves. Fruit 3 lines long, without any beak. Mericarps with 5 ribs, and one vitta in each furrow. Styles 2, very short. Chérophyllum articulátum, Bose, in herb. Vent.

Procúmbent Cicely. Pl. procúmbent.

3 C. vilòsòsum (Wall. cat. no. 558.) stem erect, the base beset
with retrograde hairs, and the top with spreading ones; leaves rather ploose, pinnate; leaflets bipinnatifid; lobules short, acut- ish; umbels of 3-4 rays, without any involucra. 8. H. Native of Nipaul, on the mountain called Chandaherry. Herb 2 feet high, branched, very hispid at the base. Involvecles of 3-4 linear acute leaves. Fruit a little shorter than the pedicels. Styles short, straight.

*Villous Cicely.* Fl. 2 feet.

### Sect. III. Eucalyxphyllum (from eu, eu, well, and chero- phyllum; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 225. Fruit glabrous, evidently ribbed. Styles more or less diverging. —Biennial or biennial plants.

1 C. coloratum (Lin. mant. p. 57.) root simple, fusiform; stem terete, and is as well as the petioles ploose; leaves terately decompound; leaflets pinnatifid, divaricate; involucre glabrous, yellow. 8. H. Native of Dahamua. Jaq. hort. vind. 1. t. 51. Myrrhis colorata, Spreng, in Schultes, syst. 6. p. 515.—Pink, alm. t. 190. f. 5.—Mors, expon. sect. 9. t. 19. f. 6. Root yellowish. Flowers yellow. Styles short, diverging. Hairs on the stem usually deflexed.

2 C. Pescettii (D. C. prod. 4. p. 225.) root unknown; stem beset with retrograde hairs below, but glabrous above; leaves supra-decompound, the lower ones ploose at the petioles: super-orior ones glabrous: leaflets multifid: lobes linear; leaves of involucres cupisicate and glabrous; styles hardly diverging; fruit cylindrical.—Native of Altaia. Very like C. bulbosum, but the styles are hardly diverging, and erectish on the fruit, which is much slenderer and longer.

*Prescott’s Cicely.* Fl. 1½ foot.

3 C. bulbosum (Lin. spec. p. 370.) root turbinate; stem beset with retrograde hairs at the bottom, and glabrous at the top; leaves supra-decompound; lower ones ploose at the petioles: superior ones glabrous; segmentes multifid, linear; leaves of involucres glabrous, cupisicate; styles short, divergente.

8. H. Native of Alsatsia, Germany, Siberia, Daham, even to Persia, in humid parts of woods. Jaq. fl. austral. t. 63. Hayn. arb. 1. t. 32. Scandix bulbosa, Roth, germ. 1. p. 123. Myrrhis bulbosa, Spreng, in Schultes, syst. 6. p. 513. Horn. fl. dan. t. 1768.—J. Bank. hist. 3. p. 183, with a figure.—Pench. icon. t. 207. Perhaps the same as C. verticillatum, hort. paris, ex Pers. Root not bulbous, but turgid and turnip-formed. Stem usually tumid at the nodi, spotted at the base. Leaves triply pinnate, finely cleft. Flowers white. The roots taken up early in the spring are eaten boiled, with oil and vinegar. Gmelin affirms both these and the seeds to occassion vertigees; but certainly this is not true, at least of the fresh root, many persons having eaten of that with impunity.

7 C. Tenne'nti (Lin. spec. 370.) root spindle shaped, subdivided; stem solid, striated, rough with short deflexed hairs, and spotted with dark purple, swelled under each leaf like most of the other species; leaves dark green, hairy, twice pinnate; leaflets pinnatifid or lobed; umbels of many unequal hairy seeds; involucra wanting, of one leaf, rarely of several; involucræ of several ovate pointed leaves, which are finely fringed at the margins and keel, occasionally confoent at the base; seeds forrowed, nearly smooth. 8. H. Native of Europe, in bushy places, and under hedges, common; plentiful in Britain. Jaq. austral. t. 65. Fl. dan. 918. Smith, engl. bot. 1621. Curt. lod. fasc. 6. t. 24. Hayn. arb. gew. t. 34.—Scandix tenua, Roth, fl. germ. 1. p. 22. C. tenuulm, D. C. prod. 4. p. 126. Scandix nitans, Monch, meth. p. 101. Myrrhis tenuula, Gaertn. fruct. 1. p. 23. t. 10. Schultes, syst. 6. p. 514. Myrrhis tenuifolium, Smith, engl. fl. 1. p. 51. C. aurem, Lin. mant. p. 355, but not of his spec. according to Smith in Lin. trans. 10. p. 339.—Myrrhis, Riv. pent. i. t. 49.—Moris, hist. 9. p. 305. sect. 9. t. 10. f. 7. Cerefolium sylvæstre, Raui, syn. 207. Anthriscus Plautii, Dalesch, hist. 791. with a figure. —Wild Chervil, Petiv. herb. brit. t. 25. f. 3. Flowers white, numerous, very slightly irregular, partly barren; those of the circumference principly fertile. Fruit linear, crowned with the short recurved caryee. The whole plant is sweetish and aromatic, acceptable to domestic catle, nor is any intoxicating quality recorded, notwithstanding the specific name. The herbage is often mildewed. Linnæus asserts that all the flowers are perfect, which does not accord with Haller’s account, nor with our English specimens.

*Intoxicating or Rough Cicely, or Rough Cow-parsley.* Fl. June, July, Britain. Fl. 3 feet.

### *Perennial species.*

8 C. monocyclorum (Kit. ex Link, enum. 1. p. 281.) stem quite glabrous; leaves decompound, each with leaflets lanceolate, deeply serrated, having the middle nerve and margins hairy; leaves of involucra and involucræ ciliated. 8. H. Native of Hungary. C. angulatum, Kit. According to Link and Koch, this is a very distinct plant from Anthriscus sylvestris, although it has been joined into it by Sprengel. Perhaps C. ciliatum, Kit. in Schultes, syst. is the same, and probably C. nitidum, Wahl. fl. carp. p. 85. It is perhaps only a variety of C. aurem.

*Monogynus Cicely.* Fl. May, June. Fl. 1810. Fl. 3 feet.

9 C. aurem (Lin. spec. p. 370. but not of his mant.) stem solid, branched, angular, striated, downy, with copious short deflexed hairs, intermixed with more or less numerous coarser bristles; leaves decompound; the stem ones remarkable for their tapering leaflets, with numerous fine sharp parallel segments, their surfaces hairy or smooth; fruit in the early state club-shaped, when ripe linear, crowned with the lengthened spreading styles; seeds linear, of a tawny yellow, each with 3 prominent obtuse permanent ribs, which are often roughish upwards, as well as the furrows; involucra wanting, or of very few leaves; leaves of involucræ ovate-lanceolate, pointed, reflexed, coloured. 8. H. Native of Middle Europe, among the mountains. In Scotland between Arbroath and Montrose; and at Corstorphine near Edinburgh, on the borders of fields. Smith, engl. bot. 2103. Jaq. austral. t. 64. Myrrhis aurea, Spreng. Prod. 29. and in Schultes, syst. 6. p. 511. Smith, engl. fl. 1. p. 52. exclusive of the synonyms of Wild. Scandix aurea, Roth, germ. 1. p. 123.—Lob. icon. t. 734. Ger. emac. 1059.—Moris, hist. 9. p. 301. sect. 9. t. 10. f. 2.—Rupp. gen. ed. Hall. 282. t. 5. Joints of stem more densely hairy than the other parts, and a little swollen, crowned by the narrow annular base of each petiole. Flowers cream coloured, slightly irregular, the barren ones numerous, with only globose rudiments of styles. Stylodia somewhat depressed, and considerably wrinkled.

10 C. maculatum (Willd. ex Link, enum. suppl. 15.) stems smoothish, angular, spotted; leaves supra-decompound, ploose; leaflets lanceolate, deeply serrated, attenuated at the apex; fruit mutic, coloured, 6 times longer than broad. 8. H. Native of the south of Europe, but the particular places are not known. It differs from C. aurem, to which it has been joined by Sprengel, in the stem being spotted and smooth, and in the fruit being twice the length.

*Spotted-stemmed Cicely.* Fl. May, Ju. Fl. 1819. Fl. 3 feet.

11 C. villosellum (D. C. prod. 4. p. 226.) stem and petioles hispid from pili; leaves many-parted; leaflets linear-ligniform, glabrous, distant; involucræ of one leaf; leaves of involu-

*Millefoil-leaved* Cicely. Fl. May, June. Cite. 1818. Pl. 1 to 1 ½ foot. 12 C. róseum (Stev. mem. mose. 3, p. 260. Bibb. Fl. taur. no. 582.) stem and petioles hispid, and rather pilose; leaves many-parted; leaflets pinnatifid, glabrous; segments linear, approximate; involucre generally of one leaf; leaves of involucres numerous, deflexed, subulate at the apex, ciliated at the base, woolly, longer than the umbelles. 2. H. Native of Caucasus and Iberia, in mountain meadows. Leaves as finely cut as those of the carrott. Petals of a fine rose colour, not ciliated as in C. hirsutum. Myrrhis rósea, Spreng. in Schultes, syst. 6, p. 519. Fruit not seen.

*Rose-colored-flowered* Cicely. Fl. May, June. Cite. 1817. Pl. 1 to ½ foot. 13 C. húmile (Bieb. suppl. 240.) stems aggregate, declinate, equal, pubescent; leaves decomposed; leaflets pinnatifid; segments oblong, very short; involucre of 1 or 2 leaves; involucres usually of 5 leaves, which are ciliated and margined with white. 2. H. Native of Iberia, at the river Ksani. Myrrhis húmílis, Schultes, syst. 6, p. 519. Flowers white.

*Humble* Cicely. Fl. May, June. Cite. 1823. Pl. 1 foot. 14 C. hybriúm (Ten. fl. nap. prod. 66.) stem glabrous, striated, rather scabrous; leaves tripinnate; leaflets lanceolate-oblong, deeply serrated; segments acuminated, smoothish above, rather hispid beneath; leaves of involucre and involucres ovate, acuminated, ciliated with long hairs; petals glabrous; styles divaricate. 2. H. Native of the kingdom of Naples, in the woods of Magella. Flowers white.

*Hybrid* Cicely. Fl. May, June. Cite. 1822. Pl. 3 feet. 15 C. hírsútum (Lin. spec. 371.) stem fistular, beset with deflexed hairs; leaves ternately decomposed, nearly naked; leaflets ovate-cordate, acute, pinnatifid; segments deeply serrated; petals usually ciliated; styles stiff, diverging, straight, permanent. 2. H. Native of the temperate parts of Europe, as in Switzerland, Germany, Austria, Carniolia, in mountain groves. Jacq. fl. austral. t. 148. Scándix hírsutu, Scop. carp. no. 330. Myrrhis hírústa, Spreng. in Schultes, syst. 6, p. 510. —Riv. pent. irr. t. 51.—J. Banh. hist. 5, pt. 2, p. 182. f. 2.—Moris. hist. p. 304. sect. 9. t. 10. f. 6. Petals white, with the ciliæ sometimes deciduous or almost wanting. Involute of 5 lanceolate acuminated leaves. Leaves sometimes hairy on the veins beneath.

Var. β, glabrárum (Lam. dict. 1, p. 683.) stem and leaves smooth. 2. H. Native of more humid places than the species. C. cicurátia, Murr. bot. 60. but not of Vill. C. pállácens, Presl. in helv. Balb. Petals ciliated.

Var. γ, élegans (Schlecht. cat. 1821.) stem hairy; leaves pubescent; leaflets and segments elongated. 2. H. Native of the Alps of Switzerland. Ch. élegans, Gaudin, helv. fl. fr. 364. Ch. hírústum subverticillárum, Schlecht. et exsic. no. 40. 2. H. rubírfórum (D. C. prod. 4, p. 227.) flowers of a rusty purplish colour. 2. H. Native of Switzerland, Savoy, Germany, Carniola, &c. in meadows on the higher mountains.

*Hair-y* Cicely. Fl. June, July. Cite. 1759. Pl. 1 ½ foot. 16 C. mágelle'nsc (Tenor. fl. nap. append. 4, p. 15. var. β, exclusive of variety γ,) stem beset with retrograde hairs, especially at the base; leaves pubescent, many-parted; leaflets oblong, pinnatifid; lobes acute, deeply toothed, lanceolate; petals a little ciliated; fruit cylindrical; styles stiff, permanent, diverging. 2. H. Native of the kingdom of Naples, on Mount Magella. The species received from Tenore under this name is nothing but Anthusis sylvestris var. γ; but another specimen has been sent by him to Moricand in flower and fruit, which differs from C. hírsútum in the fruit being longer and thicker.

*Magella* Cicely. Fl. May, June. Pl. 3 feet. 17 C. calábricum (Guss. in act. reg. soc. bor. ex litt. 1828.) stem finely pubescent; leaves doubly dissected; leaflets broad, ovate, somewhat cordate, acute, deeply toothed, puberulous along the nerves, the rest glabrous; sheaths of leaves and leaves of involucres glabrous, hardly ciliated; petals subciliated; styles erect. 2. H. Native of Cabaria, on the mountains about springs and rivulets. In habit the plant is intermediate between C. hírsútum and C. aro'máticum.

Calabrian Cicely. Fl. 1 to 2 feet. 18 C. aro'máticum (Lin. spec. 371. Jacq. fl. austral. t. 150.) stem striated, round, and hairy in the lower part, but smooth upwards, slightly tumid and angular below each joint; leaves binate, large, on narrow-winged footstalks; leaflets stalked, broad, ovate or elliptic-oblong, acute, sharply and finely serrated, both sides nearly smooth, the serratures minutely fringed; umbels smooth; involucre occasionally of a few lanceolate pointed leaves; involucres of several; fruit linear, smooth, crowned by the long, slender, spreading styles. 2. H. Native of Greece, Turkey, Hungary, Poland, Silesia, Austria, &c. In Scotland, near Guthrie, by the road leading from Forter to Arbroath. Scándix tinctíoría, Scop. carp. no. 351. Myrrhis aro'mátiu, Spreng. prod. 23. Smith, engl. fl. 1, p. 52. Schultes, syst. 6, p. 509.—Riv. pont. t. 53.—Boeck. mus. 29, t. 19. Herb when bruised somewhat aromatic; but the seeds, according to Jacquin, have scarcely any flavour. Seopoli says, they stain the fingers when rubbed with a brownish red. Flowers numerous, white, the external ones fertile.

† Species not sufficiently known.

20 C. arbo'reescès (Lin. spec. 1, p. 571.) stem frutescent; leaves supra-decompound, smooth; involucres present only; flowers all fertile. 2. H. Native of Virginia. This species is very doubtful.

Arborescent Cicely. Shrub. 21 C. Capé's(e) (Thumb. prod. p. 51, fl. cap. 2, p. 204.) stem terete, glabrous; leaves trinerved, rather hairy; leaflets rather remote, linear-lanceolate, somewhat trifid, cuspitate; involucels glabrous; fruit obliquely pyramidal, a little beaked, acutely 5-ribbed; styles permanent, reflexed.—Native of the Cape of Good Hope. Myrrhis Capénís, Spreng. umb. spec. p. 352. Schultes, syst. 6, p. 513.

Cape Cicely. Fl. May, June. Cite. 1810. Pl. 1 ½ foot. 22 C. ? arístå'tum (Thumb. fl. jap. 119.) stem terete, gla-
brons; leaves ternately decompound, rather bipartite on both surfaces; leaflets ovate, acuminate, pinnately cut; fruit rather strigosous; styles permanent, divaricate.—Native of Japan. Myrrhis aristata, Spreng. umb. spec. 133. Schultes, syst. 6. p. 512. Said to be allied to *Urospermum dioic* and probably a species of that genus.

*Anned Cicely.* Pl. 2 to 3 feet.

23 **C. minimum** (Vand. in Roth. script. p. 56.) stems numerous, hairy; radical leaves flat on the ground, binate, hairy; leaflets somewhat 3-lobed, cut; involucrally wanting; involucels minutely-ovate, about 7-10 cm. diam. On the mountains about Milan. Vittm. suppl. p. 369. Schultes, syst. 6. p. 524. Moretti suspects this to be nothing but a variety of *C. hirsutum*.

*Least Cicely.* Pl. ½ foot.

24 **C. tenuifolium** (Poir. suppl. 4. p. 342. but not of Stev.) plant glabrous; leaves decumbent; leaflets finely cut, acute; fruit nearly glabrous, profoundly ribbed.—Native of the kingdom of Morocco. Myrrhis tenuifolia, Schultes, syst. 6. p. 520.

*Fine-leaved Cicely.* Pl. 1 to 2 feet?

*Cult.* All the species are of the most easy culture, and will grow in any soil.

**CXXXIX. CALDA'SIA** (in honour of J. Caldas, a naturalist of Santa Fe de Bogota). Lag. am. nat. 1821. no. 2. p. 98. obs. nov. p. 26, and dis. in litt. D.C. coll. dis. 5. p. 60. t. 2. f. 1. but not of Wild. nor Murias.—Myrrhis, Kunth, nov. gen. amer. 5. p. 13. t. 419. but not of Koch.

**Lin. syst.** Pentadria, Digynia. Margin of calyx obsolete. Petals oval, with an entire subinvolute point, pilose on the outside. Fruit somewhat compressed from the sides, ovate-oblong, crowned by the short diverging styles. Mericarps with 5 obtuse prominent ribs, 3 dorsal, and 2 marginating; vitte one in each furrow, which are broad, flat, and striated. Commissure furrowed in the middle. Carpophore bipartite. Seed teretly convex, somewhat convoluted at the commissure.—Puberulous or hairy tufted herbs, not above 2 or 4 inches high. Leaves tripinnately multifid; segments lanceolate-linear, acute. Scapes erect, pubescent. Umbels simple, containing about 20 flowers, surrounded by involucres composed of about 20 leaves each, which are oblong-lanceolate. Flowers white, some male, and others female.—This genus, from the seed and fruit, is allied to *Sciadix*; but differs from *Chereophyllum* in the umbels being simple, in the ribs of the mericarps being distant, and in the furrows being broad.

1 **C. Anécula** (Lag. in litt. D.C. coll. mem. 5. t. 2. f. j. 1-3.) the plant is either wholly glabrous or puberulous; pedicels smooth, a little longer than the involucrum. **2. F.** Native of South America, in grassy plains at Antisana, at the height of 6000 to 7000 feet. Myrrhis Anécula, H. B. et Kunth, nov. gen. amer. 5. p. 13. t. 419. Plant dwarf, tufted, deep green, but becoming blackish on drying. Umbels 10-12-flowered. Scapes rarely twice the length of the leaves. Kunth's specimen is less than that of Dombrey's, and more glabrous; but the hairs of the scapes in both are deflect. Pedicels glabrous.

*Anned Caldasia.* Pl. 2 to 3 inches.

2 **C. eriófora** (D.C. l. c. f. j. 4-5.) the whole plant is clothed with hairy pubescence; pedicels tomentose or hairy, much longer than the involucrum. **2. F.** Native of New Holland, where it was collected by D'Urville. Scapes 4 times longer than the leaves. Leaves of involucrum oval-oblong. Fruit quite glabrous, seated on very hairy pedicels.

*Woolly-pedicelled Caldasia.* Pl. 2 to 3 inches.

† **Species not sufficiently known.**

3 **C. cerophyllum** (Lag. am. nat. 2. p. 98. and in litt. med.) stems covered with retrograde hairs; segments of involucrem entire, or cut, about equal in length to the flowering umbel. **2. F.** Native of Peru.

*Tar. α, globériscula* (D.C. prod. 4. p. 229.) leaves puberulous, especially above, as well as the outside of the involucra; petals almost glabrous; peduncles dichotomous, twin. **2. F.** Native of Peru, at the town of Chinchin, in the province of Chanchay, where it was collected by Ruiz et Pav.

*Tar. β, hirsuta* (D.C. l. c.) leaves pubescently hairy on both surfaces, as well as the outside of the involucres and petals; forks of umbels 0-4-rayed.

*Chereophylli Callasía.* Pl. 2 to 3 inches.

4 **C. lamiópetala** (Lag. in litt. ex D.C. prod. 4. p. 229.) stem and leaves rather tomentose, greyish; segments of involucres cut and pinnatifid, longer than the umbels; petals pubescent on the outside. **2. F.** Native of the Andes, in the tract called Cordillera del Peru.

*Hairy-petalled Caldasia.* Pl. 2 to 3 inches.

*Cult.* See Frigiana, p. 259. for culture and propagation.

**CXL. SPALLEROCRATRUS (σπάλλος, spállo) to deceive, and κύρσας, kúrás, fruit; from the fruit being liable to be mistaken for cumin seed).** Bess. in litt. 1828. D. C. coll. mem. 5. p. 64. t. 2. f. N. prod. 4. p. 230.

**Lin. syst.** Pentadria, Digynia. Teeth of calyx 5, subulate. Petals ovato-elliptic, emarginate, with an index point; outer ones of the umbrella radiant. Styles short, at length reflexed. Stylopodium rather ureate, toothed. Fruit elliptic-oblong, contracted from the sides, without a beak. Mericarps with 5 subulate ribs: lateral ribs marginaling. Vitte 2-3 in each furrow, which are convex; and 4-6 in the commissure. Carpophore bipartite. Seed having a furrow inside.—Herbs. Stems terete, and as well as the petioles hairy. Leaves bipinnate; leaflets pinnatifid; lobes linear, acute. Involucrum wanting. Umbels 6-7-rayed. Involucels of 5 lanceolate leaves. Flowers white, nearly all hermaphrodite in the terminal umbels, and male in the lateral ones.

*Cumin-like Spalleroecarpus.* Fl. June, July. Ch. 1822. Pl. 2 to 3 feet.

*Cult.* The seeds of this plant only require to be sown in the open border.

**CXL. MOLOPOSPERMUM (from μολόψ, molops, a stripe, and σπόρος, sporos, a seed; the fruit is yellowish, and the vitive chestnut coloured, giving the fruit the appearance of being striped).** Koch, umb. p. 108. diss. inc. in litt. 1828. D. C. prod. 4. p. 230.—Ligusticum species, Lin. and Spreng.

**Lin. syst.** Pentadria, Digynia. Calyx 5-toothed, foliaceous. Petals lanceolate, entire, ending in a long ascending acumen each. Fruit contracted from the sides; mericarps with 5 membranous winged ribs, the 2 lateral ones marginaling, and one-half shorter than the rest, and the 3 dorsal ones are very sharp. Seed bluntly tetragonal or angular; angle of commissure opposite, engraved by a profound furrow; the canals empty between the seed and commissure of the pericarp. Vitte broad, brown, solitary in the furrows; but none in the commissure, which is very narrow. Carpophore bipartite.—A perennial glabrous herb. Leaves ternately decompound; leaflets lanceo-
late, elongated, shining, or decurvately pineate-parted; segments sharply pinnatifid. Leaves of involucrum numerous, elongated, rather membranous, sometimes multifid. Involucres of many leaves. Flowers white, on short pedicels. Terminal umbels, large, fertile: lateral ones smaller, male. Fruit often deformed, having the lateral ribs almost meeting, and the vittae of the lateral furrows. Perhaps this genus comes nearer to _Pleurispermum_ and _Hymenolepis_ than to _Valeriana_.

*Cult.* This plant will grow in any soil, and is easily increased either by dividing at the root or by seed.

**LIN. Syst. Pentadria, Digynia.** Margin of calyx obliterated. Petals unknown. _Stylodium_ conically depressed, short. Styles erect, filiform. Fruit ovate, without a beak; mericarps somewhat compressed from the sides, having the transverse section nearly terete; ribs 5, the 2 lateral ones marginaled, and nearly filiform, the 3 dorsal ones winged; vittae usually 5 in the furrows, but sometimes only 2, probably from 2 of them being joined in one; and 4 in the commissure. _Albumben involuta_. _Carphophore bipartite from the base._—A branched glabrous herb. Stem subulate striated. Leaves ternately decumpli; leaflets nearly sessile, trifid, or pinnatifid, serrated, cuneated at the base. _Umbels_ terminal, of about 20 rays. _Involucra_ and involucres none. Fruit almost like that of _Cudium_, but differs in the alburnen being involute; of _Pleurisperum_, but the calyx is toothless, the commissure less contracted, and the furrows marked with many stripes; of _Myrrhis_, but the vittae are more numerous, and the carphophore is bipartite to the base.

_Toluccæ Velæ_. Pl. 2 feet.

*Cult._ This plant will require some shelter in severe winters. It will be easily increased by seed or by dividing at the root.

**LIN. Syst. Pentadria, Digynia.** Margin of calyx obsolete. Petals obvolute, hardly emarginate, with a short inflexed point each. Fruit elongated, tapering into a tail at the base, solid, acutely angled: having the transverse section nearly terete; mericarps with the angles rather furrowed and hispid: having 5 acute ribs each; commissure furrowed, vittae none. Seed tersely involute, much shorter than the tube of the calyx. _Carphophore semibifid._—_American perennial herbs_. Roots fibrous, sweet-smelling. Stems branched, 2 feet high. Leaves biarrately; leaflets broadly ovate-lanceolate, deeply-toothed. _Involucra_ of 2-3 leaves; involucres usually of 5 leaves; leaves of both the involucra and involucres lanceolate, ciliated. Flowers white, the central ones of the umbellules male, the outer ones alone fertile.

§ 1. _Involucra_ and _involucres_ of 3 or 5 leaves.

3 B

2 O. brevistylis (D. C. prod. 4. p. 232.) styles short, conical, tapering at the base and apex, one-half shorter than the breadth of the fruit. 2. H. Native of North America, in the United States and Canada, and in woody places on the west side of the Rocky Mountains; and from the mouth of the Columbia to Observatory Inlet, in lat. 55° on the north-west coast. Hook. fl. amer. bot. 1. p. 272. t. 97. Myrrhis Clayton., Torr. fl. un. st. 1. p. 310. exclusive of many synonyms. Ursiparmium hirsutum, Big. fl. bost. ed. 2. p. 112. Umbels usually of 3-4 rays. Leaves of involucre linear-lanceolate, deciduous. The root, according to Bigelow, has an ungrateful scent, similar to that of Arâlia nudicaulis; but according to Torrey it has a sweet anise scent.

Short-styled Osmorhiza. Pl. 2 feet.

§ 2. Involucra and involucels wanting.

Bertero’s Osmorhiza. Pl. 2 feet.

Cult. See Myrrhis, p. 369. for culture and propagation.

Lin. syst. Pentádria, Digínia. Teeth of calyx 5, stiff, permanent. Petals obcordate, with an inflexed point. Styles short, conical, diverging, permanent, stiff. Fruit cylindrical, without a beak; mericarps with 5 primary flat-tipped white ribs; furrows flat, having one vitta in each; and the commissure having 2. Seed unknown.—Quite glabrous herbs, natives of the Levant. Stems branched. Leaves pinnate; leaflets multifid: lobes linear-setaceous. Umbels compound, of from 5 to 16 rays. Leaves of involucra 5-7, multifid; of the involucels linear-subulate, rarely cut. Pedicels stiff, thickening after flowering. This is a very distinct genus, but from the structure of the seed being unknown, the place which it should occupy in the order is doubtful.

1 G. daceóides (D. C. l. c. t. 3. f. K.) leaves of involucra multifid; most of the flowers in each umbelkule are fertile; fruit terete, crowned by the calycine teeth, which are conical and elongated.—Native of Armenia, ex herb. Tourn. about Amadán in Persia, ex herb. Oliv. et Brug. Myrrhis Armenia folius Mei seu ficiniseli semine brevi. Tourn. herb. Herb quite glabrous, erect. Root terete, nearly simple. Stem furrowed, a foot high. Leaves nearly like those of Daicus scítolíus, having the petals dilated at the base. Central umbel of 15-16 rays, lateral ones of 10-12.

Carrot-like Grammosciadium. Pl. 1 foot.

Mean-like Grammosciadium. Pl. 1 foot.

Cult. The species will grow in any common soil, and will be easily increased by seed.

Tribe XVI.

SMYRNEÆ (this tribe contains plants agreeing with the genus Smyrnium in character), or Campylomérpaœ pæcijugate turgideæ, Koch, umb. 133. D. C. prod. 4. p. 233. Fruit turgid, usually compressed or contracted from the sides; mericarps with 5 ribs: the lateral ribs marginating, or situated in the front of the margin; the ribs sometimes nearly obliterated. Seed involute, or with a furrow inside, semilunar or complicate.

—Habit of plants and inflorescence variable; the genus Exoa- clántula and Echínóphora agree in habit with Eryngium, in consequence of having spinose leaves; Lagóceia agrees with Acti- nothus in the one-seeded fruit; Peucpérmium with Astrántia in the utricular fruit.

CXLVI. LA-GÉCIA (from laryng, larys, a hare, and osce, olos, a house; the place where a hare lies; the seeds enrolled in the hairy involucrum have been likened to young leverets in a hare’s form). Lin. gen. no. 255. Gaertn. fruit. I. p. 103. t. 23. f. 3. Lag. am. nat. 2. p. 106. D. C. prod. 4. p. 233.—Cumnóides, Tourn. inst. t. 155.

Lin. syst. Pentádria, Digínia. Lobes of calyx large, pinnated. Petals obcordately bífid, shorter than the calyx; lobes awned. Ovarium bilocular, one of the cells abortive; the fruit is therefore ovate, and crowned by the calyx, hence there is a furrow on one side indicating the place of the abortive cell. Seed marked with a furrow on one side, and therefore appearing involute.—An annual erect herb. Leaves pinnate; leaflets ovate, uniform, alternate, coarsely toothed; teeth arched. Peduncles opposite the leaves. Umbels compound, of many rays. Umbellules 1-flowered. Leaves of involucra 6-7, pectinated, of the involucels 4, also pectinated. Flowers pedicelate, within the involucel, white. Fruit downy.

1 L. cu-míoines (Lin. spec. 294.) C. H. Native of Galatia, Persia, Greece, Candia, Lyibia, Spain, etc. in corn fields and vineyards. Smith. fl. grec. t. 243. prod. 1. p. 162. Schkuhr, handb. 1. t. 48. Lam. ill. t. 142. Sabb. hort. 4. t. 55. Plench. icon. t. 155.—Mor. hist. 3. sect. 9. t. 13. umb. 1. f. 13. Umbels nodding before flowering, but at length becoming nearly globose. The seeds are mostly all abortive in the plants cultivated in gardens.

Cult. The seeds should be sown in autumn, soon after they are ripe; otherwise if this is deferred till spring, they commonly remain a year, and sometimes two or three years before they grow.

CXLVII. OLLéRIVIA (in honour of M. G. A. Olivier, author of a history of insects, and formerly one of the editors of the Encyclopédie Methodique, and who was sent with M. Bruguière by the French government into the Levant, for the purpose of collecting objects of natural history). Vent. hort. cels. t. 21. Lag. am. nat. 2. p. 105. D. C. prod. 4. p. 234.

Lin. syst. Pentádria, Digínia. Margin of calyx 5-toothed. Petals profoundly obcordate, nearly biparite: lobes involute on the margin at the base, and excavated on the side, undulate and reflexed above. Fruit obovate-ovate, hairy; mericarps nearly terete, bluntly 5-ribbed. Carpolobus bifid at the apex. Seed marked with a furrow on the inside, therefore the albumen is probably involute.—A branched herb, native of the Levant. Stems erect, white. Leaves pinnate, having the scent of thyme when bruised; leaflets many-parted: segments trifid, acute. Umbels of 3-4 rays. Umbellules dense, many-flowered. Leaves of involucrum 3-4, trifid: lobes usually tridentate. Leaves of
involucres numerous, cuneiform, trifid. Flowers equal, hermaphrodite, white.

1 O. ORIENTALIS (D. C. prod. 4. p. 234.) C. H. Native about Bagdad, on the banks of the Euphrates, where it was detected by Olivier and Bruguier. Oliviera decumbens, Vent. hort. cels. t. 21. Stems white, decumbent in Venetian's figure, but stiff and erect in the spontaneous specimens. Lower and floral leaves clothed with soft velvety villi.

**Eastern Oliviera. Fl. May, July. Clt. 1816. Pl. 1 foot. Cult.** The seeds of this plant only require to be sown in the open border in spring or autumn, in a warm sheltered situation.

CXLVIII. ANISOSCIADIIUM (from *anemos*, *anisos*, unequal, and *sciaer*, *sciadion*, an umbel; in reference to the lobes of the calyx and petals being unequal in the outer and inner flowers of the umbel). D. C. coll. mem. v. p. 63. t. 15. prod. 4. p. 234.

**Lin. Syst. Pentantria, Digynia.** Lobes of calyx in the outer flowers of the umbels, large, ovate, and foliaceous; in the inner central flowers stiff, hooked, and mucronate-formed; in the inner ones all wanting or tooth-formed. Petals very unequal, outer ones large, obcordately bifid; inner ones small. Fruit rather pubescent, oblong-cylindrical, crowned by the calyx, and 9-sti. conic in the umbel. Mericarps semi-terete, one of which is usually abortive; ribs 5, very blunt; vitre one in each furrow, brown, but none in the commissure. Albumen involute.—An herb, native of the Levant. Root simple. Stems diffuse, stiff, dichotomously branched, puberulous when examined by a lens. Leaves petiolate, pinnate; leaflets deeply pinnatifid: lobules short, hardly acute. Branches opposite the leaves. Involucra of 4-5 leaves, which are unequal, oblong, acute, and at length rather spinose. Rays of umbel 4-5, stiff; a little longer than the involucre. Leaves of involucres 4-5, oval, spreading, permanent, unequal. Flowers white, 7-10, sessile, stiff.

1 A. ORIENTALE (D. C. l. c. t. 15.) C. H. Native of the Levant, between Bagdad and Aleppo, where it was collected by Olivier and Bruguier.

**Eastern Anisosciadium. Pl. spreading. Cult. See Oliviera above for culture and propagation.**

**Lin. Syst. Pentantria, Digynia.** Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point; or the outer ones are larger and bident. Styles in the female flowers elongated (f. 65. A.), filiform, 2, rarely 3. Fruit ovate, nearly terete (f. 65. f.), enclosed in a hollow receptacle, furnished with a short emersed beak. Mericarps with 5 depressed equal undulated ribs. Vitre one in each furrow, covered by a cobwebbed membrane. Albumen deeply involute (f. 65. j.).—Perennial herbs. Leaves pinnatifid; segments cut. Umbels terminal; the flowers of the ray male, and joined together at the base before flowering, having the receptacle girding them; the female flowers solitary and central. Involucra and involucules constantly of many leaves.

**Sect. I. LEUCÉPHAORA (from *leukos*, leukos, white, and *phore*, phero, to bear; in reference to the white flowers of the species). D. C. prod. 4. p. 235. Flowers white. Petals obcordate, glabrous, nearly equal. Lobes of leaves pungent, terete or conical.**

1 E. STVINOSA (Lin. spec. 344.) plant glaucous, finely downy; leaves pinnate; leaflets subulate, trifid, stiff; leaves of involucrum and involucules spinose. 2. H. Native along the Mediterranean, in the sand by the sea side. Said to have been found by Ray on the sea coast of Lancashire, and by Mr. Blackstone between Forrestan and Sea Salter; between Whitsable and the Isle of Thanet, by Sandwich, and near West Chester by Gerarde; but it has been since searched for without success; it was therefore nothing but the common samphire that was found in the above mentioned habitats. Cav. icon. 2. t. 127. Smith, fl. grac. t. 263. eng. bot. 2413. D. C. coll. mem. v. t. 16.—Mor. ox. sect. 9. t. 1. f. 1. Root fusi-form, edible. Flowers white. (f. 65.)

**Vari. β, pubescens** (Guss. prod. fl. sic. 1. p. 309.) stem pubescent, deeply furrowed; leaves scabrous; rays of umbels piously pubescent. 2. H. Native of the Levant.

**Prickly Sea-paraspin. Fl. Jul. Pl. 2 to 3 feet.**

2 E. FLATY'LOBA (D. C. prod. 4. p. 235.) plant smoothish or pubescent in the upper part. Leaves petiolate, pinnate; leaflets 3-4-cleft: lobes lanceolate, flatish, divaricate, spineose; leaves of involucre lanceolate, spinous. 2. H. Native of Persia, about Teheran. Stems angular, flexuous. Umbels small, when young, pubescent. Flowers white.

**Broad-lated Sea-paraspin. Pl. 1/2 to 1 foot.**

3 S. TRIKOHYLLA (Smith, in Rees' cyclo. vol. 12. no. 3.) leaves biternate; segments filiform, channelled, acute, unarm'd. 2. H. Native of the Levant, in stony places at the foot of Mount Ararat; and of Persia, in the province of Aderbeijanzjan, where it was gathered by Szovits. Umbels turbidly muricated, about the size of those of *E. spinosa*, of a deep purple while young; petals white. Perhaps this plant is the same as *E. orientalis*pageIndexuedifolium, Vaill. herb. The plant has a strong smell of galdaban according to Szovits.

**Hair-leaved Sea-paraspin. Fl. July. Clt. 1820. Pl. 1 foot.**

**Sect. II. CURYSHÖPHA (from *chrysos*, chrysos, gold, and *phore*, phero, to bear; in reference to the yellow flowers). D. C. prod. 4. p. 235. Flowers yellow. Petals ovate, barbately ciliated; the outer ones of the umbel rather radiant. Lobes of leaves flat, foliaceous, toothed at the apex. According to Fischer it is probably a distinct genus.

4 E. TETRÖFILA (Lin. spec. 344.) plant pubescent; leaves bipinnatifid; leaflets pinnatifid or cut, cuneated, unarm'd at the apex. 2. H. Native of Apulia, Sicily, Greece, Tauria, and abot Smyrna and Constantinople, in fields; and of Persia, in the province of Erivan, in dry saltish places. Sibth. and Smith, fl. grce. 266. prod. 1. p. 179. Stev. mem. soc. mosc. 3. p. 240 and 258. D'Urv. enum. 29.—Moris. oxon. sect. 9. t. 1. f. 2. Pink. aln. t. 11. f. 1. The fruit is similar to the rest of the species. A much branched glaucous plant.

**Fine-leaved Sea-paraspin. Fl. July, Aug. Clt. 1731. Pl. 13 f. Cult.** These plants not producing seeds in this country are increased by cuttings of the roots or stems. Place them in a warm situation and a dry soil, or else cover them in winter, to prevent the frost from destroying them.

CL. EXOACANTHA (from *exos*, exo, without, and *acrotha*, a spine; in allusion to the leaves of the involucres being spinose, and situated on the outside of the umbellules). Labill. pl. syr. dec. 1. p. 10. t. 2. Lag. am. nat. 2. p. 106. D. C. prod. 4. p. 235.
UMBELLIFERÆ. CL. EXOACANTHA.

LIN. SYST. PENTADRIA, Digiñia. Flowers polygamous, central ones fertile, the rest sterile. Calyx in the sterile flowers, with obsolete margins. Petals obcordate, indented, equal. Young fruit of the sterile flowers obovate, and striated; those of the central flowers much larger, ovate, and somewhat papillos, crowned by 15 elongated stiff bristles. Seed unknown.—An herb, native of the Levant. Leaves pinnate: leaflets of the radical leaves ovate, toothed, rather cut; of the cauline leaves lanceolate-linear, acute. Umbels terminal, compound; umbelules on short peduncles. Leaves of involucra 10-12, large, channelled, spinose, longer than the rays, spreading; leaves of involucels 7-11, spinose, situated on the outer side of the umbelules, and longer than them, very unequal, 1 of which is very long, 2-4 are middle-sized, and 2-4 are bristle-formed. Flowers white.—This very singular genus is allied to Echinophora and Arctopus from the inflorescence, but the fruit is scarcely known. Perhaps the fruit is said to be crowned by 13 bristles, because the calyx is 5-parted, and each of these parts again trisected.

1 E. heterophylla (Labill. 1. c.) G. F. Native of the Levant, at Nazareth. Variable-leaved Exoacantha. Fl. 2 feet.

Cult. The seed of this plant ought to be sown in a pot; and the plants when of sufficient size to be potted separately; and in the second year, about the month of May, they may be planted out into the open border, where they will flower and seed freely.

CL. ARCTOPUS (from ἀρκτός, a bear, and ρουσ, ροσ, a foot; this singular plant is beset with spines, which have been compared to the claws of a bear.) Lin. Hort. Cliff. 493. Gen. no. 1163. Lam. ill. t. 865. Gertr. fil. carp. 3. p. 14. t. 182. f. 4. D. C. prod. 4. p. 256.—A. Rich. Adans. Fam. 2. p. 182.

LIN. SYST. PENTADRIA, Digiñia. Flowers polygamo-dioecious. Margin of calyx 5-toothed. Petals lanceolate, with an incurved acute entire margin. Stamens in the male flowers twice the length of the corolla, antheriform. Stylodium flat. Styles 2, very short, deciduous. Ovary abortive. Stamens in the female flowers none. Styles 2, thickened at the base, and divaricate at the apex. Fruit ovate, beaked, crowned by the calyx, and conterminated with it from the middle, having one side depressed and nacked, with a furrow, not separable into two parts, but bilocular, with one of the cells abortive; the fruit is therefore 1-seeded from abortion, roundish, convex on one side, and concave with a furrow on the other.—A perennial herb, native of the Cape of Good Hope. Radical leaves pressed close to the ground in a stellate manner, with flat petioles, and roundish trifid limbs; the lobes toothed and spiny-ciliated. Male umbels compound, pedunculate, sterile, but mixed with a few female flowers; umbelules nearly glabose; involucel usually of 3 leaves, which are joined together after flowering. Female umbels sessile, fertile, surrounded by the 3 concrete leaves of the involucel, which are coriaceous, reticulated, and spiny toothed, girdling the fruit. Petals white.

1 A. Echinatus (Lin. spec. ed. 2. vol. 2. p. 1512.) G. F. Native of the Cape of Good Hope, on hills about Cape Town, &c. Thumb. fl. cap. 255. Ker. bot. reg. t. 765.—Burm. aff. 1. t. 1.—Pluk. mant. t. 271. f. 5. The roots are used with success at the Cape in cases of siphilit; but upon trial here some years since they were found to be less efficient than sarasinilla.

Rough Arctopus. Fl. May, June. Cl. 1771. Fl. 1 foot.

Cult. This plant should be grown in a mixture of peat, sand, and loam; and it may either be increased by dividing the plant or by seed.

CL. I. CACHRYS (one of the names given by the Romans to the Rosemary. According to Morison, the name was derived from καθώς, katho, to burn, on account of the carminative qualities of the plants.) Tourn. inst. t. 172. Lin. gen. no. 342. D. C. coll. mem. v. p. 65. prod. 4. p. 236.—Cachrys and Hippomâtrathrum, Link. hort. berol. 1. p. 271. Koch, umb. 136. f. 36, 37.—Cachrys species, Schultes.
